

# ESP32-P4

Technical Reference Manual Pre-release v0.1

PRELIMINARY

ESPRESSIF

## About This Document

The **ESP32-P4 Technical Reference Manual** is targeted at developers working on low level software projects that use the ESP32-P4 SoC. It describes the hardware modules listed below for the ESP32-P4 SoC and other products in ESP32-P4 series. The modules detailed in this document provide an overview, list of features, hardware architecture details, any necessary programming procedures, as well as register descriptions.

## Navigation in This Document

Here are some tips on navigation through this extensive document:

- [Release Status at a Glance](#) on the very next page is a minimal list of all chapters from where you can directly jump to a specific chapter.
- Use the **Bookmarks** on the side bar to jump to any specific chapters or sections from anywhere in the document. Note this PDF document is configured to automatically display **Bookmarks** when open, which is necessary for an extensive document like this one. However, some PDF viewers or browsers ignore this setting, so if you don't see the **Bookmarks** by default, try one or more of the following methods:
  - Install a PDF Reader Extension for your browser;
  - Download this document, and view it with your local PDF viewer;
  - Set your PDF viewer to always automatically display the **Bookmarks** on the left side bar when open.
- Use the native **Navigation** function of your PDF viewer to navigate through the documents. Most PDF viewers support to go **Up**, **Down**, **Previous**, **Next**, **Back**, **Forward** and **Page** with buttons, menu, or hot keys.
- You can also use the built-in **GoBack** button on the upper right corner on each and every page to go back to the previous place before you click a link within the document. Note this feature may only work with some Acrobat-specific PDF viewers (for example, Acrobat Reader and Adobe DC) and browsers with built-in Acrobat-specific PDF viewers or extensions (for example, Firefox).

## Release Status at a Glance

Note that this manual is still work in progress. See our release progress below:

| No.  | Chapter  | Progress  |
|--|--|-----------|
| <b>Part I. Microprocessor and Master</b>       |  |           |
| 1  | High-Performance CPU [to be added later]             | 95%       |
| 2  | RISC-V Trace Encoder (TRACE)                         | Published |
| 3  | Processor Instruction Extensions [to be added later] | 57%       |
| 4  | Low-Power CPU  | Published |
| <b>Part II. System DMA</b>                     |  |           |
| 5  | GDMA Controller (GDMA-AHB, GDMA-AXI)                 | Published |
| 6  | VDMA Controller (VDMA)                               | Published |
| 7  | 2D-DMA Controller (2D-DMA)                           | Published |
| <b>Part III. Memory Organization</b>           |  |           |
| 8  | System and Memory                                    | Published |
| 9  | eFuse Controller                                     | Published |
| <b>Part IV. System Component</b>               |  |           |
| 10   | GPIO Matrix and IO MUX                               | Published |
| 11   | Reset and Clock                                      | Published |
| 12   | Chip Boot Control                                    | Published |
| 13   | Interrupt Matrix                                     | Published |
| 14   | Event Task Matrix (ETM)                              | Published |
| 15   | Low-Power Management                                 | Published |
| 16   | System Timer   | Published |
| 17   | Timer Group (TIMG)                                   | Published |
| 18   | Watchdog Timers (WDT)                                | Published |
| 19   | RTC Timer  | Published |
| 20   | Permission Control (PMS)                             | Published |
| 21   | System Registers [to be added later]                 | 90%       |
| 22   | Debug Assistant                                      | Published |
| 23   | LP Mailbox   | Published |
| 24   | Brown-out Detector                                   | Published |
| <b>Part V. Cryptography/Security Component</b> |  |           |
| 25   | AES Accelerator (AES)                                | Published |
| 26   | ECC Accelerator (ECC)                                | Published |
| 27   | HMAC Accelerator (HMAC)                              | Published |
| 28   | RSA Accelerator (RSA)                                | Published |
| 29   | SHA Accelerator (SHA)                                | Published |
| 30   | Digital Signature Algorithm (DSA)                    | Published |
| 31   | Elliptic Curve Digital Signature Algorithm (ECDSA)   | Published |
| 32   | External Memory Encryption and Decryption (XTS_AES)  | Published |
| 33   | Random Number Generator (RNG)                        | Published |
| <b>Part VI. Image and Voice Processing</b>     |  |           |
| 34   | JPEG Codec   | Published |

| No.  | Chapter                                      | Progress  |
|--|--|-----------|
| 35   | Image Signal Processor (ISP)                 | Published |
| 36   | Pixel-Processing Accelerator (PPA)           | Published |
| 37   | LCD and Camera Controller (LCD_CAM)          | Published |
| 38   | H264 Encoder [to be added later]             | 81%       |
| 39   | MIPI CSI                                     | Published |
| 40   | MIPI DSI [to be added later]                 | 48%       |
| 41   | Voice Activity Detection (VAD)               | Published |
| <b>Part VII. Connectivity Interface</b>    |  |           |
| 42   | UART Controller (UART)                       | Published |
| 43   | SPI Controller (SPI)                         | Published |
| 44   | I2C Controller (I2C)                         | Published |
| 45   | Analog I2C Controller                        | Published |
| 46   | I3C Controller [to be added later]           | 48%       |
| 47   | I2S Controller (I2S)                         | Published |
| 48   | LP I2S Controller                            | Published |
| 49   | Pulse Count Controller (PCNT)                | Published |
| 50   | USB 2.0 High-Speed OTG                       | Published |
| 51   | USB 2.0 Full-Speed OTG                       | Published |
| 52   | USB Serial/JTAG Controller (USB_SERIAL_JTAG) | Published |
| 53   | Ethernet Media Access Controller (EMAC)      | Published |
| 54   | Two-Wire Automotive Interface (TWAI)         | Published |
| 55   | SD/MMC Host Controller (SDHOST)              | Published |
| 56   | LED PWM Controller (LEDC)                    | Published |
| 57   | Motor Control PWM (MCPWM)                    | Published |
| 58   | Remote Control Peripheral (RMT)              | Published |
| 59   | Parallel IO Controller (PARLIO)              | Published |
| 60   | BitScrambler                                 | Published |
| <b>Part VIII. Analog Signal Processing</b> |  |           |
| 61   | Touch Sensor (TOUCH)                         | Published |
| 62   | Temperature Sensor (TSENS)                   | Published |
| 63   | ADC Controller (ADC)                         | Published |
| 64   | Analog Voltage Comparator                    | Published |

# Part I

## Microprocessor and Master

This part covers the essential processing elements of the system, diving into the microprocessor architecture with both high-performance and low-power CPUs. Details include CPU instruction extensions and trace encoding for debugging purposes.

## Chapter 1

### RISC-V Trace Encoder (TRACE)

The high-performance CPU (HP CPU) of ESP32-P4 supports the instruction trace interface through the trace encoder. The trace encoder connects to HP CPU's instruction trace interface, compresses the information into smaller packets, and then stores the packets into internal SRAM (see Chapter 6 *System and Memory*).

Figure 1.0-1. Trace Encoder Overview

## 1.1 Terminology

To better illustrate the functions of the RISC-V Trace Encoder, the following terms are used in this chapter.

|   |   |
|---|---|
| <b>hart</b>                                 | RISC-V hardware thread  |
| <b>branch</b>                               | an instruction which conditionally changes the execution flow   |
| <b>uninferable discontinuity (updiscon)</b> | a program counter change that can not be inferred from the program binary alone   |
| <b>delta</b>                                | a change in the program counter that is other than the difference between two instructions placed consecutively in memory |
| <b>trap</b>                                 | the transfer of control to a trap handler caused by either an exception or an interrupt                                   |
| <b>qualification</b>                        | an instruction that meets the filtering criteria passes the qualification, and will be traced                             |
| <b>te_inst</b>                              | the name of the packet type emitted by the encoder  |
| <b>retire</b>                               | the final stage of executing an instruction, when the machine state is updated  |
| <b>EPC</b>                                  | exception program counter   |

## 1.2 Introduction

In complex systems, understanding program execution flow is not straightforward. This may be due to a number of factors, for example, interactions with other cores, peripherals, real-time events, poor implementations, or some combination of all of the above.

It is hard to use a debugger to monitor the program execution flow of a running system in real time, as this is intrusive and might affect the running state. However, it is important to provide the visibility of program execution.

That is where instruction trace comes in, which provides trace of the program execution.

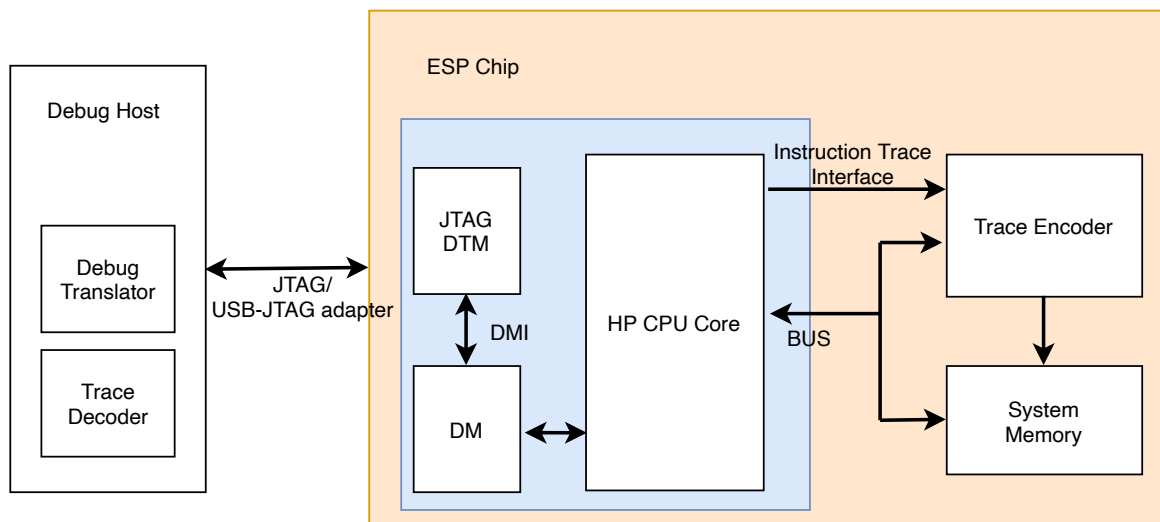

Figure 1.2-1. Trace Flow Overview

Figure 1.2-1 shows the instruction delta trace flow. Each HP Core has a private encoder that can work independently, and the trace flow of each core is the same:

- The HP CPU core provides an instruction trace interface that outputs the instruction information executed by the HP CPU. Such information includes instruction address, instruction type, etc. For more details about ESP32-P4 HP CPU's instruction trace interface, please refer to Chapter 1 [High-Performance CPU \[to be added later\]](#).
- The trace encoder collects the relevant instruction trace information from HP CPU's instruction trace interface, compresses the information into lower bandwidth packets, and then stores the packets in system memory.
- The debugger (debug host) can dump the trace packets from the system memory via JTAG or USB Serial/JTAG, and use a decoder to decompress and reconstruct the program execution flow. The trace decoder, usually software on an external PC, takes in the trace packets and reconstructs the program instruction flow with the program binary that runs on the originating hart. This decoding step can be done offline or in real time while the hart is executing.

## 1.3 Features

- Compatible with Efficient Trace for RISC-V Version 2.0. See Table 1.3-1 for the implemented parameters
- Support for delta address mode and full address mode
- Support for a filter unit
- Support for notifying an instruction address via debug trigger or filter unit
- Support for the following sideband signals to control trace data flow:
  - Support for debugging trigger to start or end encoder
  - When the hart is halted, the encoder can report the last packet and then stop
  - When the hart is reset, the encoder can report the last packet and then stop
  - Support for stalling the hart when FIFO is almost full
- Arbitrary address range of the trace memory size
- Configurable synchronization modes:
  - Synchronization counter counts by packet
  - Synchronization counter counts by cycle
  - Synchronization counter can be disabled
- Trace lost status to indicate packet loss
- Automatic restart after packet loss
- Memory writing in the loop or non-loop mode
- Support two interrupts:
  - Triggered when the packet size exceeds the configured memory space
  - Triggered when a packet is lost
- FIFO (128 × 8 bits) to buffer packets
- AHB burst transmission with configurable burst length

**Table 1.3-1. Trace Encoder Parameters**

| Parameter Name      | Value | Description                             |
|---------------------|-------|---|
| arch_p              | 0     | Initial version                         |
| bpred_size_p        | 0     | Branch prediction mode is not supported |
| cache_size_p        | 0     | Jump target cache mode is not supported |
| call_counter_size_p | 0     | Implicit return mode is not supported   |
| ctype_width_p       | 0     | Width of the ctype bus                  |
| context_width_p     | 0     | Width of context bus                    |
| ecause_width_p      | 6     | Width of exception cause                |
| ecause_choice_p     | 0     | Multiple choice is not supported        |
| f0s_width_p         | 0     | Format 0 packets are not supported      |
| filter_context_p    | 0     | Filtering on context is not supported   |

| Parameter Name      | Value | Description  |
|---------------------|-------|--|
| filter_excint_p     | 1     | Filtering on exception cause or interrupt is supported       |
| filter_privilege_p  | 1     | Filtering on privilege is supported                          |
| filter_tval_p       | 1     | Filtering on trap value is supported                         |
| iaddress_lsb_p      | 1     | Compressed instructions are supported                        |
| iaddress_width_p    | 32    | The instruction bus is 32-bit                                |
| iretire_width_p     | 1     | Width of the iretire bus                                     |
| ilastsize_width_p   | 0     | Width of the ilastsize                                       |
| itype_width_p       | 3     | Width of the itype bus                                       |
| nocontext_p         | 1     | Exclude context from te_inst packets                         |
| notime_p            | 1     | Exclude time from te_inst packets                            |
| privilege_width_p   | 1     | Only machine and user mode are supported                     |
| retires_p           | 1     | Maximum number of instructions that can be retired per block |
| return_stack_size_p | 0     | Implicit return mode is not supported                        |
| sijump_p            | 0     | Sequentially inferable jump mode is not supported            |
| taken_branches_p    | 1     | Only one instruction retired per cycle                       |
| impdef_width_p      | 0     | Not implemented  |

For detailed descriptions of the above parameters, please refer to the Efficient Trace for RISC-V Version 2.0 > Chapter Parameters and Discovery.

## 1.4 Architectural Overview

This chapter mainly introduces the implementation details of ESP32-P4's trace encoder.

As shown in Figure 1.0-1, the trace encoder contains an encoder, a FIFO, a register configuration module, and a transmission control module.

The encoder receives the HP CPU's instruction information via the instruction trace interface, compresses it into different packets, and writes it to the internal FIFO.

The transmission control module writes the data in the FIFO to the internal SRAM through the AHB bus.

The FIFO is 128 deep and 8-bit wide. When the memory bandwidth is insufficient, the FIFO may overflow, and packet loss occurs. If a packet is lost, the encoder will send a packet to tell that a packet is lost, stop working until the FIFO is empty, and also trigger an interrupt meanwhile if the interrupt is enabled.

## 1.5 Functional Description

### 1.5.1 Synchronization

In order to make the trace robust there must be regular synchronization points within the trace. Synchronization is accomplished by sending a full valued instruction address. When the synchronization counter value reaches the value of the [TRACE\\_RESYNC\\_PROLONGED](#) field of the [TRACE\\_RESYNC\\_PROLONGED\\_REG](#) register, the encoder will send a synchronization packet (format 3 subformat 0, see Section 1.6.3.1).

The synchronization counter is configured via [TRACE\\_RESYNC\\_MODE](#):

- 0: Disable the synchronization counter
- 1: Invalid. No effect
- 2: Synchronization counter counts by packet
- 3: Synchronization counter counts by cycle

You can adjust the trace bandwidth by increasing the value of [TRACE\\_RESYNC\\_PROLONGED](#) to reduce the frequency of sending synchronization packets, thereby reducing the bandwidth occupied by packets.

## 1.5.2 Address Mode

ESP32-P4 supports two address modes: delta address mode and full address mode.

- Delta address mode (default): In delta address mode, addresses are encoded as the difference between the actual address of the current instruction and the actual address of the instruction reported in the previous packet that contained an address. This differential encoding requires fewer bits than the full address, and thus results in more efficient trace compression.
- Full address mode: In full address mode, all addresses in the trace are encoded as absolute addresses instead of in differential form. This kind of encoding is always less efficient, but it can be a useful debugging aid for software decoder developers. This mode is enabled by setting [TRACE\\_FULL\\_ADDRESS](#).

## 1.5.3 Optional Sideband Signals

The Efficient Trace for RISC-V Version 2.0 > Chapter Optional Sideband Signals has provided some optional sideband signals for encoder control. ESP32-P4 has implemented the following functions:

**Table 1.5-1. Optional sideband signals**

| Signal       | Function   |
|--------------|--|
| trigger[2:0] | <ul style="list-style-type: none"> <li>• A pulse on bit 0 will cause the encoder to start tracing, and continue until further notice, subject to other filtering criteria also being met.</li> <li>• A pulse on bit 1 will cause the encoder to stop tracing until further notice.</li> <li>• A pulse on bit 2 will cause the encoder to report a specific address. This function is enabled by setting <a href="#">TRACE_DM_TRIGGER_ENA</a>. The trigger signal is asserted upon a trigger match. For example, if the <a href="#">action</a> field of <a href="#">mcontrol</a> is 2, while the trigger matched it will assert trigger bit0; if the <a href="#">action</a> is 3, while the trigger matched it will assert trigger bit1. For details, please refer to Table 1.8-1.</li> </ul> |
| halted       | <p>Hart is halted. Upon assertion, the encoder will output a packet to report the address of the last instruction retired before halting, followed by a support packet to indicate that tracing has stopped. Upon deassertion, the encoder will start tracing again, commencing with a synchronization packet. This function is enabled by setting <a href="#">TRACE_HALT_ENA</a>.</p>   |

| Signal | Function   |
|--------|--|
| reset  | Hart is in reset. Behavior is as described above for halted.   |
| stall  | Stall request to hart. Some applications may require lossless trace, which can be achieved by using this signal to stall the hart if the trace encoder is unable to output a trace packet (internal FIFO almost full). This function is enabled by setting <a href="#">TRACE_STALL_ENA</a> . |

### 1.5.4 Filtering

Filtering provides a mechanism to control the criteria for encoder to produce a trace. For example, it may be desirable to trace:

- When the instruction address is within a particular range
- Starting from one instruction address and continue until a second instruction address
- For one or more specified privilege levels
- Exception and/or interrupt handlers for specified exception causes

The filtering unit has a filter and a comparator unit.

Each comparator unit is actually a pair of comparators (Primary and Secondary, or P, S) allowing a bounded range to be matched with a signal unit if required, and offers:

- Input selected from iaddress and tval
- A range of arithmetic options (<, >, =, !=, etc.) independently selectable for each comparator
- Secondary match value may be used as a mask for the primary comparator
- The two comparators can be combined in several ways:  $P$ ,  $P \& \& S$ ,  $!(P \& \& S)$ , latch (set on P clear on S)
- Each comparator can also be used to explicitly report a particular instruction address

Each filter can specify filtering against instruction from the hart, and offers:

- 1 run-time selectable comparator units to match
- Multiple choice selection for priv and cause inputs
- Select matching for interrupt

### 1.5.5 Anchor Tag

Since the length of data packets is variable, in order to identify boundaries between data packets when packed packets are written to memory, the ESP32-P4 encoder inserts zero bytes between data packets:

- The maximum packet length is 13 bytes, so a sequence of at least 14 zero bytes cannot occur within a normal packet. Therefore, the first non-zero byte seen after a sequence of at least 14 zero bytes must be the first byte of a packet.
- Every time when 128 packets are transmitted, the encoder writes 14 zero bytes to the memory partition boundary as anchor tags.

## 1.5.6 Memory Writing Mode

When writing the trace memory, the size of the trace packets might exceed the capacity of the memory. In this case, you can choose whether to wrap around the trace memory or not by configuring the memory writing mode:

- Loop mode: When the size of the trace packets exceeds the capacity of the trace memory (namely when `TRACE_MEM_CURRENT_ADDR_REG` reaches the value of `TRACE_MEM_END_ADDR_REG`), the trace memory is wrapped around, so that the encoder loops back to the memory's starting address `TRACE_MEM_START_ADDR_REG`, and old data in the memory will be overwritten by new data.
- Non-loop mode: When the size of the trace packets exceeds the capacity of the trace memory, the trace memory is not wrapped around. The encoder stops at `TRACE_MEM_END_ADDR_REG`, and old data will be retained.

## 1.5.7 Automatic Restart

When packets are lost due to FIFO overflow, the encoder will stop working and need to be resumed by software manually or restarted by hardware automatically. If the `TRACE_RESTART_ENA` bit of `TRACE_TRIGGER_REG` is set, once the FIFO is empty, the encoder can automatically be restarted.

If the automatic restart feature is enabled, the encoder will be restarted in any case. Therefore, to disable the encoder, the automatic restart feature must be disabled first by clearing the `TRACE_RESTART_ENA` bit of the `TRACE_TRIGGER_REG` register.

## 1.6 Encoder Output Packets

This section mainly introduces ESP32-P4 trace encoder output packet format.

Figure 1.6-1. Trace packet Format

A packet includes header, index and payload. Header, index and payload are transmitted sequentially in bit stream form, from the fields listed at the top of tables below to the fields listed at the bottom. If a field consists of multiple bits, then the least significant bit is transmitted first.

### 1.6.1 Header

Header is 1-byte long. The format of header is shown in Table 1.6-1.

**Table 1.6-1. Header Format**

| Field     | Bits | Description            | Value  |
|-----------|------|------------------------|--------|
| length    | 5    | Length of whole packet | 4 ~ 13 |
| flow      | 2    | Reserved               | 0      |
| timestamp | 1    | Reserved               | 0      |

## 1.6.2 Index

Index has 2 bytes. The format of index is shown in Table 1.6-2.

**Table 1.6-2. Index Format**

| Field | Bits | Description              | Value   |
|-------|------|--------------------------|---------|
| index | 16   | The index of each packet | 0~65536 |

## 1.6.3 Payload

The length of payload ranges from 1 byte to 10 bytes.

### 1.6.3.1 Format 3 Packets

Format 3 packets are used for synchronization, and report supporting information. There are 4 subformats defined in the specification. ESP32-P4 only supports 3 of them.

#### Format 3 Subformat 0 - Synchronization

This packet contains all the information the decoder needs to fully identify an instruction. It is sent for the first traced instruction (unless that instruction also happens to be the first one in an exception handler), and when synchronization has been scheduled by expiry of the synchronization timer. The payload length is 5 bytes.

**Table 1.6-3. Packet format 3 subformat 0**

| Field name  | Bits | Description  |
|-------------|------|--|
| format      | 2    | 11 (sync): Synchronization   |
| subformat   | 2    | 00 (start): Start of tracing, or resync  |
| branch      | 1    | Set to 0 if the address points to a branch instruction, and the branch was taken. Set to 1 if the instruction is not a branch or if the branch is not taken. |
| privilege   | 1    | The privilege level of the reported instruction  |
| address     | 31   | Full instruction address. The address must be left shifted 1 bit in order to recreate the original byte address.   |
| sign_extend | 3    | Reserved   |

#### Format 3 Subformat 1 - Exception

This packet also contains all the information the decoder needs to fully identify an instruction. It is sent following an exception or interrupt, and includes the cause, the 'trap value' (for exceptions), and the address

of the trap handler or of the exception itself. The length is variable: if the interrupt field is 1, the tvalepc field is omitted and the length is 6 bytes, otherwise the length is 10 bytes.

**Table 1.6-4. Packet format 3 subformat 1**

| Field name  | Bits | Description   |
|-------------|------|---|
| format      | 2    | 11 (sync): Synchronization  |
| subformat   | 2    | 01 (exception): Exception cause and trap handler address  |
| branch      | 1    | Set to 0 if the address points to a branch instruction, and the branch was taken. Set to 1 if the instruction is not a branch or if the branch is not taken.  |
| privilege   | 1    | The privilege level of the reported instruction   |
| ecause      | 6    | Exception cause   |
| interrupt   | 1    | Interrupt   |
| theadr      | 1    | When set to 1, the address field points to the trap handler address. When set to 0, the address field points to the EPC (exception program counter) for an exception at the target for an updiscon, and is undefined for other exceptions and interrupts. |
| address     | 31   | Full instruction address. The value of this field must be left shifted 1 bit in order to recreate the original byte address.  |
| tvalepc     | 32   | Value from appropriate utval/stval/mtval CSR (control/status register). Omitted if the interrupt is 1   |
| sign_extend | 3    | Reserved  |

### Format 3 Subformat 3 - Support

This packet provides supporting information to aid the decoder. It is issued when the trace is ended, filter match is failed, or a packet is lost. The length is 2 bytes.

**Table 1.6-5. Packet format 3 subformat 3**

| Field name   | Bits | Description   |
|--------------|------|---|
| format       | 2    | 11 (sync): Synchronization  |
| subformat    | 2    | 11 (support): Supporting information for the decoder  |
| enable       | 1    | Indicates if the encoder is enabled   |
| encoder_mode | 1    | Always 0. Only supported by branch trace  |
| qual_status  | 2    | Indicates qualification status: <ul style="list-style-type: none"> <li>• 00 (no_change): No change to filter qualification</li> <li>• 01 (ended_rep): Qualification ended, preceding instruction sent explicitly to indicate last qualification instruction</li> <li>• 10 (trace lost): One or more packets lost</li> <li>• 11 (ended_upd): Qualification ended, preceding te_inst would have been sent anyway due to an updiscon, even if wasn't the last qualified instruction</li> </ul> |

| Field name  | Bits | Description  |
|-------------|------|--|
| ioptions    | 6    | <p>Indicates optional modes:</p> <ul style="list-style-type: none"> <li>sequentially inferred jumps (Bits 5): When set to 1, the targets of sequentially inferable jumps will not be reported. (This feature is not implemented, so bit 5 should always be 0)</li> <li>branch prediction (Bit 4): When set to 1, the branch prediction is enabled. (This feature is not implemented, so bit 4 should always be 0)</li> <li>jump target cache (Bit 3): When set to 1, the jump target cache is enabled. (This feature is not implemented, so bit 3 should always be 0)</li> <li>full address (Bit 2): <ul style="list-style-type: none"> <li>0: delta address mode</li> <li>1: full address mode</li> </ul> </li> <li>implicit exception (Bit 1): Exclude address from format 3 subformat 1 packet if trap vector can be determined from ecause. (This feature is not implemented, so bit 1 should always be 0)</li> <li>implicit return (Bit 0): When set to 1, function return addresses will not be reported. (This feature is not implemented, bit 0 should always be 0)</li> </ul> |
| sign_extend | 2    | Reserved   |

### 1.6.3.2 Format 2 Packets

This packet contains only an instruction address, and is used when the address of an instruction must be reported (for example if the instruction is the target for an updiscon, or is the last instruction before exception), and there is no reported branch information.

The length is variable if delta address mode is enabled, ranging from 5 bytes to 8 bytes. The address field can be 8/16/24/32 bits, inferred from the packet length. For example, if the header length is  $n$  bytes, the address bits are  $n - 4$  bytes. A sign bit is required to extend the address field to 32 bits.

**Table 1.6-6. Packet format 2**

| Field name | Bits | Description  |
|------------|------|--|
| format     | 2    | 10 (addr-only): No branch information  |
| notify     | 1    | If the value of this bit is different from the MSB of address, it indicates that this packet is reporting an instruction that is not the target of an uninferable discontinuity because a notification was requested via trigger[2] or a filter matched. |
| updiscon   | 1    | If the value of this bit is different from notify, it indicates that this packet is reporting the instruction following an uninferable discontinuity and is also the instruction before an exception, privilege change or resync.                        |

| Field name  | Bits     | Description  |
|-------------|----------|--|
| zero_extend | 4        | Reserved   |
| address     | Variable | Delta instruction address. These bits can be 8/16/24/32. |

### 1.6.3.3 Format 1 Packets

This packet includes branch information, and is used when either the branch information must be reported (for example because the branch map is full), or when the address of instruction must be reported, and there has been at least one branch since the previous packet.

The packet length is variable if delta address mode is enabled, ranging from 5 bytes to 12 bytes. The address field can be 8/16/24/32 bits, inferred from the packet length. For example:

- The header length is  $n$  bytes
- The value of the format field is 1
- The value of the branch field is:
  - 0: the packet is format 1 without address
  - 1: branch\_map is 1 bit wide, zero\_ext is 6 bits wide, and address is  $n - 5$  bits wide
  - 2 ~ 3: branch\_map is 3 bits wide, zero\_ext is 4 bits wide, and address is  $n - 5$  bits wide
  - 4 ~ 7: branch\_map is 7 bits wide, zero\_ext is 0 bits wide, and address is  $n - 5$  bits wide
  - 8 ~ 15: branch\_map is 15 bits wide, zero\_ext is 0 bits wide, and address is  $n - 6$  bits wide
  - 16 ~ 31: branch\_map is 31 bits wide, zero\_ext is 0 bits wide, and address is  $n - 8$  bits wide

#### Format 1 - address, branch\_map

The length is variable.

**Table 1.6-7. Packet format 1 with address**

| Field name | Bits | Description  |
|------------|------|--|
| format     | 2    | 01: Includes branch information  |
| branches   | 5    | Number of valid bits branch_map. The number of bits of branch_map is determined as follows: <ul style="list-style-type: none"> <li>• 0: (cannot occur for this format)</li> <li>• 1: 1 bit</li> <li>• 2 ~ 3: 3 bits</li> <li>• 4 ~ 7: 7 bits</li> <li>• 8 ~ 15: 15 bits</li> <li>• 16 ~ 31: 31 bits</li> </ul> For example if branches = 12, branch_map is 15-bit long, and the 12 LSBs are valid. |

| Field name | Bits     | Description   |
|------------|----------|---|
| branch_map | Variable | An array of bits indicating whether branches are taken or not. Bit 0 represents the oldest branch instruction executed. For each bit: <ul style="list-style-type: none"> <li>• 0: branch taken</li> <li>• 1: branch not taken</li> </ul> The field Bits is variable and determined by the branches field. |
| notify     | 1        | If the value of this bit is different from the MSB of address, it indicates that this packet is reporting an instruction that is not the target of an uninferable discontinuity because a notification was requested via trigger[2] or a filter matched.  |
| updiscon   | 1        | If the value of this bit is different from notify, it indicates that this packet is reporting the instruction following an uninferable discontinuity and is also the instruction before an exception, privilege change or resync.   |
| zero_ext   | Variable | The length of this field is determined by branches as follows: <ul style="list-style-type: none"> <li>• 1: 6 bits</li> <li>• 2 ~ 3: 4 bits</li> <li>• 4 ~ 31: 0 bits</li> </ul>   |
| address    | Variable | Delta instruction address. These bits can be 8/16/24/32   |

**Format 1 - no address, branch\_map**

The length is 5 bytes.

**Table 1.6-8. Packet format 1 without address**

| Field name  | Bits | Description  |
|-------------|------|--|
| format      | 2    | 01: includes branch information  |
| branches    | 5    | Number of valid bits in branch_map. The length of branch_map is 31 bits. Only 0 valid.   |
| branch_map  | 31   | An array of bits indicating whether branches are taken or not. Bit 0 represents the oldest branch instruction executed. For each bit: <ul style="list-style-type: none"> <li>• 0: branch taken</li> <li>• 1: branch not taken</li> </ul> |
| sign_extend | 2    | Reserved   |

## 1.7 Interrupt

ESP32-P4's CORE<sub>n</sub>\_TRACE (i.e., the trace encoder of core 0 or core 1) can generate the CORE<sub>n</sub>\_TRACE\_INTR interrupt signal that will be sent to the [Interrupt Matrix](#).

There are several internal interrupt sources from CORE<sub>n</sub>\_TRACE that can generate the above interrupt signal. The interrupt sources from CORE<sub>n</sub>\_TRACE are listed with their trigger conditions and the resulted interrupt signals in Table 1.7-1.

Table 1.7-1. CORE<sub>n</sub>\_TRACE's Internal Interrupt Sources

| Internal Interrupt Source | Trigger Condition  | Interrupt Signal              |
|---------------------------|--|-------------------------------|
| TRACE_MEM_FULL_INTR       | Triggered when the packet size exceeds the capacity of the trace memory, namely when <a href="#">TRACE_MEM_CURRENT_ADDR_REG</a> reaches the value of <a href="#">TRACE_MEM_END_ADDR_REG</a> . If necessary, this interrupt can be enabled to notify the HP CPU for processing, such as applying for a new memory space again | CORE <sub>n</sub> _TRACE_INTR |
| TRACE_FIFO_OVERFLOW_INTR  | Triggered when the internal FIFO overflows and one or more packets have been lost.   | CORE <sub>n</sub> _TRACE_INTR |

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter 11 [Interrupt Matrix](#) > Section 11.2 [Interrupt Terminology in ESP32-P4](#).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section 1.9 [Register Summary](#).

## 1.8 Programming Procedures

### 1.8.1 Encoder Option Configuration

The Encoder has some optional configuration options.

- Full address mode
  - The encoder uses delta address mode by default. Users can set [TRACE\\_FULL\\_ADDRESS](#) to enable full address mode for debugging.
- Restart after packet loss
  - Once the trace packet is lost due to FIFO overflow, the encoder will automatically stop if [TRACE\\_RESTART\\_ENA](#) is set. When the FIFO is empty, the encoder will restart to report packets.
- Stall CPU while FIFO is almost full
  - If [TRACE\\_STALL\\_ENA](#) is set, when the FIFO is almost full, a stall request will be asserted to the CPU, and the CPU will be stalled until the request is deasserted.
- Stop tracing when the CPU is halted
 

If [TRACE\\_HALT\\_ENA](#) is set, when the CPU is halted, the encoder will output a packet to report the address of the last instruction before halting, followed by a support packet to indicate that tracing has stopped. Upon the deassertion of the halted signal, the encoder will start tracing again, commencing with a synchronization packet.
- Stop tracing when the CPU is in reset

The encoder will be reset separately, if [TRACE\\_RESET\\_ENA](#) is set. When the CPU is in reset, the encoder will output a packet to report the address of the last instruction before reset, followed by a support packet to indicate that tracing has stopped. Once the CPU exits from reset, the encoder will start tracing again, commencing with a synchronization packet.

- Using trigger outputs from the Debug Module

The debug module of the RISC-V hart has a trigger unit. This defines a match control register ([mcontrol](#)) containing a 4-bit [action](#) field, and reserves codes 2 ~ 4 of this field for trace use. ESP32-P4 has implemented this feature. The values of the [action](#) field are listed in Table 1.8-1.

**Table 1.8-1. Debug module trigger support (the [action](#) field of the [mcontrol](#) register)**

| Value | Description   |
|-------|---|
| 2     | Trace-on: start trace                                 |
| 3     | Trace-off: end trace                                  |
| 4     | Trace-notify: notify the encoder to report an address |

For details about the debug module trigger unit, please refer to Chapter 1 [High-Performance CPU \[to be added later\]](#).

## 1.8.2 Filter Configuration

The filter unit described in Section 1.5.4 can be configured as follows:

1. Select one of the following match modes:
  - Set [TRACE\\_MATCH\\_PRIVILEGE](#) to enable privilege match mode:
    - Configure [TRACE\\_MATCH\\_CHOICE\\_PRIVILEGE](#) to specify the privilege level.
  - Set [TRACE\\_MATCH\\_ECAUSE](#) to enable ecause match mode:
    - Configure [TRACE\\_MATCH\\_CHOICE\\_ECAUSE](#) to specify the ecause value
  - Set [TRACE\\_MATCH\\_INTERRUPT](#) to enable interrupt match mode:
    - Configure [TRACE\\_MATCH\\_VALUE\\_INTERRUPT](#) to specify interrupt level
  - Set [TRACE\\_MATCH\\_COMP](#) to enable comparator match mode:
    - Configure the primary comparator:
      - \* Configure [TRACE\\_P\\_INPUT](#) to choose the input
      - \* Configure [TRACE\\_P\\_FUNCTION](#) to select the comparator function
      - \* Configure [TRACE\\_FILTER\\_P\\_COMPARATOR\\_MATCH\\_REG](#) to define match value
    - Configure the secondary comparator if needed:
      - \* Configure [TRACE\\_S\\_INPUT](#) to choose the input
      - \* Configure [TRACE\\_S\\_FUNCTION](#) to select the comparator function
      - \* Configure [TRACE\\_FILTER\\_S\\_COMPARATOR\\_MATCH\\_REG](#) to define match value
    - Choose which comparator to match via [TRACE\\_MATCH\\_MODE](#):

- \* 0: only the primary comparator matches, and the secondary comparator has no effect
- \* 1: both the primary comparator and the secondary comparator match ( $P \& \& S$ )
- \* 2: neither the primary comparator nor secondary comparator match ( $\neg(P \& \& S)$ )
- \* 3: start filtering when primary matches up until secondary matches

If [TRACE\\_P\\_NOTIFY](#) or [TRACE\\_S\\_NOTIFY](#) is set, the comparator will report the matched address as a notification, the instructions will not be filtered. For example:

- If the [TRACE\\_MATCH\\_MODE](#) is 0, and [TRACE\\_P\\_NOTIFY](#) is set, then all instructions will be traced, and the matched primary comparator will be notified.
- If the [TRACE\\_MATCH\\_MODE](#) is 0, and [TRACE\\_S\\_NOTIFY](#) is set, the instruction will be filtered by the primary comparator, and the instruction that matches the secondary comparator will be notified.

2. Set [TRACE\\_FILTER\\_EN](#) to enable filter unit.

### 1.8.3 Enable Encoder

- Configure the address space for the trace memory via [TRACE\\_MEM\\_START\\_ADDR\\_REG](#) and [TRACE\\_MEM\\_END\\_ADDR\\_REG](#). The encoder can access L2 MEM and PSRAM:
  - L2MEM: 0x4FF00000 ~ 0x4FFBFFFF
  - PSRAM: 0x48000000 ~ 0x4BFFFFFF
- Update the value of [TRACE\\_MEM\\_CURRENT\\_ADDR\\_REG](#) to the value of [TRACE\\_MEM\\_START\\_ADDR\\_REG](#) by setting [TRACE\\_MEM\\_CURRENT\\_ADDR\\_UPDATE](#)
- (Optional) Configure the memory writing mode via the [TRACE\\_MEM\\_LOOP](#) bit of [TRACE\\_TRIGGER\\_REG](#)
  - 0: Non-loop mode
  - 1: Loop mode (default)
- Configure the synchronization mode via the [TRACE\\_RESYNC\\_MODE](#) bit of [TRACE\\_RESYNC\\_PROLONGED\\_REG](#)
  - 0: Disable the synchronization counter
  - 1: Invalid. No effect
  - 2: Synchronization counter counts by packet
  - 3: Synchronization counter counts by cycle
- (Optional) Configures the threshold for the synchronization counter (default value is 128) via [TRACE\\_RESYNC\\_PROLONGED\\_REG](#)
- (Optional) Enable Interrupt
  - Set the corresponding bit of [TRACE\\_INTR\\_ENA\\_REG](#) to enable the corresponding interrupt
  - Set the corresponding bit of [TRACE\\_INTR\\_CLR\\_REG](#) to clear the corresponding interrupt
  - Read [TRACE\\_INTR\\_RAW\\_REG](#) to know which interrupt occurs

- (Optional) Enable automatic restart by setting the [TRACE\\_RESTART\\_ENA](#) bit of [TRACE\\_TRIGGER\\_REG](#). This function is enabled by default
- There are 2 ways to enable the trace encoder:
  - Setting the [TRACE\\_TRIGGER\\_ON](#) bit of [TRACE\\_TRIGGER\\_REG](#)
  - Through the Debug module Trace-on to start the encoder. When the trigger is matched and the [action](#) is 2, it will start the encoder. For trigger configurations, please refer to the RISC-V Debug Specification.

Once the encoder is enabled, it will keep tracing the HP CPU's instruction trace interface and writing packets to the trace memory.

### 1.8.4 Disable Encoder

There are two ways to end output trace packets:

1. Set [TRACE\\_TRIGGER\\_OFF](#) of [TRACE\\_TRIGGER\\_REG](#) to end the encoder
2. Through the Debug module Trace-off to end the encoder. When the trigger is matched and the [action](#) is 3, it will end the encoder. For trigger configurations, please refer to the RISC-V Debug Specification.

Due to the internal FIFO, the packets are not written to the memory immediately after the end of the trace. It is recommended to query the [TRACE\\_FIFO\\_STATUS\\_REG](#) to confirm that the data is all written to memory.

**Table 1.8-2. Trace Status**

| Field                             | Description  |
|-----------------------------------|--|
| <a href="#">TRACE_FIFO_EMPTY</a>  | If 1 indicates that the FIFO is empty, all data have been written to memory  |
| <a href="#">TRACE_WORK_STATUS</a> | Encoder's work status: <ul style="list-style-type: none"> <li>• 0: idle state, the encoder is not started</li> <li>• 1: the encoder is normally working that output packets</li> <li>• 2: the encoder is not outputting packets, the CPU is halted or in reset</li> <li>• 3: the encoder is not outputting packets, it occurs while a packet is lost, and is waiting for FIFO empty to restart.</li> </ul> |

### 1.8.5 Notify

Users may want to report a special address, even if it is not the target of an uninferable discontinuity. There are two ways to notify and report a special address:

1. The debug trigger unit matched, and the [action](#) is 4
2. The filter comparator matched

When a notification is requested, the encoder will report a format 2 or format 1 with an address packet, determined by the [branch\\_map](#). If [branch\\_map](#) is 0, report format 2, otherwise report format 1. The notify field shows whether the packet is reporting a notification address. If it is the target of an uninferable discontinuity,

even if it is a notification, the notify field will not be asserted, otherwise the decoder cannot reconstruct the instruction stream correctly.

### 1.8.6 Decode Data Packets

- Find the first address to decode
  - Read the [TRACE\\_MEM\\_FULL\\_INTR\\_RAW](#) bit of the [TRACE\\_INTR\\_RAW\\_REG](#) register to know if the trace memory is full
    - \* if read 0, read the trace packets from [TRACE\\_MEM\\_START\\_ADDR\\_REG](#)
    - \* if read 1, and the loop mode is enabled, then the old trace packets are overwritten. In this case, read the [TRACE\\_MEM\\_CURRENT\\_ADDR\\_REG](#) to know the last writing address, and use this address as the first address to decode
- Use the decoder to decode data packets
  - The decoder reads all data packets starting from the first address, and reconstructs the data stream with the binary file
  - As mentioned in [1.6](#), the encoder writes 14 zero bytes to the memory partition boundary every time when 128 packets are transmitted. Given this fact, the first non-zero byte after 14 zero bytes should be the header of a new packet

### 1.8.7 AHB Configuration

ESP32-P4 encoder supports the AHB bus. There are some optional configurations to control the transmission bandwidth of the encoder.

If there are many DMA masters, users can increase the bandwidth of Trace by setting AHB burst [TRACE\\_AHB\\_CONFIG\\_REG](#).

- The [TRACE\\_HBURST](#) supports the following configurations:
  - 0x0: SINGLE
  - 0x1: INCR (length not defined)
  - 0x2: INCR4
  - 0x4: INCR8
  - Others: reserved

Burst transfer means that once arbitration is successful, multiple words can be transferred continuously. For SINGLE, the length is 1; for INCR, the length is undefined; for INCR4, the length is 4; for INCR8, the length is 8. The longer the burst length, the better the bandwidth.

- When configured as INCR transfer, since INCR is a burst of indeterminate length, in order to avoid Trace occupying the bus for a long time, it will end the INCR transfer after the transfer length up to [TRACE\\_MAX\\_INCR](#), and restart bus arbitration.

This is the configuration used to adjust the bandwidth. When the bandwidth is sufficient, it's not required to do the configuration, and users can use the default configuration.

### 1.8.8 Software Retention

The `TRACE_WORK_STATUS` represents the state of the encoder. When the encoder is not in the IDLE state, it must backup and restore the configuration when the chip enters sleep.

## 1.9 Register Summary

The addresses in this section are relative to RISC-V Trace Encoder base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name   | Description                               | Address | Access |
|--|---|---------|--------|
| <b>Memory configuration registers</b>                  |   |         |        |
| <a href="#">TRACE_MEM_START_ADDR_REG</a>               | Memory start address                      | 0x0000  | R/W    |
| <a href="#">TRACE_MEM_END_ADDR_REG</a>                 | Memory end address                        | 0x0004  | R/W    |
| <a href="#">TRACE_MEM_CURRENT_ADDR_REG</a>             | Memory current address                    | 0x0008  | RO     |
| <a href="#">TRACE_MEM_ADDR_UPDATE_REG</a>              | Memory address update                     | 0x000C  | WT     |
| <b>FIFO status register</b>                            |   |         |        |
| <a href="#">TRACE_FIFO_STATUS_REG</a>                  | FIFO status register                      | 0x0010  | RO     |
| <b>Interrupt registers</b>                             |   |         |        |
| <a href="#">TRACE_INTR_ENA_REG</a>                     | Interrupt enable register                 | 0x0014  | R/W    |
| <a href="#">TRACE_INTR_RAW_REG</a>                     | Interrupt raw status register             | 0x0018  | RO     |
| <a href="#">TRACE_INTR_CLR_REG</a>                     | Interrupt clear register                  | 0x001C  | WT     |
| <b>Trace configuration registers</b>                   |   |         |        |
| <a href="#">TRACE_TRIGGER_REG</a>                      | Trace trigger register                    | 0x0020  | varies |
| <a href="#">TRACE_CONFIG_REG</a>                       | Trace configuration register              | 0x0024  | R/W    |
| <a href="#">TRACE_FILTER_CONTROL_REG</a>               | Filter control register                   | 0x0028  | R/W    |
| <a href="#">TRACE_FILTER_MATCH_CONTROL_REG</a>         | Filter match control register             | 0x002C  | R/W    |
| <a href="#">TRACE_FILTER_COMPARATOR_CONTROL_REG</a>    | Filter comparator match control register  | 0x0030  | R/W    |
| <a href="#">TRACE_FILTER_P_COMPARATOR_MATCH_REG</a>    | Primary comparator match value register   | 0x0034  | R/W    |
| <a href="#">TRACE_FILTER_S_COMPARATOR_MATCH_REG</a>    | Secondary comparator match value register | 0x0038  | R/W    |
| <a href="#">TRACE_RESYNC_PROLONGED_REG</a>             | Resynchronization configuration register  | 0x003C  | R/W    |
| <a href="#">TRACE_AHB_CONFIG_REG</a>                   | AHB configuration register                | 0x0040  | R/W    |
| <b>Clock gating control and configuration register</b> |   |         |        |
| <a href="#">TRACE_CLOCK_GATE_REG</a>                   | Clock gating control register             | 0x0044  | R/W    |
| <b>Version register</b>                                |   |         |        |
| <a href="#">TRACE_DATE_REG</a>                         | Version control register                  | 0x03FC  | R/W    |

## 1.10 Registers

The addresses in this section are relative to RISC-V Trace Encoder base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

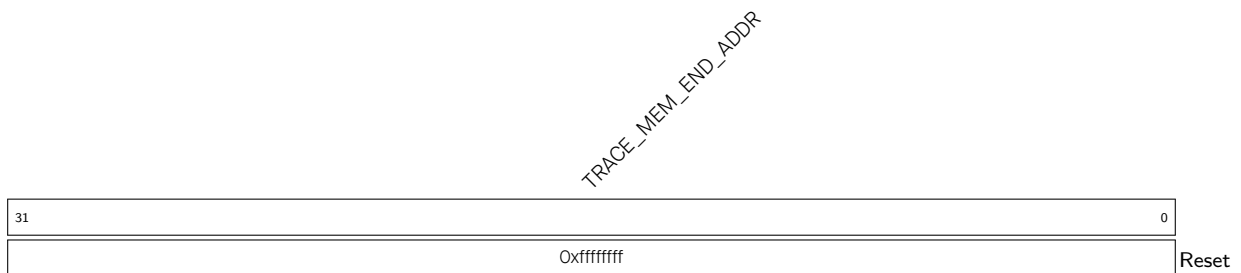

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

**Register 1.1. TRACE\_MEM\_START\_ADDR\_REG (0x0000)**

**TRACE\_MEM\_START\_ADDR** Configures the start address of the trace memory. (R/W)

**Register 1.2. TRACE\_MEM\_END\_ADDR\_REG (0x0004)**

**TRACE\_MEM\_END\_ADDR** Configures the end address of the trace memory. (R/W)

**Register 1.3. TRACE\_MEM\_CURRENT\_ADDR\_REG (0x0008)**

**TRACE\_MEM\_CURRENT\_ADDR** Represents the current memory address for writing. (RO)

#### Register 1.4. TRACE\_MEM\_ADDR\_UPDATE\_REG (0x000C)

**TRACE\_MEM\_CURRENT\_ADDR\_UPDATE** Configures whether to update the value of **TRACE MEM CURRENT ADDR** to **TRACE MEM START ADDR**.

0: Not update

1: Update

(WT)

### Register 1.5. TRACE\_FIFO\_STATUS\_REG (0x0010)

**TRACE\_FIFO\_EMPTY** Represents whether the FIFO is empty.

1: Empty

0: Not empty (RO)

**TRACE\_WORK\_STATUS** Represents the state of the encoder:

0: Idle state

1: Working state

2: Wait state because the hart is halted or in reset

3: Lost state

(RO)

### Register 1.6. TRACE\_INTR\_ENA\_REG (0x0014)

**TRACE\_FIFO\_OVERFLOW\_INTR\_ENA** Write 1 to enable TRACE\_FIFO\_OVERFLOW\_INTR. (R/W)

**TRACE\_MEM\_FULL\_INTR\_ENA** Write 1 to enable TRACE\_MEM\_FULL\_INTR. (R/W)

### Register 1.7. TRACE\_INTR\_RAW\_REG (0x0018)

**TRACE\_FIFO\_OVERFLOW\_INTR\_RAW** The raw interrupt status of TRACE\_FIFO\_OVERFLOW\_INTR.  
(RO)

|                                |   |
|--------------------------------|---|
| <b>TRACE_MEM_FULL_INTR_RAW</b> | The raw interrupt status of TRACE_MEM_FULL_INTR. (RO) |
|--------------------------------|---|

### Register 1.8. TRACE\_INTR\_CLR\_REG (0x001C)

**TRACE\_FIFO\_OVERFLOW\_INTR\_CLR** Write 1 to clear TRACE\_FIFO\_OVERFLOW\_INTR. (WT)

**TRACE\_MEM\_FULL\_INTR\_CLR** Write 1 to clear TRACE\_MEM\_FULL\_INTR. (WT)

Register 1.9. TRACE\_TRIGGER\_REG (0x0020)

- TRACE\_TRIGGER\_ON

Configures whether to enable the encoder.

0: Invalid

1: Enable

(WT)
- TRACE\_TRIGGER\_OFF

Configures whether to disable the encoder.

0: Invalid

1: Disable

(WT)
- TRACE\_MEM\_LOOP

Configures the memory writing mode.

0: Non-loop mode

1: Loop mode

(R/W)
- TRACE\_RESTART\_ENA

Configures whether to enable automatic restart.

0: Disable

1: Enable

(R/W)

### Register 1.10. TRACE\_CONFIG\_REG (0x0024)

**TRACE\_DM\_TRIGGER\_ENA** Configure whether to enable the trigger signal.

0: Disable

1: Enable

(R/W)

**TRACE\_RESET\_ENA** Configures whether to enable the reset signal.

0: Disable

1: Enable

(R/W)

**TRACE\_HALT\_ENA** Configures whether to enable the halted signal.

0: Disable

1: Enable

(R/W)

**TRACE\_STALL\_ENA** Configures whether to enable the stall signal.

0: Disable

1: Enable

(R/W)

**TRACE\_FULL\_ADDRESS** Configure the address mode.

0: Delta address mode

### 1: Full address mode

(R/W)

### Register 1.11. TRACE\_FILTER\_CONTROL\_REG (0x0028)

**TRACE\_FILTER\_EN** Configure whether to enable filtering.

0: Disable

1: Enable

(R/W)

**TRACE\_MATCH\_COMP** Configures whether to enable the comparator match mode.

0: Disable

1: Enable

(R/W)

**TRACE\_MATCH\_PRIVILEGE** Configures whether to enable the privilege match mode.

0: Disable

1: Enable

(R/W)

**TRACE\_MATCH\_ECAUSE** Configures whether to enable the ecause match mode.

0: Disable

1: Enable

(R/W)

**TRACE\_MATCH\_INTERRUPT** Configures whether to enable the interrupt match mode.

0: Disable

1: Enable

(R/W)

### Register 1.12. TRACE\_FILTER\_MATCH\_CONTROL\_REG (0x002C)

**TRACE\_MATCH\_CHOICE\_PRIVILEGE** Configures the privilege level for matching.

0: User mode

## 1: Machine mode

(R/W)

**TRACE\_MATCH\_VALUE\_INTERRUPT** Configures the interrupt level for matching. Valid only when

TRACE\_MATCH\_INTERRUPT is set.

0: itype=1

1: itype=2

(R/W)

**TRACE\_MATCH\_CHOICE\_ECAUSE** Configures the ecause code for matching. (R/W)

**Register 1.13. TRACE\_FILTER\_COMPARATOR\_CONTROL\_REG (0x0030)**

|                               |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                  |       |            |    |                |    |                  |    |            |   |               |   |            |   |                |   |                  |   |            |  |               |  |
|-------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|------------------|-------|------------|----|----------------|----|------------------|----|------------|---|---------------|---|------------|---|----------------|---|------------------|---|------------|--|---------------|--|
| (reserved)                    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | TRACE_MATCH_MODE |       | (reserved) |    | TRACE_S_NOTIFY |    | TRACE_S_FUNCTION |    | (reserved) |   | TRACE_S_INPUT |   | (reserved) |   | TRACE_P_NOTIFY |   | TRACE_P_FUNCTION |   | (reserved) |  | TRACE_P_INPUT |  |
| 31                            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 18               | 17    | 16         | 15 | 14             | 13 | 12               | 10 |            | 9 | 8             | 7 | 6          | 5 | 4              | 2 |                  | 1 | 0          |  |               |  |

**TRACE\_P\_INPUT** Configures the input of the primary comparator for matching.

0: iaddr

1: tval

(R/W)

**TRACE\_P\_FUNCTION** Configures the function for the primary comparator.

0: Equal

1: Not equal

2: Less than

3: Less than or equal

4: Greater than

5: Greater than or equal

Others: Always match

(R/W)

**TRACE\_P\_NOTIFY** Configures whether to explicitly report an instruction address matched against the primary comparator.

0: Not report

1: Report

(R/W)

**TRACE\_S\_INPUT** Configures the input of the secondary comparator for matching.

0: iaddr

1: tval

(R/W)

**TRACE\_S\_FUNCTION** Configures the function of for secondary comparator.

0: Equal

1: Not equal

2: Less than

3: Less than or equal

4: Greater than

5: Greater than or equal

6: The second comparator value is the masked value of the primary comparator

Others: Always match

(R/W)

Continued on the next page...

**Register 1.13. TRACE\_FILTER\_COMPARATOR\_CONTROL\_REG (0x0030)**

Continued from the previous page...

**TRACE\_S\_NOTIFY** Configures whether to explicitly report an instruction address matched against the secondary comparator.

0: Not report

1: Report

(R/W)

**TRACE\_MATCH\_MODE** Configures the comparator match condition.

0: Only the primary comparator matches

1: Both primary and secondary comparators match (P&amp;&amp;S)

2: Neither primary nor secondary comparator match (!P&amp;&amp;S)

3: Start filtering when the primary comparator matches and stop filtering when the secondary comparator matches

(R/W)

**Register 1.14. TRACE\_FILTER\_P\_COMPARATOR\_MATCH\_REG (0x0034)****TRACE\_P\_MATCH** Configures the match value for the primary comparator. (R/W)**Register 1.15. TRACE\_FILTER\_S\_COMPARATOR\_MATCH\_REG (0x0038)****TRACE\_S\_MATCH** Configures the match value for the secondary comparator. (R/W)

Register 1.16. TRACE\_RESYNC\_PROLONGED\_REG (0x003C)

**TRACE\_RESYNC\_PROLONGED** Configures the threshold for the synchronization counter. (R/W)

**TRACE\_RESYNC\_MODE** Configures the synchronization mode.

- 0: Disable the synchronization counter
  - 1: Invalid
  - 2: Synchronization counter counts by packet
  - 3: Synchronization counter counts by cycle
- (R/W)

Register 1.17. TRACE\_AHB\_CONFIG\_REG (0x0040)

**TRACE\_HBURST** Configures the AHB burst mode.

- 0: SINGLE
  - 1: INCR (length not defined)
  - 2: INCR4
  - 4: INCR8
  - Others: Invalid
- (R/W)

**TRACE\_MAX\_INCR** Configures the maximum burst length for INCR mode. (R/W)

Register 1.18. TRACE\_CLOCK\_GATE\_REG (0x0044)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |              |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|--------------|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | TRACE_CLK_EN |   |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 1 | 0            |   |       |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0            | 1 | Reset |

**TRACE\_CLK\_EN** Configures register clock gating. 0: Support clock only when the application writes registers to save power  
1: Always force the clock on for registers  
This bit doesn't affect register access  
(R/W)

Register 1.19. TRACE\_DATE\_REG (0x03FC)

|            |   |   |    |            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |       |

**TRACE\_DATE** Version control register. (R/W)

## Chapter 2

## Low-Power CPU

### 2.1 Overview

The ESP32-P4 Low-Power CPU (LP CPU) is a 32-bit processor based upon RISC-V ISA comprising integer (I), multiplication/division (M), atomic (A), and compressed (C) standard extensions. It features ultra-low power consumption and has a 2-stage, in-order, and scalar pipeline. The LP CPU core complex has an interrupt controller (INTC), a debug module (DM), and system bus (SYS BUS) interfaces for memory and peripheral access.

The LP CPU is in sleep mode by default (see Section 2.10). It can stay powered on when the chip enters Deep-sleep mode (see Chapter 13 *Low-Power Management* for details) and can access most peripherals and memories (see Chapter 6 *System and Memory* for details). It has two application scenarios:

- Power insensitive scenario: When the High-Performance CPU (HP CPU) is active, the LP CPU can assist the it with some speed- and efficiency-insensitive controls and computations.
- Power sensitive scenario: When the HP CPU is in the power-down state to save power, the LP CPU can be woken up to handle some external wake-up events.

Figure 2.1-1 shows the resources accessible to the HP CPU and the LP CPU.

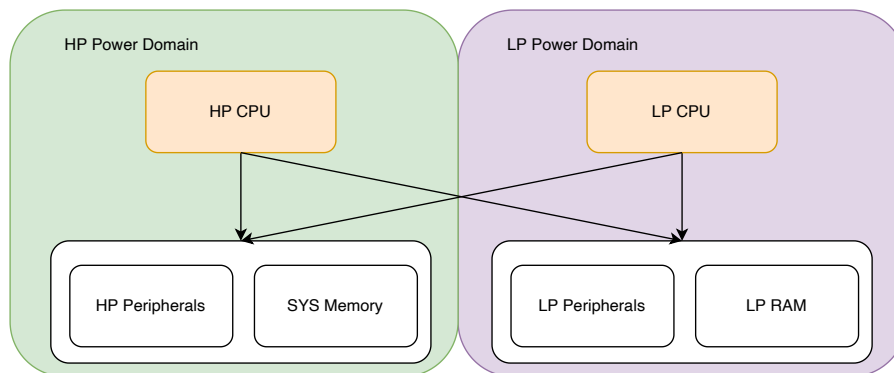

Figure 2.1-1. LP CPU Overview

In the figure above, the HP Power Domain and LP Power Domain can be powered on and off independently. When one domain is powered down, the CPU of the other domain cannot access the resources of that domain. In other words, only when the domain is powered on can its resources be accessed. For more information about power, please refer to the chapter 13 *Low-Power Management*.

### 2.2 Features

The LP CPU has the following features:

- Operating clock frequency of up to 40 MHz
- 18 vector interrupts
- Debug module compliant with RISC-V External Debug Support Version 0.13 with external debugger support over an industry-standard JTAG/USB port
- Hardware trigger compliant with RISC-V External Debug Support Version 0.13 with up to 2 breakpoints/watchpoints
- Core performance metric events
- Wake-up interrupt for HP CPU
- Access to HP memory and LP memory
- Access to the entire peripheral address space

## 2.3 Configuration and Status Registers (CSRs)

### 2.3.1 Register Summary

Below is a list of CSRs that are supported by the LP CPU. Except for the custom performance counter CSRs, all the implemented CSRs follow the standard mapping of bit fields as described in the RISC-V Instruction Set Manual, Volume II: Privileged Architecture, Version 1.10. It must be noted that even among the standard CSRs, not all bit fields have been implemented, limited by the subset of features implemented in the CPU. For a detailed description of the subset of fields implemented under each of these CSRs, please refer to Section 2.3.2.

The abbreviations given in Column **Access** are explained in Section [Access Types for Registers](#).

| Name  | Description                  | Address | Access |
|---|------------------------------|---------|--------|
| <b>Machine Information CSR</b>                      |                              |         |        |
| <a href="#">mhartid</a>                             | Machine Hart ID              | 0xF14   | RO     |
| <b>Machine Trap Setup CSRs</b>                      |                              |         |        |
| <a href="#">mstatus</a>                             | Machine Mode Status          | 0x300   | R/W    |
| <a href="#">misa</a> <sup>1</sup>                   | Machine ISA                  | 0x301   | R/W    |
| <a href="#">mie</a>                                 | Machine Interrupt Enable     | 0x304   | R/W    |
| <a href="#">mtvec</a> <sup>2</sup>                  | Machine Trap Vector          | 0x305   | R/W    |
| <b>Machine Trap Handling CSRs</b>                   |                              |         |        |
| <a href="#">mscratch</a>                            | Machine Scratch              | 0x340   | R/W    |
| <a href="#">mepc</a>                                | Machine Trap Program Counter | 0x341   | R/W    |
| <a href="#">mcause</a> <sup>3</sup>                 | Machine Trap Cause           | 0x342   | R/W    |
| <a href="#">mtval</a>                               | Machine Trap Value           | 0x343   | R/W    |
| <a href="#">mip</a>                                 | Machine Interrupt Pending    | 0x344   | R/W    |
| <b>Trigger Module CSRs (shared with Debug Mode)</b> |                              |         |        |
| <a href="#">tselect</a>                             | Trigger Select Register      | 0x7A0   | R/W    |

<sup>1</sup>Although [misa](#) is specified as having both read and write access (R/W), its fields are hardwired and thus write has no effect. This is what would be termed WARL (Write Any Read Legal) in RISC-V terminology.

<sup>2</sup>[mtvec](#) only provides configuration for trap handling in vectored mode with the base address aligned to 256 bytes.

<sup>3</sup>External interrupt IDs reflected in [mcause](#) include even those IDs which have been reserved by RISC-V standard for core internal sources.

| Name                                     | Description   | Address    | Access |
|--|---|------------|--------|
| <a href="#">tdata1</a>                   | Trigger Abstract Data 1                                       | 0x7A1      | R/W    |
| <a href="#">tdata2</a>                   | Trigger Abstract Data 2                                       | 0x7A2      | R/W    |
| <b>Debug Mode CSRs</b>                   |   |            |        |
| <a href="#">dcsr</a>                     | Debug Control and Status                                      | 0x7B0      | R/W    |
| <a href="#">dpc</a>                      | Debug PC  | 0x7B1      | R/W    |
| <a href="#">dscratch0</a>                | Debug Scratch Register 0                                      | 0x7B2      | R/W    |
| <a href="#">dscratch1</a>                | Debug Scratch Register 1                                      | 0x7B3      | R/W    |
| <b>Machine Counter/Timer CSRs</b>        |   |            |        |
| <a href="#">mcycle</a>                   | Machine Clock Cycle Counter                                   | 0xB00      | R/W    |
| <a href="#">minstret</a>                 | Machine Retired Instruction Counter                           | 0xB02      | R/W    |
| <a href="#">mhpmcounter</a> $n(n:3-12)$  | Machine Performance Monitor Counter                           | 0xB00+ $n$ | R/W    |
| <a href="#">mcycleh</a>                  | The higher 32 bits of <a href="#">mcycle</a>                  | 0xB80      | R/W    |
| <a href="#">minstreth</a>                | The higher 32 bits of <a href="#">minstret</a>                | 0xB82      | R/W    |
| <a href="#">mhpmcounter</a> $nh(n:3-12)$ | The higher 32 bits of <a href="#">mhpmcounter</a> $n(n:3-12)$ | 0xB80+ $n$ | R/W    |
| <b>Machine Counter Setup CSR</b>         |   |            |        |
| <a href="#">mcountinhibit</a>            | Machine Counter Control                                       | 0x320      | R/W    |

Note that if write, set, or clear operation is attempted on any of the read-only (RO) CSRs indicated in the above table, the CPU will generate an illegal instruction exception.

## 2.3.2 Registers

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

**Register 2.1. mhartid (0xF14)**

|            |   |
|------------|---|
| MHARTID    |   |
| 31         | 0 |
| 0x00000000 |   |
| Reset      |   |

**MHARTID** Represents hart ID. The LP CPU hart ID is 0. (RO)

**Register 2.2. mstatus (0x300)**

|            |  |  |  |            |      |    |    |            |     |  |  |     |     |    |    |            |   |     |  |      |   |   |     |            |  |  |       |     |   |  |  |            |  |   |  |
|------------|--|--|--|------------|------|----|----|------------|-----|--|--|-----|-----|----|----|------------|---|-----|--|------|---|---|-----|------------|--|--|-------|-----|---|--|--|------------|--|---|--|
| (reserved) |  |  |  | (reserved) |      |    |    | (reserved) |     |  |  | MPP |     |    |    | (reserved) |   |     |  | MPIE |   |   |     | (reserved) |  |  |       | MIE |   |  |  | (reserved) |  |   |  |
| 31         |  |  |  |            | 22   | 21 | 20 |            |     |  |  | 13  | 12  | 11 | 10 |            |   |     |  | 8    | 7 | 6 |     |            |  |  | 4     | 3   | 2 |  |  |            |  | 0 |  |
| 0x000      |  |  |  | 0          | 0x00 |    |    |            | 0x0 |  |  |     | 0x0 |    |    |            | 0 | 0x0 |  |      |   | 0 | 0x0 |            |  |  | Reset |     |   |  |  |            |  |   |  |

**MIE** Write 1 to enable the global machine mode interrupt. (R/W)

**MPIE** Write 1 to enable the machine previous interrupt (before trap). (R/W)

**MPP** Configures machine previous privilege mode (before trap).

0x3: Machine mode

Other values: Invalid

Note: Only the lower bit is writable. Any write to the higher bit is ignored as it is directly tied to the lower bit.

(R/W)

Register 2.3. misa (0x301)

| MXL |    | (reserved) |    |    |    | Z  | Y  | X  | W  | V  | U  | T  | S  | R  | Q  | P  | O  | N  | M  | L  | K  | J | I | H | G | F | E | D | C | B | A |

**LP\_SW\_IE** Write 1 to enable LP software interrupt. (R/W)

**LP\_UART\_IE** Write 1 to enable LP UART interrupt. (R/W)

**LP\_SPI\_IE** Write 1 to enable LP SPI interrupt. (R/W)

**LP\_I2C\_IE** Write 1 to enable I2C interrupt. (R/W)

**LP\_GPIO\_IE** Write 1 to enable LP GPIO interrupt. (R/W)

**LP\_ADC\_IE** Write 1 to enable LP ADC interrupt. (R/W)

**LP\_TOUCH\_IE** Write 1 to enable LP TOUCH interrupt. (R/W)

**LP\_TSENS\_IE** Write 1 to enable LP TSENS interrupt. (R/W)

**LP\_EFUSE\_IE** Write 1 to enable LP eFuse interrupt. (R/W)

**LP\_SYSREG\_IE** Write 1 to enable SYSREG interrupt. (R/W)

**LP\_ANAPERI\_IE** Write 1 to enable ANAPERI interrupt. (R/W)

**LP\_PMU\_IE** Write 1 to enable PMU interrupt. (R/W)

**LP\_MB\_IE** Write 1 to enable Mailbox interrupt. (R/W)

**LP\_TIMER\_IE** Write 1 to enable LP Timer interrupt. (R/W)

**LP\_WDT\_IE** Write 1 to enable WDT interrupt. (R/W)

**LP\_RTC\_IE** Write 1 to enable RTC interrupt. (R/W)

**HP\_IE** Write 1 to enable HP interrupt. (R/W)

**Register 2.5. mtvec (0x305)**

|          |   |   |   |   |   |  |  |            |  |  |  |      |  |       |
|----------|---|---|---|---|---|--|--|------------|--|--|--|------|--|-------|
| BASE     |   |   |   |   |   |  |  | (reserved) |  |  |  | MODE |  |       |
| 31       | 8 | 7 | 2 | 1 | 0 |  |  |            |  |  |  |      |  |       |
| 0x000000 |   |   |   |   |   |  |  | 0x00       |  |  |  | 0x1  |  | Reset |

**MODE** Represents whether machine mode interrupts are vectored. Only vectored mode **0x1** is available. (RO)

**BASE** Configures the higher 24 bits of trap vector base address aligned to 256 bytes. (R/W)

**Register 2.6. mscratch (0x340)**

|                 |   |
|-----------------|---|
| <i>MSCRATCH</i> |   |
| 31              | 0 |
| 0x00000000      |   |
| Reset           |   |

**MSCRATCH** Contains machine scratch information for custom use. (R/W)

**Register 2.7. mepc (0x341)**

|             |   |
|-------------|---|
| <i>MEPC</i> |   |
| 31          | 0 |
| 0x00000000  |   |
| Reset       |   |

**MEPC** Configures the machine trap/exception program counter. This is automatically updated with address of the instruction which was about to be executed while CPU encountered the most recent trap. (R/W)

**Register 2.8. mcause (0x342)**

|                |            |            |   |                |       |
|----------------|------------|------------|---|----------------|-------|
| Interrupt Flag |            | (reserved) |   | Exception Code |       |
| 31             | 30         | 5          | 4 | 0              |       |
| 0              | 0x00000000 |            |   | 0x00           |       |
|                |            |            |   |                | Reset |

**Exception Code** This field is automatically updated with unique ID of the most recent exception or interrupt due to which CPU entered trap. Possible exception IDs are:

0x2: Illegal instruction

0x3: Hardware breakpoint/watchpoint or EBREAK

0x6: Misaligned atomic instructions

Note: Exception ID 0x0 (instruction access misaligned) is not present because CPU always masks the lowest bit of the address during instruction fetch.

(R/W)

**Interrupt Flag** This flag is automatically updated when CPU enters trap. If this is found to be set, it indicates that the latest trap occurred due to an interrupt. For exceptions it remains unset.

(R/W)

**Register 2.9. mtval (0x343)**

**MTVAL** Configures machine trap value. This is automatically updated with an exception dependent data which may be useful for handling that exception. Data is to be interpreted depending upon exception IDs:

0x1: Faulting address of instruction

0x2: Faulting instruction opcode

0x5: Faulting data address of load operation

0x7: Faulting data address of store operation

Note: The value of this register is not valid for other exception IDs and interrupts.

(R/W)

Register 2.10. mip (0x344)

|            |     |       |     |           |     |           |     |             |     |          |     |        |     |     |     |            |  |              |     |             |     |             |     |             |     |           |     |            |     |           |  |            |  |            |  |           |  |            |  |            |  |            |  |          |  |            |  |

## Register 2.11. mcycle (0xB00)

**MCYCLE** Configures the lower 32 bits of the clock cycle counter. (R/W)

## Register 2.12. minstret (0xB02)

**MINSTRET** Configures the lower 32 bits of the instruction counter. (R/W)

Register 2.13. mhpmpcounter<sub>*n*</sub> (*n*: 3-12) (0xB00+*n*)

**MHPMCOUNTER<sub>*n*</sub>** Configures the lower 32 bits of the performance counter *n*. (R/W)

## Register 2.14. mcycleh (0xB80)

**MCYCLEH** Configures the higher 32 bits of the clock cycle counter. (R/W)

Register 2.15. minstreth (0xB82)

|           |   |
|-----------|---|
| minstreth |   |
| 31        | 0 |
| 0x0       |   |
| Reset     |   |

**MINSTRETH** Configures the higher 32 bits of the instruction counter. (R/W)

Register 2.16. mhpmpcounter $n$ ( $n$ : 3-12)h (0xB80+ $n$ )

|                  |   |
|------------------|---|
| mhpmpcounter $n$ |   |
| 31               | 0 |
| 0x0              |   |
| Reset            |   |

**MHPMCOUNTER $n$ h** Configures the higher 32 bits of the performance counter  $n$ . (R/W)

Register 2.17. mcountinhibit (0x320)

|     |   |                     |     |     |
|-----|---|---------------------|-----|-----|
| HPM |   | IR (reserved)<br>CY |     |     |
|     |   | 3                   | 2   | 1 0 |
| 31  | 0 | 0x0                 | 0x0 | 0x0 |
| 0x0 |   | Reset               |     |     |

**HPM** Configures whether the performance counter  $n$ ( $n$ :3-12) increments.

0: The counter does not count

1: The counter increments

(R/W)

**IR** Configure whether the instruction counter increments.

0: The counter does not count

1: The counter increments

(R/W)

**CY** Configure whether the clock cycle counter increments.

0: The counter does not count

1: The counter increments

(R/W)

## 2.4 Interrupts and Exceptions

The LP CPU handles interrupts and exceptions according to RISC-V Instruction Set Manual, Volume II: Privileged Architecture, Version 1.10. After entering an interrupt/exception handler, the CPU:

- Saves the current program counter (PC) value to the [mepc](#) CSR
- Copies the state of [MIE](#) of [mstatus](#) to [MPIE](#) of [mstatus](#)
- Saves the current privileged mode to [MPP](#) of [mstatus](#)
- Clears [MIE](#) of [mstatus](#)
- Toggles the privileged mode to machine mode (M mode)
- Jumps to the handler address
  - For exceptions, the handler address is the base address of the vector table in the [mtvec](#) CSR
  - For interrupts, the handler address is  $mtvec + 4 * ID$ , where ID is the interrupt ID. For more information, see Section 2.4.1
- After the mret instruction is executed, the core jumps to the PC saved in the [mepc](#) CSR, restores the value of [MPIE](#) of [mstatus](#) to [MIE](#) of [mstatus](#), and restores the privileged mode to that indicated by [MPP](#) of [mstatus](#)

When the core starts up, the base address of the vector table is initialized to the boot address 0x50000000. After startup, the base address can be changed by writing to the [mtvec](#) CSR. For more information about CSRs, see Section 2.3.1.

After a reset, the core starts to fetch instructions from the memory address specified by the LP\_SYS\_LP\_CORE\_BOOT\_ADDR\_REG register with an offset of 0x80. The default value for this register is 0x50100000, which corresponds to the starting address of the LP ROM.

### 2.4.1 Interrupts

The LP CPU in the ESP32-P4 supports 18 interrupt inputs. Each interrupt corresponds to an ID, which is denoted as *n* (where *n* = 3, 7, 11, 16 to 30), and has a specific entry address of  $mtvec + 4 * n$ . These interrupts are associated with specific peripheral sources. For the mapping between peripheral sources and interrupt IDs, please refer to 2.4-1.

**Table 2.4-1. LP CPU Interrupt Mapping**

| Interrupt ID | Peripheral Source |
|--------------|-------------------|
| 3            | LP_SW_INTR        |
| 7            | LP_UART_INTR      |
| 11           | LP_SPI_INTR       |
| 17           | LP_I2C_INTR       |
| 18           | LP_GPIO_INTR      |
| 19           | LP_ADC_INTR       |
| 20           | LP_TOUCH_INTR     |
| 21           | LP_TSENS_INTR     |
| 22           | LP_EFUSE_INTR     |

| Interrupt ID | Peripheral Source                        |
|--------------|--|
| 23           | LP_SYSREG_INTR                           |
| 24           | LP_ANAPERI_INTR                          |
| 25           | PMU_REG_O_INTR, PMU_REG_1_INTR           |
| 26           | MB_HP_INTR, MB_LP_INTR                   |
| 27           | LP_TIMER_REG_O_INTR, LP_TIMER_REG_1_INTR |
| 28           | LP_WDT_INTR                              |
| 29           | LP_RTC_INTR                              |
| 30           | HP_INTR                                  |

The read-only register LPINTR\_STATUS\_REG indicates the current status of the LP CPU external interrupt sources. For the mapping between this register and the interrupt sources, please refer to the description of this register.

## 2.4.2 Interrupt Handling

By default, interrupts are disabled globally because the MIE bit in `mstatus` has a reset value of 0. Software must set this bit to enable global interrupts.

Assuming the interrupt to enable is Interrupt `n`:

1. Enable Interrupt `n`:
  - To enable interrupts globally, write 1 to the MIE bit of `mstatus`.
  - To enable Interrupt `n`, write 1 to the `n`th bit of `mie` CSR.
2. After Interrupt `n` is enabled, the LP CPU can respond to it. Meanwhile, the corresponding peripheral interrupt should be configured to send an interrupt signal to the LP CPU.
3. After the interrupt is triggered, the LP CPU jumps to the  $mtvec + 4 * n$  address.
4. To clear Interrupt `n`, the peripheral needs to clear the interrupt signal.

## 2.4.3 Exceptions

The LP CPU supports the RISC-V standard exceptions and can trigger the following exceptions:

**Table 2.4-2. LP CPU Exception Causes**

| Exception ID | Description                    |
|--------------|--------------------------------|
| 1            | Instruction access fault       |
| 2            | Illegal instructions           |
| 3            | Breakpoints (EBREAK)           |
| 5            | Load access fault              |
| 6            | Misaligned atomic instructions |
| 7            | Store access fault             |

## 2.5 Debugging

This section describes how to debug and test the LP CPU. Debug support is provided through standard JTAG pins and complies with RISC-V External Debug Support Version 0.13.

For ESP32-P4 system debugging overview, please refer to Chapter 1 *High-Performance CPU [to be added later]* > Figure 1.1 *Debug System Overview [to be added later]*.

The user interacts with the Debug Host (e.g., laptop), which is running a debugger (e.g., gdb). The debugger communicates with a Debug Translator (e.g., OpenOCD, which may include a hardware driver) to communicate with Debug Transport Hardware (e.g., ESP-Prog adapter). The Debug Transport Hardware connects the Debug Host to the CPU's Debug Transport Module (DTM) through a standard JTAG interface. The DTM provides access to the debug module (DM) using the Debug Module Interface (DMI).

ESP32-P4 features two DTMs interconnected in a daisy-chain configuration. Specifically, TAP0 connects to the HP CPU, while TAP1 is dedicated to the LP CPU.

The HP DM supports multicore debugging according to the specification RISC-V External Debug Support Version 0.13. It can simultaneously control both cores of the HP CPU. In contrast, the LP DM is designed for debugging the single-core LP CPU.

The LP CPU implements four registers for core debugging: [dcsr](#), [dpc](#), [dscratch0](#), and [dscratch1](#). All of those registers can only be accessed from debug mode. If software attempts to access them when the LP CPU is not in debug mode, an illegal instruction exception will be triggered.

### 2.5.1 Features

The Low-Power CPU debug module has the following debugging features:

- Access to necessary information about the implementation
- CPU core halt and resume
- Read and write of CPU core registers (including CSRs)
- CPU core reset
- CPU halted on software breakpoint (planted breakpoint instruction)
- Hardware single-stepping
- Two hardware triggers (which can be used as breakpoints/watchpoints). See Section 2.6 for details

### 2.5.2 Functional Description

The debugging mechanism adheres to the specification RISC-V External Debug Support Version 0.13. For a detailed description of the debugging features, refer to the specification.

According to the specification, a hart has the following states: nonexistent, unavail, running, and halted. By default, the LP CPU is in the unavail state. To connect the LP CPU for debugging, users need to clear that state by configuring the [LPPERI\\_CPU\\_REG](#) register.

## 2.5.3 Register Summary

The following table lists the debug CSRs supported for the LP CPU.

The abbreviations given in Column **Access** are explained in Section [Access Types for Registers](#).

| Name                      | Description              | Address | Access |
|---------------------------|--------------------------|---------|--------|
| <a href="#">dcsr</a>      | Debug Control and Status | 0x7B0   | R/W    |
| <a href="#">dpc</a>       | Debug PC                 | 0x7B1   | R/W    |
| <a href="#">dscratch0</a> | Debug Scratch Register 0 | 0x7B2   | R/W    |
| <a href="#">dscratch1</a> | Debug Scratch Register 1 | 0x7B3   | R/W    |

All debug module registers are implemented in accordance with the specification RISC-V External Debug Support Version 0.13. For more information, refer to the specification.

## 2.5.4 Registers

The following is a detailed description of the debug CSR supported by the LP CPU.

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

Register 2.18. dcsr (0x7B0)

| xdebugver |   |   |   | (reserved) |   |   |   |    |   |   |   |   |   |   |   | ebreakm |   |   |   | (reserved) |   |    |   | ebreaku |   |    |   | (reserved) |   |   |   | cause |   |   |   | (reserved) |   |       |  | step |  | prv |  |   |  |
|-----------|---|---|---|------------|---|---|---|----|---|---|---|---|---|---|---|---------|---|---|---|------------|---|----|---|---------|---|----|---|------------|---|---|---|-------|---|---|---|------------|---|-------|--|------|--|-----|--|---|--|
| 31        |   |   |   | 28         |   |   |   | 27 |   |   |   |   |   |   |   | 16      |   |   |   | 15         |   | 14 |   | 13      |   | 12 |   | 11         |   | 9 |   | 8     |   | 6 |   | 5          |   | 3     |  | 2    |  | 1   |  | 0 |  |
| 0         | 1 | 0 | 0 | 0          | 0 | 0 | 0 | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       | 0 | 0 | 0 | 0          | 0 | 0  | 0 | 0       | 0 | 0  | 0 | 0          | 0 | 0 | 0 | 0     | 0 | 0 | 0 | 1          | 1 | Reset |  |      |  |     |  |   |  |

**xdebugver** Represents the debug version.

4: External debug support exists  
(RO)

**ebreakm** Configures execution of the EBREAK instruction in machine mode.

0: Trigger an exception with mcause = 3  
1: Enter debug mode  
(R/W)

**ebreaku** Configures execution of the EBREAK instruction in user mode.

0: Trigger an exception with mcause = 3 as described in privileged mode  
1: Enter debug mode  
(R/W)

**cause** Represents the reason why debug mode was entered. When there are multiple reasons to enter debug mode in a single cycle, the cause with the highest priority number is the one written.

1: An EBREAK instruction was executed. (priority 3)  
2: The Trigger Module caused a halt. (priority 4)  
3: haltreq was set. (priority 2)  
4: The CPU core single stepped because step was set. (priority 1)  
Other values: reserved for future use  
(RO)

**step** When set and not in Debug Mode, the core will only execute a single instruction and then enter Debug Mode.

If the instruction does not complete due to an exception, the core will immediately enter Debug Mode before executing the trap handler, with appropriate exception registers set.

Setting this bit does not mask interrupts. This is a deviation from the RISC-V External Debug Support Specification Version 0.13.

(R/W)

**prv** Contains the privilege level the core is operating in when debug mode is entered. A debugger can change this value to change the core's privilege level when exiting debug mode. Only **0x3** (machine mode) and **0x0** (user mode) are supported. (RO)

**Register 2.19. dpc (0x7B1)**

**dpc** Upon entry to debug mode, dpc is written with the address of the next instruction that will be executed. When resuming, the CPU core's PC is updated to the address stored in dpc. In debug mode, dpc can be modified. This field can be accessed in debug mode. (R/W)

**Register 2.20. dscratch0 (0x7B2)**

**dscratch0** Used by the debug module internally. (R/W)

**Register 2.21. dscratch1 (0x7B3)**

**dscratch1** Used by the debug module internally. (R/W)

## 2.6 Hardware Trigger

### 2.6.1 Features

Hardware Trigger module provides breakpoint and watchpoint capability for debugging. It has the following features:

- Two independent trigger units
- Configurable unit to match the address of the program counter
- Able to halt execution and transfer control to the debugger

### 2.6.2 Functional Description

The hardware trigger module provides three CSRs. See Section 2.6 for details. Among them, `tdata1` and `tdata2` are abstract CSRs, which means they are shadow registers for accessing internal registers in the trigger units, one at a time.

To select a specific trigger unit, the corresponding number (0-1) needs to be written to the [tselect](#) CSR. When a valid value is written, the abstract CSRs, [tdata1](#) and [tdata2](#), automatically match the internal registers of the trigger unit. Each trigger unit has two internal registers, namely [mcontrol](#) and [maddress](#), which are mapped to [tdata1](#) and [tdata2](#), respectively.

Writing a value more than 1 to [tselect](#) will set [tselect](#) to 1.

Since software or debugger may need to know the type of the selected trigger to correctly interpret [tdata1](#) and [tdata2](#), the 4-bit field (31-28) of [tdata1](#) encodes the type of the selected trigger. This type field is read-only and always provides a value of 0x2 for every trigger, which stands for support for address and data matching. Hence, it is inferred that [tdata1](#) and [tdata2](#) are to be interpreted as fields of [mcontrol](#) and [maddress](#), respectively. The specification RISC-V External Debug Support Version 0.13 provides information on other possible values, but the trigger module only supports the 0x2 type.

Once a trigger unit has been chosen by writing its index to [tselect](#), it will become possible to configure it by setting the appropriate bits in [mcontrol](#) CSR ([tdata1](#)) and writing the target address to [maddress](#) CSR ([tdata2](#)).

### 2.6.3 Trigger Execution Flow

When a hart is halted and enters debug mode due to the firing of a trigger ([action](#) = 1):

- [dpc](#) is set to the current PC in the decoding phase
- The cause field in [dcsr](#) is set to 2, which means halt due to trigger

### 2.6.4 Register Summary

Below is a list of Trigger Module CSRs supported by the CPU. These are only accessible from machine mode.

The abbreviations given in Column **Access** are explained in Section [Access Types for Registers](#).

| Name                     | Description                            | Address | Access |
|--------------------------|--|---------|--------|
| <a href="#">tselect</a>  | Trigger Select Register                | 0x7A0   | R/W    |
| <a href="#">tdata1</a>   | Trigger Abstract Data 1                | 0x7A1   | R/W    |
| <a href="#">mcontrol</a> | <a href="#">tdata1</a> Shadow Register | 0x7A1   | R/W    |
| <a href="#">tdata2</a>   | Trigger Abstract Data 2                | 0x7A2   | R/W    |
| <a href="#">maddress</a> | <a href="#">tdata2</a> Shadow Register | 0x7A2   | R/W    |

### 2.6.5 Registers

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

**Register 2.22. tselect (0x7A0)**

**tselect** Configures the index of the selected trigger unit. (R/W)

**Register 2.23. tdata1 (0x7A1)**

**type** Represents the trigger type. This field is reserved since only match type (0x2) triggers are supported. (RO)

**dmode** This is set to 1 if a trigger is being used by the debugger. This field is reserved since it is only supported in debug mode. (RO)

**data** Configures the abstract tdata1 content. This will always be interpreted as fields of [mcontrol](#) since only match type (0x2) triggers are supported. (R/W)

**Register 2.24. tdata2 (0x7A2)**

**tdata2** Configures the abstract tdata2 content. This will always be interpreted as [maddress](#) since only match type (0x2) triggers are supported. (R/W)

Register 2.25. mcontrol (0x7A1)

| (reserved) |    |    |    | dmode | maskmax |    |    |    | hit | select | timing | sizelo | action |    | chain | match | m | (reserved) |   |   | s | u | execute | store | load |  |  |
|------------|----|----|----|-------|---------|----|----|----|-----|--------|--------|--------|--------|----|-------|-------|---|------------|---|---|---|---|---------|-------|------|--|--|
| 31         | 28 | 27 | 26 |       |         | 21 | 20 | 19 | 18  | 17     | 16     | 15     |        | 12 | 11    | 10    |   | 7          | 6 | 5 | 4 | 3 | 2       | 1     | 0    |  |  |
| 0x2        |    |    |    | 0     | 0x0     |    |    |    | 0   | 0      | 0      | 0      | 0001   |    | 0     | 0     | 0 | 0          | 0 | 0 | 0 | 0 | 0       | 0     | 0    |  |  |
| Reset      |    |    |    |       |         |    |    |    |     |        |        |        |        |    |       |       |   |            |   |   |   |   |         |       |      |  |  |

Reset

**dmode** Same as [dmode](#) in [tdata1](#). (RO)

**maskmax** Represents the maximum NAPOT range.

0: A byte. Only exact match is supported.

Other values: Not supported.

(RO)

**hit** Not implemented in hardware. This field remains 0. (RO)

**select** Configures to select between an address match or a data match.

0: Perform a match on the virtual address

1: Perform a match on the data value loaded or stored, or the instruction executed

Note: Only address match is implemented. This field remains 0.

(RO)

**timing** Configures when the trigger will take action.

0: Take action before the instruction is executed

1: Take action after the instruction is executed

Note: The field remains 0.

(RO)

**sizelo** Only match of any size is supported. This field remains 0. (RO)

**action** Configure action of the selected trigger after it is triggered.

0x0: Cause a breakpoint exception

0x1: Enter debug mode (Valid only when dmode = 1)

Note: Only entering debug mode is supported. This field remains 1.

(RO)

**CHAIN** Not implemented in hardware. This field remains 0. (RO)

**match** Configures the trigger to perform the matching operation of the lower data/instruction address.

0x0: Exact match. Namely, the address corresponding to a certain byte during the access must exactly match the value of [maddress](#).

0x1: NAPOT match. Namely, at least one byte during the access is in the NAPOT region specified in [maddress](#).

Note: Only exact byte match is supported. This field remains 0.

(R/W)

**m** Set this field to make the selected trigger operate in machine mode. (RO)

**s** Set this field to make the selected trigger operate in supervisor mode. Operation in supervisor mode is not supported. This field is always 0. (RO)

Continued on the next page...

**Register 2.25. mcontrol (0x7A1)****Continued from the previous page...**

**u** Set this field to make the selected trigger operate in user mode. Operation in user mode is not supported. This field is always 0. (RO)

**execute** Configures whether to enable the selected trigger to match the virtual address of instructions.

0: Not enable

1: Enable

(R/W)

**store** Set this field to make the selected trigger match the virtual address of the memory write operation. Not supported by hardware. This field is always 0. (RO)

**load** Set this field to make the selected trigger match the virtual address of a memory read operation. Not supported by hardware. This field is always 0. (RO)

**Register 2.26. maddress (0x7A2)**

**maddress** Configures the address used by the selected trigger when performing match operation. (R/W)

## 2.7 Performance Counter

The LP CPU implements one clock cycle counter [mcycle\(h\)](#), one instruction counter [minstret\(h\)](#), and ten event counters [mhpmcounter\(n:3-12\)](#). The clock cycle counter and instruction counter are always available and each is 64-bit wide. The performance counters are 40-bit wide each.

By default, all counters are enabled after reset. A counter can be enabled or disabled individually via the corresponding bit in the [mcountinhibit](#) CSR.

As shown in Table 2.7-1, each counter is dedicated to counting a particular event.

**Table 2.7-1. Performance Counter**

| Counter      | Counted Event                 |
|--------------|-------------------------------|
| mcycle       | Clock cycles                  |
| minstret     | The number of instructions    |
| mhpmcounter3 | Wait cycles for memory access |

| Counter       | Counted Event  |
|---------------|--|
| mhpmcounter4  | Wait cycles for fetching instructions  |
| mhpmcounter5  | The number of memory read operations. An unaligned read is counted as two.   |
| mhpmcounter6  | The number of memory write operations. An unaligned write is counted as two. |
| mhpmcounter7  | The number of unconditional jump instructions (jal, jr, jalr)                |
| mhpmcounter8  | The number of branch instructions  |
| mhpmcounter9  | The number of taken branch instructions                                      |
| mhpmcounter10 | The number of compressed instructions  |
| mhpmcounter11 | Wait cycles for multiplication instructions                                  |
| mhpmcounter12 | Wait cycles for division instructions  |

## 2.8 System Access

The LP CPU has access to both memory and peripherals. When accessing an illegal address, i.e., outside the memory's or peripherals' address space, it will trigger the corresponding access error exception based on the type of access.

### 2.8.1 Memory Access

The ESP32-P4 LP CPU can access LP ROM, LP SRAM, and L2 SRAM. For more information, please refer to Section 6 *System and Memory*.

- LP ROM: 16 KB region starting from 0x5010\_0000 to 0x5010\_3FFF. It is used for instruction fetch, data read, etc.
- LP SRAM: 32 KB region starting from 0x5010\_8000 ~ 0x5010\_FFFF. It is used for instruction fetch, data read, data write, etc.
- L2 SRAM: 768 KB region starting from 0x4FF0\_0000 to 0x4FFB\_FFFF. It is used for instruction fetch, data read, data write, etc.

**Note:**

The LP CPU experiences significant latency when accessing L2 SRAM, with each access taking approximately 20 LP CPU clock cycles. However, it can access LP ROM and LP SRAM with no latency.

The LP CPU supports the atomic instruction set. Both the LP CPU and the HP CPU can access memory through atomic instructions, thus achieving atomicity of memory access. For details on the atomic instruction set, please refer to RISC-V Instruction Set Manual Volume I: Unprivileged ISA, Version 2.2.

### 2.8.2 Peripheral Access

Table 6.3-2 in Chapter 6 *System and Memory* lists the peripherals accessible by the LP CPU and their base addresses.

## 2.9 Event Task Matrix Feature

The LP CPU on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows LP CPU's ETM tasks to be triggered by any peripherals' ETM events, or LP CPU's ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM tasks and events related to the LP CPU. For more information, please refer to Chapter 12 [Event Task Matrix \(ETM\)](#).

LP CPU can receive the following ETM task:

- ULP\_TASK\_WAKEUP\_CPU: Wakes up the LP CPU.
- ULP\_TASK\_INT\_CPU: Triggers an LP CPU interrupt.

LP CPU can generate the following ETM events:

- ULP\_EVT\_ERR\_INTR: Indicates that an LP CPU exception occurs.
- ULP\_EVT\_START\_INTR: Indicates that the LP CPU clock is turned on.
- ULP\_EVT\_HALT: Indicates that the LP CPU enters the sleep state

## 2.10 Sleep and Wake-Up Process

### 2.10.1 Features

Here are the sleep and wake-up features supported by the LP CPU.

- Independent operation, sleeping, and waking-up in the low-power system when the HP CPU is sleeping
- Actively configuring registers to enter the sleep state based on software operating status
- Multiple wake-up sources
- Sleep entry rejection by peripherals

### 2.10.2 Process

The LP CPU is in sleep by default and its wake-up module follows the process below to wake it up for work and make it sleep.

To configure wake-up sources, please refer to Table [2.10-1](#).

The first startup of the LP CPU after power-up depends on the wake-up enable and wake-up source configuration by the HP CPU.

- Initialization of the LP CPU
  - Initialize the LP memory.
  - Start the LP CPU. Since the startup of the LP CPU depends on the wake-up process, it is recommended to use the [PMU\\_HP\\_TRIGGER\\_LP](#) register to start the initialization of the LP CPU in the following way:
    - \* Set [PMU\\_LP\\_CPU\\_WAKEUP\\_EN](#) to 0x400000
    - \* Set [PMU\\_HP\\_TRIGGER\\_LP](#) to 0x1

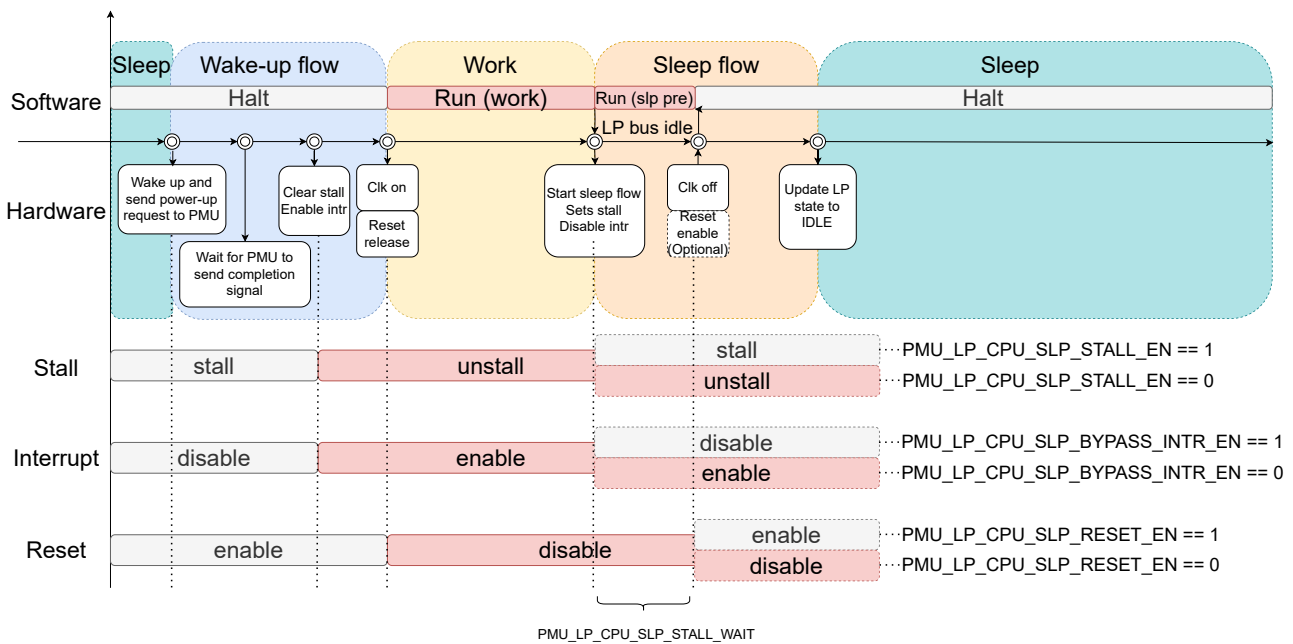

Figure 2.10-1. Wake-Up and Sleep Flow of LP CPU

\* The LP CPU will go through the wake-up process to start running

- Wake-up process:

- The wake-up module receives a wake-up signal and sends a power-up request to the PMU.
- If the current power consumption state (clock, power supply, etc.) meets the requirements of the LP CPU, the PMU will immediately reply with the completion signal. Otherwise, it will adjust the power consumption state before replying with the completion signal.
- The wake-up module disables the STALL state of the LP CPU and enables interrupt receiving.
- The wake-up module starts the clock, releases reset (ignore this step if reset is not enabled for sleep), and starts working.

- Sleep process:

- The LP CPU configures the `PMU_LP_CPU_SLEEP_REQ` register to enable the wake-up module to start the sleep process.
- If `PMU_LP_CPU_SLP_STALL_EN` is 1, the wake-up module enables the STALL state of the LP CPU. If it is 0, the module does not enable that state. If `PMU_LP_CPU_SLP_BYPASS_INTR_EN` is 1, the module masks all the LP CPU's interrupts. If it is 0, the module does not mask them.
- The wake-up module waits for `PMU_LP_CPU_SLP_STALL_WAIT` LP CPU clock cycles, and then turns off the LP CPU clock. If `PMU_LP_CPU_SLP_RESET_EN` is 1, the module enables reset of the LP CPU.
- The wake-up module changes the state of the LP CPU to IDLE and the PMU can enter a deeper level of sleep state.

## 2.10.3 Wake-Up Sources

Table 2.10-1. Wake Sources

| Register Value <sup>1</sup> | Wake-Up Source             | Description  |
|-----------------------------|----------------------------|--|
| BIT(9)                      | LP IO                      | The LP CPU can be waken up by the LP IO interrupt status register signal. For more information, please refer to Chapter 8 <i>GPIO Matrix and IO MUX</i> .  |
| BIT(10)                     | LP UART                    | The LP CPU can be waken up when the LP UART receives a certain number of RX pulses. REG_UART_WAKEUP_EN needs to be enabled. For more information, please refer to Chapter 37 <i>UART Controller (UART)</i> . |
| BIT(13)                     | RTC timer                  | The LP CPU can be waken up by the RTC timer target 0 timeout interrupt. For more information, please refer to Chapter 13 <i>Low-Power Management</i> .   |
| BIT(14)                     | Brownout detection         | The LP CPU can be waken up when a brownout occurs. For more information, please refer to Chapter 21 <i>Brown-out Detector</i> .  |
| BIT(17)                     | ETM                        | The LP CPU can be waken up by the ETM task. For more information, please refer to Chapter 12 <i>Event Task Matrix (ETM)</i> .  |
| BIT(18)                     | RTC timer                  | The LP CPU can be waken up by the RTC timer target 0 timeout interrupt. For more information, please refer to Chapter 13 <i>Low-Power Management</i> .   |
| BIT(19)                     | LP I2S audio               | The LP CPU can be waken up when the predefined audio is received via I2S. For more details, please refer to Chapter 41 <i>I2S Controller (I2S)</i> .   |
| BIT(22)                     | PMU_HP_TRIGGER_LP register | The HP CPU sets the register PMU_HP_TRIGGER_LP to wake up the LP CPU, and sets REG_HP_SW_TRIGGER_INT_CLR to clear this wake-up source.   |

<sup>1</sup> Value of the PMU\_LP\_CPU\_WAKEUP\_EN register

## 2.10.4 Sleep Rejection

When the LP CPU is preparing to enter the sleep state, it can be rejected by peripheral events. In other words, peripheral events have the capability to prevent the LP CPU from entering sleep mode. Below is the configuration process for the rejection:

1. The LP CPU configures PMU\_SLP\_REJECT\_EN to enable the functionality that allows peripherals to reject the LP CPU from entering the sleep mode.
2. The LP CPU configures PMU\_SLEEP\_REJECT\_ENA to enable the corresponding peripheral event to prevent the LP CPU from entering the sleep state.

The peripheral sources that can prevent the LP CPU from sleeping are the same as the wake-up sources.

## Part II

# System DMA

Focused on managing and transferring data within the system, this part explores controllers for Direct Memory Access (DMA), providing guidelines for efficient data movement supporting various peripherals and devices.

## Chapter 3

# GDMA Controller (GDMA-AHB, GDMA-AXI)

## 3.1 Overview

General Direct Memory Access (GDMA) is a feature that allows peripheral-to-memory, memory-to-peripheral, and memory-to-memory data transfer at high speed. The CPU is not involved in the GDMA transfer and therefore is more efficient with less workload.

ESP32-P4 has two types of general-purpose DMA controllers, namely GDMA-AHB and GDMA-AXI, to directly access the AHB bus or the AXI bus respectively. Both GDMA-AHB and GDMA-AXI have six independent channels, i.e., three transmit channels and three receive channels.

The GDMA-AHB channels are shared and can be assigned to I3C, UHCI, I2S, ADC, or RMT to access internal memory.

The GDMA-AXI channels are also shared and can be assigned to LCD, CAM, two general-purpose SPIs, PARLIO, AES, or SHA to access both internal and external memory.

GDMA-AHB and GDMA-AXI use configurable priority and weight arbitration schemes to manage peripherals' needs for bandwidth.

Unless otherwise specified, the term "GDMA controller" refers to both GDMA-AHB and GDMA-AXI in the following text.

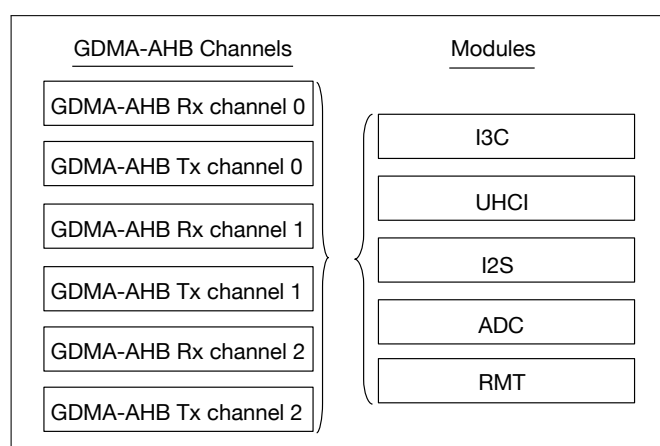

Figure 3.1-1. Modules that Share GDMA-AHB Channels

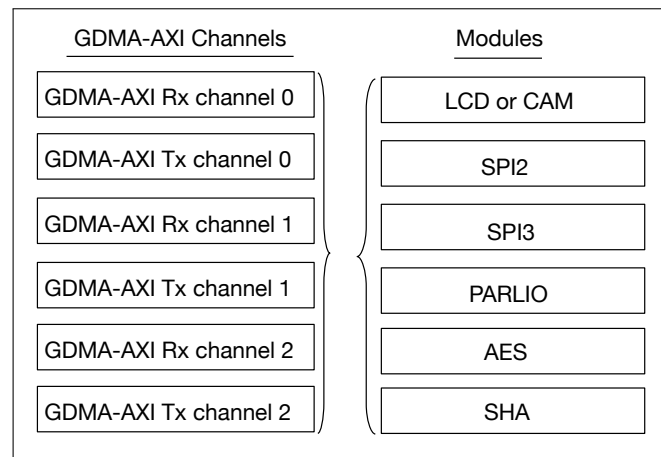

Figure 3.1-2. Modules that Share GDMA-AXI Channels

## 3.2 Features

GDMA-AHB and GDMA-AXI have the following features:

- Architecture:
  - GDMA-AHB: AHB bus architecture
  - GDMA-AXI: AXI bus architecture, which gives the possibility to complete up to 8 transactions out of order and up to 8 outstanding transactions
- Programmable length of data to be transferred in bytes
- Access via any address and size
- Alignment:
  - GDMA-AHB:
    - \* Descriptor address: 1-word aligned
    - \* Data address and length (only internal memory is accessible): no requirements
  - GDMA-AXI:
    - \* Descriptor address: 2-word aligned
    - \* Data address and length:
      - Internal memory and non-encrypted external memory address space: no requirements
      - Encrypted external memory address space: 16-byte aligned
- Linked list of descriptors
- INCR burst transfer when accessing memory
- Three transmit channels and three receive channels for each controller
- Software-configurable selection of peripheral requesting its service
- Configurable channel priority and weight arbitration
- Support for memory transfer

- CRC calculation of data

### 3.3 Architecture

In ESP32-P4, all modules that need high-speed data transfer support GDMA. The GDMA controller and CPU data bus have access to the same address space in memory. Figure 3.3-1 shows the basic architecture of the GDMA controller.

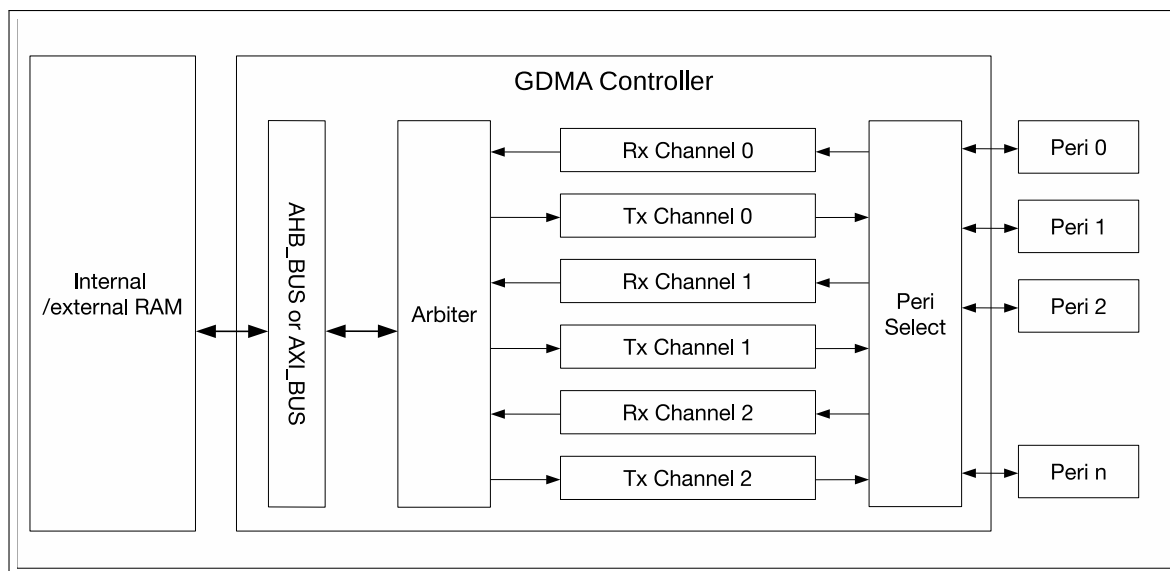

Figure 3.3-1. GDMA controller Architecture

GDMA-AHB and GDMA-AXI have six independent channels respectively, i.e., three transmit channels and three receive channels. Every channel can be connected to different peripherals. In other words, channels are general-purpose, and shared by peripherals.

GDMA-AHB and GDMA-AXI read data from or write data to internal memory or internal and external memory via AHB\_BUS or AXI\_BUS respectively. Before this, GDMA uses configurable arbitration schemes for channels requesting read or write access. For the available address range of internal and external memory, please see Chapter 6 [System and Memory](#).

Software can use the GDMA through linked lists. GDMA-AHB linked lists are stored in internal memory, while GDMA-AXI linked lists are stored in internal or external memory. These linked lists consist of outlink<sub>*n*</sub> and inlink<sub>*n*</sub>, where *n* indicates the channel number (ranging from 0 to 2). The GDMA reads an outlink<sub>*n*</sub> (i.e., a linked list of transmit descriptors) from memory and transmit data in corresponding memory according to the outlink<sub>*n*</sub>, or read an inlink<sub>*n*</sub> (i.e., a linked list of receive descriptors) and store received data into specific address space in memory according to the inlink<sub>*n*</sub>.

### 3.4 Functional Description

#### 3.4.1 Linked List

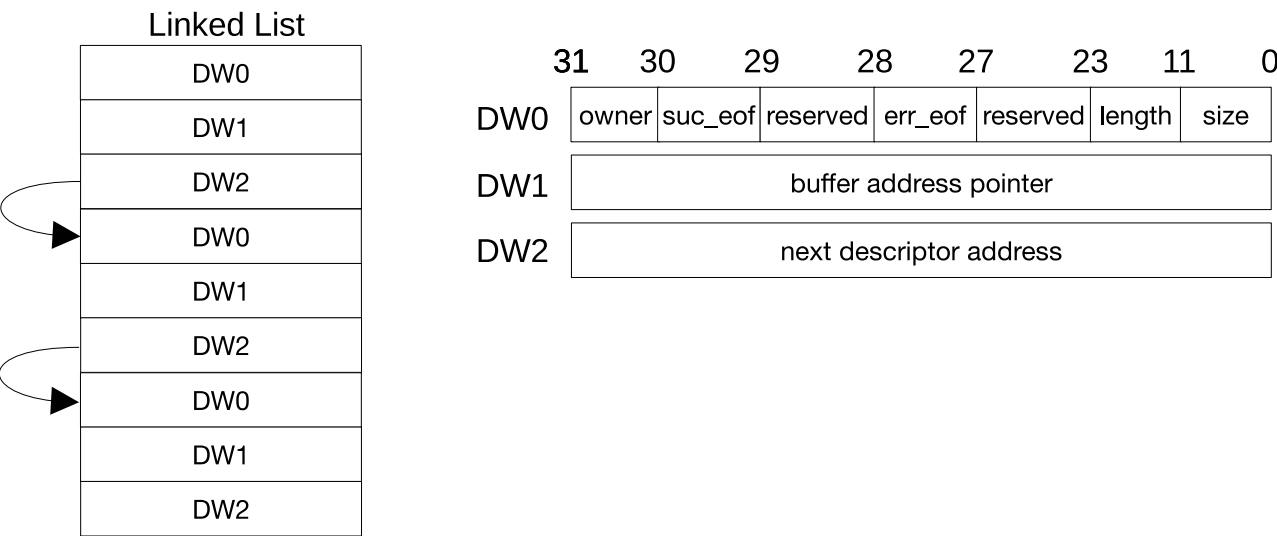

Figure 3.4-1. Structure of a Linked List

Figure 3.4-1 shows the structure of a linked list. An outlink and an inlink have the same structure. A linked list is formed by one or more descriptors, and each descriptor consists of three words. Linked lists should be stored in the memory for the GDMA to be able to use them. The meanings of a descriptor’s fields are as follows:

- owner (DW0) [31]: Specifies who is allowed to access the buffer that this descriptor points to.  
0: CPU can access the buffer.  
1: The GDMA controller can access the buffer.  
When the GDMA controller stops using the buffer, this bit in a receive descriptor is automatically cleared by hardware, while this bit in a transmit descriptor can only be automatically cleared by hardware if [AHB/AXI\\_DMA\\_OUT\\_AUTO\\_WRBACK\\_CHn](#) is set to 1. Software can disable automatic clearing by hardware by setting the [AHB/AXI\\_DMA\\_OUT\\_LOOP\\_TEST\\_CHn](#) or [AHB/AXI\\_DMA\\_IN\\_LOOP\\_TEST\\_CHn](#) bit. When software loads a linked list, this bit should be set to 1.  
**Note:** AHB/AXI\_DMA\_OUT is the prefix of transmit channel registers, and AHB/AXI\_DMA\_IN is the prefix of receive channel registers.
- suc\_eof (DW0) [30]: Specifies whether the [AHB/AXI\\_DMA\\_IN\\_SUC\\_EOF\\_CHn\\_INT](#) or [AHB/AXI\\_DMA\\_OUT\\_EOF\\_CHn\\_INT](#) interrupt will be triggered when the data corresponding to this descriptor has been received or transmitted.  
0: No interrupt will be triggered after the current descriptor’s successful transfer;  
1: An interrupt will be triggered after the current descriptor’s successful transfer.  
For receive descriptors, software needs to clear this bit to 0, and hardware will set it to 1 after receiving data containing the EOF flag.  
For transmit descriptors, software needs to set this bit to 1 as needed.  
If software configures this bit to 1 in a descriptor, the GDMA will include the EOF flag in the data sent to the corresponding peripheral, indicating to the peripheral that this data segment marks the end of one

transfer phase.

- reserved (DWO) [29]: Reserved. The value of this bit does not matter.
- err\_eof (DWO) [28]: Specifies whether the received data has errors.  
0: The received data does not have errors.  
1: The received data has errors.  
This bit is used only when UHCI or PARLIO uses the GDMA to receive data. When an error is detected in the received data segment corresponding to a descriptor, this bit in the receive descriptor is set to 1 by hardware.
- reserved (DWO) [27:24]: Reserved.
- length (DWO) [23:12]: Specifies the number of valid bytes in the buffer that this descriptor points to. This field in a transmit descriptor is written by software and indicates how many bytes can be read from the buffer; this field in a receive descriptor is written by hardware automatically and indicates how many valid bytes have been stored in the buffer.
- size (DWO) [11:0]: Specifies the size of the buffer that this descriptor points to.
- buffer address pointer (DW1): Address of the buffer.
- next descriptor address (DW2): Address of the next descriptor. If the current descriptor is the last one, this value is 0. For GDMA-AHB, this field can only point to the internal memory space; for GDMA-AXI, this field can point to the internal or external memory space.

**Note:**

Please note that addresses of GDMA-AHB descriptors should be 4-byte aligned, and addresses of GDMA-AXI descriptors should be 8-byte aligned.

If the length of data received is smaller than the size of the buffer, the GDMA controller will not use the available space of the buffer in the next transaction.

### 3.4.2 Peripheral-to-Memory and Memory-to-Peripheral Data Transfer

The GDMA controller can transfer data from memory to peripheral (transmit) and from peripheral to memory (receive). A transmit channel transfers data in the specified memory location to a peripheral's transmitter via an outlink<sub>*n*</sub>, whereas a receive channel transfers data received by a peripheral to the specified memory location via an inlink<sub>*n*</sub>.

Every transmit and receive channel can be connected to any peripheral with the GDMA feature. Table 3.4-1 and Table 3.4-2 illustrate how to select the peripheral to be connected via registers. “Dummy-*n*” corresponds to register values for memory-to-memory data transfer. When a channel is connected to a peripheral, the rest of the channels cannot be connected to that peripheral.

**Table 3.4-1. GDMA-AHB Selecting Peripherals via Register Configuration**

| AHB_DMA_PERI_IN_SEL_CH <sub><i>n</i></sub><br>AHB_DMA_PERI_OUT_SEL_CH <sub><i>n</i></sub> | Peripheral |
|---|------------|
| 0   | I3C        |
| 1   | Dummy-1    |

|         |               |
|---------|---------------|
| 2       | UHCI          |
| 3       | I2S0          |
| 4       | I2S1          |
| 5       | I2S2          |
| 6 ~ 7   | Dummy-6 ~ 7   |
| 8       | ADC           |
| 9       | Dummy-9       |
| 10      | RMT           |
| 11 ~ 15 | Dummy-11 ~ 15 |
| 16 ~ 63 | Invalid       |

Table 3.4-2. GDMA-AXI Selecting Peripherals via Register Configuration

| AXI_DMA_PERI_IN_SEL_CH $n$<br>AXI_DMA_PERI_OUT_SEL_CH $n$ | Peripheral   |
|---|--------------|
| 0   | LCD or CAM   |
| 1   | SPI2         |
| 2   | SPI3         |
| 3   | PARLIO       |
| 4   | AES          |
| 5   | SHA          |
| 6 ~ 15  | Dummy-6 ~ 15 |
| 16 ~ 63   | Invalid      |

### 3.4.3 Memory-to-Memory Data Transfer

The GDMA controller also allows memory-to-memory data transfer. Such data transfer can be enabled by setting `AHB/AXI_DMA_MEM_TRANS_EN_CH $n$` , which connects the output of transmit channel  $n$  to the input of receive channel  $n$ . Note that a transmit channel is only connected to the receive channel with the same number ( $n$ ), and `AHB/AXI_DMA_PERI_IN_SEL_CH $n$`  and `AHB/AXI_DMA_PERI_OUT_SEL_CH $n$`  should be configured to the same value corresponding to “Dummy”.

To access external memory, please use GDMA-AXI.

### 3.4.4 Enabling GDMA

The software uses the GDMA controller through linked lists. When the GDMA controller receives data, software loads an inlink, configures the `AHB/AXI_DMA_INLINK_ADDR_CH $n$`  field with the address of the first receive descriptor, and sets the `AHB/AXI_DMA_INLINK_START_CH $n$`  bit to enable GDMA. When the GDMA controller transmits data, software loads an outlink, prepares data to be transmitted, configures the `AHB/AXI_DMA_OUTLINK_ADDR_CH $n$`  field with address of the first transmit descriptor, and sets the `AHB/AXI_DMA_OUTLINK_START_CH $n$`  bit to enable GDMA. The `AHB/AXI_DMA_INLINK_START_CH $n$`  bit and `AHB/AXI_DMA_OUTLINK_START_CH $n$`  bit are cleared automatically by hardware.

In some cases, you may want to append more descriptors to a DMA transfer that is already started. Naively, it would seem to be possible to do this by clearing the EOF bit of the final descriptor in the existing list and

setting its next descriptor address pointer field (DW2) to the first descriptor of the to-be-added list. However, this strategy fails if the existing DMA transfer is almost or entirely finished. Instead, the GDMA controller has specialized logic to make sure a DMA transfer can be continued or restarted: if the transfer is ongoing, the controller will make sure to take the appended descriptors into account; if the transfer has already finished, the controller will restart with the new descriptors. This is implemented by the Restart function.

When using the Restart function, software needs to rewrite the address of the first descriptor in the new list to DW2 of the last descriptor in the loaded list, and set [AHB/AXI\\_DMA\\_INLINK\\_RESTART\\_CH<sub>n</sub>](#) bit or [AHB/AXI\\_DMA\\_OUTLINK\\_RESTART\\_CH<sub>n</sub>](#) bit (these two bits are cleared automatically by hardware). As shown in Figure 3.4-2, by doing so hardware can obtain the address of the first descriptor in the new list when reading the last descriptor in the loaded list, and then read the new list.

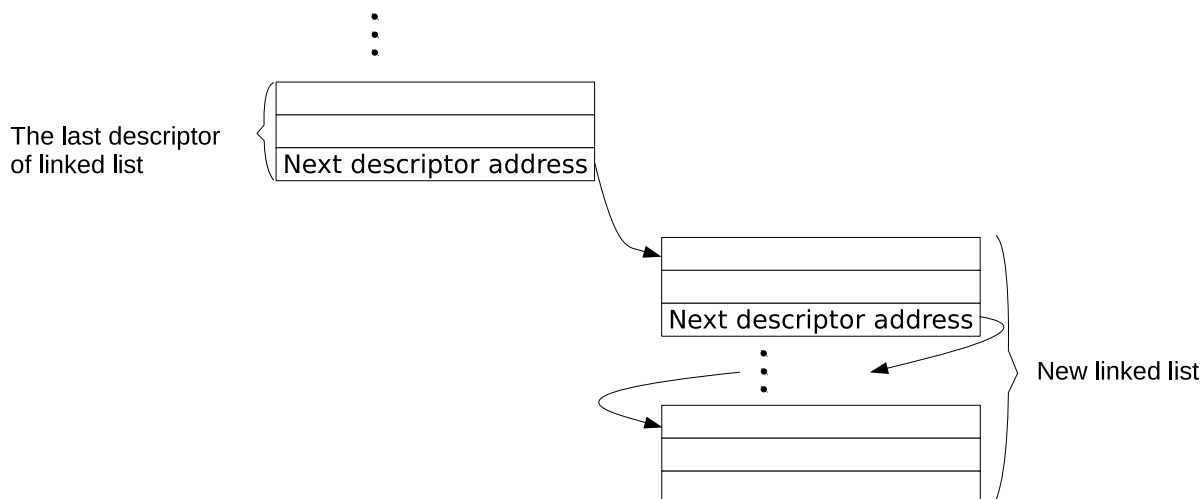

Figure 3.4-2. Relationship among Linked Lists

### 3.4.5 Linked List Reading Process

Once configured and enabled by software, the GDMA controller starts to read the linked list from memory. The GDMA performs checks on descriptors in the linked list. Only if descriptors pass the checks, the corresponding GDMA channel will start data transfer. If the descriptors fail any of the checks, hardware will trigger descriptor error interrupt (either [AHB/AXI\\_DMA\\_IN\\_DSCR\\_ERR\\_CH<sub>n</sub>\\_INT](#) or [AHB/AXI\\_DMA\\_OUT\\_DSCR\\_ERR\\_CH<sub>n</sub>\\_INT](#)), and the channel will halt.

The checks performed on descriptors are:

- Owner bit check when [AHB/AXI\\_DMA\\_IN\\_CHECK\\_OWNER\\_CH<sub>n</sub>](#) or [AHB/AXI\\_DMA\\_OUT\\_CHECK\\_OWNER\\_CH<sub>n</sub>](#) is set to 1. If the owner bit is 0, the buffer is accessed by the CPU. In this case, the owner bit fails the check. The owner bit will not be checked if [AHB/AXI\\_DMA\\_IN\\_CHECK\\_OWNER\\_CH<sub>n</sub>](#) or [AHB/AXI\\_DMA\\_OUT\\_CHECK\\_OWNER\\_CH<sub>n</sub>](#) is 0.
- Descriptor address check, which checks if the descriptor address is located in configured internal memory space for GDMA-AHB, and configured internal or external memory space for GDMA-AXI. If a GDMA-AHB descriptor points to [AHB\\_DMA\\_ACCESS\\_INTR\\_MEM\\_START\\_ADDR](#) ~ [AHB\\_DMA\\_ACCESS\\_INTR\\_MEM\\_END\\_ADDR](#) (the value should be located in internal memory), it passes the check. If a GDMA-AXI descriptor points to [AXI\\_DMA\\_ACCESS\\_INTR\\_MEM\\_START\\_ADDR](#) ~ [AXI\\_DMA\\_ACCESS\\_INTR\\_MEM\\_END\\_ADDR](#) (the value should be located in internal memory), or [AXI\\_DMA\\_ACCESS\\_EXTR\\_MEM\\_START\\_ADDR](#) ~ [AXI\\_DMA\\_ACCESS\\_EXTR\\_MEM\\_END\\_ADDR](#) (the value

should be located in external memory), it passes the check. For details, please refer to Section 3.4.7.

After the software detects a descriptor error interrupt, it must reset the corresponding channel, and enable GDMA by setting [AHB/AXI\\_DMA\\_OUTLINK\\_START\\_CHn](#) or [AHB/AXI\\_DMA\\_INLINK\\_START\\_CHn](#) bit.

### 3.4.6 EOF

**Note:** In this chapter, EOF of transmit descriptors refers to `suc_eof` (i.e., bit 30 of DWO), while EOF of receive descriptors refers to both `suc_eof` and `err_eof` (i.e., bit 28 of DWO).

The GDMA controller uses EOF (end of frame) flags to indicate the end of data segment transfer corresponding to a specific descriptor.

For data transmission, the GDMA generates two types of EOF interrupts:

- [AHB/AXI\\_DMA\\_OUT\\_EOF\\_CHn\\_INT](#), generated when the `suc_eof` bit of any descriptor in the linked list is set, and the data corresponding to this descriptor has been transmitted. This interrupt is enabled by setting the [AHB/AXI\\_DMA\\_OUT\\_EOF\\_CHn\\_INT\\_ENA](#) bit.
- [AHB/AXI\\_DMA\\_OUT\\_TOTAL\\_EOF\\_CHn\\_INT](#), generated when the `suc_eof` bit of the last descriptor in the linked list is set, and the data corresponding to the last descriptor has been transmitted. This interrupt is enabled by setting the [AHB/AXI\\_DMA\\_OUT\\_TOTAL\\_EOF\\_CHn\\_INT\\_ENA](#) bit.

For data reception, the GDMA also generates two types of EOF interrupts:

- [AHB/AXI\\_DMA\\_IN\\_SUC\\_EOF\\_CHn\\_INT](#), generated when a data segment with an EOF flag has been received. This interrupt is enabled by setting the [AHB/AXI\\_DMA\\_IN\\_SUC\\_EOF\\_CHn\\_INT\\_ENA](#) bit.
- (UHCI and PARLIO only) [AHB/AXI\\_DMA\\_IN\\_ERR\\_EOF\\_CHn\\_EOF\\_INT](#), generated when a data segment corresponding to a descriptor has been received with errors. This interrupt is enabled by setting the [AHB/AXI\\_DMA\\_IN\\_ERR\\_EOF\\_CHn\\_INT\\_ENA](#) bit, and is valid only when the channel is connected to UHCI or PARLIO.

When detecting an [AHB/AXI\\_DMA\\_OUT\\_TOTAL\\_EOF\\_CHn\\_INT](#) or [AHB/AXI\\_DMA\\_IN\\_SUC\\_EOF\\_CHn\\_INT](#) interrupt, software can read the value of the [AHB/AXI\\_DMA\\_OUT\\_EOF\\_DES\\_ADDR\\_CHn](#) or

[AHB/AXI\\_DMA\\_IN\\_SUC\\_EOF\\_DES\\_ADDR\\_CHn](#) field, which stores the address of the finished descriptor.

Therefore, the software can tell which descriptors have been used and reclaim them as needed. For RX, the address of the descriptor can also be stored to the [AHB/AXI\\_DMA\\_IN\\_ERR\\_EOF\\_DES\\_ADDR\\_CHn](#) field when an [AHB/AXI\\_DMA\\_IN\\_ERR\\_EOF\\_CHn\\_INT](#) interrupt is triggered.

### 3.4.7 Accessing Memory

Any transmit and receive channels of GDMA-AHB and GDMA-AXI can access the internal memory address space configured by [AHB/AXI\\_DMA\\_ACCESS\\_INTR\\_MEM\\_START\\_ADDR](#) and

[AHB/AXI\\_DMA\\_ACCESS\\_INTR\\_MEM\\_END\\_ADDR](#). Moreover, the transmit and receive channels of GDMA-AXI can access the external memory address space configured by [AXI\\_DMA\\_ACCESS\\_EXTR\\_MEM\\_START\\_ADDR](#) and [AXI\\_DMA\\_ACCESS\\_EXTR\\_MEM\\_END\\_ADDR](#).

To improve data transfer efficiency, GDMA can send data in burst mode. For GDMA-AHB, this mode is disabled by default, and can be enabled for receive channels by setting [AHB\\_DMA\\_IN\\_DATA\\_BURST\\_EN\\_CHn](#), and enabled for transmit channels by setting [AHB\\_DMA\\_OUT\\_DATA\\_BURST\\_EN\\_CHn](#). For GDMA-AXI, this mode is enabled by default, and cannot be disabled. Users can configure the number of data bytes in a single AXI

burst (burst length) to 8, 16, 32, 64, or 128 bytes via [AXI\\_DMA\\_IN\\_BURST\\_SIZE\\_SEL\\_CHn](#) and [AXI\\_DMA\\_OUT\\_BURST\\_SIZE\\_SEL\\_CHn](#).

When GDMA-AHB accesses the configured internal memory space, there are no requirements for descriptor field alignment. When GDMA-AXI accesses the configured internal memory and non-encrypted external memory space, there are no requirements for descriptor field alignment; when it accesses the encrypted external memory space (see Chapter [29 External Memory Encryption and Decryption \(XTS\\_AES\)](#)), buffer address pointer and data should be 16-byte aligned, and other fields are not required to be aligned.

### 3.4.8 Arbitration

To ensure timely response to peripherals running at a high speed with low latency (such as SPI), the GDMA controller implements two arbitration schemes, based on channel priority and channel weight respectively.

- Priority arbitration: Each channel can be assigned a priority from 0 ~ 5 (in total 6 levels). The larger the number, the higher the priority. When several channels perform data transfers at the same time, the GDMA would respond to the transfer requests according to priority levels, and the channel with higher priority would get a response more timely.
- Weight arbitration:
  - Each channel is assigned a weight (i.e., the number of tokens) from 0 ~ 15. The GDMA divides the AHB or AXI bus clock period into multiple time slots, and in each time slot, the number of transfers performed by a channel is determined by the number of its tokens. Every time a channel performs a data transfer, one of its tokens is spent. If all of its tokens have been spent in a time slot, then this channel's transfer request will no longer be responded to until the time slot expires, or until tokens of all channels have been spent and the new time slot starts.
  - If the number of tokens assigned to a channel is not zero, the GDMA waits for this channel's tokens to be spent even if it does not have data transfer requests, and will not exit from this time slot ahead of expiration. This leads to a waste of bandwidth. Therefore, the GDMA provides weight arbitration optimization. When this feature is enabled, a channel without data transfer requests will not be involved in the arbitration and its tokens will be ignored. When all channels no longer have transfer requests, the GDMA arbiter exits from the current time slot before expiration. This way, the arbitration response is accelerated and the transfer efficiency is improved.

**Note:**

- If channels have the same weight but different priorities, on condition that the number of bytes to be transferred is the same and not large, channels with higher priorities would finish data transfers first.
- If channels have different priorities and weights, on condition that the number of bytes to be transferred is the same, channels with higher weights would be allocated more bandwidth and finish data transfers first.

### 3.4.9 CRC Calculation

The GDMA has a CRC calculation module for both TX and RX. This module supports arbitrary polynomials and 8-bit parallel computation, namely 8 bits at a time. The CRC result is up to 32-bit wide for GDMA-AHB, and up

to 16-bit for GDMA-AXI. It is calculated for each linked list descriptor by descriptor and becomes invalid when the Restart function is triggered during transfer.

For easier understanding of register configuration rules, assume:

- The 8-bit data to calculate each time is `data[7:0]`.
- The required CRC result is 5-bit wide, and the polynomial used is  $crc[4 : 0] = x \oplus 5 + x \oplus 2 + 1$ ;
- The initial CRC value is 0x1F, and the intermediate result calculated in each clock cycle is `crc_tmp[4:0]`.

Taking as an example the GDMA reading data from memory and transmitting the data to peripherals, the following fields are provided by hardware for CRC computation:

- **AHB/AXI\_DMA\_OUT\_CRC\_INIT\_DATA\_CH $n$** : Configures the initial CRC value, i.e., 0x1F in the above example. **AHB\_DMA\_OUT\_CRC\_INIT\_DATA\_CH $n$**  can be configured with a 32-bit value at the maximum, while **AXI\_DMA\_OUT\_CRC\_INIT\_DATA\_CH $n$**  can be configured with a 16-bit value at the maximum, meaning that the CRC result could be 32 bits or 16 bits at most.
- **AHB/AXI\_DMA\_OUT\_CRC\_FINAL\_RESULT\_CH $n$** : Stores the computation result of all data in a DMA transfer (until data pointed by the last descriptor in the linked list has been transferred). The computation result could be 32 bits at most.
- **AHB/AXI\_DMA\_TX\_CRC\_WIDTH\_CH $n$** : Configures the CRC result length.
- **AHB/AXI\_DMA\_TX\_CRC\_LAUTCH\_FLGA\_CH $n$** , which latches the CRC result.
- **AHB/AXI\_DMA\_TX\_CRC\_EN\_WR\_DATA\_CH $n$** : Indicates which bits in `crc_tmp[4:0]` are used to compute `crc[x]` ( $x$  is configured via **AHB/AXI\_DMA\_TX\_CRC\_EN\_ADDR\_CH $n$** ). If **AHB/AXI\_DMA\_TX\_CRC\_EN\_WR\_DATA\_CH $n$**  is configured as 0xF, it means that only `crc_tmp[3]`, `crc_tmp[2]`, `crc_tmp[1]`, and `crc_tmp[0]` are used for computation, and other bits are not used (in this case `crc_tmp[4]`).
- **AHB/AXI\_DMA\_TX\_CRC\_DATA\_EN\_WR\_DATA\_CH $n$** : Indicates which bits in `data[7:0]` are used to compute `crc[x]` ( $x$  is configured via **AHB/AXI\_DMA\_TX\_CRC\_DATA\_EN\_ADDR\_CH $n$** ). GDMA calculates the CRC in the unit of byte, so only the lower 8 bits of this field needs to be configured. If **AHB/AXI\_DMA\_TX\_CRC\_DATA\_EN\_WR\_DATA\_CH $n$**  is configured as 0xF, it means that only `data[3]`, `data[2]`, `data[1]`, and `data[0]` are used for computation.

CRC calculation is achieved in the GDMA by configuring a parallel calculation matrix derived from the polynomial. If the expected CRC result is  $n$  bits, then the matrix has  $n$  rows and  $n + 8$  columns.

Based on the assumptions at the beginning of this section, the calculation matrix would be 5 rows and 13 columns, and the actual hardware CRC calculation formulas would be as follows ( $\oplus$  represents the XOR operation):

$$\begin{aligned} crc[0] &= crc\_tmp[0] \oplus crc\_tmp[2] \oplus crc\_tmp[3] \oplus data[0] \oplus data[3] \oplus data[5] \oplus data[6] \\ crc[1] &= crc\_tmp[1] \oplus crc\_tmp[3] \oplus crc\_tmp[4] \oplus data[1] \oplus data[4] \oplus data[6] \oplus data[7] \\ crc[2] &= crc\_tmp[0] \oplus crc\_tmp[3] \oplus crc\_tmp[4] \oplus data[0] \oplus data[2] \oplus data[3] \oplus data[6] \oplus data[7] \\ crc[3] &= crc\_tmp[0] \oplus crc\_tmp[1] \oplus crc\_tmp[4] \oplus data[1] \oplus data[4] \oplus data[3] \oplus data[7] \\ crc[4] &= crc\_tmp[1] \oplus crc\_tmp[2] \oplus data[2] \oplus data[4] \oplus data[5] \end{aligned}$$

The above calculation formula can be abstracted as a switch matrix shown in Figure 3.4-3:

Figure 3.4-3. CRC Calculation Matrix

**Note:**

The CRC calculation described above is a Linear Feedback Shift Register (LFSR) implementation of the bitwise CRC algorithm. The formulas can be generated with some online tools according to the polynomial and the data width for parallel computation (always 8 bits for ESP32-P4).

## 3.5 Event Task Matrix Feature

The GDMA controller on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows GDMA's ETM tasks to be triggered by any peripherals' ETM events, or GDMA's ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM tasks and events related to GDMA. For more information, please refer to Chapter 12 [Event Task Matrix \(ETM\)](#).

GDMA can receive the following ETM tasks:

- GDMA\_AHB/AXI\_TASK\_IN\_START\_CH $n$ : Enables the corresponding RX channel  $n$  for data transfer.
- GDMA\_AHB/AXI\_TASK\_OUT\_START\_CH $n$ : Enables the corresponding TX channel  $n$  for data transfer.

**Note:**

Above ETM tasks can achieve the same functions as CPU configuring [AHB/AXI\\_DMA\\_INLINK\\_START\\_CH \$n\$](#)  and [AHB/AXI\\_DMA\\_OUTLINK\\_START\\_CH \$n\$](#) . When [AHB/AXI\\_DMA\\_IN\\_ETM\\_EN\\_CH \$n\$](#)  or [AHB/AXI\\_DMA\\_OUT\\_ETM\\_EN\\_CH \$n\$](#)  is 1, only ETM tasks can be used to configure the transfer direction and enable the corresponding GDMA channel. When [AHB/AXI\\_DMA\\_IN\\_ETM\\_EN\\_CH \$n\$](#)  or [AHB\\_DMA\\_OUT\\_ETM\\_EN\\_CH \$n\$](#)  is 0, only CPU can be used to enable the corresponding GDMA channel.

GDMA can generate the following ETM events:

- GDMA\_AHB/AXI\_EVT\_IN\_DONE\_CH $n$ : Indicates that the data has been received according to the receive descriptor via channel  $n$ .

- GDMA\_AHB/AXI\_EVT\_IN\_SUC\_EOF\_CH $n$ : Indicates that the data corresponding to a receive descriptor has been received via channel  $n$  and the EOF bit of this descriptor is 1.
- GDMA\_AHB/AXI\_EVT\_IN\_FIFO\_EMPTY\_CH $n$ : Indicates that the RX FIFO has become empty.
- GDMA\_AHB/AXI\_EVT\_IN\_FIFO\_FULL\_CH $n$ : Indicates that the RX FIFO has become full.
- GDMA\_AHB/AXI\_EVT\_OUT\_DONE\_CH $n$ : Indicates that the data has been transmitted according to the transmit descriptor via channel  $n$ .
- GDMA\_AHB/AXI\_EVT\_OUT\_SUC\_EOF\_CH $n$ : Indicates that the data corresponding to a transmit descriptor has been transmitted or received via channel  $n$  and the EOF bit of this descriptor is 1.
- GDMA\_AHB/AXI\_EVT\_OUT\_TOTAL\_EOF\_CH $n$ : Indicates that the data corresponding to the last transmit descriptors has been sent via transmit channel  $n$  and the EOF bit of this descriptor is 1.
- GDMA\_AHB/AXI\_EVT\_OUT\_FIFO\_EMPTY\_CH $n$ : Indicates that the TX FIFO has become empty.
- GDMA\_AHB/AXI\_EVT\_OUT\_FIFO\_FULL\_CH $n$ : Indicates that the TX FIFO has become full.

In practical applications, GDMA's ETM events can trigger its own ETM tasks. For example, the GDMA\_AHB/AXI\_EVT\_OUT\_TOTAL\_EOF\_CH0 event can trigger the GDMA\_AHB/AXI\_TASK\_IN\_START\_CH1 task, and in this way trigger a new round of GDMA operations.

## 3.6 Interrupts

ESP32-P4's GDMA module can generate the following interrupt signals that will be sent to the [Interrupt Matrix](#).

- AHB/AXI\_PDMA\_IN\_CH0\_INTR
- AHB/AXI\_PDMA\_IN\_CH1\_INTR
- AHB/AXI\_PDMA\_IN\_CH2\_INTR
- AHB/AXI\_PDMA\_OUT\_CH0\_INTR
- AHB/AXI\_PDMA\_OUT\_CH1\_INTR
- AHB/AXI\_PDMA\_OUT\_CH2\_INTR

There are several internal interrupt sources from GDMA that can generate the above interrupt signals.

The AHB/AXI\_PDMA\_IN\_CH $n$ \_INTR ( $n$  is 0 ~ 2) signals are generated by the following interrupt sources:

- AHB/AXI\_DMA\_IN\_DONE\_CH $n$ \_INT: Triggered when all data corresponding to a receive descriptor has been received via receive channel  $n$ .
- AHB/AXI\_DMA\_IN\_SUC\_EOF\_CH $n$ \_INT: Triggered when the suc\_eof bit in a receive descriptor is 1 and the data corresponding to this receive descriptor has been received via receive channel  $n$ .
- AHB/AXI\_DMA\_IN\_ERR\_EOF\_CH $n$ \_INT: Triggered when an error is detected in the data segment corresponding to a descriptor received via receive channel  $n$ . This interrupt is used only for UHCI (UART0 or UART1) or PARLIO.
- AHB/AXI\_DMA\_IN\_DSCR\_EMPTY\_CH $n$ \_INT: Triggered when the size of the buffer pointed by receive descriptors is smaller than the length of data to be received via receive channel  $n$ .

- AHB/AXI\_DMA\_IN\_DSCR\_ERR\_CH $n$ \_INT: Triggered when a receive descriptor on receive channel  $n$  fails any of the two descriptor checks.
- AHB\_DMA\_INFIFO\_OVF\_CH $n$ \_INT or AXI\_DMA\_INFIFO\_L1/L2/L3\_OVF\_CH $n$ \_INT: Triggered when the RX FIFO of GDMA-AHB or the L1/L2/L3 RX FIFO of GDMA-AXI overflows.
- AHB\_DMA\_INFIFO\_UDF\_CH $n$ \_INT or AXI\_DMA\_INFIFO\_L1/L2/L3\_UDF\_CH $n$ \_INT: Triggered when the RX FIFO of GDMA-AHB or the L1/L2/L3 RX FIFO of GDMA-AXI underflows.

The AHB/AXI\_PDMA\_OUT\_CH $n$ \_INTR ( $n$  is 0 ~ 2) signals are generated by the following interrupt sources:

- AHB/AXI\_DMA\_OUT\_DONE\_CH $n$ \_INT: Triggered when all data corresponding to a transmit descriptor has been sent via transmit channel  $n$ .
- AHB/AXI\_DMA\_OUT\_EOF\_CH $n$ \_INT: Triggered when the suc\_eof bit in a transmit descriptor is 1 and data corresponding to this descriptor has been sent via transmit channel  $n$ . If [AHB/AXI\\_DMA\\_OUT\\_EOF\\_MODE\\_CH \$n\$](#)  is 0, this interrupt will be triggered when the last byte of data corresponding to this descriptor enters GDMA's transmit channel; if [AHB/AXI\\_DMA\\_OUT\\_EOF\\_MODE\\_CH \$n\$](#)  is 1, this interrupt is triggered when the last byte of data is taken from GDMA's transmit channel.
- AHB/AXI\_DMA\_OUT\_DSCR\_ERR\_CH $n$ \_INT: Triggered when a transmit descriptor on transmit channel  $n$  fails any of the two descriptor checks.
- AHB/AXI\_DMA\_OUT\_TOTAL\_EOF\_CH $n$ \_INT: Triggered when all data corresponding to a linked list (including multiple descriptors) has been sent via transmit channel  $n$ .
- AHB\_DMA\_OUTFIFO\_OVF\_CH $n$ \_INT or AXI\_DMA\_OUTFIFO\_L1/L2/L3\_OVF\_CH $n$ \_INT: Triggered when the TX FIFO of GDMA-AHB or the L1/L2/L3 TX FIFO of GDMA-AXI overflows.
- AHB\_DMA\_OUTFIFO\_UDF\_CH $n$ \_INT or AXI\_DMA\_OUTFIFO\_L1/L2/L3\_UDF\_CH $n$ \_INT: Triggered when the TX FIFO of GDMA-AHB or the L1/L2/L3 TX FIFO of GDMA-AXI underflows.

## 3.7 Programming Procedures

The clock gating for GDMA can be configured via [HP\\_SYS\\_CLKRST\\_AHB/AXI\\_PDMA\\_SYS\\_CLK\\_EN](#), and is enabled by default. GDMA can be reset by configuring [HP\\_SYS\\_CLKRST\\_RST\\_EN\\_AHB/AXI\\_PDMA](#).

### 3.7.1 Programming Procedures for GDMA's Transmit Channel

To transmit data, GDMA's transmit channel should be configured by software as follows:

1. Set [AHB/AXI\\_DMA\\_OUT\\_RST\\_CH \$n\$](#)  first to 1 and then to 0, to reset the state machine of GDMA's transmit channel and FIFO pointer.
2. Load an outlink, and configure [AHB/AXI\\_DMA\\_OUTLINK\\_ADDR\\_CH \$n\$](#)  with address of the first transmit descriptor.
3. Configure [AHB/AXI\\_DMA\\_PERI\\_OUT\\_SEL\\_CH \$n\$](#)  with the value corresponding to the peripheral to be connected, as shown in Table 3.4-1 and Table 3.4-2.
4. Set [AHB/AXI\\_DMA\\_OUTLINK\\_START\\_CH \$n\$](#)  to enable GDMA's transmit channel for data transfer.

5. Configure and enable the corresponding peripheral (SPI2, UHCI (UART0 or UART1), I2S, AES, SHA, and ADC). See details in individual chapters of these peripherals.
6. Wait for the AHB/AXI\_DMA\_OUT\_TOTAL\_EOF\_CH $n$ \_INT interrupt, which indicates the completion of data transfer.

### 3.7.2 Programming Procedures for GDMA's Receive Channel

To receive data, GDMA's receive channel should be configured by software as follows:

1. Set AHB/AXI\_DMA\_IN\_RST\_CH $n$  first to 1 and then to 0, to reset the state machine of GDMA's receive channel and FIFO pointer.
2. Load an inlink, and configure AHB/AXI\_DMA\_INLINK\_ADDR\_CH $n$  with address of the first receive descriptor.
3. Configure AHB/AXI\_DMA\_PERI\_IN\_SEL\_CH $n$  with the value corresponding to the peripheral to be connected, as shown in Table 3.4-1 and Table 3.4-2.
4. Set AHB/AXI\_DMA\_INLINK\_START\_CH $n$  to enable GDMA's receive channel for data transfer.
5. Configure and enable the corresponding peripheral (SPI2, UHCI (UART0 or UART1), I2S, AES, SHA, and ADC). See details in individual chapters of these peripherals.

### 3.7.3 Programming Procedures for Memory-to-Memory Transfer

To transfer data from one memory location to another, GDMA should be configured by software as follows:

1. Set AHB/AXI\_DMA\_OUT\_RST\_CH $n$  first to 1 and then to 0, to reset the state machine of GDMA's transmit channel and FIFO pointer.
2. Set AHB/AXI\_DMA\_IN\_RST\_CH $n$  first to 1 and then to 0, to reset the state machine of GDMA's receive channel and FIFO pointer.
3. Load an outlink, and configure AHB/AXI\_DMA\_OUTLINK\_ADDR\_CH $n$  with address of the first transmit descriptor.
4. Load an inlink, and configure AHB/AXI\_DMA\_INLINK\_ADDR\_CH $n$  with address of the first receive descriptor.
5. Set AHB/AXI\_DMA\_MEM\_TRANS\_EN\_CH $n$  to enable memory-to-memory transfer.
6. Set AHB/AXI\_DMA\_OUTLINK\_START\_CH $n$  to enable GDMA's transmit channel for data transfer.
7. Set AHB/AXI\_DMA\_INLINK\_START\_CH $n$  to enable GDMA's receive channel for data transfer.
8. If the suc\_eof bit is set in a transmit descriptor, an AHB/AXI\_DMA\_IN\_SUC\_EOF\_CH $n$ \_INT interrupt will be triggered when the data segment corresponding to this descriptor has been transmitted.

### 3.7.4 Programming Procedures for Channel Priority and Weight

The priority arbitration can be configured as follows:

1. Configure the channel priority for TX and RX respectively via AHB/AXI\_DMA\_TX\_PRI\_CH $n$  and AHB/AXI\_DMA\_RX\_PRI\_CH $n$ .

The weight arbitration can be configured as follows:

1. Configure the time slot for TX and RX respectively via [AHB/AXI\\_DMA\\_ARB\\_TIMEOUT\\_TX](#) and [AHB/AXI\\_DMA\\_ARB\\_TIMEOUT\\_RX](#).
2. Configure the number of tokens for TX and RX respectively via [AHB/AXI\\_DMA\\_TX\\_CH\\_ARB\\_WEIGHT\\_CHn](#) and [AHB/AXI\\_DMA\\_RX\\_CH\\_ARB\\_WEIGHT\\_CHn](#).
3. Enable weight arbitration optimization for TX and RX respectively by clearing [AHB/AXI\\_DMA\\_TX\\_ARB\\_WEIGHT\\_OPT\\_DIR\\_CHn](#) and [AHB/AXI\\_DMA\\_RX\\_ARB\\_WEIGHT\\_OPT\\_DIR\\_CHn](#).
4. Enable the arbitration for TX and RX respectively by setting [AHB/AXI\\_DMA\\_WEIGHT\\_EN\\_TX](#) and [AHB/AXI\\_DMA\\_WEIGHT\\_EN\\_RX](#).

### 3.7.5 Programming Procedures for CRC Calculation

The CRC calculation registers can be configured as follows:

1. Configure which bits in `crc_tmp` and data are used in the matrix via [AHB/AXI\\_DMA\\_TX\\_CRC\\_EN\\_ADDR\\_CHn](#), [AHB/AXI\\_DMA\\_TX\\_CRC\\_DATA\\_EN\\_ADDR\\_CHn](#), [AHB/AXI\\_DMA\\_TX\\_CRC\\_EN\\_WR\\_DATA\\_CHn](#), and [AHB/AXI\\_DMA\\_TX\\_CRC\\_DATA\\_EN\\_WR\\_DATA\\_CHn](#).
2. Latch the values of the above four fields by first writing 1 and then 0 to [AHB/AXI\\_DMA\\_TX\\_CRC\\_LAUTCH\\_FLGA\\_CHn](#). Then the configuration for a row is complete.
3. Repeat Step 1 and Step 2 until all rows in the matrix are set up, and then start DMA transfer.

## 3.8 Register Summary

### 3.8.1 GDMA-AHB Register Summary

The addresses in this section are relative to GDMA-AHB base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name  | Description                                   | Address | Access   |
|---|---|---------|----------|
| <b>Interrupt Registers</b>                  |   |         |          |
| <a href="#">AHB_DMA_IN_INT_RAW_CHO_REG</a>  | RX channel 0 raw interrupt status register    | 0x0000  | R/WTC/SS |
| <a href="#">AHB_DMA_IN_INT_ST_CHO_REG</a>   | RX channel 0 masked interrupt status register | 0x0004  | RO       |
| <a href="#">AHB_DMA_IN_INT_ENA_CHO_REG</a>  | RX channel 0 interrupt enable register        | 0x0008  | R/W      |
| <a href="#">AHB_DMA_IN_INT_CLR_CHO_REG</a>  | RX channel 0 interrupt clear register         | 0x000C  | WT       |
| <a href="#">AHB_DMA_IN_INT_RAW_CH1_REG</a>  | RX channel 1 raw interrupt status register    | 0x0010  | R/WTC/SS |
| <a href="#">AHB_DMA_IN_INT_ST_CH1_REG</a>   | RX channel 1 masked interrupt status register | 0x0014  | RO       |
| <a href="#">AHB_DMA_IN_INT_ENA_CH1_REG</a>  | RX channel 1 interrupt enable register        | 0x0018  | R/W      |

### 3.8.2 GDMA-AXI Register Summary

The addresses in this section are relative to GDMA-AXI base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name                                       | Description                                   | Address | Access   |
|--|---|---------|----------|
| <b>Interrupt Registers</b>                 |   |         |          |
| <a href="#">AXI_DMA_IN_INT_RAW_CHO_REG</a> | RX channel 0 raw interrupt status register    | 0x0000  | R/WTC/SS |
| <a href="#">AXI_DMA_IN_INT_ST_CHO_REG</a>  | RX channel 0 masked interrupt status register | 0x0004  | RO       |
| <a href="#">AXI_DMA_IN_INT_ENA_CHO_REG</a> | RX channel 0 interrupt enable register        | 0x0008  | R/W      |
| <a href="#">AXI_DMA_IN_INT_CLR_CHO_REG</a> | RX channel 0 interrupt clear register         | 0x000C  | WT       |

| Name   | Description   | Address | Access   |
|--|---|---------|----------|
| <a href="#">AXI_DMA_IN_INT_RAW_CH1_REG</a>       | RX channel 1 raw interrupt status register                                  | 0x0068  | R/WTC/SS |

## 3.9 Registers

### 3.9.1 GDMA-AHB Registers

The addresses in this section are relative to GDMA-AHB base address provided in Table 6.3-2 in Chapter 6 [System and Memory](#).

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

Register 3.1. AHB\_DMA\_IN\_INT\_RAW\_CH $n$ \_REG ( $n$ : 0-2) (0x0000+0x10\* $n$ )

**AHB\_DMA\_IN\_DONE\_CH $n$ \_INT\_RAW** The raw interrupt status of AHB\_DMA\_IN\_DONE\_CH $n$ \_INT. (R/WTC/SS)

**AHB\_DMA\_IN\_SUC\_EOF\_CH $n$ \_INT\_RAW** The raw interrupt status of AHB\_DMA\_IN\_SUC\_EOF\_CH $n$ \_INT. For UHCI, this bit turns to 1 when the last data byte pointed by one receive descriptor has been received and no data error is detected for RX channel  $n$ . (R/WTC/SS)

**AHB\_DMA\_IN\_ERR\_EOF\_CH $n$ \_INT\_RAW** The raw interrupt status of AHB\_DMA\_IN\_ERR\_EOF\_CH $n$ \_INT. Valid only for UHCI. (R/WTC/SS)

**AHB\_DMA\_IN\_DSCR\_ERR\_CH $n$ \_INT\_RAW** The raw interrupt status of AHB\_DMA\_IN\_DSCR\_ERR\_CH $n$ \_INT. (R/WTC/SS)

**AHB\_DMA\_IN\_DSCR\_EMPTY\_CH $n$ \_INT\_RAW** The raw interrupt status of AHB\_DMA\_IN\_DSCR\_EMPTY\_CH $n$ \_INT. (R/WTC/SS)

**AHB\_DMA\_INFIFO\_OVF\_CH $n$ \_INT\_RAW** The raw interrupt status of AHB\_DMA\_INFIFO\_OVF\_CH $n$ \_INT. (R/WTC/SS)

**AHB\_DMA\_INFIFO\_UDF\_CH $n$ \_INT\_RAW** The raw interrupt status of AHB\_DMA\_INFIFO\_UDF\_CH $n$ \_INT. (R/WTC/SS)

Register 3.2. AHB\_DMA\_IN\_INT\_ST\_CH $n$ \_REG ( $n$ : 0-2) (0x0004+0x10\* $n$ )

**AHB\_DMA\_IN\_DONE\_CH $n$ \_INT\_ST** The masked interrupt status of AHB\_DMA\_IN\_DONE\_CH $n$ \_INT.  
(RO)

**AHB\_DMA\_IN\_SUC\_EOF\_CH<sub>n</sub>INT\_ST** The masked interrupt status of AHB DMA IN SUC EOF CH<sub>n</sub> INT. (RO)

**AHB\_DMA\_IN\_ERR\_EOF\_CH $n$ \_INT\_ST** The masked interrupt status of AHB\_DMA\_IN\_ERR\_EOF\_CH $n$ \_INT. (RO)

**AHB\_DMA\_IN\_DSCR\_ERR\_CH $n$ \_INT\_ST** The masked interrupt status of AHB DMA IN DSCR ERR CH $n$  INT. (RO)

**AHB\_DMA\_IN\_DSCR\_EMPTY\_CH $n$ \_INT\_ST** The masked interrupt status of AHB\_DMA\_IN\_DSCR\_EMPTY\_CH $n$ \_INT. (RO)

**AHB\_DMA\_INFIFO\_OVF\_CH $n$ \_INT\_ST** The masked interrupt status of AHB\_DMA\_INFIFO\_OVF\_CH $n$ \_INT. (RO)

**AHB\_DMA\_INFIFO\_UDF\_CH $n$ \_INT\_ST** The masked interrupt status of AHB\_DMA\_INFIFO\_UDF\_CH $n$ \_INT. (RO)

Register 3.3. AHB\_DMA\_IN\_INT\_ENA\_CH $n$ \_REG ( $n$ : 0-2) (0x0008+0x10\* $n$ )

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |       |  |  |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-------|--|--|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | AHB_DMA_INFIFO_UDF_CH <sub>n</sub> _INT_ENA<br>AHB_DMA_INFIFO_OVF_CH <sub>n</sub> _INT_ENA<br>AHB_DMA_IN_DSCR_EMPTY_CH <sub>n</sub> _INT_ENA<br>AHB_DMA_IN_DSCR_ERR_CH <sub>n</sub> _INT_ENA<br>AHB_DMA_IN_SUC_EOF_CH <sub>n</sub> _INT_ENA<br>AHB_DMA_IN_DONE_CH <sub>n</sub> _INT_ENA |   |   |   |   |       |  |  |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 7 | 6 | 5 | 4   | 3 | 2 | 1 | 0 | Reset |  |  |

**AHB\_DMA\_IN\_DONE\_CH $n$ \_INT\_CLR** Write 1 to clear AHB\_DMA\_IN\_DONE\_CH $n$ \_INT. (WT)

**AHB\_DMA\_IN\_SUC\_EOF\_CH $n$ \_INT\_CLR** Write 1 to clear AHB\_DMA\_IN\_SUC\_EOF\_CH $n$ \_INT. (WT)

**AHB\_DMA\_IN\_ERR\_EOF\_CH $n$ \_INT\_CLR** Write 1 to clear AHB\_DMA\_IN\_ERR\_EOF\_CH $n$ \_INT. (WT)

**AHB\_DMA\_IN\_DSCR\_ERR\_CH $n$ \_INT\_CLR** Write 1 to clear AHB\_DMA\_IN\_DSCR\_ERR\_CH $n$ \_INT.  
(WT)

**AHB\_DMA\_IN\_DSCR\_EMPTY\_CH $n$ \_INT\_CLR** Write 1 to clear AHB\_DMA\_IN\_DSCR\_EMPTY\_CH $n$ \_INT.  
(WT)

**AHB\_DMA\_INFIFO\_OVF\_CH $n$ \_INT\_CLR** Write 1 to clear AHB\_DMA\_INFIFO\_OVF\_CH $n$ \_INT. (WT)

**AHB\_DMA\_INFIFO\_UDF\_CH $n$ \_INT\_CLR** Write 1 to clear AHB\_DMA\_INFIFO\_UDF\_CH $n$ \_INT. (WT)

Register 3.5. AHB\_DMA\_OUT\_INT\_RAW\_CHn\_REG (n: 0-2) (0x0030+0x10\*n)

- AHB\_DMA\_OUT\_DONE\_CHn\_INT\_RAW

The raw interrupt status of AHB\_DMA\_OUT\_DONE\_CHn\_INT. (R/WTC/SS)
- AHB\_DMA\_OUT\_EOF\_CHn\_INT\_RAW

The raw interrupt status of AHB\_DMA\_OUT\_EOF\_CHn\_INT. (R/WTC/SS)
- AHB\_DMA\_OUT\_DSCR\_ERR\_CHn\_INT\_RAW

The raw interrupt status of AHB\_DMA\_OUT\_DSCR\_ERR\_CHn\_INT. (R/WTC/SS)
- AHB\_DMA\_OUT\_TOTAL\_EOF\_CHn\_INT\_RAW

The raw interrupt status of AHB\_DMA\_OUT\_TOTAL\_EOF\_CHn\_INT. (R/WTC/SS)
- AHB\_DMA\_OUTFIFO\_OVF\_CHn\_INT\_RAW

The raw interrupt status of AHB\_DMA\_OUTFIFO\_OVF\_CHn\_INT. (R/WTC/SS)
- AHB\_DMA\_OUTFIFO\_UDF\_CHn\_INT\_RAW

The raw interrupt status of AHB\_DMA\_OUTFIFO\_UDF\_CHn\_INT. (R/WTC/SS)

Register 3.6. AHB\_DMA\_OUT\_INT\_ST\_CHn\_REG (n: 0-2) (0x0034+0x10\*n)

**AHB\_DMA\_OUT\_DONE\_CHn\_INT\_ST** The masked interrupt status of AHB\_DMA\_OUT\_DONE\_CHn\_INT. (RO)

**AHB\_DMA\_OUT\_EOF\_CHn\_INT\_ST** The masked interrupt status of AHB\_DMA\_OUT\_EOF\_CHn\_INT. (RO)

**AHB\_DMA\_OUT\_DSCR\_ERR\_CHn\_INT\_ST** The masked interrupt status of AHB\_DMA\_OUT\_DSCR\_ERR\_CHn\_INT. (RO)

**AHB\_DMA\_OUT\_TOTAL\_EOF\_CHn\_INT\_ST** The masked interrupt status of AHB\_DMA\_OUT\_TOTAL\_EOF\_CHn\_INT. (RO)

**AHB\_DMA\_OUT\_FIFO\_OVF\_CHn\_INT\_ST** The masked interrupt status of AHB\_DMA\_OUT\_FIFO\_OVF\_CHn\_INT. (RO)

**AHB\_DMA\_OUT\_FIFO\_UDF\_CHn\_INT\_ST** The masked interrupt status of AHB\_DMA\_OUT\_FIFO\_UDF\_CHn\_INT. (RO)

Register 3.7. AHB\_DMA\_OUT\_INT\_ENA\_CHn\_REG (n: 0-2) (0x0038+0x10\*n)

**AHB\_DMA\_OUT\_DONE\_CHn\_INT\_ENA** Write 1 to enable AHB\_DMA\_OUT\_DONE\_CHn\_INT. (R/W)

**AHB\_DMA\_OUT\_EOF\_CHn\_INT\_ENA** Write 1 to enable AHB\_DMA\_OUT\_EOF\_CHn\_INT. (R/W)

**AHB\_DMA\_OUT\_DSCR\_ERR\_CHn\_INT\_ENA** Write 1 to enable AHB\_DMA\_OUT\_DSCR\_ERR\_CHn\_INT.  
(R/W)

**AHB\_DMA\_OUT\_TOTAL\_EOF\_CHn\_INT\_ENA** Write 1 to enable AHB\_DMA\_OUT\_TOTAL\_EOF\_CHn\_INT.  
(R/W)

**AHB\_DMA\_OUT\_FIFO\_OVF\_CHn\_INT\_ENA** Write 1 to enable AHB\_DMA\_OUT\_FIFO\_OVF\_CHn\_INT.  
(R/W)

**AHB\_DMA\_OUT\_FIFO\_UDF\_CHn\_INT\_ENA** Write 1 to enable AHB\_DMA\_OUT\_FIFO\_UDF\_CHn\_INT.  
(R/W)

Register 3.8. AHB\_DMA\_OUT\_INT\_CLR\_CH $n$ \_REG ( $n$ : 0-2) (0x003C+0x10\* $n$ )

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |  |   |       |   |   |  |

**AHB\_DMA\_AHB\_TESTMODE** Reserved. (R/W)

**AHB\_DMA\_AHB\_TESTADDR** Reserved. (R/W)

### Register 3.10. AHB\_DMA\_MISC\_CONF\_REG (0x0064)

[illegible]

**AHB\_DMA\_AHBM\_RST\_INTER** Write 1 and then 0 to reset the internal AHB FSM. (R/W)

**AHB\_DMA\_ARB\_PRI\_DIS** Configures whether to disable the priority arbitration.

0: Enable

1: Disable

(R/W)

**AHB\_DMA\_CLK\_EN** Configures AHB DMA clock gating.

0: Support clock only when the application writes registers

1: Always force the clock on for registers

(R/W)

**Register 3.12. AHB\_DMA\_IN\_CONF1\_CH $n$ \_REG ( $n$ : 0-2) (0x0074+0xC0\* $n$ )**

**AHB\_DMA\_IN\_CHECK\_OWNER\_CH**n Configures whether to enable owner bit check for RX channel

 $n.$ 

0: Disable

1: Enable

(R/W)

**Register 3.13. AHB\_DMA\_IN\_POP\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x007C+0xC0\**n*)**

**AHB\_DMA\_INFIFO\_RDATA\_CH<sub>n</sub>** Represents the data popped from AHB DMA RX FIFO. (RO)

**AHB\_DMA\_INFIFO\_POP\_CH $n$**  Configures whether to pop data from AHB DMA RX FIFO.

0: Invalid. No effect

1: Pop

(WT)

Register 3.15. AHB\_DMA\_OUT\_CONFO\_CH $n$ \_REG ( $n$ : 0-2) (0x00D0+0xC0\* $n$ )

**AHB\_DMA\_OUT\_RST\_CH $n$**  Configures the reset state of TX channel  $n$  FSM and TX FIFO pointer.

0: Release reset

1: Reset

(R/W)

**AHB\_DMA\_OUT\_LOOP\_TEST\_CH $n$**  Reserved. (R/W)

**AHB\_DMA\_OUT\_AUTO\_WRBK\_CH $n$**  Configures whether to enable automatic outlink write-back when all the data in TX FIFO has been transmitted.

0: Disable

1: Enable

(R/W)

**AHB\_DMA\_OUT\_EOF\_MODE\_CH $n$**  Configures when to generate EOF flag.

0: EOF flag for TX channel  $n$  is generated when data to be transmitted has been pushed into FIFO in AHB DMA.

1: EOF flag for TX channel  $n$  is generated when data to be transmitted has been popped from FIFO in AHB DMA.

(R/W)

**AHB\_DMA\_OUTDSCR\_BURST\_EN\_CH $n$**  Configures whether to enable INCR burst transfer for TX channel  $n$  reading descriptors.

0: Disable

1: Enable

(R/W)

**AHB\_DMA\_OUT\_DATA\_BURST\_EN\_CH $n$**  Configures whether to enable INCR burst transfer for TX channel  $n$ .

0: Disable

1: Enable

(R/W)

**AHB\_DMA\_OUT\_ETM\_EN\_CH $n$**  Configures whether to enable ETM control for TX channel  $n$ .

0: Disable

1: Enable

(R/W)

**Register 3.16. AHB\_DMA\_OUT\_CONF1\_CH $n$ \_REG ( $n$ : 0-2) (0x00D4+0xC0\* $n$ )**

**AHB\_DMA\_OUT\_CHECK\_OWNER\_CH***n* Configures whether to enable owner bit check for TX channel *n*.  
0: Disable  
1: Enable  
(R/W)

Register 3.17. AHB\_DMA\_OUT\_PUSH\_CH $n$ \_REG ( $n$ : 0-2) (0x00DC+0xC0\* $n$ )

**AHB\_DMA\_OUTFIFO\_WDATA\_CH $n$**  Represents the data that need to be pushed into AHB DMA TX FIFO. (R/W)

**AHB\_DMA\_OUTFIFO\_PUSH\_CH**n Configures whether to push data into AHB DMA TX FIFO.

- 0: Invalid. No effect
- 1: Push

(WT)

**Register 3.18. AHB\_DMA\_OUT\_LINK\_CH $n$ \_REG ( $n$ : 0-2) (0x00E0+0xC0\* $n$ )**

**AHB\_DMA\_OUTLINK\_STOP\_CH***n* Configures whether to stop TX channel *n* from transmitting data.

0: Invalid. No effect

1: Stop

(WT)

**AHB\_DMA\_OUTLINK\_START\_CH***n* Configures whether to enable TX channel *n* for data transfer.

0: Disable

1: Enable

(WT)

**AHB\_DMA\_OUTLINK\_RESTART\_CH $n$**  Configures whether to restart TX channel  $n$  for AHB DMA transfer.

0: Invalid. No effect

1: Restart

(WT)

**AHB\_DMA\_OUTLINK\_PARK\_CH<sub>n</sub>** Represents the status of the transmit descriptor's FSM.

0: Running

1: Idle

(RO)

Register 3.19. AHB\_DMA\_OUT\_CRC\_INIT\_DATA\_CH $n$ \_REG ( $n$ : 0-2) (0x02BC+0x28\* $n$ )

**AHB\_DMA\_OUT\_CRC\_INIT\_DATA\_CH $n$**  Configures the CRC initial value for TX channel  $n$ . (R/W)

Register 3.20. AHB\_DMA\_TX\_CRC\_WIDTH\_CH $n$ \_REG ( $n$ : 0-2) (0x02C0+0x28\* $n$ )

**AHB\_DMA\_TX\_CRC\_WIDTH\_CH $n$**  Configures the CRC result width for TX channel  $n$ . 0:  $\leq 8$  bits

1:  $\leq 16$  bits

2:  $\leq 24$  bits

3:  $\leq 32$  bits

(R/W)

**AHB\_DMA\_TX\_CRC\_LAUTCH\_FLGA\_CH $n$**  Write 1 and then 0 to latch the values of AHB\_DMA\_TX\_CRC\_EN\_ADDR\_CH $n$ , AHB\_DMA\_TX\_CRC\_DATA\_EN\_ADDR\_CH $n$ , AHB\_DMA\_TX\_CRC\_EN\_WR\_DATA\_CH $n$ , and AHB\_DMA\_TX\_CRC\_DATA\_EN\_WR\_DATA\_CH $n$ . (R/W)

Register 3.21. AHB\_DMA\_OUT\_CRC\_CLEAR\_CH $n$ \_REG ( $n$ : 0-2) (0x02C4+0x28\* $n$ )

 (R/W)

**Register 3.31. AHB\_DMA\_IN\_CRC\_CLEAR\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x033C+0x28\**n*)**

AHB\_DMA\_IN\_CRC\_CLEAR\_CH<sub>n</sub> REG Reserved. (R/W)

Register 3.32. AHB\_DMA\_IN\_CRC\_FINAL\_RESULT\_CH $n$ \_REG ( $n$ : 0-2) (0x0340+0x28\* $n$ )

AHB\_DMA\_IN\_CRC\_FINAL\_RESULT\_CH $n$  Represents the CRC result for RX channel  $n$ . (RO)

Register 3.33. AHB\_DMA\_RX\_CRC\_EN\_WR\_DATA\_CH $n$ \_REG ( $n$ : 0-2) (0x0344+0x28\* $n$ )

AHB\_DMA\_RX\_CRC\_EN\_WR\_DATA\_CH $n$  Configures whether to include each bit of the intermediate result in the CRC calculation matrix for RX channel  $n$ .

- 0: Not include
  - 1: Include
- (R/W)

Register 3.34. AHB\_DMA\_RX\_CRC\_EN\_ADDR\_CHn\_REG (n: 0-2) (0x0348+0x28\*n)

AHB\_DMA\_RX\_CRC\_EN\_ADDR\_CHn Configures at which bit of the CRC result the AHB\_DMA\_RX\_CRC\_EN\_WR\_DATA\_CHn\_REG register targets for RX channel n. (R/W)

Register 3.35. AHB\_DMA\_RX\_CRC\_DATA\_EN\_WR\_DATA\_CHn\_REG (n: 0-2) (0x034C+0x28\*n)

AHB\_DMA\_RX\_CRC\_DATA\_EN\_WR\_DATA\_CHn Configures whether to include each bit of the data in the CRC calculation matrix for RX channel n.

0: Not include

1: Include

(R/W)

**Register 3.36. AHB\_DMA\_RX\_CRC\_DATA\_EN\_ADDR\_CH $n$ \_REG ( $n$ : 0-2) (0x0350+0x28\* $n$ )**

**AHB\_DMA\_RX\_CRC\_DATA\_EN\_ADDR\_CH $n$**  Configures at which bit of the CRC result the AHB\_DMA\_RX\_CRC\_DATA\_EN\_WR\_DATA\_CH $n$ \_REG register targets for RX channel  $n$ . (R/W)

**Register 3.37. AHB\_DMA\_RX\_CH\_ARB\_WEIGHT\_CH $n$ \_REG ( $n$ : 0-2) (0x0354+0x28\* $n$ )**

**AHB\_DMA\_RX\_CH\_ARB\_WEIGHT\_CH $n$**  Configures the weight (i.e the number of tokens) of RX channel  $n$ .  
Value range: 0 ~ 15. (R/W)

**Register 3.38. AHB\_DMA\_RX\_ARB\_WEIGH\_OPT\_DIR\_CH $n$ \_REG ( $n$ : 0-2) (0x0358+0x28\* $n$ )**

**AHB\_DMA\_RX\_ARB\_WEIGH\_OPT\_DIR\_CH $n$**  Configures whether to enable weight optimization for RX channel  $n$ .

0: Enable

1: Disable (R/W)

**Register 3.39. AHB\_DMA\_IN\_LINK\_ADDR\_CH $n$ \_REG ( $n$ : 0-2) (0x03AC+0x4\* $n$ )**

**AHB\_DMA\_INLINK\_ADDR\_CH $n$**  Represents the first receive descriptor's address. (R/W)

**Register 3.40. AHB\_DMA\_OUT\_LINK\_ADDR\_CH $n$ \_REG ( $n$ : 0-2) (0x03B8+0x4\* $n$ )**

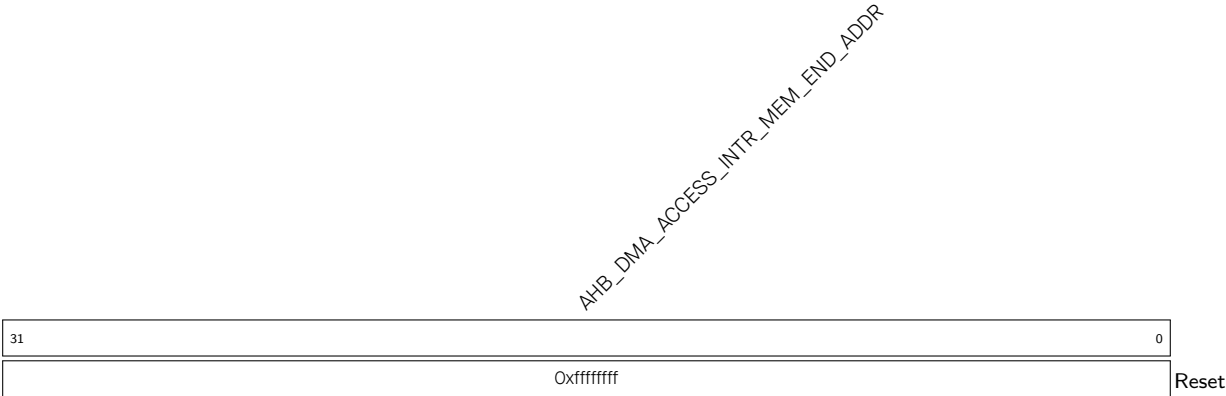

**AHB\_DMA\_OUTLINK\_ADDR\_CH $n$**  Represents the first transmit descriptor's address. (R/W)

Register 3.41. AHB\_DMA\_INTR\_MEM\_START\_ADDR\_REG (0x03C4)

**AHB\_DMA\_ACCESS\_INTR\_MEM\_START\_ADDR** Configures the start address of accessible address space. (R/W)

Register 3.42. AHB\_DMA\_INTR\_MEM\_END\_ADDR\_REG (0x03C8)

**AHB\_DMA\_ACCESS\_INTR\_MEM\_END\_ADDR** Configures the end address of accessible address space. (R/W)

Register 3.43. AHB\_DMA\_ARB\_TIMEOUT\_TX\_REG (0x03CC)

**AHB\_DMA\_ARB\_TIMEOUT\_TX** Configures the time slot for TX. Measurement unit: AHB bus clock cycle. (R/W)

**Register 3.44. AHB\_DMA\_ARB\_TIMEOUT\_RX\_REG (0x03D0)**

 1: Enable  
 (R/W)

### Register 3.47. AHB\_DMA\_DATE\_REG (0x0068)

Diagram of the AHB-DMA\_DATE register. The register is 32 bits wide, with bit 31 on the left and bit 0 on the right. The value 0x2303140 is shown in the center, and the word "Reset" is at the bottom right.

**AHB\_DMA\_DATE** Version control register. (R/W)

**Register 3.48. AHB\_DMA\_INFIFO\_STATUS\_CH $n$ \_REG ( $n$ : 0-2) (0x0078+0xC0\* $n$ )**

Diagram illustrating the structure of the AHB\_DMA\_INFIFO\_CNT register (32 bits wide). The register is divided into three main sections:

- Top Section (Bits 31-22):** Contains fields for DMA channel status and counts:
  - (reserved) [31:28]
  - AHB\_DMA\_IN\_BUF\_HUNGRY\_CHn [27]
  - AHB\_DMA\_IN\_REMAIN\_UNDER\_4B\_CHn [26]
  - AHB\_DMA\_IN\_REMAIN\_UNDER\_3B\_CHn [25]
  - AHB\_DMA\_IN\_REMAIN\_UNDER\_2B\_CHn [24]
  - AHB\_DMA\_IN\_REMAIN\_UNDER\_1B\_CHn [23]
- Middle Section (Bits 7-0):** (reserved)
- Bottom Section (Bits 1-0):** Contains the AHB\_DMA\_INFIFO\_CNT\_CHn field, split into two bits:
  - 1 [1]
  - 0 [0]

Reset values are indicated for the bottom section: 1 for bit 1 and 1 for bit 0.

**AHB\_DMA\_INFIFO\_FULL\_CH<sub>n</sub>** Represents whether L1 RX FIFO is full.

0: Not Full

1: Full

(RO)

**AHB\_DMA\_INFIFO\_EMPTY\_CH<sub>n</sub>** Represents whether L1 RX FIFO is empty.

0: Not empty

1: Empty

(RO)

**AHB\_DMA\_INFIFO\_CNT\_CH $n$**  Represents the number of data bytes in L1 RX FIFO for RX channel  $n$ .

(RO)

AHB\_DMA\_IN\_REMAIN\_UNDER\_1B\_CHn Reserved. (RO)

AHB\_DMA\_IN\_REMAIN\_UNDER\_2B\_CH<sub>n</sub> Reserved. (RO)

AHB DMA IN REMAIN UNDER 3B CH Reserved. (RO)

AHB\_DMA\_IN\_REMAIN\_UNDER\_4B\_CH<sub>n</sub> Reserved. (RO)

AHB\_DMA\_IN\_BUF\_HUNGRY\_CH<sub>n</sub> Reserved. (RO)

**Register 3.49. AHB\_DMA\_IN\_STATE\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x0084+0xC0\**n*)**

**AHB\_DMA\_INLINK\_DSCR\_ADDR\_CH<sub>*n*</sub>** Represents the lower 18 bits of the next receive descriptor address that is pre-read (but not processed yet). If the current receive descriptor is the last descriptor, then this field represents the address of the current receive descriptor. (RO)

**AHB\_DMA\_IN\_DSCR\_STATE\_CH<sub>*n*</sub>** Reserved. (RO)

**AHB\_DMA\_IN\_STATE\_CH<sub>*n*</sub>** Reserved. (RO)

**Register 3.50. AHB\_DMA\_IN\_SUC\_EOF\_DES\_ADDR\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x0088+0xC0\**n*)**

**AHB\_DMA\_IN\_SUC\_EOF\_DES\_ADDR\_CH<sub>*n*</sub>** Represents the address of the receive descriptor when the EOF bit in this descriptor is 1. (RO)

**Register 3.51. AHB\_DMA\_IN\_ERR\_EOF\_DES\_ADDR\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x008C+0xC0\**n*)**

**AHB\_DMA\_IN\_ERR\_EOF\_DES\_ADDR\_CH<sub>*n*</sub>** Represents the address of the receive descriptor when there are some errors in the currently received data. Valid only for UHCI. (RO)

**Register 3.52. AHB\_DMA\_INLINK\_DSCR\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x0090+0xC0\**n*)**

**AHB\_DMA\_INLINK\_DSCR\_CH<sub>*n*</sub>** Represents the address of the next receive descriptor x+1 pointed by the current receive descriptor that is pre-read. (RO)

**Register 3.53. AHB\_DMA\_IN\_DSCR\_BFO\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x0094+0xC0\**n*)**

**AHB\_DMA\_INLINK\_DSCR\_BFO\_CH<sub>*n*</sub>** Represents the address of the current receive descriptor x that is pre-read. (RO)

**Register 3.54. AHB\_DMA\_IN\_DSCR\_BF1\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x0098+0xC0\**n*)**

**AHB\_DMA\_INLINK\_DSCR\_BF1\_CH<sub>*n*</sub>** Represents the address of the previous receive descriptor x-1 that is pre-read. (RO)

**Register 3.55. AHB\_DMA\_OUTFIFO\_STATUS\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x00D8+0xC0\**n*)**

**AHB\_DMA\_OUTFIFO\_FULL\_CH<sub>*n*</sub>** Represents whether L1 TX FIFO is full.

0: Not Full

1: Full

(RO)

**AHB\_DMA\_OUTFIFO\_EMPTY\_CH<sub>*n*</sub>** Represents whether L1 TX FIFO is empty.

0: Not empty

1: Empty

(RO)

**AHB\_DMA\_OUTFIFO\_CNT\_CH<sub>*n*</sub>** Represents the number of data bytes in L1 TX FIFO for TX channel *n*. (RO)

**AHB\_DMA\_OUT\_REMAIN\_UNDER\_1B\_CH<sub>*n*</sub>** Reserved. (RO)

**AHB\_DMA\_OUT\_REMAIN\_UNDER\_2B\_CH<sub>*n*</sub>** Reserved. (RO)

**AHB\_DMA\_OUT\_REMAIN\_UNDER\_3B\_CH<sub>*n*</sub>** Reserved. (RO)

**AHB\_DMA\_OUT\_EOF\_DES\_ADDR\_CH<sub>*n*</sub>** Represents the address of the transmit descriptor when the EOF bit in this descriptor is 1. (RO)

**Register 3.58. AHB\_DMA\_OUT\_EOF\_BFR\_DES\_ADDR\_CH $n$ \_REG ( $n$ : 0-2) (0x00EC+0xC0\* $n$ )**

**AHB\_DMA\_OUT\_EOF\_BFR\_DES\_ADDR\_CH $n$**  Represents the address of the transmit descriptor before the last transmit descriptor. (RO)

**Register 3.59. AHB\_DMA\_OUT\_DSCR\_CH $n$ \_REG ( $n$ : 0-2) (0x00F0+0xC0\* $n$ )**

**AHB\_DMA\_OUTLINK\_DSCR\_CH $n$**  Represents the address of the next transmit descriptor  $y+1$  pointed by the current transmit descriptor that is pre-read. (RO)

**Register 3.60. AHB\_DMA\_OUT\_DSCR\_BFO\_CH $n$ \_REG ( $n$ : 0-2) (0x00F4+0xC0\* $n$ )**

**AHB\_DMA\_OUTLINK\_DSCR\_BFO\_CH $n$**  Represents the address of the current transmit descriptor  $y$  that is pre-read. (RO)

**Register 3.61. AHB\_DMA\_OUT\_DSCR\_BF1\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x00F8+0xC0\**n*)**

**AHB\_DMA\_OUTLINK\_DSCR\_BF1\_CH<sub>*n*</sub>** Represents the address of the previous transmit descriptor y-1 that is pre-read. (RO)

**Register 3.62. AHB\_DMA\_IN\_PRI\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x009C+0xC0\**n*)**

**AHB\_DMA\_RX\_PRI\_CH<sub>*n*</sub>** Configures the priority of RX channel *n*. The larger the value, the higher the priority.  
Value range: 0 ~ 5 (R/W)

**Register 3.63. AHB\_DMA\_OUT\_PRI\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x00FC+0xC0\**n*)**

**AHB\_DMA\_TX\_PRI\_CH<sub>*n*</sub>** Configures the priority of TX channel *n*. The larger the value, the higher the priority.  
Value range: 0 ~ 5 (R/W)

Register 3.64. AHB\_DMA\_IN\_PERI\_SEL\_CHn\_REG (n: 0-2) (0x00A0+0xC0\*n)

AHB\_DMA\_PERI\_IN\_SEL\_CHn Configures the peripheral connected to RX channel n.

- 0: I3C
  - 1: Dummy-1
  - 2: UHCI
  - 3: I2S0
  - 4: I2S1
  - 5: I2S2
  - 6: Dummy-6
  - 7: Dummy-7
  - 8: ADC
  - 9: Dummy-9
  - 10: RMT
  - 11 ~ 15: Dummy-11 ~ Dummy-15
  - 16 ~ 63: Invalid
- (R/W)

Register 3.65. AHB\_DMA\_OUT\_PERI\_SEL\_CHn\_REG (n: 0-2) (0x0100+0xC0\*n)

AHB\_DMA\_OUT\_PERI\_SEL\_CHn Configures the peripheral connected to TX channel n.

- 0: I3C
  - 1: Dummy-1
  - 2: UHCI
  - 3: I2S0

3.9.2 GDMA-AXI Registers

The addresses in this section are relative to GDMA-AXI base address provided in Table 6.3-2 in Chapter 6 System and Memory.

For how to program reserved fields, please refer to Section Programming Reserved Register Field.

**Register 3.66. AXI\_DMA\_IN\_INT\_RAW\_CH $n$ \_REG ( $n$ : 0-2) (0x0000+0x68\* $n$ )**

**AXI\_DMA\_IN\_DONE\_CH $n$ \_INT\_RAW** The raw interrupt status of AXI\_DMA\_IN\_DONE\_CH $n$ \_INT. (R/WTC/SS)

**AXI\_DMA\_IN\_SUC\_EOF\_CH $n$ \_INT\_RAW** The raw interrupt status of AXI\_DMA\_IN\_SUC\_EOF\_CH $n$ \_INT. For UHCI this bit turns to 1 when the last data byte pointed by one receive descriptor has been received and no data error is detected for RX channel 0. (R/WTC/SS)

**AXI\_DMA\_IN\_ERR\_EOF\_CH $n$ \_INT\_RAW** The raw interrupt status of AXI\_DMA\_IN\_ERR\_EOF\_CH $n$ \_INT. Valid only for UHCI. (R/WTC/SS)

**AXI\_DMA\_IN\_DSCR\_ERR\_CH $n$ \_INT\_RAW** The raw interrupt status of AXI\_DMA\_IN\_DSCR\_ERR\_CH $n$ \_INT. (R/WTC/SS)

**AXI\_DMA\_IN\_DSCR\_EMPTY\_CH $n$ \_INT\_RAW** The raw interrupt status of AXI\_DMA\_IN\_DSCR\_EMPTY\_CH $n$ \_INT. (R/WTC/SS)

**AXI\_DMA\_INFIFO\_L1\_OVF\_CH $n$ \_INT\_RAW** The raw interrupt status of AXI\_DMA\_INFIFO\_L1\_OVF\_CH $n$ \_INT. (R/WTC/SS)

**AXI\_DMA\_INFIFO\_L1\_UDF\_CH $n$ \_INT\_RAW** The raw interrupt status of AXI\_DMA\_INFIFO\_L1\_UDF\_CH $n$ \_INT. (R/WTC/SS)

**AXI\_DMA\_INFIFO\_L2\_OVF\_CH $n$ \_INT\_RAW** The raw interrupt status of AXI\_DMA\_INFIFO\_L2\_OVF\_CH $n$ \_INT. (R/WTC/SS)

**AXI\_DMA\_INFIFO\_L2\_UDF\_CH $n$ \_INT\_RAW** The raw interrupt status of AXI\_DMA\_INFIFO\_L2\_UDF\_CH $n$ \_INT. (R/WTC/SS)

**AXI\_DMA\_INFIFO\_L3\_OVF\_CH $n$ \_INT\_RAW** The raw interrupt status of AXI\_DMA\_INFIFO\_L3\_OVF\_CH $n$ \_INT. (R/WTC/SS)

**AXI\_DMA\_INFIFO\_L3\_UDF\_CH $n$ \_INT\_RAW** The raw interrupt status of AXI\_DMA\_INFIFO\_L3\_UDF\_CH $n$ \_INT. (R/WTC/SS)

**Register 3.74. AXI\_DMA\_IN\_CONFO\_CH $n$ \_REG ( $n$ : 0-2) (0x0010+0x68\* $n$ )**

**AXI\_DMA\_IN\_RST\_CH $n$**  Write 1 and then 0 to reset RX channel  $n$  FSM and RX FIFO pointer.(R/W)

**AXI\_DMA\_IN\_LOOP\_TEST\_CH $n$**  Reserved. (R/W)

**AXI\_DMA\_MEM\_TRANS\_EN\_CH $n$**  Configures whether to enable memory-to-memory data transfer.

0: Disable

1: Enable

(R/W)

**AXI\_DMA\_IN\_ETM\_EN\_CH $n$**  Configures whether to enable ETM control for RX channel  $n$ .

0: Disable

1: Enable

(R/W)

**AXI\_DMA\_IN\_BURST\_SIZE\_SEL\_CH $n$**  Configures the burst length for RX channel  $n$ .

0: 8 bytes

1: 16 bytes

2: 32 bytes

3: 64 bytes

4: 128 bytes

5 ~ 7: Invalid

(R/W)

**AXI\_DMA\_IN\_CMD\_DISABLE\_CH $n$**  Configures whether to disable command on RX channel  $n$ .

0: Enable

1: Disable

(R/W)

**AXI\_DMA\_IN\_ECC\_AEC\_EN\_CH $n$**  Configures whether AXI DMA can access external memory space for ECC and AES via RX channel  $n$ .

0: Not access

1: Access

(R/W)

**AXI\_DMA\_INDCR\_BURST\_EN\_CH $n$**  Configures whether to enable INCR burst transfer for RX channel  $n$  to read descriptors when accessing internal memory.

0: Disable

1: Enable

(R/W)

Register 3.75. AXI\_DMA\_IN\_CONF1\_CH $n$ \_REG ( $n$ : 0-2) (0x0014+0x68\* $n$ )

**AXI\_DMA\_IN\_CHECK\_OWNER\_CH<sub>n</sub>** Configures whether to enable owner bit check for RX channel

 $n.$ 

0: Disable

1: Enable

(R/W)

Register 3.76. AXI\_DMA\_IN\_POP\_CH $n$ \_REG ( $n$ : 0-2) (0x001C+0x68\* $n$ )

**AXI\_DMA\_INFIFO\_RDATA\_CH<sub>n</sub>** Represents the data popped from AXI DMA RX FIFO. (RO)

**AXI\_DMA\_INFIFO\_POP\_CHn** Configures whether to pop data from AXI DMA RX FIFO.

0: Invalid. No effect

1: Pop

(WT)

Register 3.77. AXI\_DMA\_IN\_LINK1\_CH $n$ \_REG ( $n$ : 0-2) (0x0020+0x68\* $n$ )

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |   |   |   |   |   |       |

**AXI\_DMA\_INLINK\_AUTO\_RET\_CH $n$**  Configures whether to return to the current receive descriptor's address when there are some errors in current receiving data.

0: Not return

1: Return

(R/W)

**AXI\_DMA\_INLINK\_STOP\_CH $n$**  Configures whether to stop RX channel  $n$  from receiving data.

0: Invalid. No effect

1: Stop

(WT)

**AXI\_DMA\_INLINK\_START\_CH $n$**  Configures whether to enable RX channel  $n$  for data transfer.

0: Disable

1: Enable

(WT)

**AXI\_DMA\_INLINK\_RESTART\_CH $n$**  Configures whether to restart RX channel  $n$  for AXI DMA transfer.

0: Invalid. No effect

1: Restart

(WT)

**AXI\_DMA\_INLINK\_PARK\_CH $n$**  Represents the status of the receive descriptor's FSM.

0: Running

1: Idle

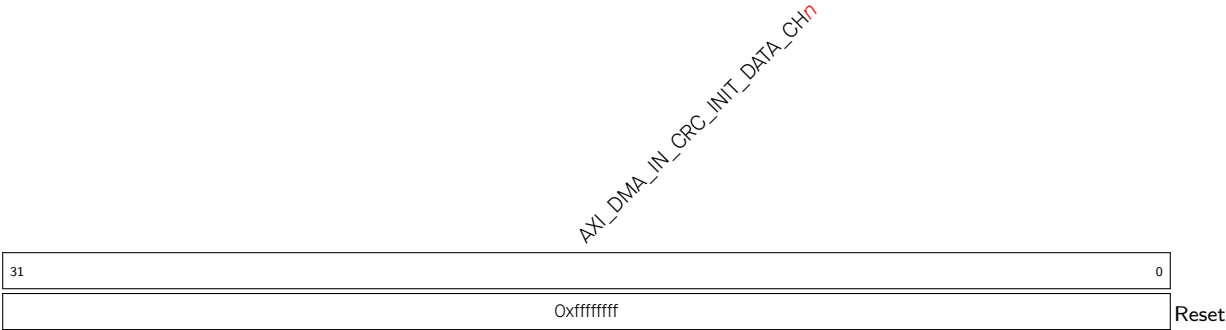

(RO)

Register 3.78. AXI\_DMA\_IN\_LINK2\_CHn\_REG (n: 0-2) (0x0024+0x68\*n)

AXI\_DMA\_INLINK\_ADDR\_CHn Represents the first receive descriptor’s address. (R/W)

Register 3.79. AXI\_DMA\_IN\_CRC\_INIT\_DATA\_CHn\_REG (n: 0-2) (0x0048+0x68\*n)

AXI\_DMA\_IN\_CRC\_INIT\_DATA\_CHn Configures the CRC initial value for RX channel n. (R/W)

Register 3.80. AXI\_DMA\_RX\_CRC\_WIDTH\_CH $n$ \_REG ( $n$ : 0-2) (0x004C+0x68\* $n$ )

**AXI\_DMA\_RX\_CRC\_WIDTH\_CH $n$**  Configures the CRC result width for RX channel  $n$ . 0:  $\leq 8$  bits

1:  $\leq 16$  bits

2:  $\leq 24$  bits

3:  $\leq 32$  bits

(R/W)

**AXI\_DMA\_RX\_CRC\_LAUTCH\_FLGA\_CH $n$**  Write 1 and then 0 to latch the values of AXI\_DMA\_RX\_CRC\_EN\_ADDR\_CH $n$ , AXI\_DMA\_RX\_CRC\_DATA\_EN\_ADDR\_CH $n$ , AXI\_DMA\_RX\_CRC\_EN\_WR\_DATA\_CH $n$ , and AXI\_DMA\_RX\_CRC\_DATA\_EN\_WR\_DATA\_CH $n$ . (R/W)

**Register 3.81. AXI\_DMA\_IN\_CRC\_CLEAR\_CH $n$ \_REG ( $n$ : 0-2) (0x0050+0x68\* $n$ )**

**AXI\_DMA\_IN\_CRC\_CLEAR\_CH $n$ \_REG** Configures whether to clear the CRC result for RX channel  $n$ .

0: Not clear

1: Clear

(R/W)

Register 3.82. AXI\_DMA\_IN\_CRC\_FINAL\_RESULT\_CH $n$ \_REG ( $n$ : 0-2) (0x0054+0x68\* $n$ )

AXI\_DMA\_IN\_CRC\_FINAL\_RESULT\_CH $n$  Represents the CRC result for RX channel  $n$ . (RO)

Register 3.83. AXI\_DMA\_RX\_CRC\_EN\_ADDR\_CH $n$ \_REG ( $n$ : 0-2) (0x005C+0x68\* $n$ )

AXI\_DMA\_RX\_CRC\_EN\_ADDR\_CH $n$  Configures at which bit of the CRC result the AXI\_DMA\_RX\_CRC\_EN\_WR\_DATA\_CH $n$ \_REG register targets for TX channel  $n$ . (R/W)

Register 3.84. AXI\_DMA\_RX\_CRC\_DATA\_EN\_WR\_DATA\_CH $n$ \_REG ( $n$ : 0-2) (0x0060+0x68\* $n$ )

AXI\_DMA\_RX\_CRC\_DATA\_EN\_WR\_DATA\_CH $n$  Configures whether to include each bit of the data in the CRC calculation matrix for TX channel  $n$ .

- 0: Not include
- 1: Include

(R/W)

Register 3.85. AXI\_DMA\_RX\_CRC\_DATA\_EN\_ADDR\_CH $n$ \_REG ( $n$ : 0-2) (0x0064+0x68\* $n$ )

AXI\_DMA\_RX\_CRC\_DATA\_EN\_ADDR\_CH $n$  Configures at which bit of the CRC result the AXI\_DMA\_RX\_CRC\_DATA\_EN\_WR\_DATA\_CH $n$ \_REG register targets for TX channel  $n$ . (R/W)

Register 3.86. AXI\_DMA\_OUT\_CONFO\_CH $n$ \_REG( $n$ : 0-2) (0x0148+0x68\* $n$ )

**AXI\_DMA\_OUT\_RST\_CH $n$**  Configures the reset state of TX channel  $n$  FSM and TX FIFO pointer.

0: Release reset

1: Reset

(R/W)

**AXI\_DMA\_OUT\_LOOP\_TEST\_CH $n$**  Reserved. (R/W)

**AXI\_DMA\_OUT\_AUTO\_WRBACK\_CH $n$**  Configures whether to enable automatic outlink write-back when all the data in TX FIFO has been transmitted.

0: Disable

1: Enable

(R/W)

**AXI\_DMA\_OUT\_EOF\_MODE\_CH $n$**  Configures when to generate EOF flag.

0: EOF flag for TX channel  $n$  is generated when data to be transmitted has been pushed into FIFO in AXI DMA.

1: EOF flag for TX channel  $n$  is generated when data to be transmitted has been popped from FIFO in AXI DMA.

(R/W)

**AXI\_DMA\_OUT\_ETM\_EN\_CH $n$**  Configures whether to enable ETM control for TX channel  $n$ .

0: Disable

1: Enable

(R/W)

**AXI\_DMA\_OUT\_BURST\_SIZE\_SEL\_CH $n$**  Configures the burst length for TX channel  $n$ .

0: 8 bytes

1: 16 bytes

2: 32 bytes

3: 64 bytes

4: 128 bytes

5 ~ 7: Invalid

(R/W)

**AXI\_DMA\_OUT\_CMD\_DISABLE\_CH $n$**  Configures whether to disable command on TX channel  $n$ .

0: Enable

1: Disable

(R/W)

Continued on the next page...

Register 3.86. AXI\_DMA\_OUT\_CONFO\_CH $n$ \_REG( $n$ : 0-2) (0x0148+0x68\* $n$ )

Continued from the previous page...

**AXI\_DMA\_OUT\_ECC\_AEC\_EN\_CH $n$**  Configures whether AXI DMA can access external memory space for ECC and AES via TX channel  $n$ .  
0: Not access  
1: Access  
(R/W)

**AXI\_DMA\_OUTDSCR\_BURST\_EN\_CH $n$**  Configures whether to enable INCR burst transfer for TX channel  $n$  reading descriptors when accessing internal memory.  
0: Disable  
1: Enable  
(R/W)

Register 3.87. AXI\_DMA\_OUT\_CONF1\_CH $n$ \_REG ( $n$ : 0-2) (0x014C+0x68\* $n$ )

**AXI\_DMA\_OUT\_CHECK\_OWNER\_CH $n$**  Configures whether to enable owner bit check for TX channel  $n$ .  
0: Disable  
1: Enable  
(R/W)

Register 3.88. AXI\_DMA\_OUT\_PUSH\_CHn\_REG (n: 0-2) (0x0154+0x68\*n)

**AXI\_DMA\_OUTFIFO\_WDATA\_CHn** Represents the data that need to be pushed into AXI DMA TX FIFO. (R/W)

**AXI\_DMA\_OUTFIFO\_PUSH\_CHn** Configures whether to push data into AXI DMA TX FIFO.

0: Invalid. No effect

1: Push

(WT)

Register 3.89. AXI\_DMA\_OUT\_LINK1\_CH $n$ \_REG ( $n$ : 0-2) (0x0158+0x68\* $n$ )

**AXI\_DMA\_OUTLINK\_STOP\_CH $n$**  Configures whether to stop TX channel  $n$  from transmitting data.

- 0: Invalid. No effect
- 1: Stop (WT)

**AXI\_DMA\_OUTLINK\_START\_CH $n$**  Configures whether to enable TX channel  $n$  for data transfer.

- 0: Disable
- 1: Enable (WT)

**AXI\_DMA\_OUTLINK\_RESTART\_CH $n$**  Configures whether to restart TX channel  $n$  for AXI DMA transfer.

- 0: Invalid. No effect
- 1: Restart (WT)

**AXI\_DMA\_OUTLINK\_PARK\_CH $n$**  Represents the status of the transmit descriptor's FSM.

- 0: Running
- 1: Idle (RO)

Register 3.90. AXI\_DMA\_OUT\_LINK2\_CH $n$ \_REG ( $n$ : 0-2) (0x015C+0x68\* $n$ )

**AXI\_DMA\_OUTLINK\_ADDR\_CH $n$**  Represents the first transmit descriptor's address. (R/W)

Register 3.93. AXI\_DMA\_OUT\_CRC\_CLEAR\_CH $n$ \_REG ( $n$ : 0-2) (0x0188+0x68\* $n$ )

**AXI\_DMA\_OUT\_CRC\_CLEAR\_CH $n$ \_REG** Configures whether to clear the CRC result for TX channel  $n$ .

0: Not clear

1: Clear

(R/W)

Register 3.94. AXI\_DMA\_OUT\_CRC\_FINAL\_RESULT\_CH $n$ \_REG ( $n$ : 0-2) (0x018C+0x68\* $n$ )

**AXI\_DMA\_OUT\_CRC\_FINAL\_RESULT\_CH $n$**  Represents the CRC result for TX channel  $n$ . (RO)

**Register 3.95. AXI\_DMA\_TX\_CRC\_EN\_WR\_DATA\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x0190+0x68\**n*)**

**AXI\_DMA\_TX\_CRC\_EN\_WR\_DATA\_CH<sub>*n*</sub>** Configures whether to include each bit of the intermediate result in the CRC calculation matrix for TX channel *n*.

0: Not include

1: Include

(R/W)

**Register 3.96. AXI\_DMA\_TX\_CRC\_EN\_ADDR\_CH<sub>*n*</sub>\_REG (*n*: 0-2) (0x0194+0x68\**n*)**

**AXI\_DMA\_TX\_CRC\_EN\_ADDR\_CH<sub>*n*</sub>** Configures at which bit of the CRC result the AXI\_DMA\_TX\_CRC\_EN\_WR\_DATA\_CH<sub>*n*</sub>\_REG register targets for TX channel *n*. (R/W)

(reserved)

AXI\_DMA\_TX\_CRC\_DATA\_EN\_WR\_DATA\_CH<sup>n</sup>

(R/W)

AXI\_DMA\_TX\_CRC\_DATA\_EN\_ADDR\_CH1

AXI\_DMA\_TX\_CRC\_DATA\_EN\_ADDR\_CH1

AAXI\_DMA\_TX\_CRC\_DATA\_EN\_WR\_DATA\_CH*n*\_REG register targets for TX channel *n*.(R/W)

Register 3.99. AXI\_DMA\_ARB\_TIMEOUT\_REG (0x0270)

- AXI\_DMA\_ARB\_TIMEOUT\_TX Configures the time slot for TX. Measurement unit: AXI bus clock cycle. (R/W)
- AXI\_DMA\_ARB\_TIMEOUT\_RX Configures the time slot for RX. Measurement unit: AXI bus clock cycle. (R/W)

Register 3.100. AXI\_DMA\_WEIGHT\_EN\_REG (0x0274)

- AXI\_DMA\_WEIGHT\_EN\_TX Configures whether to enable weight arbitration for TX.  
0: Disable  
1: Enable  
(R/W)
- AXI\_DMA\_WEIGHT\_EN\_RX Configures whether to enable weight arbitration for RX.

**AXI\_DMA\_IN\_MEM\_CLK\_FORCE\_EN** Configures memory clock gating for RX.

0: Support clock only when AXI DMA accesses memory

1: Always force the clock on

(R/W)

**AXI\_DMA\_IN\_MEM\_FORCE\_PU** Configures whether to force power up memory for RX.

0: Not force power up

1: Force power up

(R/W)

**AXI\_DMA\_IN\_MEM\_FORCE\_PD** Configures whether to force power down memory for RX.

0: Not force power down

1: Force power down

(R/W)

**AXI\_DMA\_OUT\_MEM\_CLK\_FORCE\_EN** Configures memory clock gating for TX.

0: Support clock only when AXI DMA accesses memory

1: Always force the clock on

(R/W)

**AXI\_DMA\_OUT\_MEM\_FORCE\_PU** Configures whether to force power up memory for TX.

0: Not force power up

1: Force power up

(R/W)

**AXI\_DMA\_OUT\_MEM\_FORCE\_PD** Configures whether to force power down memory for TX.

0: Not force power down

1: Force power down

(R/W)

Register 3.102. AXI\_DMA\_INTR\_MEM\_START\_ADDR\_REG (0x027C)

**AXI\_DMA\_ACCESS\_INTR\_MEM\_START\_ADDR** Configures the start address of the accessible internal memory address space. (R/W)

Register 3.103. AXI\_DMA\_INTR\_MEM\_END\_ADDR\_REG (0x0280)

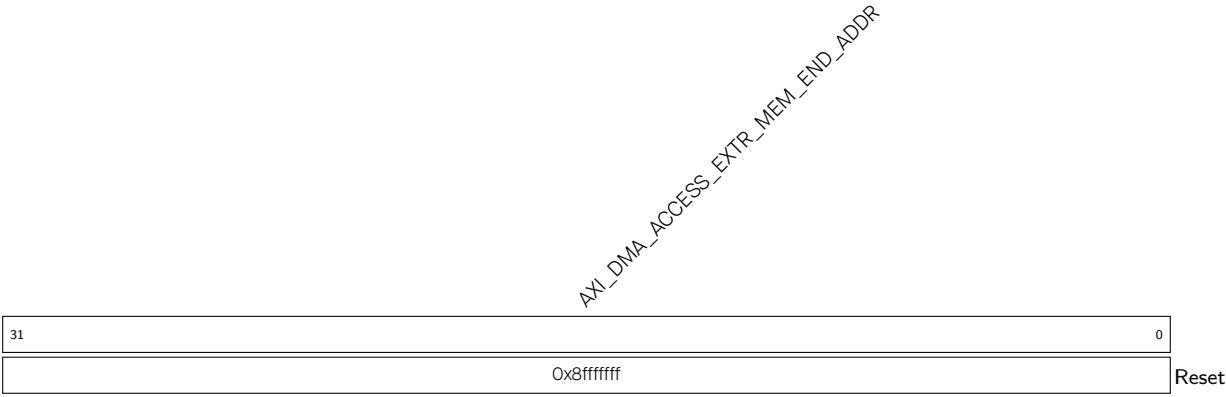

**AXI\_DMA\_ACCESS\_INTR\_MEM\_END\_ADDR** Configures the end address of the accessible internal memory address space. (R/W)

Register 3.104. AXI\_DMA\_EXTR\_MEM\_START\_ADDR\_REG (0x0284)

**AXI\_DMA\_ACCESS\_EXTR\_MEM\_START\_ADDR** Configures the start address of the accessible external memory address space. (R/W)

Register 3.105. AXI\_DMA\_EXTR\_MEM\_END\_ADDR\_REG (0x0288)

**AXI\_DMA\_ACCESS\_EXTR\_MEM\_END\_ADDR** Configures the end address of the accessible external memory address space. (R/W)

Register 3.106. AXI\_DMA\_IN\_RESET\_AVAIL\_CH $n$ \_REG ( $n$ : 0-2) (0x028C+0x4\* $n$ )

AXI\_DMA\_IN\_RESET\_AVAIL\_CH $n$  Represents whether RX channel  $n$  can be reset.

0: Cannot be reset by software

1: Can be reset

(RO)

Register 3.107. AXI\_DMA\_OUT\_RESET\_AVAIL\_CH $n$ \_REG ( $n$ : 0-2) (0x0298+0x4\* $n$ )

AXI\_DMA\_OUT\_RESET\_AVAIL\_CH $n$  Represents whether TX channel  $n$  can be reset.

0: Cannot be reset by software

1: Can be reset

. (RO)

Register 3.108. AXI\_DMA\_MISC\_CONF\_REG (0x02A8)

**AXI\_DMA\_AXIM\_RST\_WR\_INTER** Write 1 and then 0 to reset the internal AXI write FSM. (R/W)

**AXI\_DMA\_AXIM\_RST\_RD\_INTER** Write 1 and then 0 to reset the internal AXI read FSM. (R/W)

**AXI\_DMA\_ARB\_PRI\_DIS** Configures whether to disable the priority arbitration.

0: Enable

1: Disable

(R/W)

**AXI\_DMA\_CLK\_EN** Configures AXI DMA clock gating.

0: Support clock only when the application writes registers.

1: Always force the clock on for registers.

(R/W)

Register 3.128. AXI\_DMA\_DATE\_REG (0x02D8)

AXI\_DMA\_DATE Version control register. (R/W)

## Chapter 4

# VDMA Controller (VDMA)

## 4.1 Overview

DMA (Direct Memory Access) enables direct access to system memory or peripherals without CPU involvement. The VDMA controller on ESP32-P4 is a general-purpose DMA that performs high-speed data transfer from memory to memory, from memory to peripheral, and from peripheral to memory. The VDMA complies with the AXI3 protocol and includes two AXI master interfaces. This design allows users to select between the two interfaces for data transfer dynamically.

## 4.2 Terminology

The following terms are defined in the context of the VDMA controller on ESP32-P4:

- **AXI:** Advanced eXtensible Interface, a part of AMBA 3 (Advanced Microcontroller Bus Architecture) specification, designed to facilitate high bandwidth and low latency communication between memory and peripheral, and between memory and memory.
- **Peripheral:** A system component that has a handshake interface with VDMA, as listed in Table 4.4-1.
- **Memory:** A system component that is always ready for DMA transfer, which means there is no handshaking interface between VDMA and memory. The memory that supports VDMA data transfer includes HP L2MEM, external flash, and external RAM.
- **Source:** Source memory or peripheral from which VDMA reads data via the AXI interface. VDMA then stores data in channel FIFO.
- **Source transfer:** Transfer from the source to VDMA.
- **Destination:** Destination peripheral or memory to which VDMA writes the data stored in channel FIFO.
- **Destination transfer:** Transfer from VDMA to the destination.
- **Channel:** Data path between source and destination.
- **Master interface:** Refers to the two AXI master interfaces of VDMA.
- **Slave interface:** The APB3 slave interface for programming registers.
- **Handshaking interface:** The handshaking interface performs a handshake between VDMA and the source or destination peripheral. The handshaking interface requests, acknowledges, and controls an VDMA transfer.
- **Flow controller:** The flow controller defines the length of a DMA block transfer and terminates the transfer. The flow controller can be VDMA, a source peripheral, or a destination peripheral, but it cannot be memory.

## 4.3 Features

VDMA supports the following features:

- Four channels for unidirectional data transfer from source to destination
- Two AXI master interfaces
- Handshake with MIPI DSI (Display Serial Interface) and ISP (Image Signal Processor)
- Memory-to-memory, ISP-to-memory, and MIPI DSI-to-memory transfer types
- Multiple levels of DMA transfer hierarchy
- Configurable transfer type, transfer length, and transfer size for each channel
- Single-block transfer
- Multi-block transfer based on contiguous address, automatic reloading register configuration, shadow registers, and linked lists
- Independent configuration of multi-block transfer type for source transfer and destination transfer
- Channel disabling without data loss
- Channel suspension, resume, and abortion
- Configurable priorities among arbitration channels
- Flow control using VDMA or peripherals
- Programmable mapping between peripherals and channels

## 4.4 Architectural Overview

Figure [4.4-1](#) shows the architecture of VDMA and its connection with other system components.

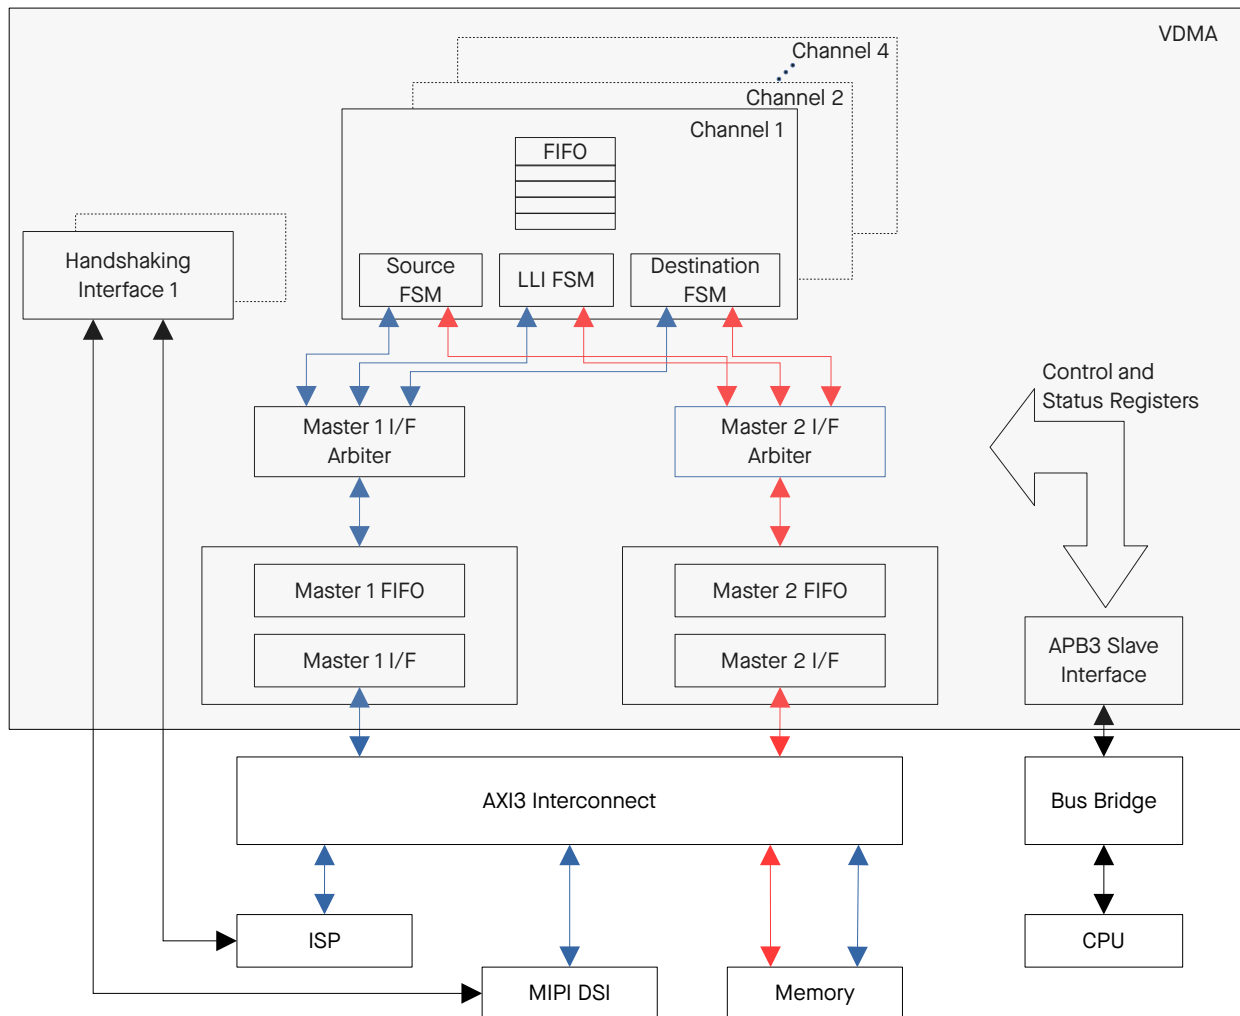

Figure 4.4-1. VDMA Architecture

It can be seen from the figure that:

- The CPU accesses VDMA registers via the APB3 slave interface.
- VDMA has four channels (Channel 1 to Channel 4). Each channel has a data FIFO with a depth of 64 and a width of 64 bits.
- VDMA has two AXI master interfaces (Master 1 and Master 2).
  - Master 1 can access ISP, MIPI DSI, and memory, as blue arrows indicate.
  - Master 2 can only access memory, as red arrows indicate.
  - Master 1 and Master 2 each have an arbiter that arbitrates read and write requests on all channels.
- VDMA has three hardware handshaking interfaces. Table 4.4-1 shows the mapping between the handshaking interfaces and peripherals.

Table 4.4-1. Hardware Handshaking Interface and Peripherals Mapping Table

| Handshaking Interface Number | Peripheral |
|------------------------------|------------|
| 0                            | MIPI DSI   |

|   |                     |
|---|---------------------|
| 1 | ISP (ISP-to-memory) |
| 2 | ISP (memory-to-ISP) |

For more information about ISP and MIPI DSI, please refer to Chapter [32 Image Signal Processor \(ISP\)](#) and Chapter [5 MIPI DSI \[to be added later\]](#).

## 4.5 Functional Description

This section provides a detailed description of the key features and operations of the module.

### 4.5.1 Transfer Hierarchy

Transfers are organized into a maximum of four levels: DMA transfer level, block transfer level, transaction level, and AXI transfer level.

Figure [4.5-1](#) shows four transfer levels between VDMA and peripherals.

Figure [4.5-2](#) shows three transfer levels between VDMA and memory. There is no transaction level because memory is assumed to be always ready for data transfer.

The following descriptions of DMA, block, and AXI transfers apply to the transfer between VDMA and memory, VDMA and peripherals. **The description of the transaction level applies only to transfers between VDMA and peripherals.**

- **DMA transfer:** Software defines the number of blocks in a DMA transfer. Once a DMA transfer has finished, VDMA disables the channel and generates an interrupt. The channel can then be reprogrammed for a new DMA transfer. A DMA transfer can consist of either a single-block or a multi-block transfer.
- **Block transfer:** A block transfer moves a specified data block through the VDMA. The flow controller controls the block length. There are two types of block transfer: single-block transfer and multi-block transfer. As shown in Figure [4.5-1](#), a block transfer may consist of multiple transactions.
- **Transaction:** A peripheral request may trigger either a single or burst transaction, corresponding to an AXI single transfer or multiple AXI burst transfers, respectively.
  - Single transaction: The length of a single transaction is always 1, in the unit of `DMAC_CHn_SRC_TR_WIDTH`.
  - Burst transaction: The length of a burst transaction is programmed into the VDMA through `DMAC_CHn_SRC_MSIZE` for the source or `DMAC_CHn_DST_MSIZE` for the destination. The burst length typically relates to the FIFO sizes in the source or destination peripherals. For more information, please refer to the chapter on each peripheral.
- **AXI transfer:** Refers to the AXI protocol transfer, which is divided into AXI single transfer and AXI burst transfer.

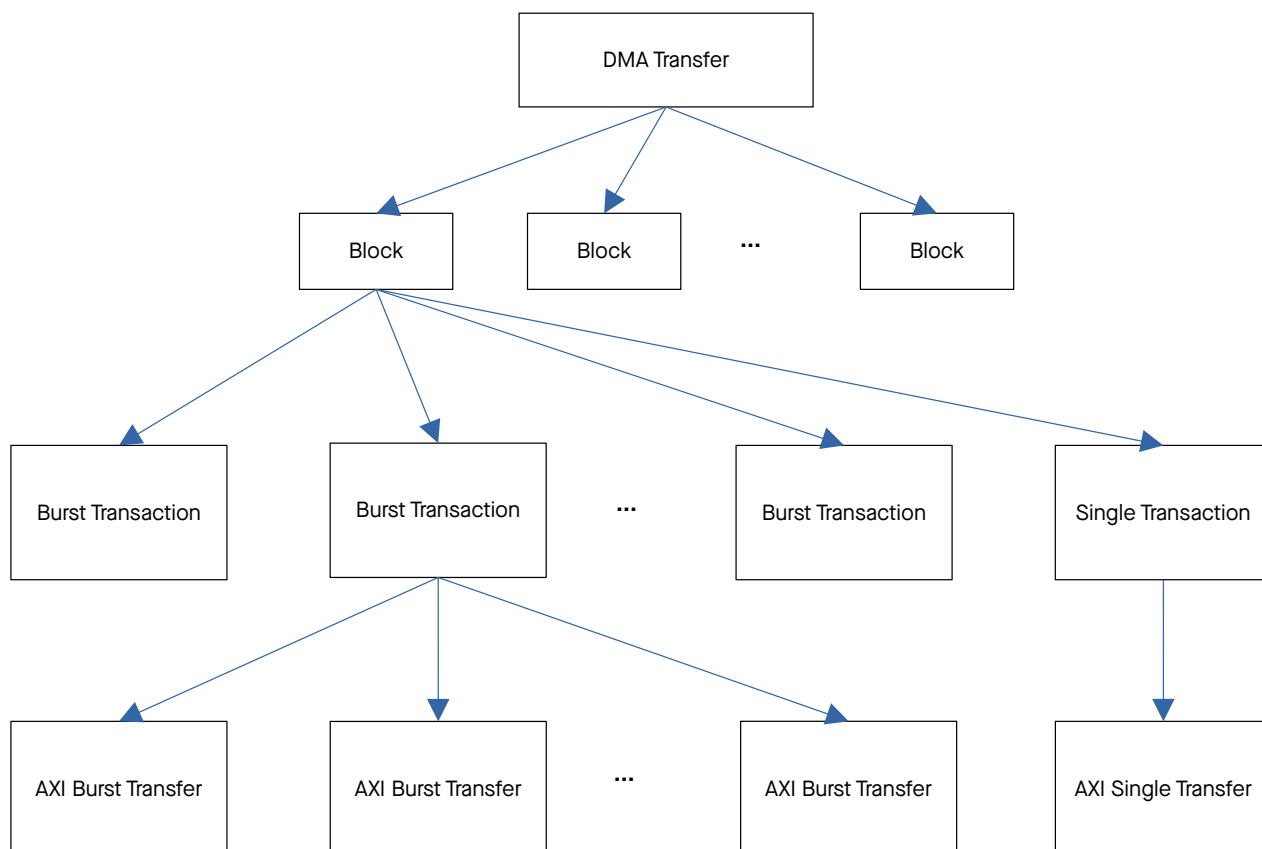

Figure 4.5-1. VDMA Transfer Hierarchy for Peripherals

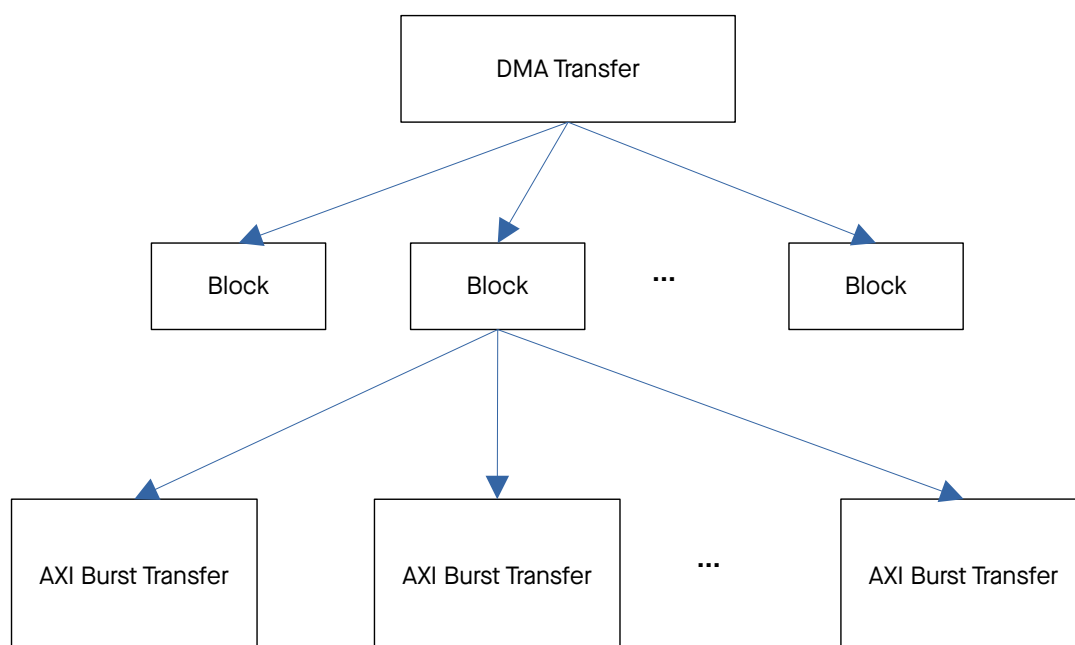

Figure 4.5-2. VDMA Transfer Hierarchy for Memory

## 4.5.2 Arbitration Scheme

The arbitration mechanism arbitrates read and write requests for all channels.

VDMA uses a priority and fair-among-equals arbitration mechanism. The priority for each channel is defined in the channel configuration register `DMAC_CH $n$ _CFG1_REG`.

A priority of 3 is the highest, while 0 is the lowest. Multiple channels can share the same priority level.

The arbitration mechanism works as follows:

- The arbitration mechanism determines which request client to grant the authorization signal based on the priority of the request. The request with the highest priority will be granted access to the channel.
- When two or more requests have the same priority, request clients will gain access randomly.

### 4.5.2.1 Read Arbiter

The read arbiter arbitrates read requests, including:

- VDMA's read requests to obtain data or status from the source
- VDMA's read requests to obtain status from the destination
- VDMA's read requests to obtain LLI descriptors

The block diagram of the read arbiter is shown in Figure 4.5-3:

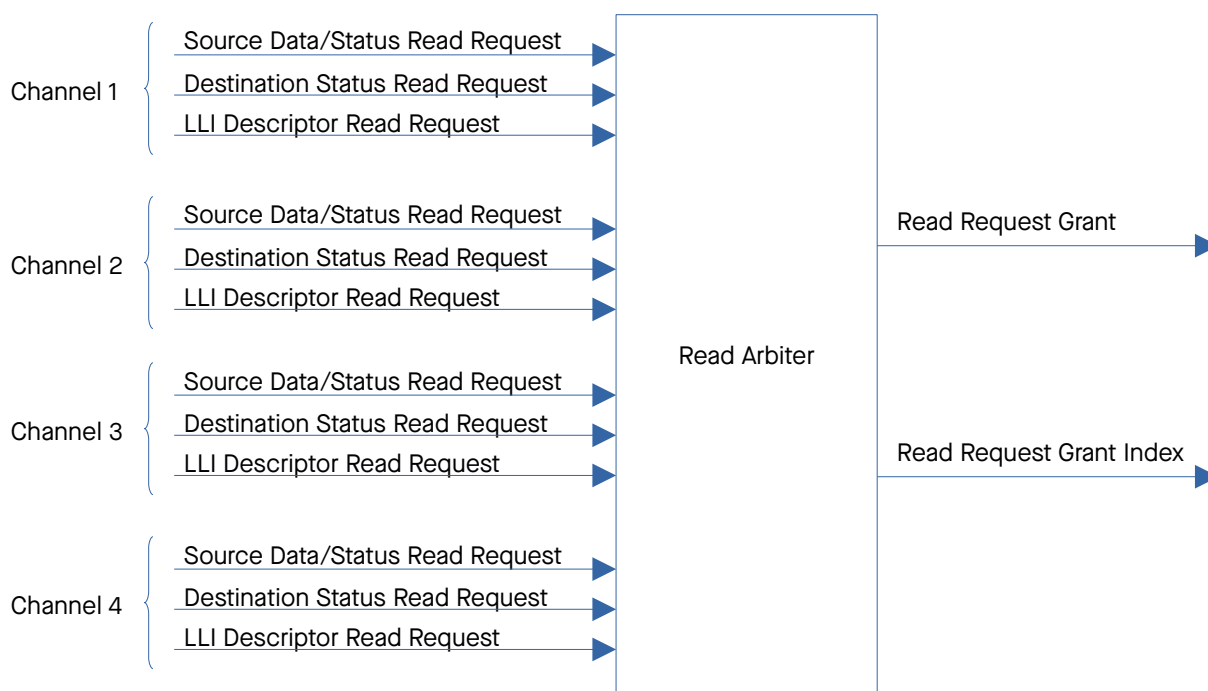

Figure 4.5-3. VDMA Read Arbiter

Read requests to obtain linked list descriptors will be granted the highest priority, regardless of the channels' priority settings.

### 4.5.2.2 Write Arbiter

The write arbiter arbitrates write requests, including:

- Destination Data Write Request
- LLI Descriptor Write-Back Request

The block diagram of the write arbiter is shown in Figure 4.5-4:

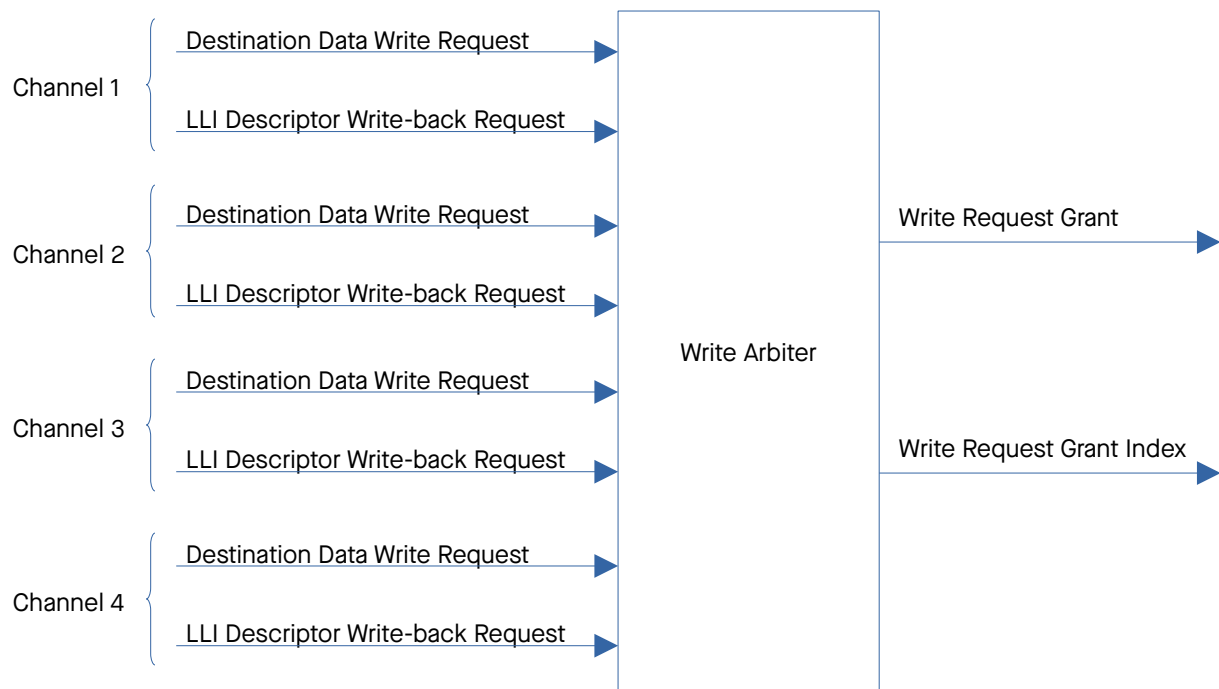

Figure 4.5-4. VDMA Write Arbiter

Within the same channel, Destination Data Write Request has higher priority than LLI Descriptor Write-Back Request. If different channels have the same priority, then Data Write Requests have the highest priority.

### 4.5.3 Handshaking Interface

A peripheral uses a handshaking interface to inform VDMA that it is ready to transmit or receive data via AXI bus. The operation of the handshaking interface depends on whether the flow controller is the peripheral or VDMA.

VDMA performs a single transaction or a burst transaction per handshake. In some cases, a block transfer cannot be completed using only burst transactions. This situation typically occurs when the block size is not a multiple of the burst transaction length. In this case, the block transfer uses burst transactions until the remaining size of the block is less than the amount of data in the burst transaction. At this point, a single transaction is used to complete the block transfer.

A source's burst transaction size is determined by `DMAC_CHn_SRC_MSIZ`. A destination's burst transaction size is determined by `DMAC_CHn_DST_MSIZ`. The transaction size also corresponds to the burst transaction size used for handshaking. The value of `DMAC_CHn_SRC_MSIZ` or `DMAC_CHn_DST_MSIZ` should match the peripheral configuration. For detailed information, please refer to the chapter on related peripherals.

VDMA has three hardware handshaking interfaces with MIPI DSI, ISP (ISP-to-memory), and ISP (memory-to-ISP). For the mapping relationship please see Table 4.4-1.

## 4.5.4 Transfer Control

Transfer control logic facilitates the data transfer from a source to a destination. Data from the source is temporarily stored in the channel FIFO before being sent to the destination. If source and destination peripherals use different transfer sizes, VDMA will pack and unpack the data to fit the FIFO configuration.

For a specific DMA transfer, the transfer type and flow control configurations are determined by `DMAC_CHn_TT_FC`.

### 4.5.4.1 Single-Block Transfer

If a DMA transfer consists of a single block, the software can set `DMAC_CHn_SRC_MULTBLK_TYPE` and `DMAC_CHn_DST_MULTBLK_TYPE` to 0 to enable contiguous-address-based single-block transfer. In this case, VDMA disables the channel once the block transfer of size `DMAC_CHn_BLOCK_TS` is completed.

**Note:**

Single-block transfer is a special case of multi-block transfer, and there is no strict distinction between the two. In this chapter, single-block transfer refers to the transfer consisting of only one block, while multi-block transfer refers to the transfer consisting of at least two blocks.

### 4.5.4.2 Multi-Block Transfer

If a DMA transfer consists of multiple blocks, the software can configure `DMAC_CHn_SRC_MULTBLK_TYPE` and `DMAC_CHn_DST_MULTBLK_TYPE` to choose a multi-block transfer type. There are four types of multi-block transfers, depending on how the transfer control registers (`DMAC_CHn_SARO_REG`, `DMAC_CHn_DARO_REG`, `DMAC_CHn_BLOCK_TS`, `DMAC_CHn_CTLO/1_REG`) are updated:

1. **Contiguous address**
2. **Auto reloading:** Register values reload from initial values
3. **Shadow register:** Register values load from shadow registers
4. **Linked list** Register values load from the next linked list (LLI)

Table 4.5-1 lists all the cases of register update methods for multi-block transfer.

Table 4.5-1. Register Update Methods for Multi-Block Transfer

| DMAC_CH $n$ _CFG0_REG         |                               | Registers Update Method   |                           |                                  |                           | Comment                                   |
|-------------------------------|-------------------------------|---------------------------|---------------------------|----------------------------------|---------------------------|---|
| DMAC_CH $n$ _SRC_MULTBLK_TYPE | DMAC_CH $n$ _DST_MULTBLK_TYPE | DMAC_CH $n$ _SARO_REG     | DMAC_CH $n$ _DARO_REG     | DMAC_CH $n$ _CTLO_REG / CTL1_REG | DMAC_CH $n$ _BLOCK_TS     |   |
| 00                            | 00                            | Contiguous address        | Contiguous address        | No update                        | No update                 | Single block or last block of multi-block |
| 00                            | 01                            | Contiguous address        | Reload from initial value | Reload from initial value        | Reload from initial value | -   |
| 00                            | 10                            | Contiguous address        | Load from shadow register | Load from shadow register        | Load from shadow register | -   |
| 01                            | 00                            | Reload from initial value | Contiguous address        | Reload from initial value        | Reload from initial value | -   |
| 01                            | 01                            | Reload from initial value | Reload from initial value | Reload from initial value        | Reload from initial value | -   |
| 01                            | 10                            | Reload from initial value | Load from shadow register | Load from shadow register        | Load from shadow register | -   |

| 10                            | 01                            | Load from shadow register | Reload from initial value | Load from shadow register        | Load from shadow register | -   |
| 10                            | 10                            | Load from shadow register | Load from shadow register | Load from shadow register        | Load from shadow register | -   |
| 00                            | 11                            | Contiguous address        | Load from next LLI        | Load from next LLI               | Load from next LLI        | -   |
| 01                            | 11                            | Reload from initial value | Load from next LLI        | Load from next LLI               | Load from next LLI        | -   |
| 11                            | 00                            | Load from next LLI        | Contiguous address        | Load from next LLI               | Load from next LLI        | -   |
| 11                            | 01                            | Load from next LLI        | Reload from initial value | Load from next LLI               | Load from next LLI        | -   |
| 11                            | 11                            | Load from next LLI        | Load from next LLI        | Load from next LLI               | Load from next LLI        | -   |
| 10                            | 11                            | -                         | -                         | -                                | -                         | Invalid. Interrupt* is generated.         |
| 11                            | 10                            | -                         | -                         | -                                | -                         | Invalid. Interrupt* is generated.         |

\*Note: The interrupt is [DMAC\\_CH \$n\$ \\_SLVIF\\_MULTIBLKTYPE\\_ERR\\_INT](#).

## Contiguous Address

In this scenario, the address for each subsequent block continues from the end of the preceding block. To achieve this contiguity, configure `DMAC_CHn_SRC_MULTBLK_TYPE` or `DMAC_CHn_DST_MULTBLK_TYPE` to 0 for the source address or destination address to remain continuous across the blocks.

In the case of multi-block transfer, the values of `DMAC_CHn_SRC_MULTBLK_TYPE` and `DMAC_CHn_DST_MULTBLK_TYPE` cannot both be selected as contiguous addresses, meaning they cannot both be configured to 0 at the same time. If both are configured to 0 during a multi-block transfer, then the current block will be considered as the last block.

During a multi-block transfer, if `DMAC_CHn_SARO_REG` and `DMAC_CHn_DARO_REG` need to have contiguous addresses between blocks, you can indirectly achieve this functionality using linked-list or shadow-register-based multi-block transfer.

### Note:

If you have enabled contiguous-address-based multi-block transfer (i.e., `DMAC_CHn_SRC_MULTBLK_TYPE` or `DMAC_CHn_DST_MULTBLK_TYPE` is 0), ensure there are at least two blocks in the DMA transfer. Otherwise, it will result in unpredictable behavior.

## Auto Reloading

In this scenario, `DMAC_CHn_SARO_REG` and `DMAC_CHn_DARO_REG` are reloaded with their initial values at the end of each block. VDMA does not proceed to the next block transfer until software clears the corresponding channel's block transfer complete interrupt by writing 1 to `DMAC_CHn_CLEAR_SRC_TRANSCOMP_INTSTAT` and `DMAC_CHn_CLEAR_DST_TRANSCOMP_INTSTAT`.

### Note:

If you have enabled auto-reloading-based multi-block transfer, please ensure there are at least two blocks in the DMA transfer. Otherwise, it will result in unpredictable behavior.

## Shadow Register

In this scenario, `DMAC_CHn_SARO_REG`, `DMAC_CHn_DARO_REG`, `DMAC_CHn_BLOCK_TS`, `DMAC_CHn_CTLO_REG`, and `DMAC_CHn_CTL1_REG` synchronize with their corresponding shadow registers when each block finishes. The values of the shadow registers are then used for the subsequent block.

Software writes the block configurations to the corresponding shadow registers. VDMA copies the shadow register contents to `DMAC_CHn_SARO_REG`, `DMAC_CHn_DARO_REG`, `DMAC_CHn_BLOCK_TS`, `DMAC_CHn_CTLO_REG`, and `DMAC_CHn_CTL1_REG` before starting the subsequent block transfer.

Read operations to the `DMAC_CHn_SARO_REG`, `DMAC_CHn_DARO_REG`, `DMAC_CHn_BLOCK_TS`, `DMAC_CHn_CTLO_REG`, and `DMAC_CHn_CTL1_REG` always return the data corresponding to the current block transfer, not the shadow register contents that correspond to the next block.

`DMAC_CHn_SHADOWREG_OR_LLI_VALID` indicates whether the shadow register contents are valid (1) or not (0). If this bit reads as 0 during a shadow register fetch phase, VDMA discards the shadow register contents and generates a `DMAC_CHn_SHADOWREG_OR_LLI_INVALID_ERR_INT` interrupt. VDMA waits until the software

writes 1 to [DMAC\\_CHn\\_BLK\\_TFR\\_RESUMEREQ](#), indicating that the shadow registers are available. After this, VDMA attempts to read the shadow registers again and continues with the next block transfer.

**Note:**

In a shadow-register-based multi-block transfer, the values in [DMAC\\_CHn\\_SARO\\_REG](#), [DMAC\\_CHn\\_DARO\\_REG](#), [DMAC\\_CHn\\_BLOCK\\_TS](#), [DMAC\\_CHn\\_CTLO\\_REG](#), and [DMAC\\_CHn\\_CTL1\\_REG](#) correspond to the current transfer configurations. When software writes to these registers, it is actually writing to the corresponding shadow registers.

## Linked List

In this scenario, VDMA retrieves a block descriptor for a specific block from memory to update [DMAC\\_CHn\\_SARO\\_REG](#), [DMAC\\_CHn\\_DARO\\_REG](#), [DMAC\\_CHn\\_BLOCK\\_TS](#), [DMAC\\_CHn\\_CTLO\\_REG](#), and [DMAC\\_CHn\\_CTL1\\_REG](#), and then initiates the block transfer. This process is called LLI (Linked List Item) update. The block chaining feature of VDMA uses the linked list pointer register [DMAC\\_CHn\\_LOCO](#) to store the address of the next linked list item in memory, thereby achieving seamless continuity of data transfer.

Figure 4.5-5 shows the VDMA linked list item:

|                          |  |               |
|--------------------------|--|---------------|
| 31                       |  | 0             |
| Reserved                 |  |               |
| Reserved                 |  |               |
| CHn_LL_P_STATUS[63:32]   |  |               |
| CHn_LL_P_STATUS[31:0]    |  |               |
| Write Back for CHn_DSTAT |  |               |
| Write Back for CHn_SSTAT |  |               |
| CHn_CTL1[31:0]           |  |               |
| CHn_CTLO[31:0]           |  |               |
| Reserved                 |  |               |
| CHn_LLPO[31:6]           |  | Reserved[5:0] |
| Reserved                 |  |               |
| CHn_BLOCK_TS[31:0]       |  |               |
| Reserved                 |  |               |
| CHn_DAR[31:0]            |  |               |
| Reserved                 |  |               |
| CHn_SAR[31:0]            |  |               |

**Figure 4.5-5. VDMA Linked List Item (Descriptor)**

VDMA can dynamically extend linked lists, which means you do not need to pre-create the entire linked list in system memory. To enable this feature, set [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_VALID](#) to 1. If the linked list item is the last one, then also configure [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_LAST](#) to 1.

**DMAC\_CH $n$ \_SHADOWREG\_OR\_LLI\_VALID** indicates whether the linked list item fetched from memory is valid (1) or not (0). If the LLI is invalid, VDMA discards the LLI and generates a **DMAC\_CH $n$ \_SHADOWREG\_OR\_LLI\_INVALID\_ERR\_INT** interrupt. This interrupt causes VDMA to halt the corresponding channel and wait until the software writes 1 to **DMAC\_CH $n$ \_BLK\_TFR\_RESUMEREQ** to indicate that the LLI is available. After this, VDMA will attempt to read the LLI again.

**Note:**

For pre-fetched LLIs, if **DMAC\_CH $n$ \_SHADOWREG\_OR\_LLI\_VALID** is 0, then the **DMAC\_CH $n$ \_SHADOWREG\_OR\_LLI\_INVALID\_ERR\_INTSTAT** interrupt will not be generated. VDMA re-attempts to fetch the LLI again after completing the current block transfer and generates a **DMAC\_CH $n$ \_SHADOWREG\_OR\_LLI\_INVALID\_ERR\_INTSTAT** interrupt only if **DMAC\_CH $n$ \_SHADOWREG\_OR\_LLI\_VALID** still reads as 0.

The following fields in LLI are prepared by software:

- CH $n$ \_SAR: The field definition is the same as **DMAC\_CH $n$ \_SARO\_REG**
- CH $n$ \_DAR: The field definition is the same as **DMAC\_CH $n$ \_DARO\_REG**
- CH $n$ \_BLOCK\_TS: The field definition is the same as **DMAC\_CH $n$ \_BLOCK\_TS**
- CH $n$ \_LLPO[31:6]: The field definition is the same as **DMAC\_CH $n$ \_LLPO\_REG**[31:6]
- CH $n$ \_CTLO: The field definition is the same as **DMAC\_CH $n$ \_CTLO\_REG**
- CH $n$ \_CTL1: The field definition is the same as **DMAC\_CH $n$ \_CTL1\_REG**

If the status write-back option is enabled, VDMA writes back CH $n$ \_CTLO, CH $n$ \_CTL1, CH $n$ \_LLP\_STATUS, CH $n$ \_SSTAT, and CH $n$ \_DSTAT information to the location defined for this field, which is from address [CH $n$ \_LLP] + 0x20 to [CH $n$ \_LLP] + 0x34. The write-back of CH $n$ \_SSTAT and CH $n$ \_DSTAT can be independently enabled or disabled by programming **DMAC\_CH $n$ \_SRC\_STAT\_EN** and **DMAC\_CH $n$ \_DST\_STAT\_EN**.

**Note:**

- If CH $n$ \_SSTAT and CH $n$ \_DSTAT write-back is not enabled, do not use PSRAM to store LLI.
- **DMAC\_CH $n$ \_SHADOWREG\_OR\_LLI\_VALID** will be 0 after the LLI write-back operation.

Figure 4.5-6 shows CH $n$ \_LLP\_STATUS write-back field of LLI:

|    |                 |  |                 |   |
|----|-----------------|--|-----------------|---|
| 63 |                 |  |                 | 0   |
| *  | Reserved[61:47] | Data Left in Channel FIFO<br>(CH $n$ _Status[46:32]) | Reserved[31:22] | Completed Block Transfer Size<br>(CH $n$ _Status[21:0]) |

Note: \* denotes Status Indication (CH $n$ \_IntStatus[1:0])

**Figure 4.5-6. CH $n$ \_LLP\_STATUS Write-Back Field of LLI**

CH $n$ \_LLP\_STATUS[63] and CH $n$ \_LLP\_STATUS[62] indicate DMA\_TFR\_DONE and BLOCK\_TFR\_DONE status respectively. These two fields are the last to be updated during LLI write-back. Software should ensure that BLOCK\_TFR\_DONE bit is set to 1 before using CH $n$ \_SSTAT and CH $n$ \_DSTAT information. DMA\_TFR\_DONE and BLOCK\_TFR\_DONE bits will be set to 1 after transferring the last block.

CH $n$ \_STATUS[21:0] corresponds to [DMAC\\_CH \$n\$ \\_CMPLTD\\_BLK\\_TFR\\_SIZE](#), and CH $n$ \_STATUS[46:32] corresponds to [DMAC\\_CH \$n\$ \\_DATA\\_LEFT\\_IN\\_FIFO\[14:0\]](#).

### Suspension of Transfers Between Blocks

At the end of every block transfer, a block transfer completion interrupt [DMAC\\_CH \$n\$ \\_BLOCK\\_TFR\\_DONE\\_INT](#) is generated if:

- Global interrupt is enabled ([DMAC\\_INT\\_EN](#) = 1)
- The channel block transfer completion interrupt is enabled  
([DMAC\\_CH \$n\$ \\_ENABLE\\_BLOCK\\_TFR\\_DONE\\_INTSTAT](#) = 1,  
[DMAC\\_CH \$n\$ \\_ENABLE\\_BLOCK\\_TFR\\_DONE\\_INTSIGNAL](#) = 1, [DMAC\\_CH \$n\$ \\_IOC\\_BLK\\_TFR](#) = 1)

For contiguous-address and auto-reloading-based multi-block transfers (neither source nor destination peripheral uses shadow-register or linked-list-based multi-block transfers), the DMA transfer automatically stalls after the [DMAC\\_CH \$n\$ \\_BLOCK\\_TFR\\_DONE\\_INT](#) interrupt is generated. VDMA does not proceed to the next block transfer until software writes 1 to [DMAC\\_CH \$n\$ \\_CLEAR\\_BLOCK\\_TFR\\_DONE\\_INTSTAT](#) to clear the interrupt.

Channel suspension between blocks ensures that the block transfer done ISR (Interrupt Service Routine) of the next-to-last block is serviced before the final block transfer starts. This ensures that the ISR has cleared [DMAC\\_CH \$n\$ \\_SRC\\_MULTBLK\\_TYPE](#) and [DMAC\\_CH \$n\$ \\_DST\\_MULTBLK\\_TYPE](#) before the final block transfer is completed.

### End of Multi-Block Transfers

If either source or destination peripheral uses shadow-register or linked-list-based multi-block transfers, then [DMAC\\_CH \$n\$ \\_SHADOWREG\\_OR\\_LLI\\_LAST](#) indicates whether the current block is the last in the transfer. If this bit is 1, VDMA recognizes that the current block is the final block in the transfer and completes the DMA transfer operation at the end of the current block transfer.

For contiguous-address and auto-reloading-based multi-block transfers (when neither source nor destination peripheral uses shadow-register or linked-list-based multi-block transfers), if the corresponding multi-block type selection fields [DMAC\\_CH \$n\$ \\_SRC\\_MULTBLK\\_TYPE](#) and/or [DMAC\\_CH \$n\$ \\_DST\\_MULTBLK\\_TYPE](#) are 0 at the end of a block transfer, VDMA understands that the previous block was the final block in the transfer and completes the DMA transfer operation.

## 4.5.5 Flow Controller

The flow controller determines the length of the DMA block transfer. The flow controller can be VDMA, the source peripheral, or the destination peripheral; memory cannot serve as a flow controller.

If the block length is known before enabling the channel, configure VDMA as the flow controller. If the block length is unknown before enabling the channel, use the source or destination peripheral as the flow controller to determine when to terminate the DMA block transfer.

## 4.5.6 Channel Suspend and Resume

Software can suspend and resume a channel during DMA transfer. To suspend a channel during DMA transfer:

1. Software writes 1 to `DMAC_CHn_SUSP`.
2. VDMA halts all transfers from the source, after completing all AXI transfers initiated from the source.
3. VDMA sets `DMAC_CHn_CH_SRC_SUSPENDED_INT` to 1 to indicate that source transfer is suspended.
4. VDMA transfers all the data in channel FIFO to the destination. If `DMAC_CHn_SRC_TR_WIDTH < DMAC_CHn_DST_TR_WIDTH` and `DMAC_CHn_SUSP` is 1, there may still be data in the channel FIFO, but not enough to form a single transfer of `DMAC_CHn_DST_TR_WIDTH`. The remaining data in the channel FIFO will be transferred to the destination if the channel is resumed.
5. VDMA sets `DMAC_CHn_CH_SUSPENDED_INT` to 1 to indicate that the channel is suspended.

After a channel suspend, software can resume the channel by setting `DMAC_CHn_SUSP` to 0. Then, VDMA resumes the DMA transfer from the point where it was suspended.

### 4.5.7 Channel Disable

Under normal operation, software enables a channel by writing 1 to `DMAC_CHn_EN`, and VDMA clears `DMAC_CHn_EN` after channel transfer completion. Software can disable a channel before a transfer completes.

#### 4.5.7.1 Disabling a Suspended Channel Before Transfer Completion

To disable a suspended channel before transfer completion:

- Write 0 to `DMAC_CHn_EN` after `DMAC_CHn_CH_SUSPENDED_INTSTAT` is set to 1. If `DMAC_CHn_SRC_TR_WIDTH < DMAC_CHn_DST_TR_WIDTH` and `DMAC_CHn_SUSP` is 1, there may still be data in the channel FIFO, but not enough to form a single transfer of `DMAC_CHn_DST_TR_WIDTH`. In this case, once the channel is disabled, the remaining data in the channel FIFO is not transferred to the destination peripheral and is lost.
- VDMA sets `DMAC_CHn_CH_DISABLED_INTSTAT` to 1 to indicate that the channel is disabled and generates an interrupt.

#### 4.5.7.2 Disabling a Non-suspended Channel Before Transfer Completion

To disable a non-suspended channel before transfer completion:

- Software writes 0 to `DMAC_CHn_EN` during DMA transfer.
- VDMA halts all transfers from the source, after completing all AXI transfers initiated on the source.
- VDMA transfers all the data in the channel FIFO to the destination. When `DMAC_CHn_SRC_TR_WIDTH < DMAC_CHn_DST_TR_WIDTH` and `DMAC_CHn_EN` is 0, there may still be data in the channel FIFO, but not enough to form a single transfer of `DMAC_CHn_DST_TR_WIDTH`. In this scenario, once the channel is disabled, the remaining data in the channel FIFO is not transferred to the destination peripheral and is lost.
- VDMA sets `DMAC_CHn_CH_DISABLED_INTSTAT` to 1 to indicate that the channel is disabled and generates an interrupt.

**Note:**

Once software initiates a channel disable procedure by writing 0 to `DMAC_CHn_EN`, before `DMAC_CHn_CH_DISABLED_INT` is set to 1, you cannot re-enable the channel by writing 1 to `DMAC_CHn_EN`. VDMA will ignore this write operation.

## 4.5.8 Low-Power Technique

VDMA implements a low-power technique that intelligently monitors idle periods across multiple DMA channels, the slave bus interface, and AXI master interface channels in various scenarios. By detecting inactivity, this feature can turn off the clock for these modules, significantly reducing overall power consumption.

When activity is detected, the logic quickly restores the clocks to these modules, ensuring that performance remains uncompromised.

Configure `DMAC_LOWPOWER_CFGO_REG` to enable the low-power feature and manage the low-power counters.

### 4.5.8.1 Low-Power Technique for DMA Channels

DMA channels occupy a significant portion of the chip area in the VDMA module, resulting in higher power consumption compared to other components. Therefore, optimizing power usage in this module is essential.

The low-power technique for DMA channels employs a **DMA channel low-power state machine** to monitor activities. When the state machine detects a low-power condition, it activates a **DMA channel low-power delay counter**. This counter runs until it expires. Once the counter expires, the DMA channels enter a low-power state by gating the `AXI_DMAC_CORE_CLK`.

The DMA channels will remain in this low-power state until any activity is detected. If activity is detected while the delay counter is still running, the counter is reset and paused until the low-power condition is detected again.

### 4.5.8.2 Low-Power Technique for Slave Bus Interface

The slave bus interface unit (SBIU) accesses the internal registers of VDMA via the APB3 slave interface. The low-power technique can optimize the power consumption in SBIU.

The low-power technique for the slave bus interface employs a **SBIU state machine** to monitor activities. When a low-power condition is detected (i.e., when there are no ongoing APB reads or writes and the SBIU state machine is idle), the **SBIU low power delay counter** is activated. Once the delay counter expires, SBIU enters the low-power state by gating `PCLK` or `AXI_DMAC_CORE_CLK` (based on the clock mode configuration).

SBIU remains in the low-power state until an active read or write transaction is detected on the slave bus interface. If an active transaction is detected while the SBIU low-power delay counter running, the delay counter is reset and paused until the low-power condition is detected again.

If a read or write transaction occurs while SBIU is in a low-power state, the low-power logic immediately exits the low-power state by un-gating `PCLK` or `AXI_DMAC_CORE_CLK`.

### 4.5.8.3 Low-Power Technique for AXI Master Interface Channels

The AXI master interface module implements the AXI bus to transfer data between memory and peripheral.

Whenever a low-power condition is detected on the AXI master interface channels, the **AXI master interface channel low-power delay counter** starts. The AXI low-power logic waits until the delay counter expires. After the delay counter expires, the AXI master interface channel enters the low-power state by gating the clock of AXI master interface and AXI\_DMAC\_CORE\_CLK. It remains in this state until any activity is detected. If an activity is detected while the AXI master interface channel low-power delay counter is running, the delay counter is reset and paused until the low-power condition is detected again.

### 4.5.8.4 Global Low-Power Technique

The global low-power technique implements the low-power option based on the idle condition of the DMA channel, slave bus interface, and AXI master interface channels. If all the mentioned modules indicate that the VDMA is idle, the **global low-power delay counter** is activated.

The global low-power logic waits until the low-power delay counter expires. After the counter expires, VDMA enters the low-power state by gating the clocks of all modules. It remains in the low-power state until any activity is detected on any of the modules. If an activity is detected while the global low-power delay counter is running, the global delay counter is reset and paused until the low-power condition is again detected.

## 4.6 Interrupts

ESP32-P4's VDMA can generate the interrupt signal AXI\_DMAC\_INTR that will be sent to the [Interrupt Matrix](#).

The interrupt signal is generated by the internal interrupt sources from VDMA.

- Common interrupts:
  - DMAC\_SLVIF\_UNDEFINEDREG\_DEC\_ERR\_INT: Slave interface undefined register decode error interrupt
  - DMAC\_SLVIF\_COMMONREG\_RD2WO\_ERR\_INT: Slave interface common register read to write-only error interrupt
  - DMAC\_SLVIF\_COMMONREG\_WR2RO\_ERR\_INT: Slave interface common register write to read-only error Interrupt
  - DMAC\_SLVIF\_COMMONREG\_DEC\_ERR\_INT: Slave interface common register decode error interrupt
- Channel interrupts ( $n = 1 \sim 4$ ):
  - DMAC\_CH $n$ \_CH\_ABORTED\_INT: Channel aborted interrupt
  - DMAC\_CH $n$ \_CH\_DISABLED\_INT: Channel disabled interrupt
  - DMAC\_CH $n$ \_CH\_SUSPENDED\_INT: Channel suspended interrupt
  - DMAC\_CH $n$ \_CH\_SRC\_SUSPENDED\_INT: Channel source suspended interrupt
  - DMAC\_CH $n$ \_SLVIF\_SHADOWREG\_WRON\_VALID\_ERR\_INT: Shadow register write on valid error interrupt

- DMAC\_CH $n$ \_SLVIF\_WRONCHEN\_ERR\_INT: Slave interface write on enabled channel error interrupt
- DMAC\_CH $n$ \_SLVIF\_RD2RWO\_ERR\_INT: Slave interface read to write-only error interrupt
- DMAC\_CH $n$ \_SLVIF\_WR2RO\_ERR\_INT: Slave interface write to read-only error interrupt
- DMAC\_CH $n$ \_SLVIF\_DEC\_ERR\_INT: Slave interface decode error interrupt
- DMAC\_CH $n$ \_SLVIF\_MULTIBLKTYPE\_ERR\_INT: Slave interface multi-block type error interrupt
- DMAC\_CH $n$ \_SHADOWREG\_OR\_LLI\_INVALID\_ERR\_INT: Shadow register or LLI invalid error interrupt
- DMAC\_CH $n$ \_LLI\_WR\_SLV\_ERR\_INT: LLI write slave error interrupt
- DMAC\_CH $n$ \_LLI\_RD\_SLV\_ERR\_INT: LLI read slave error interrupt
- DMAC\_CH $n$ \_LLI\_WR\_DEC\_ERR\_INT: LLI write decode error interrupt
- DMAC\_CH $n$ \_LLI\_RD\_DEC\_ERR\_INT: LLI read decode error interrupt
- DMAC\_CH $n$ \_DST\_SLV\_ERR\_INT: Destination slave error interrupt
- DMAC\_CH $n$ \_SRC\_SLV\_ERR\_INT: Source slave error interrupt
- DMAC\_CH $n$ \_DST\_DEC\_ERR\_INT: Destination decode error interrupt
- DMAC\_CH $n$ \_SRC\_DEC\_ERR\_INT: Source decode error interrupt
- DMAC\_CH $n$ \_DST\_TRANSCOMP\_INT: Destination transfer completed interrupt
- DMAC\_CH $n$ \_SRC\_TRANSCOMP\_INT: Source transfer completed interrupt
- DMAC\_CH $n$ \_DMA\_TFR\_DONE\_INT: DMA transfer done interrupt
- DMAC\_CH $n$ \_BLOCK\_TFR\_DONE\_INT: Block transfer done interrupt

## 4.7 Programming Procedures

This section outlines the programming steps for different types of transfers.

### 4.7.1 Common Programming Procedures

The following two steps are common and should be performed before other programming procedures.

1. Set [HP\\_SYS\\_CLKRST\\_GDMA\\_SYS\\_CLK\\_EN](#) to 1 to enable VDMA bus clock.
2. Configure [TEE\\_DMA\\_GDMA\\_CH \$n\$ \\_W\\_PMS](#) and [TEE\\_DMA\\_GDMA\\_CH \$n\$ \\_R\\_PMS](#) to define the access permission of VDMA. For more details please refer to Chapter [18 Permission Control \(PMS\)](#).

### 4.7.2 Programming Procedures for Shadow-Register-Based Multi-Block Transfer

1. Read [DMAC\\_CH \$n\$ \\_EN](#) to select an available (unused) channel.
2. Configure [DMAC\\_CH \$n\$ \\_SRC\\_MULTBLK\\_TYPE](#) and/or [DMAC\\_CH \$n\$ \\_DST\\_MULTBLK\\_TYPE](#) to 2 to enable shadow-register-based multi-block transfer for source transfer and/or destination transfer.

3. Configure [DMAC\\_CHn\\_SARO\\_REG](#) and/or [DMAC\\_CHn\\_DARO\\_REG](#), [DMAC\\_CHn\\_BLOCK\\_TS](#), [DMAC\\_CHn\\_CTLO\\_REG](#), and [DMAC\\_CHn\\_CTL1\\_REG](#) for the first block. VDMA loads the configured values to the corresponding shadow registers.

**Notice:** The [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_VALID](#) field in [DMAC\\_CHn\\_CTL1\\_REG](#) must be the last one to be set to 1.

4. Set [DMAC\\_CHn\\_EN](#) to 1 to enable the corresponding channel.
5. VDMA initiates the DMA block transfer operation based on the configurations.
  - The block transfer might start immediately or after the handshaking request, depending on [DMAC\\_CHn\\_TT\\_FC](#). Specifically,
    - When the source is memory, the source transfer starts immediately; when the destination is memory, the destination transfer starts immediately.
    - When the source is a peripheral, obtaining data from the source requires waiting for a handshake with the source. When the destination is a peripheral, writing data to the destination requires waiting for a handshake with the destination.
  - VDMA checks [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_VALID](#) and if it is seen as 0, VDMA waits until software writes 1 to [DMAC\\_CHn\\_BLK\\_TFR\\_RESUMEREQ](#) to indicate valid shadow registers availability. Then VDMA re-attempts shadow register fetch operation. In this case, VDMA may generate a [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_INVALID\\_ERR\\_INT](#) interrupt.
  - VDMA checks [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_VALID](#) and if it is seen as 1, VDMA copies the shadow register contents to the registers used for executing the DMA block transfer (i.e., [DMAC\\_CHn\\_SARO\\_REG](#) and/or [DMAC\\_CHn\\_DARO\\_REG](#), [DMAC\\_CHn\\_BLOCK\\_TS](#), [DMAC\\_CHn\\_CTLO\\_REG](#), and [DMAC\\_CHn\\_CTL1\\_REG](#)) and clears [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_VALID](#).
    - If VDMA sees [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_LAST](#) as 1, it understands that the current block is the final block in the transfer and completes the DMA transfer operation at the end of current block transfer.
    - If VDMA sees [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_LAST](#) as 0, it understands that there are one or more blocks to be transferred and checks [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_VALID](#) again at the end of current block transfer.

6. Software waits [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_VALID](#) to be cleared to 0.
7. Configure [DMAC\\_CHn\\_SARO\\_REG](#) and/or [DMAC\\_CHn\\_DARO\\_REG](#), [DMAC\\_CHn\\_BLOCK\\_TS](#), [DMAC\\_CHn\\_CTLO\\_REG](#), and [DMAC\\_CHn\\_CTL1\\_REG](#) for the next block. If the next block is the last block, set [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_LAST](#) to 1.

**Notice:** [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_VALID](#) must be the last to be set to 1.

8. Software waits for a [DMAC\\_CHn\\_BLOCK\\_TFR\\_DONE\\_INT](#) interrupt or polls [DMAC\\_CHn\\_BLOCK\\_TFR\\_DONE\\_INTSTAT](#) until it reads as 1 and goes back to Step 6.

**Note:**

In cases where a [DMAC\\_CHn\\_SHADOWREG\\_OR\\_LLI\\_INVALID\\_ERR\\_INT](#) interrupt is generated, follow the recommended flow to resume transfer:

- Configure `DMAC_CHn_SARO_REG` and/or `DMAC_CHn_DARO_REG`, `DMAC_CHn_BLOCK_TS`, `DMAC_CHn_CTLO_REG`, and `DMAC_CHn_CTL1_REG` for the next block.
- Set `DMAC_CHn_CLEAR_SHADOWREG_OR_LLI_INVALID_ERR_INTSTAT` to 1 to clear the interrupt.
- Set `DMAC_CHn_BLK_TFR_RESUMEREQ` to 1 to request for resuming block transfer.

### 4.7.3 Programming Procedures for Linked-List-Based Multi-Block Transfer

1. Reads `DMAC_CHn_EN` to select an available (unused) channel.
2. Configure `DMAC_CHn_SRC_MULTBLK_TYPE` and/or `DMAC_CHn_DST_MULTBLK_TYPE` to 3 to enable linked-list-based transfer for source transfer and/or destination transfer.
3. Configure `DMAC_CHn_LLPO_REG` to define the base address of the first linked list item and the master interface on which the linked list item is available.
4. Create one or more linked list items in the system memory. You can create the entire linked list item in advance or dynamically extend it using `DMAC_CHn_SHADOWREG_OR_LLI_VALID` and `DMAC_CHn_SHADOWREG_OR_LLI_LAST` fields of the LLI. Follow the steps below to dynamically extend the linked list.
  - During the DMA transfer process, when the linked list is not ready, configure `DMAC_CHn_SHADOWREG_OR_LLI_VALID` in the linked list to 0 and wait until the linked list is prepared. Then set `DMAC_CHn_SHADOWREG_OR_LLI_VALID` to 1 to extend the linked list.
  - When it is time to end the DMA transfer, set `DMAC_CHn_SHADOWREG_OR_LLI_LAST` of the last linked list to 1 to indicate the end of the transfer.
5. Set `DMAC_CHn_EN` to 1 to enable the channel.

**Note:**

You can swap the sequence of Step 4 and Step 5. However, if Step 5 is performed before Step 4, or if the linked list item for the next block transfer is not available in system memory during the multi-block transfer (i.e., `DMAC_CHn_SHADOWREG_OR_LLI_VALID` of the fetched LLI is 0), VDMA may generate a `DMAC_CHn_SHADOWREG_OR_LLI_INVALID_ERR_INT` interrupt.

6. VDMA initiates the DMA block transfer operation based on the configurations. The block transfer might start immediately or after the handshaking request, depending on `DMAC_CHn_TT_FC`. VDMA copies the linked list contents to the registers used for executing the DMA block transfer (i.e., `DMAC_CHn_SARO_REG` and/or `DMAC_CHn_DARO_REG`, `DMAC_CHn_BLOCK_TS`, `DMAC_CHn_CTLO_REG`, and `DMAC_CHn_CTL1_REG`) and initiates the DMA block transfer.
7. During the linked list fetch phase:
  - If VDMA reads `DMAC_CHn_SHADOWREG_OR_LLI_LAST` as 1, it understands that the current block is the final block in the transfer and completes the DMA transfer operation at the end of the current block transfer.
  - If VDMA reads `DMAC_CHn_SHADOWREG_OR_LLI_LAST` as 0, it understands that there are one or more blocks to be transferred and goes to Step 6.

- If VDMA reads `DMAC_CHn_SHADOWREG_OR_LLI_VALID` as 0, it may generate a `DMAC_CHn_SHADOWREG_OR_LLI_INVALID_ERR_INT` interrupt. VDMA waits until software writes 1 to `DMAC_CHn_BLK_TFR_RESUMEREQ` to indicate valid LLI availability before re-attempting the LLI read operation.

#### 4.7.4 Programming Procedures for Single-Block Transfer

1. Read `DMAC_CHn_EN` to choose a free (unused) channel.
2. Configure `DMAC_CHn_SRC_MULTBLK_TYPE` and `DMAC_CHn_DST_MULTBLK_TYPE` to 0 to enable contiguous-address-based single-block transfer.
3. Configure `DMAC_CHn_SARO_REG` and/or `DMAC_CHn_DARO_REG`, `DMAC_CHn_BLOCK_TS`, `DMAC_CHn_CTLO_REG`, and `DMAC_CHn_CTL1_REG` for the block.
4. Set `DMAC_CHn_EN` to 1 to enable the channel.
5. Software waits for the `DMAC_CHn_BLOCK_TFR_DONE_INT` interrupt or polls `DMAC_CHn_BLOCK_TFR_DONE_INTSTAT` until it is 1.

## 4.8 Register Summary

The addresses in this section are relative to the VDMA base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name  | Description   | Address | Access |
|---|---|---------|--------|
| <b>Version Control Registers</b>                |   |         |        |
| <a href="#">DMAC_IDO_REG</a>                    | VDMA ID number  | 0x0000  | RO     |
| <a href="#">DMAC_COMPVERO_REG</a>               | VDMA version number                                   | 0x0008  | RO     |
| <b>Configuration Registers</b>                  |   |         |        |
| <a href="#">DMAC_CFGO_REG</a>                   | VDMA Configuration register                           | 0x0010  | R/W    |
| <a href="#">DMAC_CHENO_REG</a>                  | VDMA channel enable register                          | 0x0018  | varies |
| <a href="#">DMAC_RESETO_REG</a>                 | VDMA reset control register                           | 0x0058  | R/W    |
| <a href="#">DMAC_LOWPOWER_CFGO_REG</a>          | VDMA low power configuration register 0               | 0x0060  | R/W    |
| <a href="#">DMAC_LOWPOWER_CFG1_REG</a>          | VDMA low power configuration register 1               | 0x0064  | R/W    |
| <a href="#">DMAC_CH1_SARO_REG</a>               | VDMA channel 1 source address register                | 0x0100  | R/W    |
| <a href="#">DMAC_CH1_DARO_REG</a>               | VDMA channel 1 destination address register           | 0x0108  | R/W    |
| <a href="#">DMAC_CH1_BLOCK_TSO_REG</a>          | VDMA channel 1 block transfer size register           | 0x0110  | R/W    |
| <a href="#">DMAC_CH1_CTLO_REG</a>               | VDMA channel 1 control register 0                     | 0x0118  | R/W    |

## 4.9 Registers

The addresses in this section are relative to the VDMA base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

Register 4.1. DMAC\_IDO\_REG (0x0000)

**DMAC\_DMID** Represents VDMA ID number. (RO)

Register 4.2. DMAC\_COMPVERO\_REG (0x0008)

**DMAC\_DMCOMPVER** Represents VDMA version number. (RO)

Register 4.3. DMAC\_CFG0\_REG (0x0010)

**DMAC\_DMEN** Configures whether to enable VDMA.

0: Disable

1: Enable

**Note:** If this field is cleared but a channel is still active, this field will still return 1. When hardware has terminated activity on all channels, this field will return 0.

(R/W)

**DMAC\_INT\_EN** Configures whether to enable global interrupt.

0: Disable

1: Enable

(R/W)

#### Register 4.4. DMAC\_CHENO\_REG (0x0018)

[illegible]

**DMAC\_CH $n$ \_EN ( $n$ : 1-4)** Configures whether to enable VDMA channel  $n$ . Hardware automatically clears this bit after the last AXI transfer of the DMA transfer has been completed. Software can poll this field to determine when this channel is free for a new DMA transfer.

0: Disable channel *n*

1: Enable channel  $n$

(R/W)

**DMAC\_CH*n*\_EN\_WE (*n*: 1-4)** Configures whether to enable write to **DMAC\_CH*n*\_EN**. This field always reads as 0.

0: Disable write to `DMAC_CHn_EN`

1: Enable write to DMAC\_CHn\_EN

(WO)

**DMAC\_CH $n$ \_SUSP** ( $n$ : 1-4) Configures whether to suspend channel  $n$ .

0: Do not suspend channel  $n$

1: Suspend channel  $n$

Software can clear this field to 0 after VDMA sets `DMAC_CHn_CH_SUSPENDED_INTSTAT` to 1, to exit the channel suspend mode.

**Note:** This field is cleared when channel *n* is disabled.

(R/W)

**DMAC\_CHn\_SUSP\_WE** (*n*: 1-4) Configures whether to enable write to **DMAC\_CHn\_SUSP**. This field always reads as 0.

0: Disable write to DMAC\_CHn\_SUSP

1: Enable write to DMAC CH<sub>n</sub> SUSP

(WO)

**Register 4.5. DMAC\_RESETO\_REG (0x0058)**

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |               |       |   |   |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---------------|-------|---|---|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | DMAC_DMAR_RST |       |   |   |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 1 | 0             | Reset |   |   |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0             |       | 0 | 0 |

**DMAC\_DMAC\_RST** Configures whether to reset VDMA. Software writes 1 to this field to reset VDMA and polls this field to see if it is 0. VDMA resets all the modules except the APB slave interface module and clears this field to 0.

**Note:** Software is not allowed to write 0 to this field.

(R/W)

**Register 4.6. DMAC\_LOWPOWER\_CFGO\_REG (0x0060)**

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                   |   |   |       |                   |  |  |  |                   |  |  |  |                  |  |  |  |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-------------------|---|---|-------|-------------------|--|--|--|-------------------|--|--|--|------------------|--|--|--|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | DMAC_MXIF_CSLP_EN |   |   |       | DMAC_SBIU_CSLP_EN |  |  |  | DMAC_CHNL_CSLP_EN |  |  |  | DMAC_GBL_CSLP_EN |  |  |  |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 4                 | 3 | 2 | 1     | 0                 |  |  |  |                   |  |  |  |                  |  |  |  |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1                 | 1 | 1 | Reset |                   |  |  |  |                   |  |  |  |                  |  |  |  |

**DMAC\_GBL\_CSLP\_EN** Configures whether to enable global low-power feature.

0: Disable

1: Enable

(R/W)

**DMAC\_CHNL\_CSLP\_EN** Configures whether to enable low-power feature for DMA channels.

0: Disable

1: Enable

(R/W)

**DMAC\_SBIU\_CSLP\_EN** SBIU Configures whether to enable low-power feature for slave bus interface.

0: Disable

1: Enable

(R/W)

**DMAC\_MXIF\_CSLP\_EN** Configures whether to enable low-power feature for AXI master interface.

0: Disable

1: Enable

(R/W)

Register 4.7. DMAC\_LOWPOWER\_CFG1\_REG (0x0064)

| 0 |  |  |  |  |  |  |  |

**DMAC\_GLCH\_LPDLY** Configures the value of the AXI master interface low-power delay counter. The programmed value must be greater than or equal to 0x4. If it is less than 0x4, the field will reset to 0x40. (R/W)

**DMAC\_SBIU\_LPDLY** Configures the value of the SBIU low-power delay counter. The programmed value must be greater than or equal to 0x4. If it is less than 0x4, the field will reset to 0x40. (R/W)

**DMAC\_MXIF\_LPDLY** Configures the value of the global low-power delay counter and the DMA channel low-power delay counter. The programmed value must be greater than or equal to 0x4. If it is less than 0x4, the field will reset to 0x40. (R/W)

Register 4.8. DMAC\_CH $n$ \_SARO\_REG ( $n$ : 1-4) (0x0100\* $n$ )

|                            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |

**DMAC\_CH $n$ \_DARO** Configures the destination address of DMA transfer. This field is updated after each source transfer. **DMAC\_CH $n$ \_DINC** determines whether the address increments or remains unchanged on every destination transfer throughout the block transfer. (R/W)

Register 4.10. DMAC\_CHn\_BLOCK\_TSO\_REG (n: 1-4) (0x0100\*n + 0x0010)

**DMAC\_CHn\_BLOCK\_TS** Configures the total number of **DMAC\_CHn\_SRC\_TR\_WIDTH** in a DMA transfer. The programming range of this field is 0 ~ 4,194,303.  
Block transfer size = Programmed value + 1  
(R/W)

Register 4.11. DMAC\_CH $n$ \_CTLO\_REG ( $n$ : 1-4) (0x0100\* $n$  + 0x0018)

**DMAC\_CH $n$ \_SMS** Configures which AXI master to access the source.

0: AXI Master 1

1: AXI Master 2

(R/W)

**DMAC\_CH $n$ \_DMS** Configures which AXI master to access the destination.

0: AXI Master 1

1: AXI Master 2

(R/W)

**DMAC\_CH $n$ \_SINC** Configures whether to increment the source address on every source transfer.

If VDMA is fetching data from a source peripheral's FIFO at a fixed address, then set this field to 1.

0: Increment

1: No change

(R/W)

**DMAC\_CH $n$ \_DINC** Configures whether to increment the destination address on every destination transfer. If VDMA is writing data to a source peripheral's FIFO at a fixed address, then set this field to 1.

0: Increment

1: No change

(R/W)

**DMAC\_CH $n$ \_SRC\_TR\_WIDTH** Configures source transfer width.

0x0: 8 bits

0x1: 16 bits

0x2: 32 bits

0x3: 64 bits

(R/W)

Continued on the next page...

**Register 4.11. DMAC\_CH $n$ \_CTLO\_REG ( $n$ : 1-4) (0x0100\* $n$  + 0x0018)**

Continued from the previous page...

**DMAC\_CH $n$ \_DST\_TR\_WIDTH** Configures destination transfer width.

0x0: 8 bits  
0x1: 16 bits  
0x2: 32 bits  
0x3: 64 bits  
(R/W)

**DMAC\_CH $n$ \_SRC\_MSIZ** Configures the length of the source burst transaction. Every time the handshaking interface requests for a source burst transaction, the read value of this field from the source is the number of data items, each of width **DMAC\_CH $n$ \_SRC\_TR\_WIDTH**.

0x0: 1 data item  
0x1: 4 data items  
0x2: 8 data items  
0x3: 16 data items  
0x4: 32 data items  
0x5: 64 data items  
0x6: 128 data items  
0x7: 256 data items  
0x8: 512 data items  
0x9: 1024 data items  
(R/W)

**DMAC\_CH $n$ \_DST\_MSIZ** Configures the length of the destination burst transaction. Every time the handshaking interface requests for a destination burst transaction, the read value of this field from the destination is the number of data items, each of width **DMAC\_CH $n$ \_SRC\_TR\_WIDTH**.

0x0: 1 data item  
0x1: 4 data items  
0x2: 8 data items  
0x3: 16 data items  
0x4: 32 data items  
0x5: 64 data items  
0x6: 128 data items  
0x7: 256 data items  
0x8: 512 data items  
0x9: 1024 data items  
(R/W)

Continued on the next page...

**Register 4.11. DMAC\_CH $n$ \_CTLO\_REG ( $n$ : 1-4) (0x0100\* $n$  + 0x0018)**

Continued from the previous page...

**DMAC\_CH $n$ \_NONPOSTED\_LASTWRITE\_EN** Configures whether to enable non-posted writes throughout the block transfer.

Posted writes refers to sending data without the need to write the data into the destination (the data may still be in transit); VDMA can consider this write request to be complete. Non-posted writes refers to sending data that needs to be written into the destination and requires a response, only then can VDMA consider this write request to be complete.

0: Posted writes can be used throughout the block transfer.

1: Posted writes can be used at the end of the block transfer (within the block). The last write must be non-posted to ensure synchronization between the generation of the block completion interrupt and the final written data reaching the destination.

(R/W)

Register 4.12. DMAC\_CH $n$ \_CTL1\_REG ( $n$ : 1-4) (0x0100\* $n$  + 0x001C)

|  |    |    |    |    |    |    |    |    |     |    |    |    |    |    |    |    |     |    |    |    |    |   |   |   |   |   |   |   |   |   |   | Reset |   |  |  |  |  |  |  |  |  |  |  |  |  |            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                             |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                             |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

**DMAC\_CH $n$ \_ARLEN\_EN** Configures whether to enable the length of the source burst transfer.

0: VDMA uses any possible value that is less than or equal to 16 as the length of the source burst transfer.

1: VDMA uses the value of **DMAC\_CH $n$ \_ARLEN** as the length of the source burst transfer till the extent possible. The remaining transfers use the maximum possible burst transfer length. For example, if the data size is 192 bytes and the source burst transfer length **DMAC\_CH $n$ \_ARLEN** is set to 128 bytes, then after transmitting 128 bytes, the remaining 64 bytes is the maximum possible burst transfer length.

(R/W)

**DMAC\_CH $n$ \_ARLEN** Configures the length of the source burst transfer. The specified burst length is used for source data transfer till the extent possible. The remaining transfers use the maximum possible value that is less than or equal to 16.

(R/W)

**DMAC\_CH $n$ \_AWLEN\_EN** Configures whether to enable the length of the destination burst transfer.

0: VDMA uses any possible value that is less than or equal to 16 as the length of the destination burst transfer.

1: VDMA uses the value of **DMAC\_CH $n$ \_AWLEN** as the length of the destination burst transfer till the extent possible. The remaining transfers use the maximum possible burst transfer length.

(R/W)

**DMAC\_CH $n$ \_AWLEN** Configures the length of the destination burst transfer. The specified burst length is used for destination data transfer till the extent possible. The remaining transfers use the maximum possible value that is less than or equal to 16.

(R/W)

**DMAC\_CH $n$ \_SRC\_STAT\_EN** Configures whether to enable fetch of source status.

This logic enables the fetch of the status from the source peripheral of channel  $n$  pointed to by **DMAC\_CH $n$ \_SSTATARO**. The value is subsequently stored in **DMAC\_CH $n$ \_SSTAT**. At the end of each block transfer, the status value is written back to the **DMAC\_CH $n$ \_SSTAT** register of the linked list, if either source or destination peripheral uses linked-list-based multi-block transfer.

0: Do not fetch source status

1: Fetch source status and store the value in **DMAC\_CH $n$ \_SSTAT**

(R/W)

Continued on the next page...

**Register 4.12. DMAC\_CH $n$ \_CTL1\_REG ( $n$ : 1-4) (0x0100\* $n$  + 0x001C)**

Continued from the previous page...

**DMAC\_CH $n$ \_DST\_STAT\_EN** Configures whether to enable fetch of destination status.

This logic enables the fetch of the status from the destination peripheral of channel  $n$  pointed to by [DMAC\\_CH \$n\$ \\_DSTATARO](#). The value is subsequently stored in [DMAC\\_CH \$n\$ \\_DSTAT](#). At the end of each block transfer, the status value is written back to the [DMAC\\_CH \$n\$ \\_DSTAT](#) register of the linked list, if either source or destination peripheral uses linked-list-based multi-block transfer.

0: Do not fetch destination status

1: Fetch destination status and store the value in [DMAC\\_CH \$n\$ \\_DSTAT](#)

(R/W)

**DMAC\_CH $n$ \_IOC\_BLKTRF** Configures whether to enable the interrupt on completion of multi-block transfer based on shadow register or linked list.

**Note:** If the source and destination uses contiguous-address or auto-reloading-based multi-block transfer, this field cannot be modified on a block by block basis. In addition, the programmed value before enabling the channel will be used for all the blocks in DMA transfer.

0: Disable [DMAC\\_CH \$n\$ \\_BLOCK\\_TFR\\_DONE\\_INTSTAT](#)

1: Enable [DMAC\\_CH \$n\$ \\_BLOCK\\_TFR\\_DONE\\_INTSTAT](#), valid when

[DMAC\\_CH \$n\$ \\_ENABLE\\_BLOCK\\_TFR\\_DONE\\_INTSTAT](#) is 1. To output a [DMAC\\_CH \$n\$ \\_BLOCK\\_TFR\\_DONE\\_INT](#) interrupt, set [DMAC\\_CH \$n\$ \\_ENABLE\\_BLOCK\\_TFR\\_DONE\\_INTSIGNAL](#) to 1.

(R/W)

**DMAC\_CH $n$ \_SHADOWREG\_OR\_LLI\_LAST** Configures whether the shadow register or linked list item is the last one.

0: Not the last one

1: The last one

(R/W)

**DMAC\_CH $n$ \_SHADOWREG\_OR\_LLI\_VALID** Configures whether the contents of shadow register or the linked list item are valid.

0: Invalid

1: Valid

(R/W)

**Register 4.13. DMAC\_CH*n*\_CFG0\_REG (*n*: 1-4) (0x0100\**n* + 0x0120)**

**DMAC\_CHn\_SRC\_MULTBLK\_TYPE** Configures the source multi-block transfer type.

- 0: Contiguous address
- 1: Auto reloading
- 2: Shadow register
- 3: Linked list

(R/W)

**DMAC\_CHn\_DST\_MULTBLK\_TYPE** Configures the destination multi-block transfer type.

- 0: Contiguous address
- 1: Auto reloading
- 2: Shadow register
- 3: Linked list

If both `DMAC_CHn_SRC_MULTBLK_TYPE` and `DMAC_CHn_DST_MULTBLK_TYPE` are 0, then the transfer type is single-block transfer based on contiguous address.

(R/W)

**Register 4.14. DMAC\_CH $n$ \_CFG1\_REG ( $n$ : 1-4) (0x0100\* $n$  + 0x0124)**

|            |     |                                   |     |                                   |     |                                 |    |                               |    |                                |    |            |     |                               |   |            |     |                               |   |            |   |                             |       |

**DMAC\_CHn\_TT\_FC** Configures transfer type and flow controller.

0x0: Transfer type is memory to memory and flow controller is VDMA

Ox1: Transfer type is memory to peripheral and flow controller is VDMA

0x2: Transfer type is peripheral to memory and flow controller is VDMA

0x3: Invalid

Ox4: Transfer type is peripheral to memory and flow controller is source peripheral

0x5: Invalid

0x6: Transfer type is memory to peripheral and flow controller is destination peripheral

0x7: Invalid

(R/W)

**DMAC\_CH $n$ \_SRC\_PER** Assigns a handshaking interface (0 ~ 2) to the source of channel  $n$ . (R/W)

**DMAC\_CH $n$ \_DST\_PER** Assigns a handshaking interface (0 ~ 2) to the destination of channel  $n$ .  
(R/W)

**DMAC\_CHn\_CH\_PRIOR** Assigns channel priority (0 ~ 3). A priority of 3 is the highest priority, and 0 is the lowest. A programmed value outside this range will cause erroneous behavior. (R/W)

**DMAC\_CH<sub>n</sub>\_LOCK\_CH** VDMA does not support lock feature. Reads of this field always return 0.  
(RO)

**DMAC\_CH<sub>n</sub>\_LOCK\_CH\_L** VDMA does not support lock feature. Reads of this field always return 0.  
(RO)

**DMAC\_CHn\_SRC\_OSR\_LMT** Configures the limit of the source AXI Outstanding request. The maximum number of AXI Outstanding request is 16.

Source AXI Outstanding request limit = Programmed value + 1.

AXI Outstanding is a feature in the AXI protocol that allows to send request before the previous request response is received, thereby increasing the bandwidth of the bus interface.

(R/W)

**DMAC\_CHn\_DST\_OSR\_LMT** Configures the limit of the destination AXI Outstanding request. The maximum number of AXI Outstanding request is 16.

Destination AXI Outstanding request limit = Programmed value + 1.

(R/W)

Register 4.15. DMAC\_CHn\_LLPO\_REG (n: 1-4) (0x0100\*n + 0x0128)

**DMAC\_CHn\_LMS** Selects the AXI master for accessing LLI.

0: AXI Master 1

1: AXI Master 2

(R/W)

**DMAC\_CHn\_LOCO** Configures the starting address of the first linked list item in memory. The six least significant bits (LSB) of the starting address are not stored because it is assumed that the address is 64-byte aligned. (R/W)

Register 4.16. DMAC\_CHn\_BLK\_TFR\_RESUMEREQ0\_REG (n: 1-4) (0x0100\*n + 0x0148)

**DMAC\_CHn\_BLK\_TFR\_RESUMEREQ** Configures whether to request to resume block transfer during linked-list or shadow-register-based multi-block transfer.

0: Do not request to resume block transfer

1: Request to resume block transfer

(WO)

Register 4.17. DMAC\_CH $n$ \_AXI\_ID0\_REG (0x0150)

**DMAC\_CH $n$ \_AXI\_READ\_ID\_SUFFIX** Configure the least significant bit of AXI read ID. (R/W)

**DMAC\_CH $n$ \_AXI\_WRITE\_ID\_SUFFIX** Configure the least significant bit of AXI write ID. (R/W)

Register 4.18. DMAC\_INTSTATUS0\_REG (0x0030)

**DMAC\_CH $n$ \_INTSTAT ( $n$ : 1-4)** Indicates the interrupt status for channel  $n$ .

1: Interrupt is active

0: Interrupt is inactive

(RO)

**DMAC\_COMMONREG\_INTSTAT** Indicates the common register interrupt status.

1: Interrupt is active

0: Interrupt is inactive

(RO)

#### Register 4.22. DMAC\_COMMONREG\_INTSTATUS0\_REG (0x0050)

**DMAC\_SLVIF\_COMMONREG\_DEC\_ERR\_INTSTAT** Slave interface common register decode error interrupt status bit. This error occurs when VDMA accesses an invalid address in the common register space (0x000 to 0x0FF).

0: No error occurs

1: Error occurs

(RO)

**DMAC\_SLVIF\_COMMONREG\_WR2RO\_ERR\_INTSTAT** Slave interface common register write to read-only error interrupt status bit. This error occurs when a write operation is performed to a read-only register in the common register space (0x000 to 0xFF).

0: No error occurs

1: Error occurs

(RO)

**DMAC\_SLVIF\_COMMONREG\_RD2WO\_ERR\_INTSTAT** Slave interface common register read to write-only error interrupt status bit. This error occurs when a read operation is performed to a write-only register in the common register space (0x000 to 0xFF).

0: No error occurs

1: Error occurs

(RO)

**DMAC\_SLVIF\_UNDEFINEDREG\_DEC\_ERR\_INTSTAT** Slave interface undefined register decode error interrupt signal enable bit. This error occurs when the register access is to undefined address range (>0x4FF).

0: No error occurs

1: Error occurs

(RO)

**DMAC\_CH $n$ \_CMPLTD\_BLK\_TFR\_SIZE** Indicates the total number of data of width **DMAC\_CH $n$ \_SRC\_TR\_WIDTH** transferred during the previous block transfer.

If any error occurs during DMA transfer, the block transfer might be terminated early. In such case, the value of this field indicates the actual data transferred without error in the current block.

This field is cleared to 0 when the channel is enabled.

 |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  | |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0</ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

**DMAC\_CH $n$ \_DATA\_LEFT\_IN\_FIFO** Indicates the total number of remaining data in the VDMA channel FIFO after completing the current block transfer.

The data width in the channel FIFO is **DMAC\_CH $n$ \_SRC\_TR\_WIDTH**.

For a normal block transfer completion without errors, the value of this field is 0. If any errors occur during DMA transfer, the block transfer may be terminated early; in this case, this field indicates the remaining data in the channel FIFO that cannot be transferred to the target peripheral.

This field will be cleared when the channel is enabled.

If **DMAC\_CH $n$ \_DST\_TR\_WIDTH** > **DMAC\_CH $n$ \_SRC\_TR\_WIDTH**, there may be remaining data in the FIFO that is not enough to form a single transfer of **DMAC\_CH $n$ \_SRC\_TR\_WIDTH** width; in this case, this field will return 0.

(RO)

**Register 4.29. DMAC\_CH $n$ \_SSTATO\_REG ( $n$ : 1-4) (0x0100\* $n$  + 0x0160)**

**DMAC\_CH $n$ \_SSTAT** Indicates the source status information retrieved by hardware from the address pointed to by [DMAC\\_CH \$n\$ \\_SSTATARO\\_REG](#). (RO)

**Register 4.30. DMAC\_CH $n$ \_DSTATO\_REG ( $n$ : 1-4) (0x0100\* $n$  + 0x0168)**

**DMAC\_CH $n$ \_DSTAT** Indicates the destination status information retrieved by hardware from the address pointed to by [DMAC\\_CH \$n\$ \\_DSTATARO\\_REG](#). (RO)

**Register 4.31. DMAC\_CH $n$ \_SSTATARO\_REG ( $n$ : 1-4) (0x0100\* $n$  + 0x0170)**

**DMAC\_CH $n$ \_SSTATARO** Configures the address from where the hardware obtains the source status information. (R/W)

Register 4.32. DMAC\_CHn\_DSTATARO\_REG (n: 1-4) (0x0100\*n + 0x0178)

**DMAC\_CHn\_DSTATARO** Configures the address from where the hardware obtains the destination status information. (R/W)

## Chapter 5

### 2D-DMA Controller (2D-DMA)

#### 5.1 Overview

The 2D-DMA controller is a DMA (Direct Memory Access) dedicated to two-dimensional image processing. In addition to all the features of GDMA-AXI, it includes support for macroblock reordering and color space conversion (CSC) to better meet the data transfer requirements from JPEG and PPA. Notably, the 2D-DMA facilitates memory-to-memory transfers, enabling the movement of macroblocks between different segments of memory address space while concurrently performing color space conversion.

#### 5.2 Features

- One AXI master interface
- Data transfer with unaligned starting addresses
- Memory-to-memory, peripheral-to-memory (RX), and memory-to-peripheral (TX) data transfer
- Three memory-to-peripheral channels, and two peripheral-to-memory channels
- Support for PPA and JPEG Codec
- Macroblock reordering
- Color space conversion
- Configurable channel priority and weight

#### 5.3 Architecture

In ESP32-P4, only JPEG Codec and PPA support 2D-DMA. The 2D-DMA controller and CPU data bus have access to the same address space in memory. Figure 5.3-1 shows the basic architecture of the 2D-DMA controller.

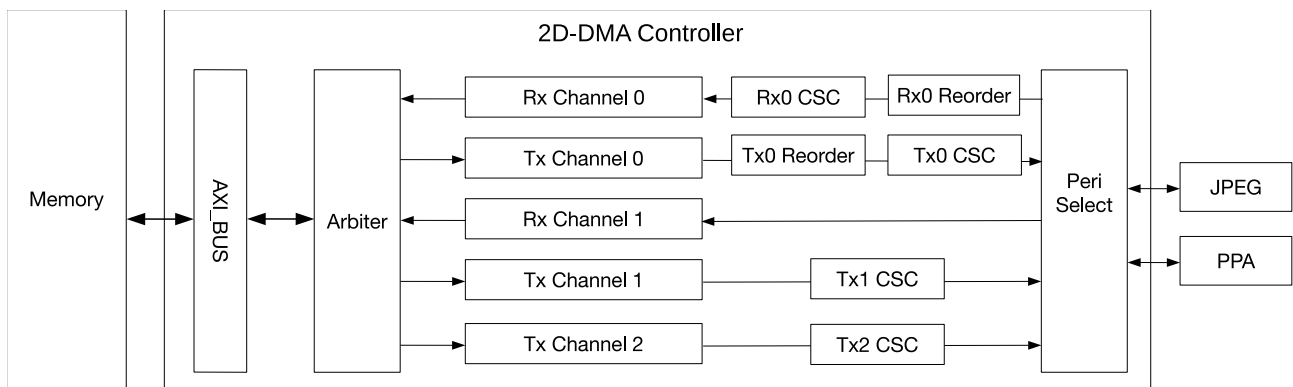

Figure 5.3-1. 2D-DMA Architecture

The 2D-DMA has five independent channels: three transmit channels and two receive channels. Every channel can be connected to different peripherals, or in other words shared by peripherals.

The macroblock reordering and color space conversion features of the 2D-DMA are not supported by all channels. Among the five channels, transmit channel 0 and receive channel 0 support macroblock reordering, while transmit channel 0 ~ 2 and receive channel 0 support color space conversion.

The 2D-DMA reads data from or writes data to the internal or external memory via AXI\_BUS. Before the data transfer, the 2D-DMA uses configurable arbitration schemes for channels requesting read or write access. For the available address range of internal and external memory, please see Chapter 6 [System and Memory](#).

The software can use the 2D-DMA through linked lists stored in internal or external memory. These linked lists consist of `outlinkn` and `inlinkn`, where `n` indicates the channel number. For `outlinkn`, `n` ranges from 0 to 2; for `inlinkn`, `n` is 0 or 1. The 2D-DMA reads an `outlinkn` (i.e., a linked list of transmit descriptors) from memory and transmit data in corresponding memory according to the `outlinkn`, or read an `inlinkn` (i.e., a linked list of receive descriptors) and store received data into specific address space in memory according to the `inlinkn`.

## 5.4 Functional Description

### 5.4.1 Transfer Mode

The 2D-DMA supports four transfer modes:

- 1D mode: enabled by setting the 2DEN field of DW0 and the mod field of DW2 to 0. In this mode, the 2D-DMA has the same functionalities as GDMA-AXI: it performs memory read/write operations based on the data length and memory space configured in the linked list, and the operation addresses are contiguous.
- 2D-MOD0 mode: enabled by setting the 2DEN field of DW0 to 1 and the mod field of DW2 to 0. In this mode, the 2D-DMA reads or writes a `hb*vb` macroblock starting from the (X, Y) coordinates of the HA\*VA image. After the last data in each row has been read or written, the address jumps to the address of the first data in the next row to be read or written.
- 2D-MOD1 mode: enabled by setting the 2DEN field of DW0 to 1 and the mod field of DW2 to 1. In this mode, the 2D-DMA reads or writes multiple macroblocks from the starting address of the HA\*VA image until the HA\*VA image has been fully read or written. For JPEG, it is necessary to configure `DMA2D_IN_MACRO_BLOCK_SIZE_CHn` or `DMA2D_OUT_MACRO_BLOCK_SIZE_CHn` to choose a

macroblock size out of the three available options (horizontal × vertical): 8 pixels × 8 pixels, 8 pixels × 16 pixels, and 16 pixels × 16 pixels. For more information about macroblock size, see Chapter 31 [JPEG Codec](#). For correspondence between macroblock size, hb, and vb of descriptors, see Table 5.4-4 and Table 5.4-5.

- DSCR-PORT mode: enabled by setting the 2DEN field of DW0 to 1, the mod field of DW2 to 0, and the [DMA2D\\_OUT\\_DSCR\\_PORT\\_EN\\_CHn](#) bit or the [DMA2D\\_IN\\_DSCR\\_PORT\\_EN\\_CHn](#) bit to 1. This mode is specifically designed for PPA. For details, see Chapter 33 [Pixel-Processing Accelerator \(PPA\)](#).

1D Mode, 2D-MOD0 Mode, 2D-MOD1 Mode, and DSCR-PORT support both peripheral-to-memory and memory-to-peripheral data transfers. Only 1D Mode and 2D-MOD0 Mode support memory-to-memory data transfers.

5.4.2 Linked List

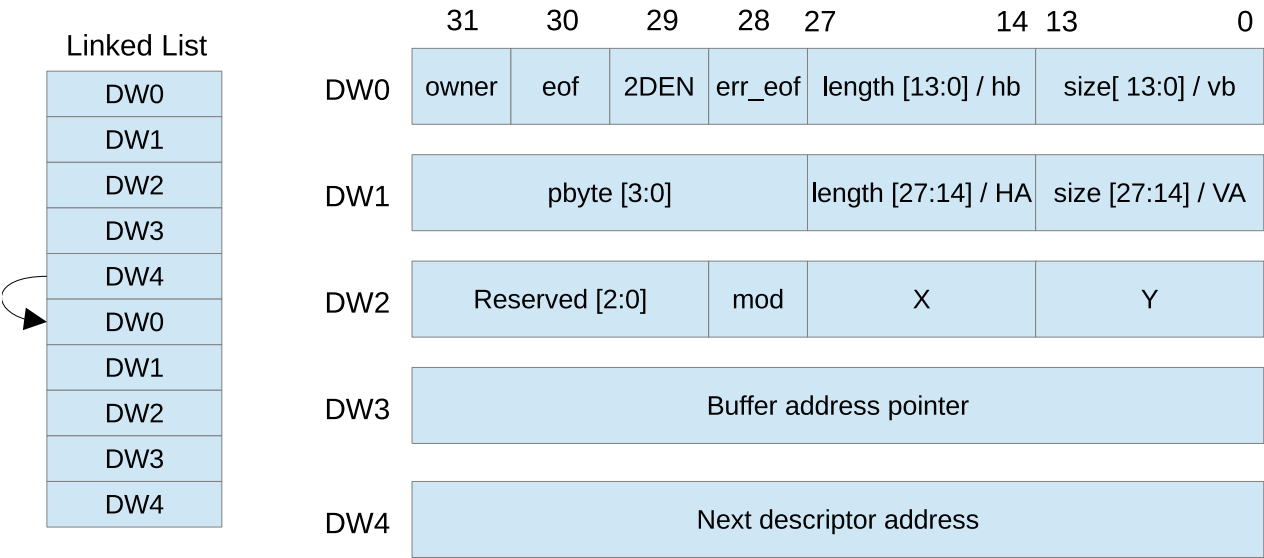

Figure 5.4-1. Structure of a Linked List

Figure 5.4-1 shows the structure of a linked list. An outlink and an inlink have the same structure. A linked list is formed by one or more descriptors, and each descriptor consists of five words. Linked lists should be stored in the memory for the 2D-DMA to be able to use them. The meanings of a descriptor’s fields are shown in Table 5.4-1.

**Note:** DMA2D\_OUT is the prefix of transmit channel registers, and DMA2D\_IN is the prefix of receive channel registers.

Table 5.4-1. Descriptor Field Description

| Bits       | Name            | Description  |
|------------|-----------------|--|
| DWO[31]    | owner           | <p>Specifies who is allowed to access the buffer that this descriptor points to.</p> <ul style="list-style-type: none"> <li>• 0: CPU can access the buffer</li> <li>• 1: The 2D-DMA controller can access the buffer</li> </ul> <p>When the 2D-DMA controller stops using the buffer, this bit in a receive descriptor is automatically cleared by hardware, while this bit in a transmit descriptor can only be automatically cleared by hardware if <code>DMA2D_OUT_AUTO_WRBCK_CHn</code> is set to 1. When software loads a linked list, this bit should be set to 1.</p> |
| DWO[30]    | eof             | <p>Specifies the end of frame.</p> <ul style="list-style-type: none"> <li>• 0: The current descriptor is not the last descriptor of an image</li> <li>• 1: The current descriptor is the last descriptor of an image</li> </ul> <p>For receive descriptors, software needs to write 0 to this bit first, and hardware would set this bit to 1 after receiving a complete image. For transmit descriptors, software should set this bit in the last descriptor of an image to 1.</p>  |
| DWO[29]    | 2DEN            | <p>Specifies whether to enable 2D functions.</p> <ul style="list-style-type: none"> <li>• 0: 2D-DMA operates in 1D mode</li> <li>• 1: 2D-DMA operates in 2D mode</li> </ul>  |
| DWO[28]    | err_eof         | <p>Specifies whether the received data has errors (JPEG only).</p> <ul style="list-style-type: none"> <li>• 0: The received data does not have errors</li> <li>• 1: The received data has errors</li> </ul> <p>For receive descriptors, the hardware sets this bit to 1 after receiving a complete image and detecting errors in the received data.</p>  |
| DWO[27:14] | length[13:0]/hb | <p><b>hb</b> in 2D mode – Specifies the horizontal width of the macroblocks to be moved in the unit of pixels.</p> <p><b>length[13:0]</b> in 1D mode – Specifies the lower 14 bits of length, which is the number of valid bytes in the buffer that this descriptor points to. This field in a transmit descriptor is written by software and indicates how many bytes can be read from the buffer; this field in a receive descriptor is written by hardware automatically and indicates how many valid bytes have been stored in the buffer.</p>                           |
| DWO[13:0]  | size[13:0]/vb   | <p><b>vb</b> in 2D mode – Specifies the vertical height of the macroblocks to be moved in the unit of pixels.</p> <p><b>size[13:0]</b> in 1D mode – Specifies the lower 14 bits of size, which is the capacity of the buffer that this descriptor points to in the unit of bytes.</p>  |

| Bits       | Name                   | Description  |
|------------|------------------------|--|
| DW1[31:28] | pbyte                  | <p>In 2D mode, specifies the number of bytes per pixel of the image to be transferred to/from the memory. (If color space conversion is applied, this field represents the number of bytes per pixel of the image stored in the memory.)</p> <ul style="list-style-type: none"> <li>• 0: 0.5 byte/pixel</li> <li>• 1: 1 byte/pixel</li> <li>• 2: 1.5 bytes/pixel</li> <li>• 3: 2 bytes/pixel</li> <li>• 4: 3 bytes/pixel</li> <li>• 5: 4 bytes/pixel</li> </ul> <p>In 1D mode, this field is not used and can be any value.</p>  |
| DW1[27:14] | length[27:14]/HA       | <p><b>HA</b> in 2D mode – Specifies the horizontal width of the original image corresponding to the macroblocks to be moved in the unit of pixels.</p> <p><b>length[27:14]</b> in 1D mode – Specifies the higher 14 bits of length.</p>  |
| DW1[13:0]  | size[27:14]/VA         | <p><b>VA</b> in 2D mode – Specifies the vertical height of the original image corresponding to the macroblocks to be moved in the unit of pixels.</p> <p><b>size[27:14]</b> in 1D mode – Specifies the higher 14 bits of size.</p>   |
| DW2[31:29] | Reserved               | Reserved. Irrelevant.  |
| DW2[28]    | mod                    | <p>Specifies the macroblock read mode.</p> <ul style="list-style-type: none"> <li>• 0: 2D-DMA reads or writes a single macroblock with horizontal width hb and vertical height vb only once</li> <li>• 1: 2D-DMA reads or writes multiple macroblocks with horizontal width hb and vertical height vb until the image data with horizontal width HA and vertical height VA is fully read or written</li> </ul> <p>In 1D mode, this bit must be 0.</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p><b>Note:</b><br/>hb/vb/HA/VA are in the unit of pixels.</p> </div> |
| DW2[27:14] | X                      | <p>In 2D mode, specifies the X coordinate of the hb*vb image block within the HA*VA image in the unit of pixels.</p> <p>In 1D mode, this field is not used and can be any value.</p>   |
| DW2[13:0]  | Y                      | <p>In 2D mode, specifies the Y coordinate of the hb*vb image block within the HA*VA image in the unit of pixels.</p> <p>In 1D mode, this field is not used and can be any value.</p>   |
| DW3        | Buffer address pointer | <p>In 2D mode, specifies the address of the HA*VA image block origin in the buffer (the address of the original image's first byte in the memory).</p> <p>In 1D mode, specifies the starting address of the buffer.</p>  |

| Bits | Name                    | Description  |
|------|-------------------------|--|
| DW4  | Next descriptor address | <p>Address of the next descriptor. If the current descriptor is the last descriptor in the linked list, this value can be 0. This address can point to the address space of internal or external memory.</p> <div style="border: 1px solid black; padding: 5px;"> <p><b>Note:</b><br/>The starting address for storing 2D-DMA descriptors must be 8-byte aligned.</p> </div> |

### 5.4.3 Padding in 2D-MOD1 Mode and DSCR-PORT Mode

This section only applies to the TX direction of 2D-DMA transfers in 2D-MOD1 and DSCR-PORT mode.

For JPEG decoding, the basic unit of image data input is a block of 8x8, 8x16, or 16x16 (pixels). In 2D-MOD1 mode, when the length and width of the image are not integer multiples of the basic unit, the image needs to pad out to integer multiples of the basic unit based on the previous or the current macroblock.

For PPA, the basic unit for transmit channels in DSCR-PORT mode is 20x20 (YUV420) or 18x18. The width and height of a basic unit for different transmit channels are configured using

[DMA2D\\_OUT\\_DSCR\\_PORT\\_BLK\\_H\\_CH \$n\$](#)  and [DMA2D\\_OUT\\_DSCR\\_PORT\\_BLK\\_V\\_CH \$n\$](#) . When the length and width of the image are not integer multiples of the basic unit, the image needs to pad out.

Below are the padding rules rules:

- Horizontally, the padding depends on the pbyte field of DW1.
  - When pbyte is 0 (0.5 byte/pixel), the remaining pixels must be even, and the padding is the last 0.5 byte.
  - When pbyte is 1 (1 byte/pixel), the padding is the last 1 byte.
  - When pbyte is 2 (1.5 bytes/pixel), the remaining pixels must be even, and the padding is the last 3 bytes.
  - When pbyte is 3 (2 bytes/pixel), the padding is the last 2 bytes.
  - When pbyte is 4 (3 bytes/pixel), the padding is the last 3 bytes.
  - When pbyte is 5 (4 bytes/pixel), the padding is the last 4 bytes.
- Vertically, the padding is the last row.

Figure 5.4-2 and Figure 5.4-3 illustrate the padding method.

In Figure 5.4-2, a blue grid represents a basic unit (a block of 8x8, 8x16, or 16x16 pixels), and a yellow box (incomplete basic unit) along with a green box (padding) forms a basic unit.

In Figure 5.4-3, a grid represents one pixel, and the numbers inside each grid represent pixel values.

Figure 5.4-2. Padding Illustration (Overall)

|   |   |   |   |   |   |   |   |
|---|---|---|---|---|---|---|---|
| 1 | 2 | 3 | 3 | 3 | 3 | 3 | 3 |

5.4.4 Peripheral-to-Memory and Memory-to-Peripheral Data Transfer

When `DMA2D_MEM_TRANS_EN_CHn` is 0, the 2D-DMA controller enters peripheral transfer mode. The transmit channel reads data from the memory and transmits it to peripherals, while the receive channel receives data from peripherals and stores it into the memory.

The transmit direction refers to data transfer from memory to peripheral, and the receive direction refers data transfer from peripheral to memory. A transmit channel transfers data in the specified memory location to a peripheral’s transmitter via an outlink`n`, whereas a receive channel transfers data received by a peripheral to the specified memory location via an inlink`n`.

Every transmit and receive channel can be connected to any peripheral that supports 2D-DMA. Table 5.4-2 and Table 5.4-3 illustrate how to select the peripheral to be connected via registers. “Dummy-`n`” corresponds to register values for memory-to-memory data transfer. When a channel is connected to a peripheral, the rest

of the channels cannot be connected to that peripheral.

**Table 5.4-2. Selecting Peripherals via Register Configuration in TX Direction**

| DMA2D_PERI_OUT_SEL_CH $n$ | Peripheral         |
|---------------------------|--------------------|
| 0                         | JPEG               |
| 1                         | PPA's SRM module   |
| 2                         | PPA's BLEND module |
| 3 ~ 7                     | Dummy-3 ~ 7        |

**Table 5.4-3. Selecting Peripherals via Register Configuration in RX Direction**

| DMA2D_PERI_IN_SEL_CH $n$ | Peripheral           |
|--------------------------|----------------------|
| 0                        | JPEG                 |
| 1                        | PPA's SRM module     |
| 2                        | PPA's BLEND0 channel |
| 3                        | PPA's BLEND1 channel |
| 4 ~ 7                    | Dummy-4 ~ 7          |

## 5.4.5 Memory-to-Memory Data Transfer

The 2D-DMA controller allows memory-to-memory data transfer only in 1D mode and 2D-MOD0 mode. Such data transfer can be enabled by setting `DMA2D_IN_MEM_TRANS_EN_CH $n$` , which connects the output of transmit channel  $n$  to the input of receive channel  $n$ . Note that a transmit channel can only be connected to the receive channel with the same number ( $n$ ), and `DMA2D_IN_PERI_SEL_CH $n$`  and `DMA2D_OUT_PERI_SEL_CH $n$`  should be configured to any value corresponding to "Dummy".

Memory-to-memory data transfer can be used in combination with color space conversion so that a macroblock can be moved from one segment of memory address space to another with its color space converted.

## 5.4.6 Macroblock Reordering

### 5.4.6.1 Macroblock Reordering in TX Direction

When the 2D-DMA accesses external memory via SPI, in order to improve the bandwidth utilization of SPI, it is necessary to initiate AXI transfers with a larger burst length. In 2D-MOD1 mode, the 2D-DMA can increase the burst length of AXI transfers by fetching multiple macroblocks at once. For example, the 2D-DMA can fetch five macroblocks of 8x8 pixels in one operation, and in this case, the `hb` field in the descriptor should be 40 and `vb` should be 8. However, the JPEG requires the 2D-DMA to send data in the order of macroblocks. This means that the 2D-DMA needs to reorder the fetched macroblocks to meet the requirements of JPEG.

Recommended configurations for macroblock reordering are listed in Table 5.4-4.

**Table 5.4-4. Recommended Configurations for Macroblock Reordering in TX Direction**

| Byte/Pixel | Macroblock Size (Pixel) | Optimal Macroblock Count | hb  | vb |
|------------|-------------------------|--------------------------|-----|----|
| 3          | 8×8                     | 5                        | 40  | 8  |
| 3          | 16×8                    | 2                        | 32  | 8  |
| 3          | 16×16                   | 2                        | 32  | 16 |
| 2          | 8×8                     | 8                        | 64  | 8  |
| 2          | 16×8                    | 4                        | 64  | 8  |
| 2          | 16×16                   | 3                        | 48  | 16 |
| 1          | 8×8                     | 16                       | 128 | 8  |

The macroblock size in TX direction should be configured via the [DMA2D\\_OUT\\_MACRO\\_BLOCK\\_SIZE\\_CHn](#) field.

#### 5.4.6.2 Macroblock Reordering in RX Direction

Currently, in RX direction the 2D-DMA can only reorder the data decoded by JPEG (the bitstream is 1 scan, see Chapter [31 JPEG Codec](#)). The 2D-DMA breaks down color component data decoded by JPEG into pixels, assembles them into larger macroblocks, and writes these blocks into the memory.

The data formats decoded by JPEG include GRAY, YUV444, YUV422, and YUV420. Recommended configurations for macroblock reordering are listed in Table [5.4-5](#).

**Table 5.4-5. Recommended Configuration Table for Macroblock Reordering in 2D-DMA Receive Direction (Without Color Format Conversion)**

| Format | Macroblock Size (pixels) | Optimal Macroblock Count | hb | vb |
|--------|--------------------------|--------------------------|----|----|
| GRAY   | 8×8                      | 12                       | 96 | 8  |
| YUV444 | 8×8                      | 5                        | 40 | 8  |
| YUV422 | 16×8                     | 4                        | 64 | 8  |
| YUV420 | 16×16                    | 3                        | 48 | 16 |

The macroblock size in TX direction should be configured via the [DMA2D\\_IN\\_MACRO\\_BLOCK\\_SIZE\\_CHn](#) field.

Figure [5.4-4](#) shows the layout of macroblocks outputted by the JPEG decoder. Each blue grid in this figure represents 8x8 bytes of continuous data, and for each color format the figure displays four macroblocks of 8×8 pixels.

Figure 5.4-4. Macroblock Layout of JPEG Decoder Output Data

### 5.4.7 Color Space Conversion

On the transmit side, the 2D-DMA converts the color space after assembling the data read from memory into pixels. The 2D-DMA supports the following conversion except YUV420:

- RGB888 to RGB565
- RGB565 to RGB888
- RGB888 to YUV444
- RGB888 to YUV422 (the number of pixels per row in RGB format must be even)
- YUV444 to RGB888
- YUV422 to RGB888

On the receive side, only pixels received from JPEG requires color space conversion. The 2D-DMA supports the following conversion:

- YUV444 to RGB888/RGB565
- YUV422 to YUV444 to RGB888/RGB565
- YUV420 to YUV444 to RGB888/RGB565

**Note:**

- For JPEG decoding, i.e., the receive side of 2D-DMA, the hardware will forcibly convert YUV422 and YUV420 to the YUV444 format. Software can optionally further convert the format to RGB888/RGB565 with the color space conversion feature.

Figure 5.4-5 shows the structure of the color space conversion module.

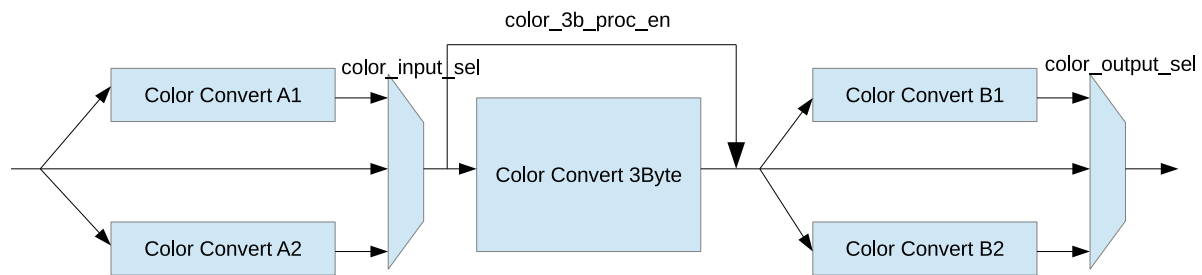

Figure 5.4-5. Color Space Conversion

Color space conversion is performed in 3 stages. The first stage converts a specific 16-bit color format (2 bytes/pixel) to a 24-bit color format (3 bytes/pixel). The source color formats can be configured via the [DMA2D\\_OUT\\_COLOR\\_INPUT\\_SEL\\_CHn](#) or [DMA2D\\_IN\\_COLOR\\_INPUT\\_SEL\\_CHO](#) field. (See the supported color format conversion in the first stage by clicking the fields)

The second stage further converts the output data of the first stage using the following formula:

$$256 * Q = A[9 : 0] * x + B[10 : 0] * y + C[9 : 0] * z + D[17 : 0]$$

In this formula, Q is the output data; x, y, and z are the most significant, middle, and the least significant byte of the input data respectively; A, B, C, and D are the corresponding multiplication or addition coefficients, which are signed numbers. At most 3 bytes of data can be processed in one go, and therefore  $3 * 4 = 12$  coefficients need to be configured via the following fields:

- [DMA2D\\_OUT\\_COLOR\\_PARAM\\_HO\\_CHn](#)/[DMA2D\\_IN\\_COLOR\\_PARAM\\_HO\\_CHO](#)
- [DMA2D\\_OUT\\_COLOR\\_PARAM\\_H1\\_CHn](#)/[DMA2D\\_IN\\_COLOR\\_PARAM\\_H1\\_CHO](#)
- [DMA2D\\_OUT\\_COLOR\\_PARAM\\_MO\\_CHn](#)/[DMA2D\\_IN\\_COLOR\\_PARAM\\_MO\\_CHO](#)
- [DMA2D\\_OUT\\_COLOR\\_PARAM\\_M1\\_CHn](#)/[DMA2D\\_IN\\_COLOR\\_PARAM\\_M1\\_CHO](#)
- [DMA2D\\_OUT\\_COLOR\\_PARAM\\_LO\\_CHn](#)/[DMA2D\\_IN\\_COLOR\\_PARAM\\_LO\\_CHO](#)
- [DMA2D\\_OUT\\_COLOR\\_PARAM\\_L1\\_CHn](#)/[DMA2D\\_IN\\_COLOR\\_PARAM\\_L1\\_CHO](#)

PARAM\_Hx, PARAM\_Mx, and PARAM\_Lx (x is 0 or 1) in field names represent the parameters for the three bytes of data respectively. Take PARAM\_Hx as examples, the lower 10 bits of the 21-bit PARAM\_H0 is coefficient A, the higher 11 bits of PARAM\_H0 is coefficient B, the lower 10 bits of the 28-bit PARAM\_H1 is coefficient C, and the higher 18 bits of PARAM\_H1 is coefficient D.

The third stage, similar to the first stage, outputs the color format converted in the second stage directly, or further converts the 24-bit color format (3 bytes/pixel) to a 16-bit color format. This is configured using [DMA2D\\_OUT\\_COLOR\\_OUTPUT\\_SEL\\_CHn](#) or [DMA2D\\_IN\\_COLOR\\_OUTPUT\\_SEL\\_CHO](#).

The following table lists the parameter configurations for commonly used color space conversions:

Table 5.4-6. Parameter Configuration for Color Space Conversion in TX Direction

| Conversion          | input_sel | proc_en | output_sel | param_h0 | param_h1 | param_m0 | param_m1 | param_l0 | param_l1 |
|---------------------|-----------|---------|------------|----------|----------|----------|----------|----------|----------|
| No conversion       | 7         | N/A     | N/A        | N/A      | N/A      | N/A      | N/A      | N/A      | N/A      |
| Only scramble order | 2/3       | 0       | 2          | N/A      | N/A      | N/A      | N/A      | N/A      | N/A      |

Additionally, the color space conversion module can scramble the order of at most three bytes per pixel. This can be done before the color space conversion in TX direction, and before or after the color space

conversion in RX direction. Table 5.4-8, Table 5.4-9, and Table 5.4-10 show the byte order per pixel required by the color space conversion module. For the JPEG decoder, if the byte order per pixel is not scrambled after the macroblock reordering in RX direction, it will conform to the requirements of color space conversion. Assuming that the order of an input pixel is represented from MSB to LSD as 2, 1, 0, the order can be scrambled and outputted as 210 (default), 201, 102, 120, 021, or 012. In RX direction, this feature can be configured before or after the color space conversion via [DMA2D\\_IN\\_SCRAMBLE\\_SEL\\_PRE\\_CHO](#) or [DMA2D\\_IN\\_SCRAMBLE\\_SEL\\_POST\\_CHO](#) respectively; in TX direction, this feature can be configured before the color space conversion via [DMA2D\\_OUT\\_SCRAMBLE\\_SEL\\_PRE\\_CHn](#).

## 5.4.8 Enabling 2D-DMA

The software uses the 2D-DMA controller through linked lists. For receive channels, software loads an inlink, configures the [DMA2D\\_INLINK\\_ADDR\\_CHn](#) field with the address of the first receive descriptor, and sets the [DMA2D\\_INLINK\\_START\\_CHn](#) bit to enable the 2D-DMA. For transmit channels, software loads an outlink, prepares data to be transmitted, configures the [DMA2D\\_OUTLINK\\_ADDR\\_CHn](#) field with address of the first transmit descriptor, and sets the [DMA2D\\_OUTLINK\\_START\\_CHn](#) bit to enable the 2D-DMA. The [DMA2D\\_INLINK\\_START\\_CHn](#) bit and [DMA2D\\_OUTLINK\\_START\\_CHn](#) bit are cleared automatically by hardware.

In some cases, you may want to append more descriptors to a 2D-DMA transfer that is already started. Naively, it would seem to be possible to do this by clearing the eof bit of the final descriptor in the existing list and setting its next descriptor address pointer field (DW4) to the first descriptor of the to-be-added list. However, this strategy fails if the existing 2D-DMA transfer is almost or entirely finished. Instead, the 2D-DMA controller has specialized logic to make sure a transfer can be continued or restarted: if the transfer is ongoing, the controller will make sure to take the appended descriptors into account; if the transfer has already finished, the controller will restart with the new descriptors. This is implemented by the Restart function.

When using the Restart function, software needs to

1. Set [DMA2D\\_INLINK\\_STOP\\_CHn](#) or [DMA2D\\_OUTLINK\\_STOP\\_CHn](#) to stop the 2D-DMA when it finishes processing the current descriptor
2. Rewrite the address of the first descriptor in the new list to DW4 of the last descriptor in the loaded list

3. Set `DMA2D_INLINK_RESTART_CHn` or `DMA2D_OUTLINK_RESTART_CHn` (these two bits are cleared automatically by hardware)

By doing so, hardware can obtain the address of the first descriptor in the new list when reading the last descriptor in the loaded list, and then read the new list.

### 5.4.9 Linked List Reading Process

Once configured and enabled by software, the 2D-DMA controller starts to read the linked list from the memory. The 2D-DMA performs checks on descriptors in the linked list. Only if descriptors pass the checks, the corresponding 2D-DMA channel will start data transfer. If the descriptors fail any of the checks, hardware will trigger descriptor error interrupt (either `DMA2D_IN_DSCR_ERR_CHn_INT` or `DMA2D_OUT_DSCR_ERR_CHn_INT`), and the channel will remain idle. This channel can be restarted by setting `DMA2D_OUTLINK_START_CHn` or `DMA2D_INLINK_START_CHn` again.

The checks performed on descriptors are:

- Owner bit check when `DMA2D_IN_CHECK_OWNER_CHn` or `DMA2D_OUT_CHECK_OWNER_CHn` is set to 1. If the owner bit is 0, the buffer is accessed by the CPU. In this case, the owner bit fails the check. The owner bit will not be checked if `DMA2D_IN_CHECK_OWNER_CHn` or `DMA2D_OUT_CHECK_OWNER_CHn` is 0.
- Descriptor address check, which checks if the descriptor address is located in configured memory space. If a 2D-DMA descriptor points to `DMA2D_ACCESS_INTR_MEM_START_ADDR ~ DMA2D_ACCESS_INTR_MEM_END_ADDR` (the value should be located in internal memory) or `DMA2D_ACCESS_EXTR_MEM_START_ADDR ~ DMA2D_ACCESS_EXTR_MEM_END_ADDR` (the value should be located in external memory), it passes the check. For details, please refer to Section 5.4.11).
- HA/VA/hb/vb/SIZE check, which checks if any of these fields is 0. If any field is 0, it fails the check. HA/VA/hb/vb fields are not checked in 1D mode, while SIZE is checked only in 1D mode.

After the software detects a descriptor error interrupt, it must reset the corresponding channel, and restart the 2D-DMA DMA by setting the `DMA2D_OUTLINK_START_CHn` or `DMA2D_INLINK_START_CHn` bit.

To quickly obtain receive or transmit descriptors from the memory, AXI burst transfers for 2D-DMA can be enabled by setting `DMA2D_INDSCR_BURST_EN_CHn` or `DMA2D_OUTDSCR_BURST_EN_CHn`.

### 5.4.10 EOF

**Note:** In this chapter, EOF of transmit descriptors refers to eof (i.e., bit 30 of DW0), while EOF of receive descriptors refers to both eof and err\_eof (i.e., bit 28 of DW0).

The 2D-DMA controller uses EOF (end of frame) flags to indicate the end of the image transmission.

For data transmission, the 2D-DMA generates two types of EOF interrupts:

- `DMA2D_OUT_EOF_CHn_INT`, generated when the eof bit of any descriptor in the linked list is set, and the data corresponding to this descriptor has been transmitted. Usually, the eof bit is set in the last descriptor for the transmission of an image. This interrupt is enabled by setting the `DMA2D_OUT_EOF_CHn_INT_ENA` bit.
- `DMA2D_OUT_TOTAL_EOF_CHn_INT`, generated when the eof bit of the last descriptor in the linked list is set, and the data corresponding to the last descriptor has been transmitted. This interrupt is enabled by

setting the [DMA2D\\_OUT\\_TOTAL\\_EOF\\_CH \$n\$ \\_INT\\_ENA](#) bit.

For data reception, the 2D-DMA also generates two types of EOF interrupts:

- [DMA2D\\_IN\\_SUC\\_EOF\\_CH \$n\$ \\_INT](#), generated when an image has been received. This interrupt is enabled by setting the [DMA2D\\_IN\\_SUC\\_EOF\\_CH \$n\$ \\_INT\\_ENA](#) bit.
- (JPEG only) [DMA2D\\_IN\\_ERR\\_EOF\\_CH \$n\$ \\_EOF\\_INT](#), generated when an image has been received with errors. This interrupt is enabled by setting the [DMA2D\\_IN\\_ERR\\_EOF\\_CH \$n\$ \\_INT\\_ENA](#) bit, and is valid only when the channel is connected to JPEG.

When detecting an [DMA2D\\_OUT\\_TOTAL\\_EOF\\_CH \$n\$ \\_INT](#) or [DMA2D\\_IN\\_SUC\\_EOF\\_CH \$n\$ \\_INT](#) interrupt, software can read the value of the [DMA2D\\_OUT\\_EOF\\_DES\\_ADDR\\_CH \$n\$](#)  or [DMA2D\\_IN\\_SUC\\_EOF\\_DES\\_ADDR\\_CH \$n\$](#)  field, which stores the address of the finished descriptor. Therefore, the software can tell which descriptors have been used and reclaim them as needed. In RX direction, the address of the descriptor can also be stored to the [DMA2D\\_IN\\_ERR\\_EOF\\_DES\\_ADDR\\_CH \$n\$](#)  field when an [DMA2D\\_IN\\_ERR\\_EOF\\_CH \$n\$ \\_INT](#) interrupt is triggered.

### 5.4.11 Accessing Memory

Any transmit and receive channels of the 2D-DMA can access the internal memory address space configured by [DMA2D\\_ACCESS\\_INTR\\_MEM\\_START\\_ADDR](#) and [DMA2D\\_ACCESS\\_INTR\\_MEM\\_END\\_ADDR](#), and the external memory address space configured by [DMA2D\\_ACCESS\\_EXTR\\_MEM\\_START\\_ADDR](#) and [DMA2D\\_ACCESS\\_EXTR\\_MEM\\_END\\_ADDR](#).

The 2D-DMA can send data in the internal memory in burst mode via the AXI bus. Burst transfer on the AXI bus is enabled by default, and cannot be disabled. Users can configure the number of data bytes in a single AXI burst (burst length) to 8, 16, 32, 64, or 128 bytes via [DMA2D\\_IN\\_MEM\\_BURST\\_LENGTH\\_CH \$n\$](#)  and [DMA2D\\_OUT\\_MEM\\_BURST\\_LENGTH\\_CH \$n\$](#) .

When the 2D-DMA accesses the encrypted external memory space (see Chapter [29 External Memory Encryption and Decryption \(XTS\\_AES\)](#)), buffer address pointer and corresponding data should be 16-byte aligned; when it accesses the configured internal memory and non-encrypted external memory space, there are no requirements for descriptor field alignment.

### 5.4.12 Arbitration

To ensure timely response to peripherals running at a high speed with low latency, the 2D-DMA controller implements two arbitration schemes, based on channel priority and channel weight respectively.

- Priority arbitration: Each channel can be assigned a priority from 0 ~ 3 (in total 4 levels). The larger the number, the higher the priority. When several channels perform data transfers at the same time, the 2D-DMA would respond to the transfer requests according to priority levels, and the channel with higher priority would get a response more timely.
- Weight arbitration:
  - Each channel is assigned a weight (i.e., the number of tokens) from 0 ~ 15. The 2D-DMA divides the AXI bus clock period into multiple time slots, and in each time slot, the number of transfers performed by a channel is determined by the number of its tokens. Every time a channel performs a data transfer, one of its tokens is spent. If all of its tokens have been spent in a time slot, then this

channel's transfer request will no longer be responded to until the time slot expires, or until tokens of all channels have been spent and the new time slot starts.

- If the number of tokens assigned to a channel is not zero, the 2D-DMA waits for this channel's tokens to be spent even if it does not have data transfer requests, and will not exit from this time slot ahead of expiration. This leads to a waste of bandwidth. Therefore, the 2D-DMA provides weight arbitration optimization. When this feature is enabled, a channel without data transfer requests will not be involved in the arbitration and its tokens will be ignored. When all channels no longer have transfer requests, the 2D-DMA arbiter exits from the current time slot before expiration. This way, the arbitration response is accelerated and the transfer efficiency is improved.

**Note:**

- If channels have the same weight but different priorities, on condition that the number of bytes to be transferred is the same and not large, channels with higher priorities would finish data transfers first.
- If channels have different priorities and weights, on condition that the number of bytes to be transferred is the same, channels with higher weights would be allocated more bandwidth and finish data transfers first.

## 5.5 Event Task Matrix Feature

The 2D-DMA controller on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows 2D-DMA's ETM tasks to be triggered by any peripherals' ETM events, or 2D-DMA's ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM tasks and events related to 2D-DMA. For more information, please refer to Chapter 12 [Event Task Matrix \(ETM\)](#).

2D-DMA can receive the following ETM tasks:

- `DMA2D_TASK_IN_START_CH $n$` : Enables the corresponding receive channel  $n$  for data transfer.
- `DMA2D_TASK_OUT_START_CH $n$` : Enables the corresponding transmit channel  $n$  for data transfer.

**Note:**

Above ETM tasks can achieve the same functions as CPU configuring `DMA2D_INLINK_START_CH $n$`  and `DMA2D_OUTLINK_START_CH $n$` . When `DMA2D_IN_ETM_EN_CH $n$`  or `DMA2D_OUT_ETM_EN_CH $n$`  is 1, only ETM tasks can be used to configure the transfer direction and enable the corresponding 2D-DMA channel. When `DMA2D_IN_ETM_EN_CH $n$`  or `DMA2D_OUT_ETM_EN_CH $n$`  is 0, only CPU can be used to enable the corresponding 2D-DMA channel.

- `DMA2D_TASK_IN_DSCR_READY_CH $n$` : Allows receive channel  $n$  to process the next descriptor.
- `DMA2D_TASK_OUT_DSCR_READY_CH $n$` : Allows transmit channel  $n$  to process the next descriptor.

**Note:**

In normal conditions, after finishing with the current descriptor if the next descriptor is available (i.e., the next descriptor address field is not zero), the 2D-DMA would process the next descriptor directly and reads/writes to the memory according to the descriptor's configuration until all descriptors are processed. When `DMA2D_IN_ETM_LOOP_EN_CH $n$`  or `DMA2D_OUT_ETM_LOOP_EN_CH $n$`  is set, after finishing with the current descriptor, the 2D-DMA would not start processing the next descriptor until receiving the `DMA2D_TASK_IN_DSCR_READY_CH $n$`  or

DMA2D\_TASK\_OUT\_DSCR\_READY\_CH $n$  task.

The DMA2D\_TASK\_IN\_DSCR\_READY\_CH $n$  or DMA2D\_TASK\_OUT\_DSCR\_READY\_CH $n$  task can be stored in the task buffer, which can cache at most four tasks. When the 2D-DMA receives this task but the current descriptor is not yet processed, it can cache the task. The depth of the task buffer is determined by

[DMA2D\\_IN\\_DSCR\\_TASK\\_MAX\\_CH \$n\$](#)  or [DMA2D\\_OUT\\_DSCR\\_TASK\\_MAX\\_CH \$n\$](#) .

When the task buffer exceeds its maximum capacity, it will trigger an [DMA2D\\_IN\\_DSCR\\_TASK\\_OVF\\_CH \$n\$ \\_INT](#) or [DMA2D\\_OUT\\_DSCR\\_TASK\\_OVF\\_CH \$n\$ \\_INT](#) interrupt.

2D-DMA can generate the following ETM events:

- DMA2D\_EVT\_IN\_DONE\_CH $n$ : Indicates that the data has been received according to the receive descriptor via channel  $n$ .
- DMA2D\_EVT\_IN\_SUC\_EOF\_CH $n$ : Indicates that the data corresponding to a receive descriptor has been received via channel  $n$  and the Eof bit of this descriptor is 1.
- DMA2D\_EVT\_OUT\_DONE\_CH $n$ : Indicates that the data has been transmitted according to the transmit descriptor via channel  $n$ .
- DMA2D\_EVT\_OUT\_SUC\_EOF\_CH $n$ : Indicates that the data corresponding to a transmit descriptor has been transmitted or received via channel  $n$  and the eof bit of this descriptor is 1.
- DMA2D\_EVT\_OUT\_TOTAL\_EOF\_CH $n$ : Indicates that the data corresponding to the last transmit descriptors has been sent via transmit channel  $n$  and the eof bit of this descriptor is 1.

In practical applications, 2D-DMA's ETM events can trigger its own ETM tasks. For example, the DMA2D\_EVT\_OUT\_TOTAL\_EOF\_CH0 event can trigger the DMA2D\_TASK\_IN\_START\_CH1 task, and in this way trigger a new round of 2D-DMA operations.

## 5.6 Interrupts

ESP32-P4's 2D-DMA module can generate the following interrupt signals that will be sent to the [Interrupt Matrix](#).

- DMA2D\_IN\_CHO\_INTR
- DMA2D\_IN\_CH1\_INTR
- DMA2D\_OUT\_CHO\_INTR
- DMA2D\_OUT\_CH1\_INTR
- DMA2D\_OUT\_CH2\_INTR

There are several internal interrupt sources from 2D-DMA that can generate the above interrupt signals.

The DMA2D\_IN\_CH $n$ \_INTR ( $n$  is 0 ~ 1) signals are generated by the following interrupt sources:

- DMA2D\_IN\_DONE\_CH $n$ \_INT: Triggered when all data corresponding to a receive descriptor has been received via receive channel  $n$ .
- DMA2D\_IN\_SUC\_EOF\_CH $n$ \_INT: Triggered when the eof bit in a receive descriptor is 1 and the data corresponding to this receive descriptor has been received (i.e., when an image corresponding to an inlink has been received) via receive channel  $n$ .

- DMA2D\_IN\_ERR\_EOF\_CH $n$ \_INT: Triggered when an error is detected in the image received via receive channel  $n$ . This interrupt is used only for JPEG.
- DMA2D\_IN\_DSCR\_EMPTY\_CH $n$ \_INT: Triggered when the size of the buffer pointed by receive descriptors is smaller than the length of data to be received via receive channel  $n$ .
- DMA2D\_IN\_DSCR\_ERR\_CH $n$ \_INT: Triggered when a receive descriptor on receive channel  $n$  fails any of the two descriptor checks.
- DMA2D\_INFIFO\_OVF\_CH $n$ \_INT: Triggered when the RX FIFO of 2D-DMA overflows.
- DMA2D\_INFIFO\_UDF\_CH $n$ \_INT or AXI\_DMA\_INFIFO\_L1/L2/L3\_UDF\_CH $n$ \_INT: Triggered when the RX FIFO of 2D-DMA underflows.
- DMA2D\_IN\_DSCR\_TASK\_OVF\_CH $n$ \_INT: Triggered when the number of cached DMA2D\_TASK\_IN\_DSCR\_READY\_CH $n$  task exceeds the maximum capacity of the task buffer.
- DMA2D\_INFIFO\_RO\_OVF\_CHO\_INT (only channel 0): Triggered when the buffer for macroblock reordering in RX direction overflows.
- DMA2D\_INFIFO\_RO\_UDF\_CHO\_INT (only channel 0): Triggered when the buffer for macroblock reordering in RX direction underflows.

The DMA2D\_OUT\_CH $n$ \_INTR ( $n$  is 0 ~ 2) signals are generated by the following interrupt sources:

- DMA2D\_OUT\_DONE\_CH $n$ \_INT: Triggered when all data corresponding to a transmit descriptor has been sent via transmit channel  $n$ .
- DMA2D\_OUT\_EOF\_CH $n$ \_INT: Triggered when the eof bit in a transmit descriptor is 1 and data corresponding to this descriptor has been sent via transmit channel  $n$ . If DMA2D\_OUT\_EOF\_MODE\_CH $n$  is 0, this interrupt will be triggered when the last byte of data corresponding to this descriptor enters 2D-DMA's transmit channel via the bus; if DMA2D\_OUT\_EOF\_MODE\_CH $n$  is 1, this interrupt is triggered when the last byte of data is taken from 2D-DMA's transmit channel.
- DMA2D\_OUT\_DSCR\_ERR\_CH $n$ \_INT: Triggered when a transmit descriptor on transmit channel  $n$  fails any of the two descriptor checks.
- DMA2D\_OUT\_TOTAL\_EOF\_CH $n$ \_INT: Triggered when all data corresponding to a linked list (including multiple descriptors) has been sent via transmit channel  $n$ .
- DMA2D\_OUTFIFO\_L1/L2/L3\_OVF\_CH $n$ \_INT: Triggered when the TX FIFO of 2D-DMA overflows.
- DMA2D\_OUTFIFO\_L1/L2/L3\_UDF\_CH $n$ \_INT: Triggered when the TX FIFO of 2D-DMA underflows.
- DMA2D\_OUT\_DSCR\_TASK\_OVF\_CH $n$ \_INT: Triggered when the number of cached DMA2D\_TASK\_OUT\_DSCR\_READY\_CH $n$  task exceeds the maximum capacity of the task buffer.
- DMA2D\_OUTFIFO\_RO\_OVF\_CHO\_INT (only channel 0): Triggered when the buffer for macroblock reordering or color space conversion in TX direction overflows.
- DMA2D\_OUTFIFO\_RO\_UDF\_CHO\_INT (only channel 0): Triggered when the buffer for macroblock reordering or color space conversion in TX direction underflows.

## 5.7 Programming Procedures

The clock gating for the 2D-DMA can be configured via [HP\\_SYS\\_CLKRST\\_DMA2D\\_SYS\\_CLK\\_EN](#), and is enabled by default. The 2D-DMA can be reset globally by configuring [HP\\_SYS\\_CLKRST\\_RST\\_EN\\_AHB/AXI\\_PDMA](#).

### 5.7.1 General Configurations for 2D-DMA

Configure the accessible address space of internal and external memory and burst length according to Section [5.4.11](#).

### 5.7.2 Mode-Specific Configurations for 2D-DMA

- 1D Mode: No specific configuration required.
- 2D-MOD0 Mode: No specific configuration required.
- 2D-MOD1 Mode: For JPEG, configure [DMA2D\\_IN\\_MACRO\\_BLOCK\\_SIZE\\_CHn](#) or [DMA2D\\_OUT\\_MACRO\\_BLOCK\\_SIZE\\_CHn](#) to choose a macroblock size out of the three available options (horizontal × vertical): 8 pixels × 8 pixels, 8 pixels × 16 pixels, and 16 pixels × 16 pixels. For more information about macroblock size, see Chapter [31 JPEG Codec](#). For correspondence between macroblock size, hb, and vb of descriptors, see Table [5.4-4](#) and Table [5.4-5](#).
- DSCR-PORT Mode: Set [DMA2D\\_OUT\\_DSCR\\_PORT\\_EN\\_CHn](#) to enter this mode. This mode is specifically designed for PPA. For details, see Chapter [33 Pixel-Processing Accelerator \(PPA\)](#).

### 5.7.3 Configurations for 2D-DMA's Transmit Channel

To transmit data, 2D-DMA's transmit channel should be configured by software as follows:

1. Set [DMA2D\\_OUT\\_RST\\_CHn](#) first to 1 and then to 0, to reset the state machine of 2D-DMA's transmit channel and FIFO pointer.
2. Load an outlink, and configure [DMA2D\\_OUTLINK\\_ADDR\\_CHn](#) with address of the first transmit descriptor.
3. Configure [DMA2D\\_OUT\\_PERI\\_SEL\\_CHn](#) with the value corresponding to the peripheral to be connected, as shown in Table [5.4-2](#).
4. Set [DMA2D\\_OUTLINK\\_START\\_CHn](#) to enable 2D-DMA's transmit channel for data transfer.
5. Configure and enable the corresponding peripheral. See details in individual chapters of these peripherals.
6. Wait for the [DMA2D\\_OUT\\_EOF\\_CHn\\_INT](#) interrupt, which indicates the completion of data transfer.

### 5.7.4 Configurations for 2D-DMA's Receive Channel

To receive data, 2D-DMA's receive channel should be configured by software as follows:

1. Set [DMA2D\\_IN\\_RST\\_CHn](#) first to 1 and then to 0, to reset the state machine of 2D-DMA's receive channel and FIFO pointer.
2. Load an inlink, and configure [DMA2D\\_INLINK\\_ADDR\\_CHn](#) with address of the first receive descriptor.

3. Configure `DMA2D_IN_PERI_SEL_CHn` with the value corresponding to the peripheral to be connected, as shown in Table 5.4-3.
4. Set `DMA2D_INLINK_START_CHn` to enable 2D-DMA's receive channel for data transfer.
5. Configure and enable the corresponding peripheral. See details in individual chapters of these peripherals.
6. Wait for `DMA2D_IN_SUC_EOF_CHn_INT` interrupt, which indicates that an image has been received.

## 5.7.5 Configurations for Memory-to-Memory Transfer

To transfer data from one memory location to another, 2D-DMA should be configured by software as follows:

1. Set `DMA2D_OUT_RST_CHn` first to 1 and then to 0, to reset the state machine of 2D-DMA's transmit channel and FIFO pointer.
2. Set `DMA2D_IN_RST_CHn` first to 1 and then to 0, to reset the state machine of 2D-DMA's receive channel and FIFO pointer.
3. Load an outlink, and configure `DMA2D_OUTLINK_ADDR_CHn` with address of the first transmit descriptor.
4. Load an inlink, and configure `DMA2D_INLINK_ADDR_CHn` with address of the first receive descriptor.
5. Configure `DMA2D_PERI_OUT_SEL_CHn` with any value corresponding to Dummy-*n* (see Table 5.4-2).
6. Configure `DMA2D_PERI_IN_SEL_CHn` with any value corresponding to Dummy-*n* (see Table 5.4-3).
7. Set `DMA2D_IN_MEM_TRANS_EN_CHn` to enable memory-to-memory transfer.
8. Set `DMA2D_OUTLINK_START_CHn` to enable 2D-DMA's transmit channel for data transfer.
9. Set `DMA2D_INLINK_START_CHn` to enable 2D-DMA's receive channel for data transfer.
10. Wait for `DMA2D_IN_SUC_EOF_CHn_INT` interrupt, which indicates that a data transaction has been completed.

## 5.7.6 Configurations for Channel Priority and Weight

The priority arbitration can be configured as follows:

1. Configure the channel priority for TX and RX respectively via `DMA2D_OUT_ARB_PRIORITY_CHn` and `DMA2D_IN_ARB_PRIORITY_CHn`.

The weight arbitration can be configured as follows:

1. Configure the time slot for TX and RX respectively via `DMA2D_OUT_ARB_TIMEOUT_NUM` and `DMA2D_IN_ARB_TIMEOUT_NUM`.
2. Configure the number of tokens for TX and RX respectively via `DMA2D_OUT_ARB_TOKEN_NUM_CHn` and `DMA2D_IN_ARB_TOKEN_NUM_CHn`.
3. Enable weight arbitration optimization for TX and RX respectively by clearing `DMA2D_OUT_ARB_WEIGHT_OPT_DIS_CHn` and `DMA2D_IN_ARB_WEIGHT_OPT_DIS_CHn`.
4. Enable the arbitration for TX and RX respectively via `DMA2D_OUT_WEIGHT_EN` and `DMA2D_IN_WEIGHT_EN`.

## 5.7.7 Resetting 2D-DMA While it Runs

When the 2D-DMA is running, namely when it is still processing descriptors, it must be stopped first before being reset fully via [HP\\_SYS\\_CLKRST\\_RST\\_EN\\_DMA2D](#) or partially (only reset AXI functions) via [DMA2D\\_AXIM\\_RD\\_RST](#) and [DMA2D\\_AXIM\\_WR\\_RST](#). The procedures are as follows:

1. Set [DMA2D\\_IN\\_CMD\\_DISABLE\\_CHn](#) and [DMA2D\\_OUT\\_CMD\\_DISABLE\\_CHn](#) to stop the 2D-DMA.
2. Reset the 2D-DMA when [DMA2D\\_OUT\\_RESET\\_AVAIL\\_CHn](#) and [DMA2D\\_IN\\_RESET\\_AVAIL\\_CHn](#) turn to 1.
3. Clear [DMA2D\\_IN\\_CMD\\_DISABLE\\_CHn](#) and [DMA2D\\_OUT\\_CMD\\_DISABLE\\_CHn](#) to 0 after the 2D-DMA is reset.

## 5.8 Register Summary

The addresses in this section are relative to 2D-DMA base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name  | Description   | Address | Access |
|---|---|---------|--------|
| <b>Configuration Registers</b>                  |   |         |        |
| <a href="#">DMA2D_OUT_CONFO_CHO_REG</a>         | Configures the TX channel 0                                     | 0x0000  | R/W    |
| <a href="#">DMA2D_OUT_PUSH_CHO_REG</a>          | Configures the FIFO of TX channel 0                             | 0x0018  | varies |
| <a href="#">DMA2D_OUT_LINK_CONF_CHO_REG</a>     | Configures the transmit descriptor operations of TX channel 0   | 0x001C  | varies |
| <a href="#">DMA2D_OUT_LINK_ADDR_CHO_REG</a>     | Configures the transmit descriptor address of TX channel 0      | 0x0020  | R/W    |
| <a href="#">DMA2D_OUT_ARB_CHO_REG</a>           | Configures the arbitration of TX channel 0                      | 0x003C  | R/W    |
| <a href="#">DMA2D_OUT_RO_PD_CONF_CHO_REG</a>    | Configures the macroblock reordering memory of TX channel 0     | 0x0044  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_CONVERT_CHO_REG</a> | Configures the color space conversion of TX channel 0           | 0x0048  | R/W    |
| <a href="#">DMA2D_OUT_SCRAMBLE_CHO_REG</a>      | Configures the byte scrambling of TX channel 0                  | 0x004C  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM0_CHO_REG</a>  | Configures the color space conversion parameter of TX channel 0 | 0x0050  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM1_CHO_REG</a>  | Configures the color space conversion parameter of TX channel 0 | 0x0054  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM2_CHO_REG</a>  | Configures the color space conversion parameter of TX channel 0 | 0x0058  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM3_CHO_REG</a>  | Configures the color space conversion parameter of TX channel 0 | 0x005C  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM4_CHO_REG</a>  | Configures the color space conversion parameter of TX channel 0 | 0x0060  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM5_CHO_REG</a>  | Configures the color space conversion parameter of TX channel 0 | 0x0064  | R/W    |
| <a href="#">DMA2D_OUT_ETM_CONF_CHO_REG</a>      | Configures the ETM of TX channel 0                              | 0x0068  | R/W    |
| <a href="#">DMA2D_OUT_DSCR_PORT_BLK_CHO_REG</a> | Configures the block size for TX channel 0 in DSCR-PORT mode    | 0x006C  | R/W    |
| <a href="#">DMA2D_OUT_CONFO_CH1_REG</a>         | Configures the TX channel 1                                     | 0x0100  | R/W    |
| <a href="#">DMA2D_OUT_PUSH_CH1_REG</a>          | Configures the FIFO of TX channel 1                             | 0x0118  | varies |
| <a href="#">DMA2D_OUT_LINK_CONF_CH1_REG</a>     | Configures the transmit descriptor operations of TX channel 1   | 0x011C  | varies |
| <a href="#">DMA2D_OUT_LINK_ADDR_CH1_REG</a>     | Configures the transmit descriptor address of TX channel 1      | 0x0120  | R/W    |
| <a href="#">DMA2D_OUT_ARB_CH1_REG</a>           | Configures the arbitration of TX channel 1                      | 0x013C  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_CONVERT_CH1_REG</a> | Configures the color space conversion of TX channel 1           | 0x0148  | R/W    |
| <a href="#">DMA2D_OUT_SCRAMBLE_CH1_REG</a>      | Configures the byte scrambling of TX channel 1                  | 0x014C  | R/W    |

| Name  | Description   | Address | Access |
|---|---|---------|--------|
| <a href="#">DMA2D_OUT_COLOR_PARAM0_CH1_REG</a>  | Configures the color space conversion parameter of TX channel 1 | 0x0150  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM1_CH1_REG</a>  | Configures the color space conversion parameter of TX channel 1 | 0x0154  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM2_CH1_REG</a>  | Configures the color space conversion parameter of TX channel 1 | 0x0158  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM3_CH1_REG</a>  | Configures the color space conversion parameter of TX channel 1 | 0x015C  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM4_CH1_REG</a>  | Configures the color space conversion parameter of TX channel 1 | 0x0160  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM5_CH1_REG</a>  | Configures the color space conversion parameter of TX channel 1 | 0x0164  | R/W    |
| <a href="#">DMA2D_OUT_ETM_CONF_CH1_REG</a>      | Configures the ETM of TX channel 1                              | 0x0168  | R/W    |
| <a href="#">DMA2D_OUT_DSCR_PORT_BLK_CH1_REG</a> | Configures the block size for TX channel 1 in DSCR-PORT mode    | 0x016C  | R/W    |
| <a href="#">DMA2D_OUT_CONFO_CH2_REG</a>         | Configures the TX channel 2                                     | 0x0200  | R/W    |
| <a href="#">DMA2D_OUT_PUSH_CH2_REG</a>          | Configures the FIFO of TX channel 2                             | 0x0218  | varies |
| <a href="#">DMA2D_OUT_LINK_CONF_CH2_REG</a>     | Configures the transmit descriptor operations of TX channel 2   | 0x021C  | varies |
| <a href="#">DMA2D_OUT_LINK_ADDR_CH2_REG</a>     | Configures the transmit descriptor address of TX channel 2      | 0x0220  | R/W    |
| <a href="#">DMA2D_OUT_ARB_CH2_REG</a>           | Configures the arbitration of TX channel 2                      | 0x023C  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_CONVERT_CH2_REG</a> | Configures the color space conversion of TX channel 2           | 0x0248  | R/W    |
| <a href="#">DMA2D_OUT_SCRAMBLE_CH2_REG</a>      | Configures the byte scrambling of TX channel 2                  | 0x024C  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM0_CH2_REG</a>  | Configures the color space conversion parameter of TX channel 2 | 0x0250  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM1_CH2_REG</a>  | Configures the color space conversion parameter of TX channel 2 | 0x0254  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM2_CH2_REG</a>  | Configures the color space conversion parameter of TX channel 2 | 0x0258  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM3_CH2_REG</a>  | Configures the color space conversion parameter of TX channel 2 | 0x025C  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM4_CH2_REG</a>  | Configures the color space conversion parameter of TX channel 2 | 0x0260  | R/W    |
| <a href="#">DMA2D_OUT_COLOR_PARAM5_CH2_REG</a>  | Configures the color space conversion parameter of TX channel 2 | 0x0264  | R/W    |
| <a href="#">DMA2D_OUT_ETM_CONF_CH2_REG</a>      | Configures the ETM of TX channel 2                              | 0x0268  | R/W    |
| <a href="#">DMA2D_OUT_DSCR_PORT_BLK_CH2_REG</a> | Configures the block size for TX channel 2 in DSCR-PORT mode    | 0x026C  | R/W    |
| <a href="#">DMA2D_IN_CONFO_CHO_REG</a>          | Configures the RX channel 0                                     | 0x0500  | R/W    |
| <a href="#">DMA2D_IN_POP_CHO_REG</a>            | Configures the FIFO of RX channel 0                             | 0x0518  | varies |
| <a href="#">DMA2D_IN_LINK_CONF_CHO_REG</a>      | Configures the receive descriptor operations of RX channel 0    | 0x051C  | varies |
| <a href="#">DMA2D_IN_LINK_ADDR_CHO_REG</a>      | Configures the receive descriptor address of RX channel 0       | 0x0520  | R/W    |
| <a href="#">DMA2D_IN_ARB_CHO_REG</a>            | Configures the arbitration of RX channel 0                      | 0x0540  | R/W    |
| <a href="#">DMA2D_IN_RO_PD_CONF_CHO_REG</a>     | Configures the macroblock reordering memory of RX channel 0     | 0x0548  | R/W    |

| Name   | Description   | Address | Access   |
|--|---|---------|----------|
| <a href="#">DMA2D_IN_COLOR_CONVERT_CHO_REG</a> | Configures the color space conversion of RX channel 0           | 0x054C  | R/W      |
| <a href="#">DMA2D_IN_SCRAMBLE_CHO_REG</a>      | Configures the byte scrambling of RX channel 0                  | 0x0550  | R/W      |
| <a href="#">DMA2D_IN_COLOR_PARAM0_CHO_REG</a>  | Configures the color space conversion parameter of RX channel 0 | 0x0554  | R/W      |
| <a href="#">DMA2D_IN_COLOR_PARAM1_CHO_REG</a>  | Configures the color space conversion parameter of RX channel 0 | 0x0558  | R/W      |
| <a href="#">DMA2D_IN_COLOR_PARAM2_CHO_REG</a>  | Configures the color space conversion parameter of RX channel 0 | 0x055C  | R/W      |
| <a href="#">DMA2D_IN_COLOR_PARAM3_CHO_REG</a>  | Configures the color space conversion parameter of RX channel 0 | 0x0560  | R/W      |
| <a href="#">DMA2D_IN_COLOR_PARAM4_CHO_REG</a>  | Configures the color space conversion parameter of RX channel 0 | 0x0564  | R/W      |
| <a href="#">DMA2D_IN_COLOR_PARAM5_CHO_REG</a>  | Configures the color space conversion parameter of RX channel 0 | 0x0568  | R/W      |
| <a href="#">DMA2D_IN_ETM_CONF_CHO_REG</a>      | Configures the ETM of RX channel 0                              | 0x056C  | R/W      |
| <a href="#">DMA2D_IN_CONFO_CH1_REG</a>         | Configures the RX channel 1                                     | 0x0600  | R/W      |
| <a href="#">DMA2D_IN_POP_CH1_REG</a>           | Configures the FIFO of RX channel 1                             | 0x0618  | varies   |
| <a href="#">DMA2D_IN_LINK_CONF_CH1_REG</a>     | Configures the receive descriptor operations of RX channel 1    | 0x061C  | varies   |
| <a href="#">DMA2D_IN_LINK_ADDR_CH1_REG</a>     | Configures the receive descriptor address of RX channel 1       | 0x0620  | R/W      |
| <a href="#">DMA2D_IN_ARB_CH1_REG</a>           | Configures the arbitration of RX channel 1                      | 0x0640  | R/W      |
| <a href="#">DMA2D_IN_ETM_CONF_CH1_REG</a>      | Configures the ETM of RX channel 1                              | 0x0648  | R/W      |
| <a href="#">DMA2D_RST_CONF_REG</a>             | Configures the reset of AXI                                     | 0x0A04  | R/W      |
| <a href="#">DMA2D_INTR_MEM_START_ADDR_REG</a>  | The start address of accessible internal memory address space   | 0x0A08  | R/W      |
| <a href="#">DMA2D_INTR_MEM_END_ADDR_REG</a>    | The end address of accessible internal memory address space     | 0x0A0C  | R/W      |
| <a href="#">DMA2D_EXTR_MEM_START_ADDR_REG</a>  | The start address of accessible external memory address space   | 0x0A10  | R/W      |
| <a href="#">DMA2D_EXTR_MEM_END_ADDR_REG</a>    | The end address of accessible external memory address space     | 0x0A14  | R/W      |
| <a href="#">DMA2D_OUT_ARB_CONFIG_REG</a>       | Configures the arbitration in TX direction                      | 0x0A18  | R/W      |
| <a href="#">DMA2D_IN_ARB_CONFIG_REG</a>        | Configures the arbitration in RX direction                      | 0x0A1C  | R/W      |

**DMA2D\_OUT\_AUTO\_WRBACK\_CH<sub>n</sub>** Configures whether to enable automatic outlink write-back when all the data in TX FIFO has been transmitted.

0: Disable

1: Enable

(R/W)

**DMA2D\_OUT\_EOF\_MODE\_CH $n$**  Configures when to generate EOF flag.

0: EOF flag for TX channel *n* is generated when data need to read has been pushed into FIFO of 2DDMA

1: EOF flag for TX channel  $n$  is generated when data need to read has been popped from FIFO of 2DDMA

(R/W)

**DMA2D\_OUTDSCR\_BURST\_EN\_CH $n$**  Configures whether to enable INCR burst transfer for TX channel  $n$  reading descriptors.

0: Disable

1: Enable

(R/W)

**DMA2D\_OUT\_ECC\_AES\_EN\_CH***n* Configures to enable the access to external memory space for ECC and AES (encrypted) via TX channel *n*.

0: Disable

1: Enable

In this case, the starting address of the space and the corresponding data should be 16-byte aligned.

(R/W)

Continued on the next page...

**Register 5.1. DMA2D\_OUT\_CONFO\_CH $n$ \_REG ( $n$ : 0-2) (0x0000+0x100\* $n$ )**

Continued from the previous page...

**DMA2D\_OUT\_CHECK\_OWNER\_CH $n$**  Configures whether to enable the owner bit check for TX channel  $n$ .

0: Disable

1: Enable

(R/W)

**DMA2D\_OUT\_MEM\_BURST\_LENGTH\_CH $n$**  Configures the burst length for TX channel  $n$ .

0: 8 bytes

1: 16 bytes

2: 32 bytes

3: 64 bytes

4: 128 bytes

Others: Invalid

(R/W)

**DMA2D\_OUT\_MACRO\_BLOCK\_SIZE\_CH $n$**  Configures macroblock size for TX channel  $n$ . Used only in 2D-MOD1 mode.

0: 8 \* 8 pixels

1: 8 \* 16 pixels

2: 16 \* 16 pixels

3: No macroblock

(R/W)

**DMA2D\_OUT\_DSCR\_PORT\_EN\_CH $n$**  Configures whether to enable the DSCR-PORT mode for TX channel  $n$ .

0: Disable

1: Enable

(R/W)

**DMA2D\_OUT\_REORDER\_EN\_CHO** Configures whether to enable macroblock reordering for TX channel 0.

0: Disable

1: Enable

(R/W)

**DMA2D\_OUT\_RST\_CH $n$**  Configures whether to reset TX channel  $n$ .

0: Reset release

1: Reset

(R/W)

Continued on the next page...

**Register 5.1. DMA2D\_OUT\_CONFO\_CH $n$ \_REG ( $n$ : 0-2) (0x0000+0x100\* $n$ )**

Continued from the previous page...

**DMA2D\_OUT\_CMD\_DISABLE\_CH***n* Configures reset command for TX channel *n*.

0: Set 0 after reset release

1: Pause transfers before reset

(R/W)

**DMA2D\_OUT\_ARB\_WEIGHT\_OPT\_DIS\_CH $n$**  Configures whether to enable weight optimization for TX channel  $n$ .

0: Enable

1: Disable

(R/W)

**Register 5.2. DMA2D\_OUT\_PUSH\_CH $n$ \_REG ( $n$ : 0-2) (0x0018+0x100\* $n$ )**

**DMA2D\_OUTFIFO\_WDATA\_CHn** Configures the data to be pushed into the 2D-DMA TX FIFO. (R/W)

**DMA2D\_OUTFIFO\_PUSH\_CH<sub>n</sub>** Configures whether to push data into the 2D-DMA TX FIFO.

0: Not push 1: Push

(R/W/SC)

**Register 5.3. DMA2D\_OUT\_LINK\_CONF\_CH $n$ \_REG ( $n$ : 0-2) (0x001C+0x100\* $n$ )**

**DMA2D\_OUTLINK\_STOP\_CH***n* Configures whether to stop TX channel *n* from transmitting data.

0: Invalid. No effect

1: Stop

(R/W/SC)

**DMA2D\_OUTLINK\_START\_CH***n* Configures whether to enable TX channel *n* for data transfer.

0: Disable

1: Enable

(R/W/SC)

**DMA2D\_OUTLINK\_RESTART\_CH***n* Configures whether to restart TX channel *n* for AXI DMA transfer.

0: Invalid. No effect

1: Restart

(R/W/SC)

**DMA2D\_OUTLINK\_PARK\_CH<sub>n</sub>** Represents the status of the transmit descriptor's FSM.

0: Running

1: Idle

(RO)

Register 5.4. DMA2D\_OUT\_LINK\_ADDR\_CH $n$ \_REG ( $n$ : 0-2) (0x0020+0x100\* $n$ )

**DMA2D\_OUTLINK\_ADDR\_CH<sub>n</sub>** Represents the first transmit descriptor's address. (R/W)

Register 5.5. DMA2D\_OUT\_ARB\_CHn\_REG (n: 0-2) (0x003C+0x100\*n)

- DMA2D\_OUT\_ARB\_TOKEN\_NUM\_CHn Configures the weight (i.e the number of tokens) of TX channel n.  
Value range: 0 ~ 15. (R/W)
- DMA2D\_OUT\_ARB\_PRIORITY\_CHn Configures the priority of TX channel n. The larger the value, the higher the priority.  
Value range: 0 ~ 3. (R/W)

Register 5.6. DMA2D\_OUT\_RO\_PD\_CONF\_CHO\_REG (0x0044)

**DMA2D\_OUT\_RO\_RAM\_FORCE\_PD\_CHO** Configures whether to force power down the macroblock reordering RAM for TX channel 0.

0: Not force power down

1: Force power down

(R/W)

**DMA2D\_OUT\_RO\_RAM\_FORCE\_PU\_CHO** Configures whether to force power up the macroblock reordering RAM for TX channel 0.

0: Not force power up

1: Force power up

(R/W)

**DMA2D\_OUT\_RO\_RAM\_CLK\_FO\_CHO** Configures the clock gating when TX channel 0 accessing the 2D-DMA RAM.

0: Use the clock gate

1: Force the clock on and bypass the clock gate

(R/W)

Register 5.7. DMA2D\_OUT\_COLOR\_CONVERT\_CHn\_REG (n: 0-2) (0x0048+0x100\*n)

**DMA2D\_OUT\_COLOR\_OUTPUT\_SEL\_CHn** Configures the third stage output of color space conversion for TX channel *n*.  
0: RGB888 to RGB565  
1: YUV444 to YUV422  
2: Output directly  
Others: Invalid  
(R/W)

**DMA2D\_OUT\_COLOR\_3B\_PROC\_EN\_CHn** Configures whether to enable the second stage of color space conversion for TX channel *n*.  
0: Disable  
1: Enable  
(R/W)

**DMA2D\_OUT\_COLOR\_INPUT\_SEL\_CHn** Configures the first stage output of color space conversion for TX channel *n*.  
0: RGB565 to RGB888  
1: YUV422 to YUV444  
2: Other 2 bytes/pixel color format  
3: Other 3 bytes/pixel color format  
7: Disable color space conversion  
Others: Invalid  
(R/W)

Register 5.8. DMA2D\_OUT\_SCRAMBLE\_CH $n$ \_REG ( $n$ : 0-2) (0x004C+0x100\* $n$ )

**DMA2D\_OUT\_SCRAMBLE\_SEL\_PRE\_CH $n$**  Configures the byte order scrambling before the color space conversion for TX channel  $n$ .

- 0: BYTE2-1-0  
1: BYTE2-0-1  
2: BYTE1-0-2  
3: BYTE1-2-0  
4: BYTE0-2-1  
5: BYTE0-1-2  
Others: Invalid  
(R/W)

**Register 5.9. DMA2D\_OUT\_COLOR\_PARAM0\_CH $n$ \_REG ( $n$ : 0-2) (0x0050+0x100\* $n$ )**

**DMA2D\_OUT\_COLOR\_PARAM\_HO\_CH $n$**  Configures the coefficient A and B for the most significant byte of the input of color space conversion's second stage for TX channel  $n$ . (R/W)

Register 5.10. DMA2D\_OUT\_COLOR\_PARAM1\_CH $n$ \_REG ( $n$ : 0-2) (0x0054+0x100\* $n$ )

**DMA2D\_IN\_MEM\_TRANS\_EN\_CH $n$**  Configures whether to enable memory-to-memory data transfer for TX and RX channel  $n$ .

0: Disable

1: Enable

(R/W)

**DMA2D\_INDSR\_BURST\_EN\_CH $n$**  Configures whether to enable INCR burst transfer for RX channel  $n$  to read descriptors when accessing internal memory.

0: Disable

1: Enable

(R/W)

**DMA2D\_IN\_ECC\_AES\_EN\_CH $n$**  Configures whether to enable the access to external memory space for ECC and AES (encrypted) via RX channel  $n$ .

0: Disable

1: Enable. In this case, the starting address of the space and the corresponding data should be 16-byte aligned.

(R/W)

**DMA2D\_IN\_CHECK\_OWNER\_CH***n* Configures whether to enable the owner bit check for RX channel *n*.

0: Disable

1: Enable

(R/W)

**DMA2D\_IN\_MEM\_BURST\_LENGTH\_CH $n$**  Configures the burst length for RX channel  $n$ .

0: 8 bytes

1: 16 bytes

2: 32 bytes

3: 64 bytes

4: 128 bytes

Others: Invalid

(R/W)

Continued on the next page...

**Register 5.17. DMA2D\_IN\_CONFO\_CH $n$ \_REG ( $n$ : 0-1) (0x0500+0x100\* $n$ )**

Continued from the previous page...

**DMA2D\_IN\_MACRO\_BLOCK\_SIZE\_CH $n$**  Configures macroblock size for RX channel  $n$ . Used only in 2D-MOD1 mode.

0: 8 \* 8 pixels

1: 8 \* 16 pixels

2: 16 \* 16 pixels

3: No macroblock

(R/W)

**DMA2D\_IN\_DSCR\_PORT\_EN\_CH $n$**  Configures whether to enable the DSCR-PORT mode for RX channel  $n$ .

0: Disable

1: Enable

(R/W)

**DMA2D\_IN\_REORDER\_EN\_CHO** Configures whether to enable macroblock reordering for RX channel 0.

0: Disable

1: Enable

(R/W)

**DMA2D\_IN\_RST\_CH $n$**  Configures whether to reset RX channel  $n$ .

0: Invalid

1: Reset

(R/W)

**DMA2D\_IN\_CMD\_DISABLE\_CH $n$**  Configures reset command for RX channel  $n$ .

0: Set 0 after reset release

1: Pause transfers before reset

(R/W)

**DMA2D\_IN\_ARB\_WEIGHT\_OPT\_DIS\_CH $n$**  Configures whether to enable weight optimization for RX channel  $n$ .

0: Enable

1: Disable

(R/W)

Register 5.18. DMA2D\_IN\_POP\_CH $n$ \_REG ( $n$ : 0-1) (0x0518+0x100\* $n$ )

**DMA2D\_INFIFO\_RDATA\_CH<sub>n</sub>** Represents the data popped from 2D-DMA RX FIFO. (RO)

**DMA2D\_INFIFO\_POP\_CH**n Configures whether to pop data from 2D-DMA RX FIFO.

0: Not pop

1: Pop

(R/W/SC)

**Register 5.19. DMA2D\_IN\_LINK\_CONF\_CH $n$ \_REG ( $n$ : 0-1) (0x051C+0x100\* $n$ )**

**DMA2D\_INLINK\_AUTO\_RET\_CH**n Configure the value of the owner bit written back to the receive descriptor.

0: Write back 0

1: Write back 1

(R/W)

**DMA2D\_INLINK\_STOP\_CH***n* Configures whether to stop RX channel *n* from receiving data.

0: Invalid. No effect

1: Stop

(R/W/SC)

**DMA2D\_INLINK\_START\_CH $n$**  Configures whether to enable RX channel  $n$  for data transfer.

0: Disable

1: Enable

(R/W/SC)

**DMA2D\_INLINK\_RESTART\_CH $n$**  Configures whether to restart RX channel  $n$  for 2D-DMA transfer.

0: Invalid. No effect

1: Restart

(R/W/SC)

**DMA2D\_INLINK\_PARK\_CH $n$**  Represents the status of the receive descriptor's FSM.

0: Running

1: Idle

(RO)

Register 5.20. DMA2D\_IN\_LINK\_ADDR\_CH $n$ \_REG ( $n$ : 0-1) (0x0520+0x100\* $n$ )

DMA2D\_INLINK\_ADDR\_CH $n$  Represents the first receive descriptor’s address. (R/W)

Register 5.21. DMA2D\_IN\_ARB\_CH $n$ \_REG ( $n$ : 0-1) (0x0540+0x100\* $n$ )

DMA2D\_IN\_ARB\_TOKEN\_NUM\_CH $n$  Configures the weight (i.e the number of tokens) of RX channel  $n$ .  
Value range: 0 ~ 15. (R/W)

DMA2D\_IN\_ARB\_PRIORITY\_CH $n$  Configures the priority of RX channel  $n$ . The larger the value, the higher the priority.  
Value range: 0 ~ 3. (R/W)

### Register 5.22. DMA2D\_IN\_RO\_PD\_CONF\_CH0\_REG (0x0548)

|                                     |  |
|-------------------------------------|--|
| <b>DMA2D_IN_RO_RAM_FORCE_PD_CHO</b> | Configures whether to force power down the macroblock reordering RAM for RX channel 0. |
|-------------------------------------|--|

0: Not force power down

1: Force power down

(R/W)

|                                     |   |
|-------------------------------------|---|
| <b>DMA2D_IN_RO_RAM_FORCE_PU_CHO</b> | Configures whether to force power up the macroblock re-ordering RAM for RX channel 0. |
|-------------------------------------|---|

0: Not force power up

1: Force power up

(R/W)

**DMA2D\_IN\_RO\_RAM\_CLK\_FO\_CHO** Configures the clock gating when RX channel 0 accessing the 2D-DMA RAM.

0: Use the clock gate

1: Force the clock on and bypass the clock gate

(R/W)

Register 5.23. DMA2D\_IN\_COLOR\_CONVERT\_CHO\_REG (0x054C)

**DMA2D\_IN\_COLOR\_OUTPUT\_SEL\_CHO** Configures the third stage output of color space conversion for RX channel 0.

0: RGB888 to RGB565

1: Output directly

(R/W)

**DMA2D\_IN\_COLOR\_3B\_PROC\_EN\_CHO** Configures whether to enable the second stage of color space conversion for RX channel 0.

0: Disable

1: Enable

(R/W)

**DMA2D\_IN\_COLOR\_INPUT\_SEL\_CHO** Configures the first stage output of color space conversion for RX channel 0.

0: YUV422/420 to YUV444

1: YUV422

2: YUV444/420

7: Disable color space conversion

Others: Invalid

(R/W)

Register 5.24. DMA2D\_IN\_SCRAMBLE\_CHO\_REG (0x0550)

**DMA2D\_IN\_SCRAMBLE\_SEL\_PRE\_CHO** Configures the byte order scrambling before the color space conversion for RX channel 0.

- 0: BYTE2-1-0
- 1: BYTE2-0-1
- 2: BYTE1-0-2
- 3: BYTE1-2-0
- 4: BYTE0-2-1
- 5: BYTE0-1-2
- Others: Invalid

(R/W)

**DMA2D\_IN\_SCRAMBLE\_SEL\_POST\_CHO** Configures the byte order scrambling after the color space conversion for RX channel 0.

- 0: BYTE2-1-0
- 1: BYTE2-0-1
- 2: BYTE1-0-2
- 3: BYTE1-2-0
- 4: BYTE0-2-1
- 5: BYTE0-1-2
- Others: Invalid

(R/W)

### Register 5.25. DMA2D\_IN\_COLOR\_PARAM0\_CHO\_REG (0x0554)

Diagram illustrating the structure of the `DMA2D_IN_COLOR_PARAM_HO_CH0` register. The register is 32 bits wide, divided into a 12-bit reserved field (bits 31-20) and a 20-bit data field (bits 19-0). The data field contains the value `0x012a`. The register is labeled `DMA2D_IN_COLOR_PARAM_HO_CH0` and has a `Reset` value of `0x012a`.

**DMA2D\_IN\_COLOR\_PARAM\_HO\_CHO** Configures the coefficient A and B for the most significant byte of the input of color space conversion's second stage for RX channel 0. (R/W)

### Register 5.26. DMA2D\_IN\_COLOR\_PARAM1\_CHO\_REG (0x0558)

|            |    |    |   |                             |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |

**DMA2D\_IN\_COLOR\_PARAM\_L1\_CHO** Configures the coefficient C and D for the least significant byte of the input of color space conversion's second stage for RX channel 0. (R/W)

Register 5.31. DMA2D\_IN\_ETM\_CONF\_CHn\_REG (n: 0-1) (0x056C+0x100\*n)

**DMA2D\_IN\_ETM\_EN\_CHn** Configures whether to enable the ETM function for RX channel *n*.  
0: Disable  
1: Enable  
(R/W)

**DMA2D\_IN\_ETM\_LOOP\_EN\_CHn** Configures whether to use the ETM task to indicate the processing of the next descriptor for RX channel *n*.  
0: Not use ETM task  
1: Use ETM task  
(R/W)

**DMA2D\_IN\_DSCR\_TASK\_MAK\_CHn** Configures the maximum number of tasks that can be cached for RX channel *n*. (R/W)

### Register 5.32. DMA2D\_RST\_CONF\_REG (0x0A04)

[illegible]

**DMA2D\_AXIM\_RD\_RST** Configures whether to reset the AXI master read data FIFO.

0: No effect

1: Reset

(R/W)

**DMA2D\_AXIM\_WR\_RST** Configures whether to reset the AXI master write data FIFO.

0: No effect

1: Reset

(R/W)

**DMA2D\_CLK\_EN** Configures the clock for registers.

0: Support clock only when application writes registers

1: Force clock on for register

(R/W)

### Register 5.33. DMA2D\_INTR\_MEM\_START\_ADDR\_REG (0x0A08)

Diagram of the DMA2D\_ACCESS\_INTR\_MEM\_START\_ADDR register. The register is 32 bits wide, with bit 31 on the left and bit 0 on the right. The value 0x30100000 is shown in the center. The label 'DMA2D\_ACCESS\_INTR\_MEM\_START\_ADDR' is written diagonally across the register.

|   |  |
|---|--|
| <b>DMA2D_ACCESS_INTR_MEM_START_ADDR</b> | Configures the start address of the accessible internal address space. (R/W) |
|---|--|

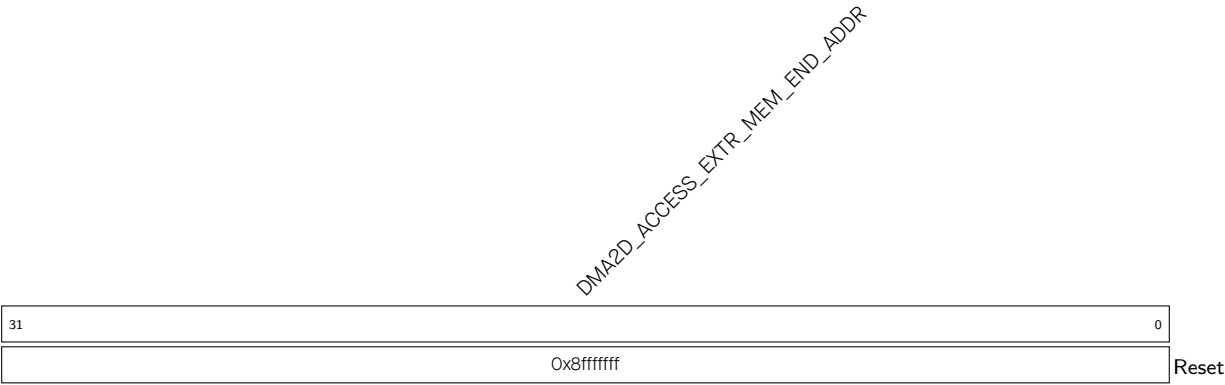

**Register 5.34. DMA2D\_INTR\_MEM\_END\_ADDR\_REG (0x0A0C)**

**DMA2D\_ACCESS\_INTR\_MEM\_END\_ADDR** Configures the end address of the accessible internal address space. Accessing an address beyond this range will result in a descriptor error. (R/W)

**Register 5.35. DMA2D\_EXTR\_MEM\_START\_ADDR\_REG (0x0A10)**

**DMA2D\_ACCESS\_EXTR\_MEM\_START\_ADDR** Configures the start address of the accessible external address space. (R/W)

Register 5.36. DMA2D\_EXTR\_MEM\_END\_ADDR\_REG (0x0A14)

**DMA2D\_ACCESS\_EXTR\_MEM\_END\_ADDR** Configures the end address of the accessible external address space. Accessing an address beyond this range will result in a descriptor error. (R/W)

Register 5.37. DMA2D\_OUT\_ARB\_CONFIG\_REG (0x0A18)

**DMA2D\_OUT\_ARB\_TIMEOUT\_NUM** Configures the time slot for TX. Measurement unit: AXI bus clock cycle. (R/W)

**DMA2D\_OUT\_WEIGHT\_EN** Configures whether to enable weight arbitration for TX.

- 0: Disable
- 1: Enable

(R/W)

### Register 5.38. DMA2D\_IN\_ARB\_CONFIG\_REG (0x0A1C)

Diagram of the DMA2D\_IN\_WEIGHT\_EN register structure:

|      |    |    |    |   |
|------|----|----|----|---|
| 31   | 17 | 16 | 15 | 0 |
| 0x00 |    |    |    |   |

Labels for fields:

- (reserved) [31:17]
- DMA2D\_IN\_WEIGHT\_EN [16]
- DMA2D\_IN\_ARB\_TIMEOUT\_NUM [15:0]

Reset value: 0x00

**DMA2D\_IN\_ARB\_TIMEOUT\_NUM** Configures the time slot for RX. Measurement unit: AXI bus clock cycle. (R/W)

**DMA2D\_IN\_WEIGHT\_EN** Configures whether to enable weight arbitration for RX.

0: Disable

1: Enable

(R/W)

Register 5.39. DMA2D\_OUT\_INT\_RAW\_CH $n$ \_REG ( $n$ : 0-2) (0x0004+0x100\* $n$ )

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |    |   |   |   |   |   |   |   |   |   |   |       |

## Part III

# Memory Organization

This part provides insights into the system's memory structure, discussing the organization and mapping of RAM, ROM, eFuse, and external memories, offering a framework for understanding memory-related subsystems.

## Chapter 6

# System and Memory

## 6.1 Overview

ESP32-P4 integrates two processors:

- a high-performance 32-bit RISC-V dual-core processor (HP CPU), five-stage pipeline, clock frequency up to 360 MHz.
- a low-power 32-bit RISC-V single-core processor (LP CPU), two-stage pipeline, clock frequency up to 40 MHz.

All internal memory, external memory, and peripherals are located on the HP CPU and LP CPU buses.

## 6.2 Features

- **Address Space**

- 896 KB of HP internal memory address space, accessible by the instruction bus or data bus of HP CPU via cache
- 8 KB of HP internal memory address space, accessible by the instruction bus or data bus of HP CPU
- 48 KB of LP internal memory address space, accessible by the instruction bus or data bus of LP CPU with zero latency
- 1256 KB of peripheral address space
- 64 MB of external flash virtual address space, accessible by the instruction bus or data bus
- 64 MB of external RAM virtual address space, accessible by the instruction bus or data bus
- 768 KB of internal DMA address space
- 128 MB of external DMA address space

- **Internal Memory**

- 128 KB of HP ROM
- 768 KB of HP L2MEM
- 8 KB of HP SPM (Scratchpad Memory)
- 16 KB of LP ROM
- 32 KB of LP SRAM

- **External Memory**

- Supports up to 64 MB of external flash and RAM
- **Peripheral Space**
  - 96 modules/peripherals in total
- **GDMA**
  - 7 GDMA-AHB supported modules/peripherals
  - 6 GDMA-AXI supported modules/peripherals

## 6.3 Functional Description

### 6.3.1 Address Mapping

Figure 6.3-1 illustrates the system structure and address mapping. All the non-reserved addresses are accessible via both the instruction bus and the data bus, meaning that the instruction bus and the data bus share the same address space.

Both the data bus and instruction bus of the HP CPU and LP CPU are little-endian. However, the HP CPU's data bus (DBUS) has a 128-bit data width, while other buses maintain a 32-bit data width.

The HP CPU can access data via the data bus using single-byte, double-byte, 4-byte alignment, and, in case of AI Instruction, up to 16-byte alignment. The LP CPU can access data via the data bus using single-byte, double-byte, and 4-byte alignment.

The HP CPU has the following access capabilities:

- Direct access to HP SPM via both the data bus and instruction bus.
- Access to internal memory and external memory mapped into the address space via cache, including:
  - 128 KB HP ROM (0x4FC0\_0000 ~ 0x4FC1\_FFFF)
  - 768 KB HP L2MEM (0x4FF0\_0000 ~ 0x4FFB\_FFFF)
  - 64 MB external flash (0x4000\_0000 ~ 0x43FF\_FFFF)
  - 64 MB external RAM (0x4800\_0000 ~ 0x4BFF\_FFFF)

**Note:**

Software can use the addresses starting with "0x4" in two ways: cache-able access or noncache-able access, depending on the control of CPU Physical Memory Attribution (PMA). Cache-able access is done via cache. Noncache-able access is done without cache, which is similar to the direct access to the addresses starting with "0x8", however, such direct access to "0x8" addresses is usually for debugging.

- Direct access to internal memory and external memory mapped into the following address space without cache. This access is slower than that via cache.
  - 128 KB HP ROM (0x8FC0\_0000 ~ 0x8FC1\_FFFF)
  - 768 KB HP L2MEM (0x8FF0\_0000 ~ 0x8FFB\_FFFF)
  - 32 KB LP SRAM (0x5010\_8000 ~ 0x5010\_FFFF)

- 64 MB external flash (0x8000\_0000 ~ 0x83FF\_FFFF)
- 64 MB external RAM (0x8800\_0000 ~ 0x8BFF\_FFFF)
- Direct access to modules/peripherals via the data bus, including:
  - HP CPU Peripherals
  - HP Peripherals
  - LP Peripherals

The LP CPU's access capabilities include:

- Direct access to LP SRAM and LP ROM via both the data bus and instruction bus.
- Access to internal memory and external memory, including:
  - 128 KB HP ROM (0x4FC0\_0000 ~ 0x4FC1\_FFFF)
  - 768 KB HP L2MEM (0x4FF0\_0000 ~ 0x4FFB\_FFFF)
  - 64 MB external flash (0x4000\_0000 ~ 0x43FF\_FFFF)
  - 64 MB external RAM (0x4800\_0000 ~ 0x4BFF\_FFFF)
- Direct access to modules/peripherals via the data bus, including:
  - HP CPU Peripherals
  - HP Peripherals
  - LP Peripherals

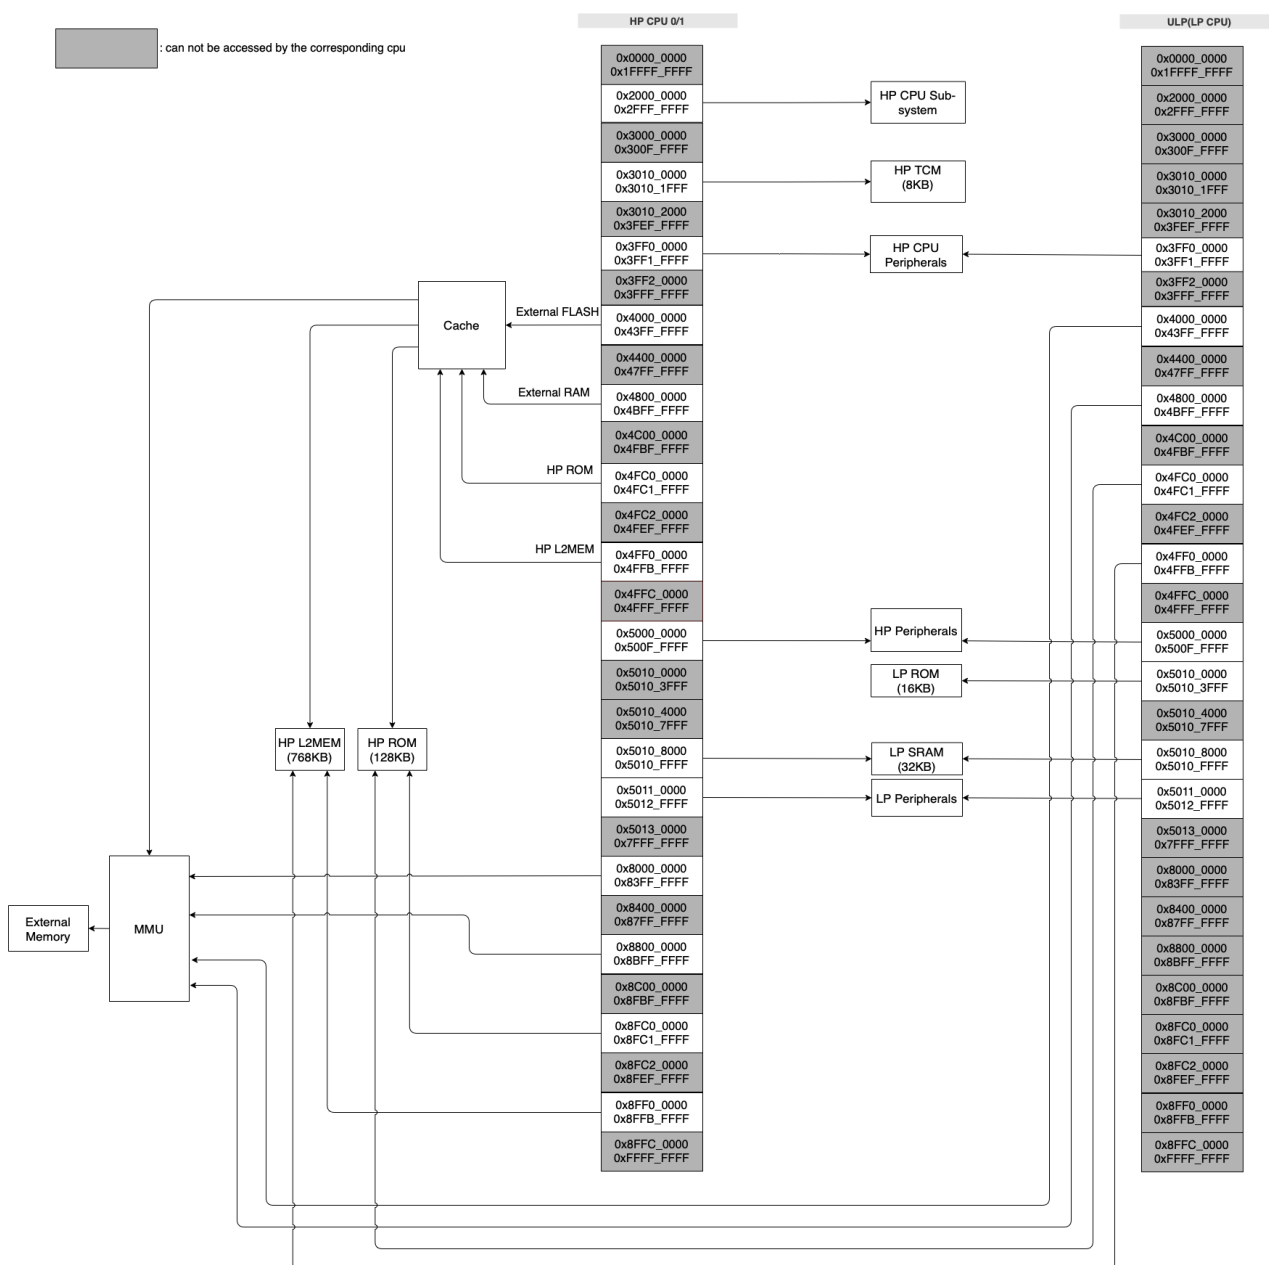

Figure 6.3-1. System Structure and Address Mapping

- The range of addresses available in the address space may be larger than the actual available memory of a particular type.
- For HP CPU sub-system, please refer to Chapter 1 *High-Performance CPU [to be added later]*.

Table 6.3-1 lists the address ranges on the data bus and instruction bus and their corresponding target memories.

Table 6.3-1. Memory Address Mapping

| Bus Type | Boundary Address |              | Size | Target*  |
|----------|------------------|--------------|------|----------|
|          | Low Address      | High Address |      |          |
|          | 0x0000_0000      | 0x300F_FFFF  |      | Reserved |

Cont'd on next page

Table 6.3-1 – cont'd from previous page

| Bus Type             | Boundary Address |              | Size   | Target *                              |
|----------------------|------------------|--------------|--------|---------------------------------------|
|                      | Low Address      | High Address |        |                                       |
| Data/Instruction bus | 0x3010_0000      | 0x3010_1FFF  | 8 KB   | HP SPM                                |
|                      | 0x3010_2000      | 0x3FEF_FFFF  |        | Reserved                              |
| Data/Instruction bus | 0x3FF0_0000      | 0x3FF1_FFFF  | 128 KB | HP CPU peripherals                    |
|                      | 0x3FF2_0000      | 0x3FFF_FFFF  |        | Reserved                              |
| Data/Instruction bus | 0x4000_0000      | 0x43FF_FFFF  | 64 MB  | External flash                        |
|                      | 0x4400_0000      | 0x47FF_FFFF  |        | Reserved                              |
| Data/Instruction bus | 0x4800_0000      | 0x4BFF_FFFF  | 64 MB  | External RAM                          |
|                      | 0x4C00_0000      | 0x4FBF_FFFF  |        | Reserved                              |
| Data/Instruction bus | 0x4FC0_0000      | 0x4FC1_FFFF  | 128 KB | HP ROM                                |
|                      | 0x4FC2_0000      | 0x4FEF_FFFF  |        | Reserved                              |
| Data/Instruction bus | 0x4FF0_0000      | 0x4FFB_FFFF  | 768 KB | HP L2MEM                              |
|                      | 0x4FFC_0000      | 0x4FFF_FFFF  |        | Reserved                              |
| Data/Instruction bus | 0x5000_0000      | 0x500F_FFFF  | 1 MB   | HP peripherals                        |
| Data/Instruction bus | 0x5010_0000      | 0x5010_3FFF  | 16 KB  | LP ROM                                |
|                      | 0x5010_4000      | 0x5010_7FFF  |        | Reserved                              |
| Data/Instruction bus | 0x5010_8000      | 0x5010_FFFF  | 32 KB  | LP SRAM                               |
| Data/Instruction bus | 0x5011_0000      | 0x5012_FFFF  | 128 KB | LP peripherals                        |
|                      | 0x5013_0000      | 0x7FFF_FFFF  |        | Reserved                              |
| Data/Instruction bus | 0x8000_0000      | 0x83FF_FFFF  | 64 MB  | External flash (direct access by CPU) |
|                      | 0x8400_0000      | 0x87FF_FFFF  |        | Reserved                              |
| Data/Instruction bus | 0x8800_0000      | 0x8BFF_FFFF  | 64 MB  | External RAM (direct access by CPU)   |
|                      | 0x8C00_0000      | 0x8FBF_FFFF  |        | Reserved                              |
| Data/Instruction bus | 0x8FC0_0000      | 0x8FC1_FFFF  | 128 KB | HP ROM (direct access by CPU)         |
|                      | 0x8FC2_0000      | 0x8FEF_FFFF  |        | Reserved                              |
| Data/Instruction bus | 0x8FF0_0000      | 0x8FFB_FFFF  | 768 KB | HP L2MEM (direct access by CPU)       |
|                      | 0x8FFC_0000      | 0xFFFF_FFFF  |        | Reserved                              |

\* Address starting with 0x4xxx\_xxxx can be configured as noncache-able or cache-able, depending on CPU PMA, whereas address starting with 0x8xxx\_xxxx is accessed directly by CPU.

\* For the targets accessible by HP CPU or LP CPU, see Figure 6.3-1.

## 6.3.2 Internal Memory

ESP32-P4 has various types of internal memory:

- **HP ROM (128 KB):** This read-only memory is dedicated to the HP system and is not programmable. It contains the ROM code and read-only data of some low-level system software. The HP ROM is accessed by the HP CPU through the I2 cache at half the frequency of HP CPU.
- **HP L2MEM (768 KB):** A volatile memory accessible by the HP CPU, LP CPU, or DMA peripherals at half the frequency of the HP CPU. HP L2MEM can be configured to retain power during Light-sleep mode, making it suitable for data retention or register backup.
- **LP ROM (16 KB):** This read-only memory serves the LP system, containing the code for booting the LP CPU and some basic system functions. The LP ROM is accessed by the LP CPU with zero latency.

- **LP SRAM (32 KB):** A volatile memory accessible by both the HP CPU and LP CPU, operating at the same frequency as the LP CPU.
- **HP SPM (8 KB):** A volatile memory accessed by the HP CPU, finishing one access in two cycles.

### 1. Details for HP ROM

The 128 KB HP ROM is a read-only memory accessed by the HP CPU through the instruction bus or data bus via the following addresses as shown in Table 6.3-1:

- 0x4FC0\_0000 (cache-able or noncache-able, configuration-dependent) ~ 0x4FC1\_FFFF (cache-able or noncache-able, configuration-dependent).
- 0x8FC0\_0000 (direct access by CPU) ~ 0x8FC1\_FFFF (direct access by CPU).

### 2. Details for HP L2MEM

This 768 KB HP L2MEM is a read-and-write memory accessed by the HP CPU or LP CPU through the instruction bus or data bus, or by DMA master through AHB matrix or AXI matrix via the following addresses as shown in Table 6.3-1:

- 0x4FF0\_0000 (cache-able or noncache-able, configuration-dependent) ~ 0x4FFB\_FFFF (cache-able or noncache-able, configuration-dependent).
- 0x8FF0\_0000 (direct access by CPU) ~ 0x8FFB\_FFFF (direct access by CPU).

HP L2MEM can be accessed by various peripherals:

- by USB 2.0 High-speed, USB 2.0 Full-speed, GMAC, SDMMC, TRACE, GDMA-AHB, and SYSMON via AHB matrix.
- by GDMA, GDMA-AXI, 2D-DMA, and H264 Encoder via AXI matrix.

The HP L2MEM supports Error Correction Code (ECC) check to correct one-bit memory flip error. In the event of a one-bit flip error, the data in HP L2MEM still remains valid. Before ECC check, HP L2MEM itself must be initialized first.

HP L2MEM consists of six memory units, each occupying 128 KB. The initialization process allows individual configuration of each unit for power considerations. It is recommended to initialize memory units sequentially rather than simultaneously. This sequential approach helps prevent excessive power consumption and avoids triggering a brownout condition when initializing the entire 768 KB HP L2MEM.

#### Detailed Configuration Steps:

Take unit0 as an example, other units follow the same configuration steps.

- Set `HP_SYSTEM_L2_MEM_UNIT0_REFRESH_EN` and clear `HP_SYSTEM_L2_MEM_REFRESH_CNT_RESET` to start initializing HP L2MEM.
- Read the value of `HP_SYSTEM_L2_MEM_UNIT0_REFRESH_DONE`.
- Once `HP_SYSTEM_L2_MEM_UNIT0_REFRESH_DONE` reaches a value of 1, set `HP_SYSTEM_L2_RAM_UNIT0_ECC_EN` to start ECC check.
- (Recommended) clear `HP_SYSTEM_L2_MEM_UNIT0_REFRESH_EN` and set `HP_SYSTEM_L2_MEM_REFRESH_CNT_RESET` after `HP_SYSTEM_L2_MEM_UNIT0_REFRESH_DONE` reaches 1 to complete the initialization process.

During the initialization process, avoid any access to HP L2MEM unit being initialized.

### 3. Details for LP ROM

This 16 KB LP ROM is a read-only memory accessed by LP CPU through the instruction bus or data bus via their shared address 0x5010\_0000 ~ 0x5010\_3FFF as shown in Table 6.3-1.

### 4. Details for LP SRAM

This 32 KB LP SRAM is a read-and-write memory accessed by the HP CPU via AHB matrix and by the LP CPU through the instruction bus or data bus via their shared address 0x5010\_8000 ~ 0x5010\_FFFF as shown in Table 6.3-1. LP SRAM supports atomic operation.

### 5. Details for HP SPM

This 8 KB HP SPM is a read-and-write memory accessed by the HP CPU through the instruction bus or data bus via their shared address 0x3010\_0000 ~ 0x3010\_1FFF as shown in Table 6.3-1. Additionally, HP SPM supports atomic operation of the HP CPU.

HP SPM supports parity check to detect one-bit memory flip error. Before conducting the parity check, HP SPM itself must be initialized first.

#### Detailed Configuration Steps:

- Set HP\_SYSTEM\_SPM\_INIT\_EN and clear HP\_SYSTEM\_SPM\_INIT\_CNT\_RESET to start initializing HP SPM.
- Read the value of HP\_SYSTEM\_SPM\_INIT\_DONE.
- Once HP\_SYSTEM\_SPM\_INIT\_DONE reaches a value of 1, set HP\_SYSTEM\_HP\_SPM\_PARITY\_CHECK\_EN to start parity check.
- (Recommended) clear HP\_SYSTEM\_SPM\_INIT\_EN and set HP\_SYSTEM\_SPM\_INIT\_CNT\_RESET after HP\_SYSTEM\_SPM\_INIT\_CNT\_RESET reaches 1 to complete the initialization process.

During the above process, avoid any access to HP SPM.

## 6.3.3 External Memory

ESP32-P4 supports SPI, dual SPI, quad SPI and QPI interfaces for connecting to external flash, as well as OPI and HPI interfaces for connecting to external RAM.

ESP32-P4 provides the following security features to protect users' data in external flash and RAM:

- hardware manual encryption and automatic decryption based on XTS-AES algorithm to protect users' programs and data stored in the external flash.
- automatic encryption and decryption based on XTS-AES algorithm to protect users' data in the external RAM.

### 6.3.3.1 External Memory Address Mapping

HP CPU can access external flash or RAM via 0x4000\_0000 ~ 0x43FF\_FFFF or via 0x4800\_0000 ~ 0x4BFF\_FFFF using cache-able or noncache-able methods. HP CPU can also access external flash or RAM directly via 0x8000\_0000 ~ 0x83FF\_FFFF or via 0x8800\_0000 ~ 0x8BFF\_FFFF, which is slower than the access via cache and is therefore commonly used for debugging.

When the HP CPU accesses external memory, it maps the addresses to physical addresses based on the information in the Memory Management Unit (MMU).

- Range (0x4000\_0000 ~ 0x43FF\_FFFF) is mapped to the physical address of the external flash accessed by HP CPU via cache.
- Range (0x4800\_0000 ~ 0x4BFF\_FFFF) is mapped to the physical address of the external RAM accessed by HP CPU via cache.
- Range (0x8000\_0000 ~ 0x83FF\_FFFF) is mapped to the physical address of the external flash accessed by HP CPU directly.
- Range (0x8800\_0000 ~ 0x8BFF\_FFFF) is mapped to the physical address of the external RAM accessed by HP CPU directly.

This mapping allows ESP32-P4 to address up to 64 MB of external flash and 64 MB of external RAM. **Note that** the instruction bus shares the same address space (64 MB) with the data bus for accessing external memory.

### 6.3.3.2 Cache

As shown in Figure 6.3-2, ESP32-P4 has a two-level cache system, with the following features:

- L1 cache, including:
  - 16 KB of instruction cache (icache) with a 64 B block size, four-way set associative
  - 64 KB of data cache (dcache) with a 64 B block size, two-way set associative, supporting two writing strategies: write-through and write-back
- L2 cache: 128 KB/256 KB/512 KB with 64 B/128 B block sizes, eight-way set associative
- Cache-able and noncache-able access, depending on CPU PMA
- Preload operation
- Lock operation
- Critical word first and early restart

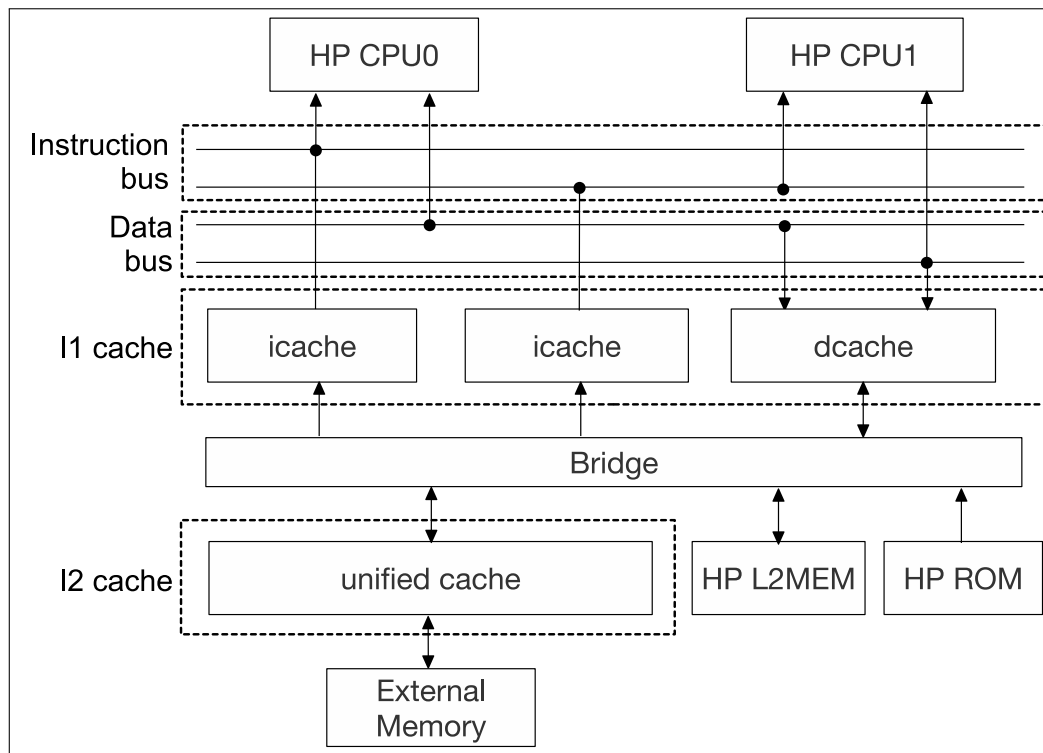

Figure 6.3-2. Cache Structure

### 6.3.3.3 Cache Operations

ESP32-P4 I1 cache and I2 cache supports the following operations:

1. **Write-back** (for dcache and I2 cache only):

- Clears dirty bits in the tag memory and updates new data to external memory.
- After the write-back operation, the new data is updated to external memory.
- Users can choose whether to invalidate the data in the cache.
- If the data is not invalidated, CPU will read/write data directly from/to the cache where data missing will not occur.

2. **Clean** (for dcache and I2 cache only):

- Clears dirty bits in the tag memory without updating data to external memory.
- After the clean operation, old data remains in external memory, while the cache holds the new one (unaware of it).
- CPU can then read/write the data directly from/to the cache, where data missing will not occur.

3. **Invalidate**:

- Removes valid data from the cache.
- Once this operation is done, the deleted data is stored only in external memory.
- HP CPU needs to access external memory if it wants to access the data again.
- Two types of invalidate operation:

- Manual-Invalidate: is performed only on data in the specified cache area.
- Invalidate-All: is performed on all data in the cache.

#### 4. Preload:

- Loads instructions and data into the cache in advance.
- Minimum unit of preload-operation is one block.
- Two types of preload operation:
  - Manual-Preload: involves the hardware prefetching continuous data based on the virtual address specified by the software.
  - Auto-Preload: involves the hardware prefetching continuous data based on the current address where the cache hits or misses (configuration-dependent).

#### 5. Lock/Unlock:

- Lock operation prevents easily replacing data in the cache.
- Two types of lock:
  - Prelock: locks data in the specified area when filling missing data to cache memory, leaving the data outside the specified area unlocked.
  - Manual Lock: checks data in the cache memory and locks data only if it falls in the specified area, leaving data outside the specified area unlocked.
- When there is missing data, the cache replaces the data in the unlocked way first, ensuring that the data in the locked way remains in the cache and will not be replaced.
- When all ways within the cache are locked, the cache will replace data, as if it was not locked.
- Unlocking is the reverse of locking and can only be done manually.
- Note: Manual-Invalidate operation only works on the unlocked data. If you plan to perform this operation on the locked data, please unlock them first.

### 6.3.4 DMA Address Space

ESP32-P4 includes AHB General Direct Memory Access (GDMA-AHB), AXI General Direct Memory Access (GDMA-AXI), and VDMA, all providing general direct memory access services.

In ESP32-P4, masters like USB 2.0 High-speed, USB 2.0 Full-speed, GDMAC, Trace0/1, VDMA, 2D-DMA, and H264 Encoder have built-in DMA function modules, providing direct memory access services.

All DMA-enabled master devices mentioned above can access:

- HP L2MEM (0x4FF0\_0000~0x4FFB\_FFFF).
- external flash (0x4000\_0000 ~ 0x43FF\_FFFF).
- external RAM (0x4800\_0000 ~ 0x4BFF\_FFFF).

Additionally, VDMA Master 1 can also access:

- MIPI CSI internal memory (0x5010\_4000 ~ 0x5010\_4FFF).
- MIPI DSI internal memory (0x5010\_5000 ~ 0x5010\_5FFF).

**Note:**

When accessing a memory via DMA, a corresponding access permission is needed, otherwise this access may fail. For more information about permission control, please refer to Chapter 18 [Permission Control \(PMS\)](#).

### 6.3.5 Modules/Peripherals Address Mapping

Table 6.3-2 lists all the modules/peripherals and their respective address ranges. Note that the address space of specific modules/peripherals is defined by “Boundary Address” (including both Low Address and High Address).

Table 6.3-2. Module/Peripheral Address Mapping

| Target                             | Boundary Address |              | Size (KB) |
|------------------------------------|------------------|--------------|-----------|
|                                    | Low Address      | High Address |           |
| HP CPU Peripherals (HP CPU PERI)   |                  |              |           |
| Reserved                           | 0x3FF0_0000      | 0x3FF0_3FFF  |           |

**Note:**

As shown in Figure 6.3-1, HP CPU and LP CPU can access HP CPU PERI, HP PERIO, HP PERI1, LP AON PERI and LP PERI listed in Table 6.3-2.

## Chapter 7

### eFuse Controller

#### 7.1 Overview

ESP32-P4 contains a 4096-bit eFuse memory to store parameters and user data. The parameters include control parameters for some hardware modules, system data parameters and keys used for the encryption/decryption module. Once an eFuse bit is programmed to 1, it can never be reverted to 0. The eFuse controller programs individual bits of parameters in eFuse according to user configurations. From outside the chip, eFuse data can only be read via the eFuse controller. For some data, such as some keys stored in eFuse for internal use by hardware cryptography modules (e.g., digital signature, HMAC), if read protection is not enabled, the data can be read from outside the chip; if read protection is enabled, the data cannot be read from outside the chip.

#### 7.2 Features

- 4096-bit one-time programmable memory (including up to 1792 bits reserved for custom use depending on whether the EFUSE\_KEY\_PURPOSE\_*n* parameters are set to 0. For more information, see Table 7.3-2.)
- Configurable write protection
- Configurable read protection
- Various hardware encoding schemes against data corruption

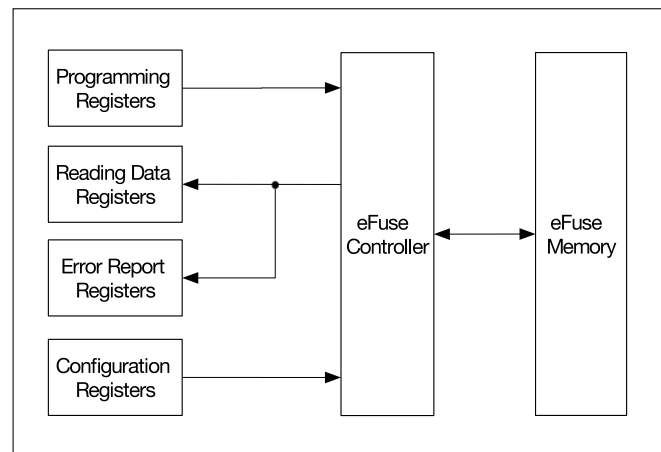

#### 7.3 Functional Description

##### 7.3.1 Structure

The eFuse system consists of the eFuse controller and eFuse memory. Data flow in this system is shown in Figure 7.3-1.

Users can program bits in the eFuse memory via the eFuse controller by writing the data to be programmed to the programming register and executing the programming instruction. For detailed programming steps, please refer to Section 7.3.2.

Users cannot directly read the data programmed in the eFuse memory, so they need to read the programmed data into the Reading Data Register of the corresponding address segment through the eFuse controller. During the reading process, if the data is inconsistent with that in the eFuse memory, the eFuse controller can automatically correct it through the hardware encoding mechanism (see Section 7.3.1.3 for details), and send the error message to the error report register. For detailed steps to read parameters, please refer to the Section 7.3.3.

**Figure 7.3-1. Data Flow in eFuse**

Data in eFuse memory is organized in 11 blocks (BLOCK0 ~ BLOCK10).

BLOCK0 holds most parameters for software and hardware uses.

Table [7.3-1](#) lists all the parameters accessible (readable and usable) to users in BLOCK0 and their offsets, bit widths, accessibility by hardware, write protection, and brief function description. For more description on the parameters, please click the link of the corresponding parameter in the table.

The [EFUSE\\_WR\\_DIS](#) parameter is used to disable write protection of other parameters. [EFUSE\\_RD\\_DIS](#) is used to disable read protection of BLOCK4 ~ BLOCK10. For more information on these two parameters, please see Section [7.3.1.1](#) and Section [7.3.1.2](#).

Table 7.3-1. Parameters in eFuse BLOCK0

| Parameters  | Bit Width | Accessible by Hardware | Write Protection by <a href="#">EFUSE_WR_DIS</a> Bit Number | Description  |
|---|-----------|------------------------|---|--|
| <a href="#">EFUSE_WR_DIS</a>                      | 32        | Y                      | N/A   | Represents whether writing of eFuse bits by eFuse controller is disabled.  |
| <a href="#">EFUSE_RD_DIS</a>                      | 7         | Y                      | 0   | Represents whether reading data from BLOCK4 ~ 10 in eFuse memory by users is disabled.   |
| <a href="#">EFUSE_USB_DEVICE_EXCHG_PINS</a>       | 1         | Y                      | 30  | Represents whether the USB Serial/JTAG pins D+ and D- are exchanged.   |
| <a href="#">EFUSE_USB_OTG11_EXCHG_PINS</a>        | 1         | Y                      | 30  | Represents whether the USB FS pins D+ and D- are exchanged.  |
| <a href="#">EFUSE_DIS_USB_JTAG</a>                | 1         | Y                      | 2   | Represents whether the USB-to-JTAG function in USB Serial/JTAG module is disabled.   |
| <a href="#">EFUSE_POWERGLITCH_EN</a>              | 1         | Y                      | 2   | Represents whether power glitch detection is enabled.  |
| <a href="#">EFUSE_DIS_FORCE_DOWNLOAD</a>          | 1         | Y                      | 2   | Represents whether the function to force the chip into Download mode is disabled.  |
| <a href="#">EFUSE_SPI_DOWNLOAD_MSPI_DIS</a>       | 1         | Y                      | 2   | Represents accessing MSPI flash/MSPI RAM by SYS AXI matrix is disabled during boot_mode_download.  |
| <a href="#">EFUSE_DIS_TWAI</a>                    | 1         | Y                      | 2   | Represents whether the TWAI controller is disabled.  |
| <a href="#">EFUSE_JTAG_SEL_ENABLE</a>             | 1         | Y                      | 2   | Represents whether the selection of a JTAG signal source through the strapping value is enabled when both <a href="#">EFUSE_DIS_PAD_JTAG</a> and <a href="#">EFUSE_DIS_USB_JTAG</a> are configured to 0. |
| <a href="#">EFUSE_SOFT_DIS_JTAG</a>               | 3         | Y                      | 31  | Represents whether PAD JTAG is disabled in the soft way.   |
| <a href="#">EFUSE_DIS_PAD_JTAG</a>                | 1         | Y                      | 2   | Represents whether PAD JTAG is disabled in the hard way (permanently).   |
| <a href="#">EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT</a> | 1         | Y                      | 2   | Represents whether flash encryption is disabled (except in SPI boot mode).   |

| Parameters  | Bit Width | Accessible by Hardware | Write Protection by <a href="#">EFUSE_WR_DIS</a> Bit Number | Description  |
|---|-----------|------------------------|---|--|
| <a href="#">EFUSE_USB_PHY_SEL</a>                   | 1         | Y                      | 30  | Represents the connection between USB Serial/JTAG Controller, OTG_FS and FS_PHY1, FS_PHY2. |
| <a href="#">EFUSE_XTS_KEY_LENGTH_256</a>            | 1         | N                      | 1   | Represents which key is used for flash encryption.   |
| <a href="#">EFUSE_WDT_DELAY_SEL</a>                 | 2         | Y                      | 2   | Represents RTC watchdog timeout threshold.   |
| <a href="#">EFUSE_SPI_BOOT_CRYPT_CNT</a>            | 3         | Y                      | 4   | Represents whether SPI boot encryption/decryption is enabled.                              |
| <a href="#">EFUSE_SECURE_BOOT_KEY_REVOKE0</a>       | 1         | N                      | 5   | Represents whether revoking the first Secure Boot key is enabled.                          |
| <a href="#">EFUSE_SECURE_BOOT_KEY_REVOKE1</a>       | 1         | N                      | 6   | Represents whether revoking the second Secure Boot key is enabled.                         |
| <a href="#">EFUSE_SECURE_BOOT_KEY_REVOKE2</a>       | 1         | N                      | 7   | Represents whether revoking the third Secure Boot key is enabled.                          |
| <a href="#">EFUSE_KEY_PURPOSE_0</a>                 | 4         | Y                      | 8   | Represents Key0 purpose. See Table <a href="#">7.3-2</a> .                                 |
| <a href="#">EFUSE_KEY_PURPOSE_1</a>                 | 4         | Y                      | 9   | Represents Key1 purpose. See Table <a href="#">7.3-2</a> .                                 |
| <a href="#">EFUSE_KEY_PURPOSE_2</a>                 | 4         | Y                      | 10  | Represents Key2 purpose. See Table <a href="#">7.3-2</a> .                                 |
| <a href="#">EFUSE_KEY_PURPOSE_3</a>                 | 4         | Y                      | 11  | Represents Key3 purpose. See Table <a href="#">7.3-2</a> .                                 |
| <a href="#">EFUSE_KEY_PURPOSE_4</a>                 | 4         | Y                      | 12  | Represents Key4 purpose. See Table <a href="#">7.3-2</a> .                                 |
| <a href="#">EFUSE_KEY_PURPOSE_5</a>                 | 4         | Y                      | 13  | Represents Key5 purpose. See Table <a href="#">7.3-2</a> .                                 |
| <a href="#">EFUSE_SEC_DPA_LEVEL</a>                 | 2         | Y                      | 14  | Represents the security level of anti-DPA (differential power analysis) attack.            |
| <a href="#">EFUSE_CRYPT_DPA_ENABLE</a>              | 1         | Y                      | 14  | Represents whether defense against DPA attack is enabled.                                  |
| <a href="#">EFUSE_SECURE_BOOT_EN</a>                | 1         | N                      | 15  | Represents whether Secure Boot is enabled.   |
| <a href="#">EFUSE_SECURE_BOOT_AGGRESSIVE_REVOKE</a> | 1         | N                      | 16  | Represents whether aggressive revocation of Secure Boot is enabled.                        |
| <a href="#">EFUSE_FLASH_TYPE</a>                    | 1         | N                      | 18  | Represents the type of the interfaced flash.   |

Table 7.3-1 – cont'd from previous page

| Parameters                           | Bit Width | Accessible by Hardware | Write Protection by <a href="#">EFUSE_WR_DIS</a> Bit Number | Description   |
|--------------------------------------|-----------|------------------------|---|---|
| <a href="#">EFUSE_OPXA_TIEH_SEL2</a> | 2         | Y                      | 2   | Represents which output source is used for Extern Power (VO3).                                |
| <a href="#">EFUSE_OPXA_TIEH_SEL3</a> | 2         | Y                      | 2   | Represents which output source is used for Extern Power (VO4).                                |
| <a href="#">EFUSE_HP_PWR_SRC_SEL</a> | 1         | Y                      | 3   | Represents the HP system power source.  |
| <a href="#">EFUSE_DCDC_VSET_EN</a>   | 1         | Y                      | N/A   | Represents whether to use the default voltage configured by <a href="#">EFUSE_DCDC_VSET</a> . |
| <a href="#">EFUSE_DIS_WDT</a>        | 1         | Y                      | 2   | Represents whether to disable the watchdog.   |
| <a href="#">EFUSE_DIS_SWD</a>        | 1         | Y                      | 2   | Represents whether to disable the super watchdog.   |

Table 7.3-2 lists all key purposes and their values. Setting the eFuse parameter EFUSE\_KEY\_PURPOSE\_*n* declares the purpose of KEY*n* (*n*: 0 ~ 5).

Table 7.3-2. Secure Key Purpose Values

| Key Purpose Values | Purposes   |
|--------------------|--|
| 0                  | User purposes  |
| 1                  | ECDSA_KEY  |
| 2                  | XTS_AES_256_KEY_1                                      |
| 3                  | XTS_AES_256_KEY_2                                      |
| 4                  | XTS_AES_128_KEY (flash/SRAM encryption and decryption) |
| 5                  | HMAC Downstream mode (both JTAG and DS)                |
| 6                  | JTAG in HMAC Downstream mode                           |
| 7                  | Digital Signature peripheral in HMAC Downstream mode   |
| 8                  | HMAC Upstream mode                                     |
| 9                  | SECURE_BOOT_DIGEST0 (secure boot key digest)           |
| 10                 | SECURE_BOOT_DIGEST1 (secure boot key digest)           |
| 11                 | SECURE_BOOT_DIGEST2 (secure boot key digest)           |

Table 7.3-3 provides the details of parameters in BLOCK1 ~ BLOCK10.

Table 7.3-3. Parameters in BLOCK1 to BLOCK10

| BLOCK   | Parameters           | Bit Width | Accessible<br>by Hardware | Write Protection by<br><a href="#">EFUSE_WR_DIS</a><br>Bit Number | Read Protection<br>by <a href="#">EFUSE_RD_DIS</a><br>Bit Number | Description          |
|---------|----------------------|-----------|---------------------------|---|--|----------------------|
| BLOCK1  | EFUSE_MAC            | 48        | N                         | 20  | N/A  | MAC address          |
|         | EFUSE_MAC_EXT        | 16        | N                         | 20  | N/A  | Extended MAC address |
|         | EFUSE_MAC_RESERVED   | 50        | N                         | 20  | N/A  | Reserved MAC address |
|         | EFUSE_SYS_DATA_PART0 | 78        | N                         | 20  | N/A  | System data          |
| BLOCK2  | EFUSE_SYS_DATA_PART1 | 256       | N                         | 21  | N/A  | System data          |
| BLOCK3  | EFUSE_USR_DATA       | 256       | N                         | 22  | N/A  | User data            |
| BLOCK4  | EFUSE_KEY0_DATA      | 256       | Y                         | 23  | 0  | KEY0 or user data    |
| BLOCK5  | EFUSE_KEY1_DATA      | 256       | Y                         | 24  | 1  | KEY1 or user data    |
| BLOCK6  | EFUSE_KEY2_DATA      | 256       | Y                         | 25  | 2  | KEY2 or user data    |
| BLOCK7  | EFUSE_KEY3_DATA      | 256       | Y                         | 26  | 3  | KEY3 or user data    |
| BLOCK8  | EFUSE_KEY4_DATA      | 256       | Y                         | 27  | 4  | KEY4 or user data    |
| BLOCK9  | EFUSE_KEY5_DATA      | 256       | Y                         | 28  | 5  | KEY5 or user data    |
| BLOCK10 | EFUSE_SYS_DATA_PART2 | 256       | N                         | 29  | 6  | System data          |

Among these blocks, BLOCK4 ~ 9 can be used to store KEY0 ~ 5. Up to six 256-bit keys can be written into eFuse. Whenever a key is written, its purpose value should also be written (see table 7.3-2). For example, when a key for the JTAG function in HMAC Downstream mode is written to KEY3 (i.e., BLOCK7), its key purpose value 6 should also be written to EFUSE\_KEY\_PURPOSE\_3.

**Note:**

Do not program the XTS-AES key into the KEY5 block, i.e., BLOCK9. Otherwise, the key may be unreadable. Instead, program it into the preceding blocks, i.e., BLOCK4 ~ BLOCK8. The last block, BLOCK9, is used to program other keys.

BLOCK1 ~ BLOCK10 use the RS coding scheme, so there are some limitations on writing to these parameters. For more detailed information, please refer to Section 7.3.1.3 and Section 7.3.2.

### 7.3.1.1 EFUSE\_WR\_DIS

Parameter EFUSE\_WR\_DIS determines whether individual eFuse parameters are write-protected. After EFUSE\_WR\_DIS has been programmed, execute an eFuse read operation so the new values would take effect.

Column “Write Protection by EFUSE\_WR\_DIS Bit Number” in Table 7.3-1 and Table 7.3-3 list the specific bits in EFUSE\_WR\_DIS that disable writing.

When the write protection bit of a parameter is set to 0, it means that this parameter is not write-protected and can be programmed, unless it has been programmed before.

When the write protection bit of a parameter is set to 1, it means that this parameter is write-protected and none of its bits can be modified, with non-programmed bits always remaining 0 and programmed bits always remaining 1. That is to say, if a parameter is write-protected, it will always remain in this state and cannot be changed.

### 7.3.1.2 EFUSE\_RD\_DIS

Only the parameters in BLOCK4 ~ BLOCK10 can be set to be read-protected from users, as shown in column “Read Protection by EFUSE\_RD\_DIS Bit Number” of Table 7.3-3. After EFUSE\_RD\_DIS has been programmed, execute an eFuse read operation so the new values would take effect.

If the corresponding EFUSE\_RD\_DIS bit is 0, the parameter controlled by this bit is not read-protected from users. If it is 1, the parameter controlled by it is read-protected from users.

Other parameters that are not in BLOCK4 ~ BLOCK10 can always be read by users.

When BLOCK4 ~ BLOCK10 are set to be read-protected, the data in them can still be read by hardware cryptography modules if the EFUSE\_KEY\_PURPOSE\_*n* bit is set accordingly.

### 7.3.1.3 Data Storage

Internally, eFuse uses the hardware encoding scheme to protect data from corruption. The scheme and the encoding process are invisible to users.

All BLOCK0 parameters except for EFUSE\_WR\_DIS are stored with four backups, meaning each bit is stored four times. This backup scheme is not visible to users.

In BLOCK0, `EFUSE_WR_DIS` occupies 32 bits, and other parameters takes 152 bits each. So, the eFuse memory space occupied by BLOCK0 is  $32 + 152 * 4 = 640$  bits.

BLOCK1 ~ BLOCK10 use RS (44, 32) coding scheme that supports up to 6 bytes of automatic error correction. The primitive polynomial of RS (44, 32) is  $p(x) = x^8 + x^4 + x^3 + x^2 + 1$ .

Figure 7.3-2. Shift Register Circuit (first 32 output)

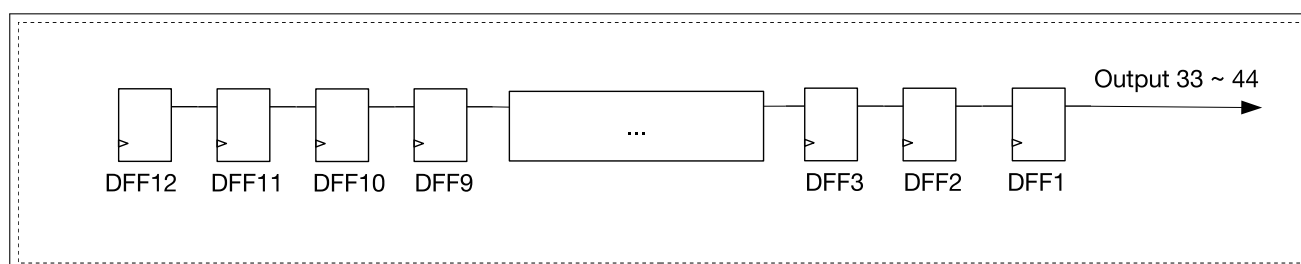

Figure 7.3-3. Shift Register Circuit (last 12 output)

The shift register circuit shown in Figure 7.3-2 and 7.3-3 processes 32 data bytes using RS (44, 32). This coding scheme encodes 32 bytes of data into 44 bytes:

- Bytes [0:31] are the data bytes itself
- Bytes [32:43] are the encoded parity bytes stored in 8-bit flip-flops DFF1, DFF2, ..., DFF12 ( $gf\_mul\_n$  is the result of multiplying a byte of data in  $GF(2^8)$  by  $\alpha^n$ , where  $n$  is an integer).

After that, the hardware programs into eFuse the 44-byte codeword consisting of the data bytes and the parity bytes. When the eFuse block is read, the eFuse controller automatically decodes the codeword and applies error correction if needed.

Because the RS check codes are generated on the entire 32-byte eFuse block, each block can only be written once.

Since the size of BLOCK1 is less than 32 bytes, the unused bits will be treated as 0 by hardware during the RS (44, 32) encoding. Thus, the final coding result will not be affected.

Among blocks using the RS (44, 32) coding scheme, the parameters in BLOCK1 is 24 bytes, and the RS check code is 12 bytes, so BLOCK1 occupies  $24 + 12 = 36$  bytes in eFuse memory.

The parameter in other blocks (Block2 ~ 10) is 32 bytes respectively, and the RS check code is 12 bytes, so they occupy  $(32 + 12) * 9 = 396$  bytes in eFuse memory.

### 7.3.2 Programming of Parameters

The eFuse controller can only program eFuse parameters in one block at a time. BLOCK0 ~ BLOCK10 share the same address range to store the parameters to be programmed. Configure parameter [EFUSE\\_BLK\\_NUM](#) to indicate which block should be programmed.

Since there is a one-to-one correspondence between the reading data registers and the programming data registers (see table [7.3-4](#) for details), users can find out where the data to be programmed is located in programming registers by checking the parameter description and the parameter location in the corresponding read registers.

For example, if the user wants to program the parameter [EFUSE\\_USB\\_DEVICE\\_EXCHG\\_PINS](#) in BLOCK0 to 1, they can first search the reading data registers [EFUSE\\_RD\\_REPEAT\\_DATA0 ~ 4\\_REG](#) in BLOCK0 for where the parameter is located, namely, the 8th bit in [EFUSE\\_RD\\_REPEAT\\_DATA0\\_REG](#). So, the user can set the 8th bit of [EFUSE\\_PGM\\_DATA1\\_REG](#) to 1 and follow the programming steps below. After the steps are completed, the corresponding bit in the eFuse memory will be programmed to 1.

#### Programming preparation

- Programming BLOCK0
  1. Set [EFUSE\\_BLK\\_NUM](#) to 0.
  2. Write into [EFUSE\\_PGM\\_DATA0\\_REG ~ EFUSE\\_PGM\\_DATA5\\_REG](#) the data to be programmed to BLOCK0.  
The data in [EFUSE\\_PGM\\_DATA6\\_REG ~ EFUSE\\_PGM\\_DATA7\\_REG](#) and [EFUSE\\_PGM\\_CHECK\\_VALUE0\\_REG ~ EFUSE\\_PGM\\_CHECK\\_VALUE2\\_REG](#) does not affect the programming of BLOCK0.
- BLOCK1 cannot be programmed by users as it has been programmed at manufacturing.
- Programming BLOCK2 ~ 10
  1. Set [EFUSE\\_BLK\\_NUM](#) to the block number.
  2. Write into [EFUSE\\_PGM\\_DATA0\\_REG ~ EFUSE\\_PGM\\_DATA7\\_REG](#) the data to be programmed. Write into [EFUSE\\_PGM\\_CHECK\\_VALUE0\\_REG ~ EFUSE\\_PGM\\_CHECK\\_VALUE2\\_REG](#) the corresponding RS code.

#### Programming process

The process of programming parameters is as follows:

1. Configure the value of parameter [EFUSE\\_BLK\\_NUM](#) to determine the block to be programmed.
2. Write parameters to be programmed to registers [EFUSE\\_PGM\\_DATA0\\_REG ~ EFUSE\\_PGM\\_DATA7\\_REG](#) and [EFUSE\\_PGM\\_CHECK\\_VALUE0\\_REG ~ EFUSE\\_PGM\\_CHECK\\_VALUE2\\_REG](#).
3. Make sure the eFuse programming voltage VDDQ is configured correctly as described in Section [7.3.4](#).
4. Configure the field [EFUSE\\_OP\\_CODE](#) of register [EFUSE\\_CONF\\_REG](#) to 0x5A5A.

5. Configure the field [EFUSE\\_PGM\\_CMD](#) of register [EFUSE\\_CMD\\_REG](#) to 1.
6. Poll register [EFUSE\\_CMD\\_REG](#) until it is 0x0, or wait for a PGM\_DONE interrupt. For more information on how to identify a PGM\_DONE or READ\_DONE interrupt, please see the end of Section 7.3.3.
7. Clear the parameters in [EFUSE\\_PGM\\_DATA0\\_REG](#) ~ [EFUSE\\_PGM\\_DATA7\\_REG](#) and [EFUSE\\_PGM\\_CHECK\\_VALUE0\\_REG](#) ~ [EFUSE\\_PGM\\_CHECK\\_VALUE2\\_REG](#).
8. Trigger an eFuse read operation (see Section 7.3.3) to update eFuse registers with the new values.
9. Check error record registers. If the values read in error record registers are not 0, the programming process should be performed again following above steps 1 ~ 7. Please check the following error record registers for different eFuse blocks:
  - BLOCK0: [EFUSE\\_RD\\_REPEAT\\_ERR0\\_REG](#) ~ [EFUSE\\_RD\\_REPEAT\\_ERR4\\_REG](#)
  - BLOCK1: [EFUSE\\_MAC\\_SYS\\_ERR\\_NUM](#), [EFUSE\\_MAC\\_SYS\\_FAIL](#)
  - BLOCK2: [EFUSE\\_SYS\\_PART1\\_ERR\\_NUM](#), [EFUSE\\_SYS\\_PART1\\_FAIL](#)
  - BLOCK3: [EFUSE\\_USR\\_DATA\\_ERR\\_NUM](#), [EFUSE\\_USR\\_DATA\\_FAIL](#)
  - BLOCK4: [EFUSE\\_KEY0\\_ERR\\_NUM](#), [EFUSE\\_KEY0\\_FAIL](#)
  - BLOCK5: [EFUSE\\_KEY1\\_ERR\\_NUM](#), [EFUSE\\_KEY1\\_FAIL](#)
  - BLOCK6: [EFUSE\\_KEY2\\_ERR\\_NUM](#), [EFUSE\\_KEY2\\_FAIL](#)
  - BLOCK7: [EFUSE\\_KEY3\\_ERR\\_NUM](#), [EFUSE\\_KEY3\\_FAIL](#)
  - BLOCK8: [EFUSE\\_KEY4\\_ERR\\_NUM](#), [EFUSE\\_KEY4\\_FAIL](#)
  - BLOCK9: [EFUSE\\_KEY5\\_ERR\\_NUM](#), [EFUSE\\_KEY5\\_FAIL](#)
  - BLOCK10: [EFUSE\\_SYS\\_PART2\\_ERR\\_NUM](#), [EFUSE\\_SYS\\_PART2\\_FAIL](#)

### Limitations

In BLOCK0, each bit can be programmed separately. However, we recommend to minimize programming cycles and program all the bits of a parameter in one programming action. In addition, after all parameters controlled by a certain bit of [EFUSE\\_WR\\_DIS](#) are programmed, that bit should be immediately programmed. The programming of parameters controlled by a certain bit of [EFUSE\\_WR\\_DIS](#), and the programming of the bit itself can even be completed at the same time in one programming action.

BLOCK1 cannot be programmed by users as it has been programmed at manufacturing.

BLOCK2 ~ 10 can only be programmed once. Repeated programming is not allowed.

## 7.3.3 Reading of Parameters by Users

Users cannot read eFuse bits directly. The eFuse controller hardware reads all eFuse bits and stores the results to their corresponding registers in its memory space. Then, users can read eFuse bits by reading the registers that start with [EFUSE\\_RD\\_](#). Details are provided in Table 7.3-4.

Table 7.3-4. Registers Information

| BLOCK | Read Registers   | Registers When Programming This Block   |
|-------|--|---|
| 0     | <a href="#">EFUSE_RD_WR_DIS_REG</a>  | <a href="#">EFUSE_PGM_DATA0_REG</a>     |
| 0     | <a href="#">EFUSE_RD_REPEAT_DATA0 ~ 4_REG</a>                              | <a href="#">EFUSE_PGM_DATA1 ~ 5_REG</a> |
| 1     | <a href="#">EFUSE_RD_MAC_SYS_0 ~ 5_REG</a>                                 | <a href="#">EFUSE_PGM_DATA0 ~ 5_REG</a> |
| 2     | <a href="#">EFUSE_RD_SYS_PART1_DATA0 ~ 7_REG</a>                           | <a href="#">EFUSE_PGM_DATA0 ~ 7_REG</a> |
| 3     | <a href="#">EFUSE_RD_USR_DATA0 ~ 7_REG</a>                                 | <a href="#">EFUSE_PGM_DATA0 ~ 7_REG</a> |
| 4-9   | <a href="#">EFUSE_RD_KEY<sub>n</sub>_DATA0 ~ 7_REG</a> ( <i>n</i> : 0 ~ 5) | <a href="#">EFUSE_PGM_DATA0 ~ 7_REG</a> |
| 10    | <a href="#">EFUSE_RD_SYS_PART2_DATA0 ~ 7_REG</a>                           | <a href="#">EFUSE_PGM_DATA0 ~ 7_REG</a> |

### Updating reading data registers

The eFuse controller reads eFuse memory to update corresponding registers. This read operation happens at system reset and can also be triggered manually by users as needed (e.g., if new eFuse values have been programmed). The process of triggering a read operation by users is as follows:

1. Configure the field [EFUSE\\_OP\\_CODE](#) in register [EFUSE\\_CONF\\_REG](#) to 0x5AA5.
2. Configure the field [EFUSE\\_READ\\_CMD](#) in register [EFUSE\\_CMD\\_REG](#) to 1.
3. Poll register [EFUSE\\_CMD\\_REG](#) until it is 0x0, or wait for a READ\_DONE interrupt. Information on how to identify a PGM\_DONE or READ\_DONE interrupt is provided below in this section.
4. Read the values of each parameter from eFuse memory.

The eFuse read registers will hold all values until the next read operation.

### Error detection

The programming error record registers allows users to check the integrity of parameters stored in the eFuse memory. For instance, they can help detect whether the four-backup parameters are consistent and whether parameters protected by RS encoding are decoded successfully.

Registers [EFUSE\\_RD\\_REPEAT\\_ERRO ~ 3\\_REG](#) indicate if there are any errors in programming parameters (except [EFUSE\\_WR\\_DIS](#)) to BLOCK0. The value 1 indicates an error is detected in programming the corresponding bit. The value 0 indicates no error.

Registers [EFUSE\\_RD\\_RS\\_ERRO ~ 1\\_REG](#) store the number of corrected bytes as well as the result of RS decoding when eFuse controller reads BLOCK1 ~ BLOCK10.

The values of the above registers will be updated every time the reading data registers of eFuse controller have been updated.

### Identifying completion of program or read operations

The methods to identify the completion of a program/read operation are described below. Please note that bit 1 corresponds to a program operation, and bit 0 corresponds to a read operation.

- Method one: Poll bit 1/0 in register [EFUSE\\_INT\\_RAW\\_REG](#) until it becomes 1, which represents the completion of a program/read operation.
- Method two:
  1. Set bit 1/0 in register [EFUSE\\_INT\\_ENA\\_REG](#) to 1 to enable the eFuse controller to post a PGM\_DONE or READ\_DONE interrupt.

2. Configure the Interrupt Matrix to enable the CPU to respond to eFuse interrupt signals. See Chapter 11 [Interrupt Matrix](#).
3. Wait for the PGM\_DONE or READ\_DONE interrupt.
4. Set bit 1/0 in register [EFUSE\\_INT\\_CLR\\_REG](#) to 1 to clear the PGM\_DONE or READ\_DONE interrupt.

#### Note

When eFuse controller is updating its registers, it will use [EFUSE\\_PGM\\_DATA<sub>n</sub>\\_REG](#) (n=0, 1, ... ,7) again to store data. So please do not write important data into these registers before this updating process is initiated.

During the chip boot process, eFuse controller will automatically update data from eFuse memory into the registers that can be accessed by users. Users can get programmed eFuse data by reading corresponding registers. Thus, there is no need to update the reading data registers in such case.

### 7.3.4 eFuse VDDQ Timing

The eFuse controller operates at the clock frequency of 20 MHz, and its programming voltage VDDQ should be configured as follows:

- [EFUSE\\_DAC\\_NUM](#) (the rising period of VDDQ): The default value of VDDQ is 2.5 V and the voltage increases by 0.01 V in each clock cycle. The default value of this parameter is 255.
- [EFUSE\\_DAC\\_CLK\\_DIV](#) (the clock divisor of VDDQ): The clock period to program VDDQ should be larger than 1  $\mu$ s.
- [EFUSE\\_PWR\\_ON\\_NUM](#) (the power-up time for VDDQ): The programming voltage should be stabilized after this time, which means the value of this parameter should be configured to exceed the result of [EFUSE\\_DAC\\_CLK\\_DIV](#) times [EFUSE\\_DAC\\_NUM](#).
- [EFUSE\\_PWR\\_OFF\\_NUM](#) (the power-out time for VDDQ): The value of this parameter should be larger than 10  $\mu$ s.

Table 7.3-5. Configuration of Default VDDQ Timing Parameters

| <a href="#">EFUSE_DAC_NUM</a> | <a href="#">EFUSE_DAC_CLK_DIV</a> | <a href="#">EFUSE_PWR_ON_NUM</a> | <a href="#">EFUSE_PWR_OFF_NUM</a> |
|-------------------------------|-----------------------------------|----------------------------------|-----------------------------------|
| 0xFF                          | 0x28                              | 0x3000                           | 0x190                             |

### 7.3.5 Parameters Used by Hardware Modules

Some hardware modules are directly connected to the eFuse peripheral in order to use the parameters that are marked with “Y” in columns “Accessible by Hardware” of Table 7.3-1 and Table 7.3-3. Users cannot intervene in this process.

## 7.4 Interrupts

ESP32-P4's eFuse controller can generate the following interrupt signal that will be sent to the [Interrupt Matrix](#).

- EFUSE\_INT

There are several internal interrupt sources from eFuse controller that can generate the above interrupt signal. The interrupt sources from eFuse controller are listed with their trigger conditions and the resulted interrupt signal in Table 7.4-1.

**Table 7.4-1. eFuse's Internal Interrupt Sources**

| Internal Interrupt Source | Trigger Condition              | Interrupt Signal |
|---------------------------|--------------------------------|------------------|
| EFUSE_PGM_DONE_INT        | Programming of eFuse completes | EFUSE_INT        |
| EFUSE_READ_DONE_INT       | Reading of eFuse completes     |                  |

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter 11 [Interrupt Matrix](#) > Section 11.2 [Interrupt Terminology in ESP32-P4](#).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section 7.5 [Register Summary](#).

## 7.5 Register Summary

The addresses in this section are relative to eFuse controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name   | Description   | Address | Access |
|--|---|---------|--------|
| <b>Programming Data Registers</b>            |   |         |        |
| <a href="#">EFUSE_PGM_DATA0_REG</a>          | Register 0 that stores data to be programmed  | 0x0000  | R/W    |
| <a href="#">EFUSE_PGM_DATA1_REG</a>          | Register 1 that stores data to be programmed  | 0x0004  | R/W    |
| <a href="#">EFUSE_PGM_DATA2_REG</a>          | Register 2 that stores data to be programmed  | 0x0008  | R/W    |
| <a href="#">EFUSE_PGM_DATA3_REG</a>          | Register 3 that stores data to be programmed  | 0x000C  | R/W    |

## 7.6 Registers

The addresses in this section are relative to eFuse controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

**Register 7.1. EFUSE\_PGM\_DATA $n$ \_REG ( $n$ : 0-7) (0x0000+0x4\* $n$ )**

|                     |   |
|---------------------|---|
| EFUSE_PGM_DATA_ $n$ |   |
| 31                  | 0 |
| 0x000000            |   |
| Reset               |   |

**EFUSE\_PGM\_DATA\_ $n$**  Configures the  $n$ th 32-bit data to be programmed. (R/W)

**Register 7.2. EFUSE\_PGM\_CHECK\_VALUE $m$ \_REG ( $m$ : 0-2) (0x0020+0x4\* $m$ )**

|                        |   |
|------------------------|---|
| EFUSE_PGM_RS_DATA_ $m$ |   |
| 31                     | 0 |
| 0x000000               |   |
| Reset                  |   |

**EFUSE\_PGM\_RS\_DATA\_ $m$**  Configures the  $m$ th 32-bit RS code to be programmed. (R/W)

**Register 7.3. EFUSE\_RD\_WR\_DIS\_REG (0x002C)**

|              |   |
|--------------|---|
| EFUSE_WR_DIS |   |
| 31           | 0 |
| 0x000000     |   |
| Reset        |   |

**EFUSE\_WR\_DIS** Represents whether programming of individual eFuse memory bit is disabled.

1: Disabled

0: Enabled

(RO)

#### Register 7.4. EFUSE\_RD\_REPEAT\_DATA0\_REG (0x0030)

[illegible]

**EFUSE\_RD\_DIS** Represents whether reading of individual eFuse block (BLOCK4 ~ BLOCK10) is disabled.

1: Disabled

0: Enabled

(RO)

**EFUSE\_USB\_DEVICE\_EXCHG\_PINS** Represents whether the USB Serial/JTAG pins D+ and D- are exchanged.

0: Not exchanged

1: Exchanged

(RO)

**EFUSE\_USB\_OTG11\_EXCHG\_PINS** Represents whether the USB FS pins D+ and D- are exchanged.

0: Not exchanged

1: Exchanged

(RO)

**EFUSE\_DIS\_USB\_JTAG** Represents whether the USB-to-JTAG function in USB Serial/JTAG is disabled.

1: Disabled

0: Enabled

(RO)

**EFUSE\_POWERGLITCH\_EN** Represents whether power glitch detection is enabled.

0: Disabled

1: Enabled

(RO)

**EFUSE\_DIS\_FORCE\_DOWNLOAD** Represents whether the function that forces chip into Download mode is disabled.

1: Disabled

0: Enabled

(RO)

**EFUSE\_SPI\_DOWNLOAD\_MSPI\_DIS** Represents accessing MSPI flash/MSPI RAM by SYS AXI matrix is disabled during boot\_mode\_download.

1: Disabled

0: Enabled

**EFUSE\_DIS\_TWAI** Represents whether TWAI function is disabled.

1: Disabled

### Register 7.5. EFUSE\_RD\_REPEAT\_DATA1\_REG (0x0034)

|                     |  |    |  |     |  |    |  |    |  |    |  |    |  |                     |  |    |  |     |  |    |  |    |  |    |  |    |  |                               |  |  |  |       |  |  |  |  |  |  |  |   |  |                               |  |  |  |  |  |  |  |  |  |  |  |  |  |                               |  |  |  |  |  |  |  |  |  |  |  |  |  |                          |  |  |  |  |  |  |  |  |  |  |  |  |  |                     |  |  |  |  |  |  |  |  |  |  |  |  |  |            |  |  |  |  |  |  |  |  |  |  |  |  |  |                          |  |  |  |  |  |  |  |  |  |  |  |  |  |            |  |  |  |  |  |  |  |  |  |  |  |  |  |

**EFUSE\_XTS\_KEY\_LENGTH\_256** Represents which key is used for flash encryption.

0: XTS-256 key. Key length: 512 bits.

1: XTS-128 key. Key length: 256 bits.

(RO)

**EFUSE\_WDT\_DELAY\_SEL** Represents RTC watchdog timeout threshold.

0: The originally configured STGO threshold  $\times 2$

1: The originally configured STGO threshold  $\times 4$

2: The originally configured STGO threshold  $\times 8$

3: The originally configured STGO threshold  $\times 16$

(RO)

**EFUSE\_SPI\_BOOT\_CRYPT\_CNT** Represents whether SPI boot encryption/decryption is enabled.

Odd count of bits with a value of 1: Enabled

Even count of bits with a value of 1: Disabled

(RO)

**EFUSE\_SECURE\_BOOT\_KEY\_REVOKEO** Represents whether revoking Secure Boot key 0 is enabled.

1: Enabled

0: Disabled

(RO)

Continued on the next page...

**Register 7.5. EFUSE\_RD\_REPEAT\_DATA1\_REG (0x0034)**

Continued from the previous page...

**EFUSE\_SECURE\_BOOT\_KEY\_REVOKE1** Represents whether revoking Secure Boot key 1 is enabled.

1: Enabled  
0: Disabled  
(RO)

**EFUSE\_SECURE\_BOOT\_KEY\_REVOKE2** Represents whether revoking Secure Boot key 2 is enabled.

1: Enabled  
0: Disabled  
(RO)

**EFUSE\_KEY\_PURPOSE\_0** Represents the purpose of Key0. See Table 7.3-2. (RO)

**EFUSE\_KEY\_PURPOSE\_1** Represents the purpose of Key1. See Table 7.3-2. (RO)

**Register 7.6. EFUSE\_RD\_REPEAT\_DATA2\_REG (0x0038)**

**EFUSE\_KEY\_PURPOSE\_2** Represents the purpose of Key2. See Table 7.3-2. (RO)

**EFUSE\_KEY\_PURPOSE\_3** Represents the purpose of Key3. See Table 7.3-2. (RO)

**EFUSE\_KEY\_PURPOSE\_4** Represents the purpose of Key4. See Table 7.3-2. (RO)

**EFUSE\_KEY\_PURPOSE\_5** Represents the purpose of Key5. See Table 7.3-2. (RO)

**EFUSE\_SEC\_DPA\_LEVEL** Represents the security level of anti-DPA attack. The level is adjusted by configuring the clock random frequency division mode.

0: Security level is SEC\_DPA\_OFF

1: Security level is SEC\_DPA\_LOW

2: Security level is SEC\_DPA\_MIDDLE

3: Security level is SEC\_DPA\_HIGH

For more information, please refer to Chapter 3 *System Registers [to be added later]* > Section 3.1 *Anti-DPA Attack Security Control [to be added later]*.

(RO)

**EFUSE\_CRYPT\_DPA\_ENABLE** Represents whether defense against DPA attack is enabled.

1: Enabled

0: Disabled

(RO)

**EFUSE\_SECURE\_BOOT\_EN** Represents whether Secure Boot is enabled.

1: Enabled

0: Disabled

(RO)

**EFUSE\_SECURE\_BOOT\_AGGRESSIVE\_REVOKE** Represents whether aggressive revocation of Secure Boot is enabled.

1: Enabled

0: Disabled

(RO)

Continued on the next page...

**Register 7.6. EFUSE\_RD\_REPEAT\_DATA2\_REG (0x0038)**

Continued from the previous page...

**EFUSE\_FLASH\_TYPE** Represents the type of the interfaced flash.

0: Four data lines

1: eight data lines

(RO)

**EFUSE\_FLASH\_PAGE\_SIZE** Represents flash page size.

0: 256 bytes

1: 512 bytes

2: 1024 bytes

3: 2048 bytes

(RO)

**EFUSE\_FLASH\_ECC\_EN** Represents whether ECC is enabled during flash boot.

0: Disabled

1: Enabled

(RO)

**EFUSE\_DIS\_USB\_OTG\_DOWNLOAD\_MODE** Represents whether download via USB-OTG is disabled.

0: Enabled

1: Disabled

(RO)

**EFUSE\_FLASH\_TPUW** Represents the flash waiting time after power-up. Measurement unit: ms.

When the value is less than 15, the waiting time is the programmed value. Otherwise, the waiting time is a fixed value, i.e., 30 ms. (RO)

Register 7.7. EFUSE\_RD\_REPEAT\_DATA3\_REG (0x003C)

**EFUSE\_DIS\_DOWNLOAD\_MODE** Represents whether all Download modes are disabled.

1: Disabled  
0: Enabled  
(RO)

**EFUSE\_DIS\_DIRECT\_BOOT** Represents whether direct boot mode is disabled.

1: Disabled  
0: Enabled  
(RO)

**EFUSE\_DIS\_USB\_SERIAL\_JTAG\_ROM\_PRINT** Represents whether print from USB-Serial-JTAG during ROM boot is disabled.

1: Disabled  
0: Enabled  
(RO)

**EFUSE\_DIS\_USB\_SERIAL\_JTAG\_DOWNLOAD\_MODE** Represents whether the USB-Serial-JTAG download function is disabled.

1: Disabled  
0: Enabled  
(RO)

**EFUSE\_ENABLE\_SECURITY\_DOWNLOAD** Represents whether security download is enabled. Only UART is supported for download. Reading/writing RAM or registers is not supported (i.e., stub download is not supported).

1: Enabled  
0: Disabled  
(RO)

**Register 7.7. EFUSE\_RD\_REPEAT\_DATA3\_REG (0x003C)**

Continued from the previous page...

**EFUSE\_UART\_PRINT\_CONTROL** Represents the type of UART printing.

- 0: Force enable printing.
  - 1: Enable printing when GPIO36 is reset at low level.
  - 2: Enable printing when GPIO36 is reset at high level.
  - 3: Force disable printing.
- (RO)

**EFUSE\_FORCE\_SEND\_RESUME** Represents whether ROM code is forced to send a resume command during SPI boot.

- 1: Forced.
  - 0: Not forced.
- (RO)

**EFUSE\_SECURE\_VERSION** Represents the security version used by ESP-IDF anti-rollback feature.

(RO)

**EFUSE\_SECURE\_BOOT\_DISABLE\_FAST\_WAKE** Represents whether FAST VERIFY ON WAKE is disabled when Secure Boot is enabled.

- 1: Disabled
  - 0: Enabled
- (RO)

**EFUSE\_HYS\_EN\_PAD** Represents whether the hysteresis function of PADO – PAD27 is enabled.

- 1: Enabled
  - 0: Disabled
- (RO)

**EFUSE\_DCDC\_VSET** Represents the default DCDC voltage. (RO)

EFUSE\_OPXA\_TIEH\_SEL\_0 Represents what controls the power supply for LDO V00.

- 0: The power supply is always high
  - 1: Controlled by the SDMMC1 peripheral
  - 2: Controlled by the PMU\_LDO\_VO\_TIEH\_O register field
  - 3: Controlled by the SDMMCO peripheral
- (RO)

EFUSE\_OPXA\_TIEH\_SEL\_1 Represents what controls the power supply for LDO VO1.

- 0: Controlled by the PMU\_LDO\_VO\_TIEH\_1 register field  
1: Controlled by the SDMMCO peripheral  
2: The power supply is always high  
3: Controlled by the SDMMC1 peripheral  
(RO)

**EFUSE\_OPXA\_TIEH\_SEL\_2** Represents what controls the power supply for LDO VO2.

- 0: Controlled by the PMU\_LDO\_VO\_TIEH\_2 register field  
1: Controlled by the SDMMCO peripheral  
2: The power supply is always high  
3: Controlled by the SDMMC1 peripheral  
(RO)

**EFUSE\_OPXA\_TIEH\_SEL\_3** Represents what controls the power supply for LDO VO3.

- 0: Controlled by the PMU\_LDO\_VO\_TIEH\_3 register field  
1: Controlled by the SDMMC0 peripheral  
2: The power supply is always high  
3: Controlled by the SDMMC1 peripheral  
(RO)

**EFUSE\_MAC\_SYS\_ERR\_NUM** Represents the number of error bytes. (RO)

**EFUSE\_MAC\_SYS\_FAIL** Represents whether programming MAC\_SYS failed.

0: No failure and the data of MAC\_SYS is reliable.

1: Programming user data failed and the number of error bytes is over 6.

(RO)

**EFUSE\_SYS\_PART1\_ERR\_NUM** Represents the number of error bytes. (RO)

**EFUSE\_SYS\_PART1\_FAIL** Represents whether programming system part1 data failed.

0: No failure and the data of system part1 is reliable.

1: Programming user data failed and the number of error bytes is over 6.

(RO)

**EFUSE\_USR\_DATA\_ERR\_NUM** Represents the number of error bytes. (RO)

**EFUSE\_USR\_DATA\_FAIL** Represents whether programming user data failed.

0: No failure and the user data is reliable.

1: Programming user data failed and the number of error bytes is over 6.

(RO)

**EFUSE\_KEY0\_ERR\_NUM** Represents the number of error bytes. (RO)

**EFUSE\_KEY0\_FAIL** Represents whether programming key0 data failed.

0: No failure and the data of key0 is reliable.

1: Programming key0 failed and the number of error bytes is over 6.

(RO)

**EFUSE\_KEY1\_ERR\_NUM** Represents the number of error bytes. (RO)

**EFUSE\_KEY1\_FAIL** Represents whether programming key1 data failed.

0: No failure and the data of key1 is reliable.

1: Programming key1 failed and the number of error bytes is over 6.

(RO)

**EFUSE\_KEY2\_ERR\_NUM** Represents the number of error bytes. (RO)

**EFUSE\_KEY2\_FAIL** Represents whether programming key2 data failed.

0: No failure and the data of key2 is reliable.

1: Programming key2 failed and the number of error bytes is over 6.

(RO)

**EFUSE\_MEM\_FORCE\_PD** Configures whether to force power down eFuse SRAM.

1: Force

0: No effect

(R/W)

**EFUSE\_MEM\_CLK\_FORCE\_ON** Configures whether to force activate clock signal of eFuse SRAM.

1: Force activate

0: No effect

(R/W)

**EFUSE\_MEM\_FORCE\_PU** Configures whether to force power up eFuse SRAM.

1: Force

0: No effect

(R/W)

**EFUSE\_CLK\_EN** Configures whether to force enable eFuse register configuration clock signal.

1: Force

0: The clock is enabled only during the reading and writing of registers

(R/W)

**EFUSE\_STATE** Represents the state of the eFuse state machine.

0: Reset state, the initial state after power-up

1: Idle state

Other values: Non-idle state

(RO)

**EFUSE\_BLK0\_VALID\_BIT\_CNT** Represents the number of block valid bit. (RO)

**EFUSE\_CUR\_ECDSA\_BLK** Represents which block is used for ECDSA key output. (RO)

Register 7.39. EFUSE\_CMD\_REG (0x01D4)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |               |     |               |   |                |  |

**EFUSE\_READ\_CMD** Configures whether to send read commands.

- 1: Send
  - 0: No effect
- (R/W/SC)

**EFUSE\_PGM\_CMD** Configures whether to send programming commands.

- 1: Send
  - 0: No effect
- (R/W/SC)

**EFUSE\_BLK\_NUM** Represents the serial number of the block to be programmed. Value 0-10 corresponds to block number 0-10, respectively. (R/W)

0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | ## Part IV

# System Component

Encompassing a range of system-level functionalities, this part describes components related to system boot, clocks, GPIO, timers, watchdogs, debug assistance, event and interrupt handling, low-power management, and various system registers.

## Chapter 8

# GPIO Matrix and IO MUX

## 8.1 Overview

GPIO matrix is a hardware structure that allows dynamic remapping between the GPIO pins and peripheral input/output signals to provide greater flexibility. IO MUX (Input/output multiplexing) is a technology that allows the same pin to perform different functions at different times, allowing dynamic switching of pin functions through configuration. ESP32-P4 provides two groups of IO MUX and GPIO matrix:

- HP GPIO matrix and HP IO MUX
- LP GPIO matrix and LP IO MUX

The ESP32-P4 chip features 55 GPIO pins, including 16 low-power (LP) GPIO pins and 39 high-performance (HP) GPIO pins. Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal.

- Through HP GPIO matrix and HP IO MUX, HP peripheral input signals can be from any GPIO pins, and HP peripheral output signals can be routed to any GPIO pins.
- Through LP GPIO matrix and LP IO MUX, LP peripheral input signals can be from any LP GPIO pins, and LP peripheral output signals can be routed to any LP GPIO pins.

Together these modules provide highly configurable I/O. The 55 GPIO pins are numbered from GPIO0 to GPIO54.

- LP GPIO pins (GPIO0 ~ GPIO15) can be used by either HP or LP peripherals.
- HP GPIO pins (GPIO16 ~ GPIO54) can be used only by HP peripherals.

The ESP32-P4 chip has dedicated pins for external flash and in-package PSRAM. Such pins can not be used for other purpose. See [ESP32-P4 Datasheet](#) > Section *Pin Mapping Between Chip and Flash/PSRAM*.

Unless otherwise specified, GPIO matrix refers to both LP GPIO matrix and HP GPIO matrix, so as to IO MUX.

## 8.2 Features

### 8.2.1 HP GPIO Matrix and HP IO MUX

HP GPIO matrix has the following features:

- A full-switching matrix between HP peripheral input/output signals and the GPIO pins
- 222 HP peripheral input signals sourced from the input of any GPIO pins
- 232 HP peripheral output signals routed to the output of any GPIO pins

- Signal synchronization for HP peripheral inputs based on **HP IO MUX operating clock**
- GPIO Filter hardware for input signal filtering
- Glitch Filter hardware for second-time filtering on input signal
- Sigma delta modulated (SDM) output
- GPIO simple input and output
- HP GPIO Wakeup

**HP IO MUX has the following features:**

- Control of 55 GPIOs (GPIO0 ~ GPIO54) for HP peripherals.
- A configuration register [IO\\_MUX\\_GPIO \$n\$ \\_REG](#) provided for each GPIO pin, to control the pin's input/output, pull-up/pull-down, drive strength, and function selection.
- Better high-frequency digital performance achieved by routing some digital signals (SPI, EMAC) directly from HP IO MUX to peripherals.

## 8.2.2 LP GPIO Matrix and LP IO MUX

**LP GPIO matrix has the following features:**

- A full-switching matrix between the LP peripheral input/output signals and the LP GPIO pins
- 14 LP peripheral input signals sourced from the input of any LP GPIO pins
- 14 LP peripheral output signals routed to the output of any LP GPIO pins
- GPIO Filter hardware for input signal filtering
- GPIO simple input and output
- LP GPIO Wakeup

**LP IO MUX has the following feature:**

- Control of 16 LP GPIO pins (GPIO0 ~ GPIO15) for LP peripherals.
- A configuration register [LP\\_IOMUX\\_PAD \$n\$ \\_REG](#) provided for each LP GPIO pin, to control the pin's input/output, pull-up/pull-down, drive strength, function selection, and IO MUX selection.

## 8.3 Architectural Overview

Figure [8.3-1](#) shows in details how HP GPIO matrix, HP IO MUX, LP GPIO matrix, and LP IO MUX route signals from pins to peripherals, and from peripherals to pins.

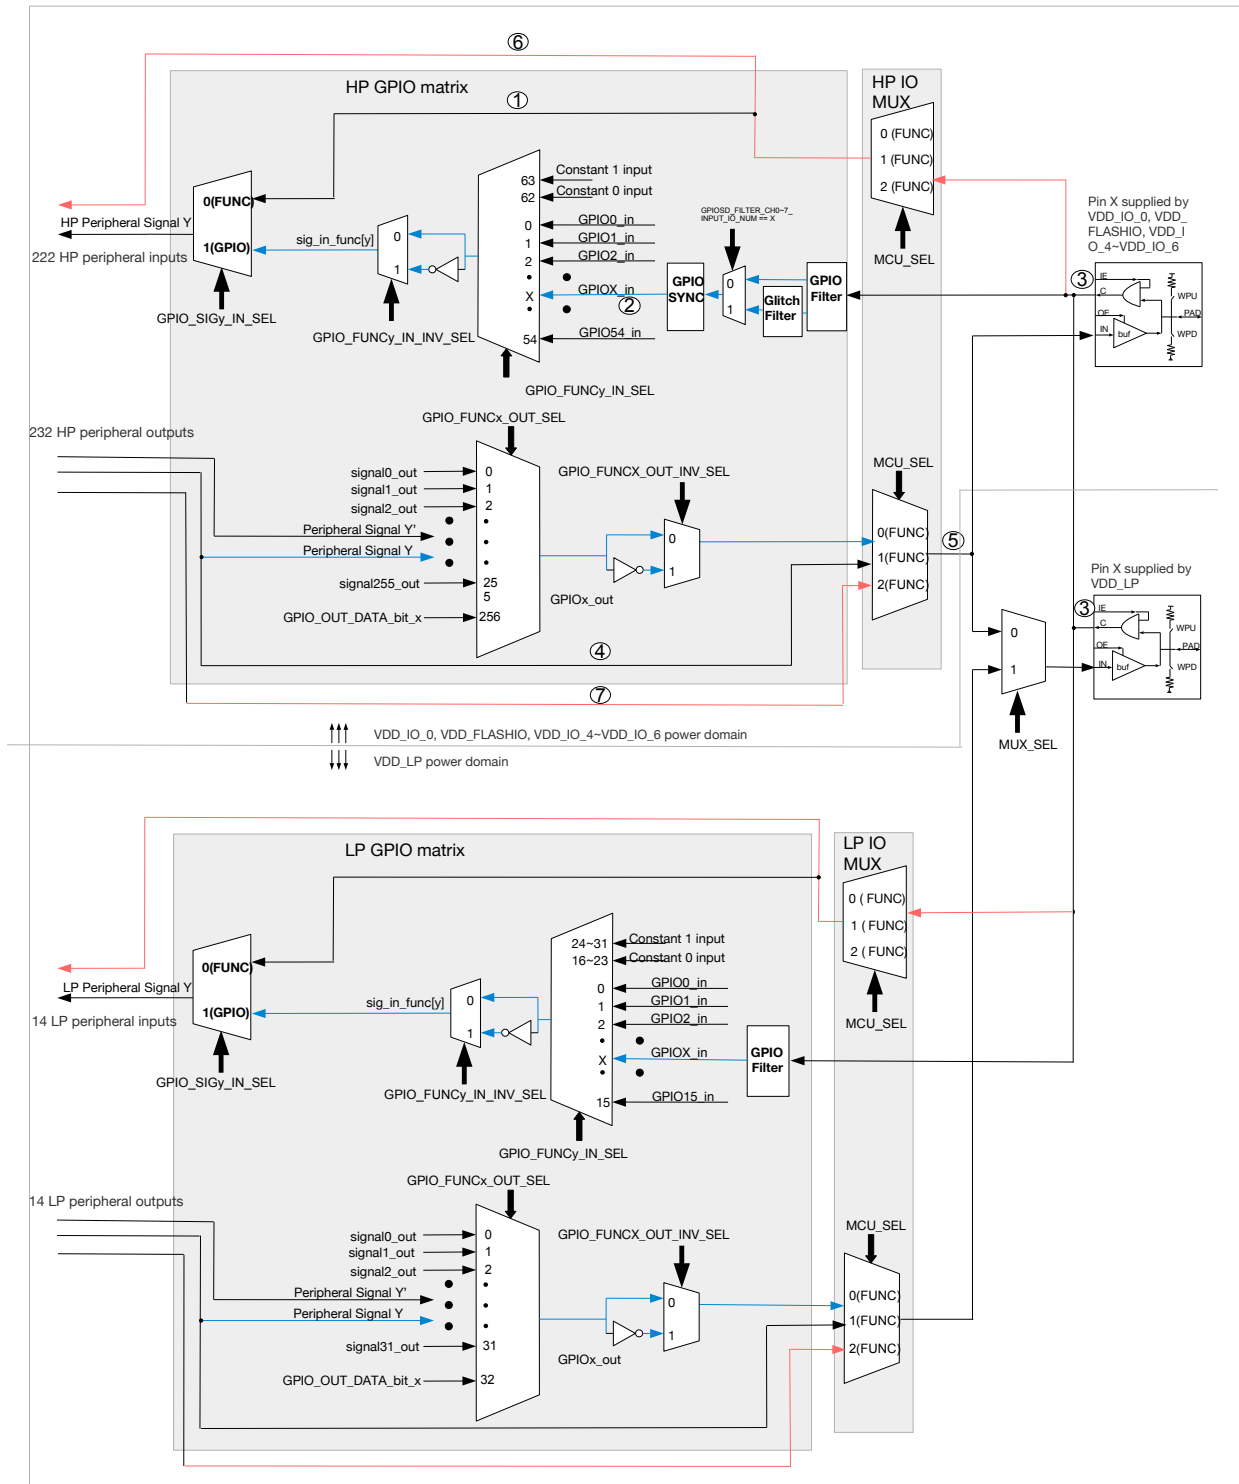

Figure 8.3-1. Architecture of HP GPIO Matrix, HP IO MUX, LP GPIO Matrix, and LP IO MUX

The following points explain the areas marked numerically in the figure above, taking the HP system as an example:

- ① Part of peripheral input signals (marked “yes” in column “Direct input through HP IO MUX” in Table

8.12-1) can be routed to the peripherals via HP IO MUX, or via HP GPIO matrix, while the other input signals can only be routed to the peripherals via HP GPIO matrix.

- ② There are only 55 inputs from GPIO SYNC to HP GPIO matrix, since ESP32-P4 provides 55 GPIO pins in total.
- ③ The pins supplied by VDD\_IO\_0, VDD\_FLASHIO, VDD\_IO\_4 ~ VDD\_IO\_6, and VDD\_LP are controlled by the signals: IE, OE, HYS, WPU, and WPD.
- ④ Part of peripheral outputs (marked “yes” in column “Direct output through HP IO MUX” in Table 8.12-1) can be routed to pins via HP IO MUX or via HP GPIO matrix, while the other output signals can only be routed to pins via HP GPIO matrix.
- ⑤ There are 55 outputs (corresponding to GPIO pin X: 0 ~ 54) from HP GPIO matrix to HP IO MUX.
- ⑥ There are peripheral inputs only through HP IO MUX.
- ⑦ There are peripheral outputs only through HP IO MUX.

Figure 8.3-2 shows the internal structure of a pad, which is an electrical interface between the chip logic and the GPIO pin. The structure is applicable to all 55 GPIO pins and can be controlled using IE, OE, WPU, and WPD signals. For the configuration of these signals, see [IO\\_MUX\\_GPIOX\\_REG](#) or [LP\\_IOMUX\\_PADX\\_REG](#).

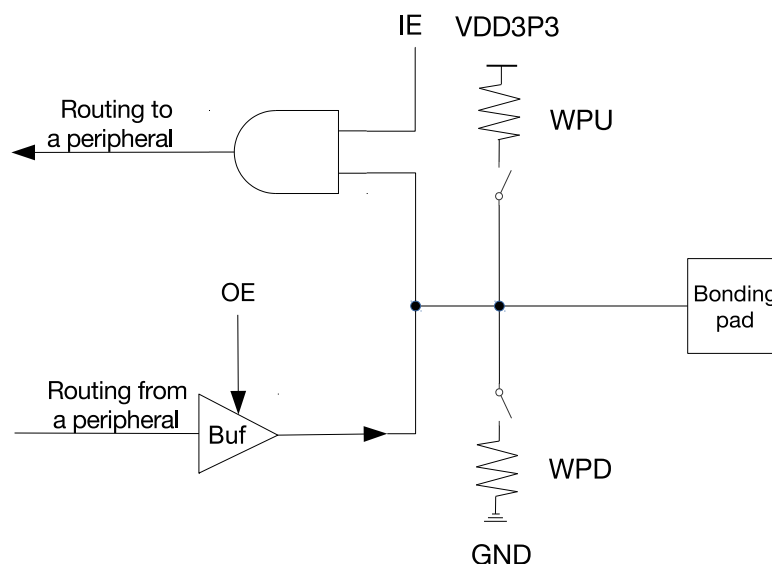

Figure 8.3-2. Internal Structure of a Pad

- IE: input enable
- OE: output enable
- WPU: internal weak pull-up resistor
- WPD: internal weak pull-down resistor
- Bonding pad: a terminal point of the chip logic used to make a physical connection from the chip die to GPIO pin in the chip package

## 8.4 Peripheral Input via GPIO Matrix

### 8.4.1 Overview

To receive a peripheral input signal via HP GPIO matrix,

- configure the matrix to source the peripheral input signal from one of the 55 GPIOs (0 ~ 54), see Table [8.12-1](#).
- configure the peripheral signal to receive input signal via HP GPIO matrix.
- configure the GPIO pin to be controlled by HP IO MUX.

For detailed configuration, see Figure [8.3-1](#) and Section [8.4.7](#).

To receive a peripheral input signal via LP GPIO matrix,

- configure the matrix to source the peripheral input signal from one of the 16 GPIOs (0 ~ 15), see Table [8.13-1](#).
- configure the peripheral signal to receive input signal via LP GPIO matrix.
- configure the LP GPIO pin to be controlled by LP IO MUX.

For detailed configuration, see Figure [8.3-1](#) and Section [8.4.7](#).

As shown in Figure [8.3-1](#), when GPIO matrix is used to input a signal from the pin, all external input signals are sourced from the GPIO pins and then filtered by the GPIO Filter, as shown in Step [2](#) in Section [8.4.7](#).

The Glitch Filter is only available in HP GPIO matrix. The Glitch Filter hardware can filter eight of the output signals from the GPIO Filter, and the other unselected signals go directly to the GPIO SYNC hardware, as shown in Step [3](#) in Section [8.4.7](#).

All signals filtered by the GPIO Filter hardware or the Glitch Filter hardware are synchronized by the GPIO SYNC hardware to IO MUX operating clock and then enter the GPIO matrix, see Section [8.4.2](#). Such signal filtering and synchronization features apply to all GPIO matrix signals but do not apply when using the IO MUX.

### 8.4.2 Signal Synchronization

Only HP GPIO matrix supports this signal synchronization function. Figure [8.4-1](#) shows the functionality of GPIO SYNC. In the figure, negative sync and positive sync mean GPIO input is synchronized on falling edge and on rising edge of HP IO MUX operating clock respectively.

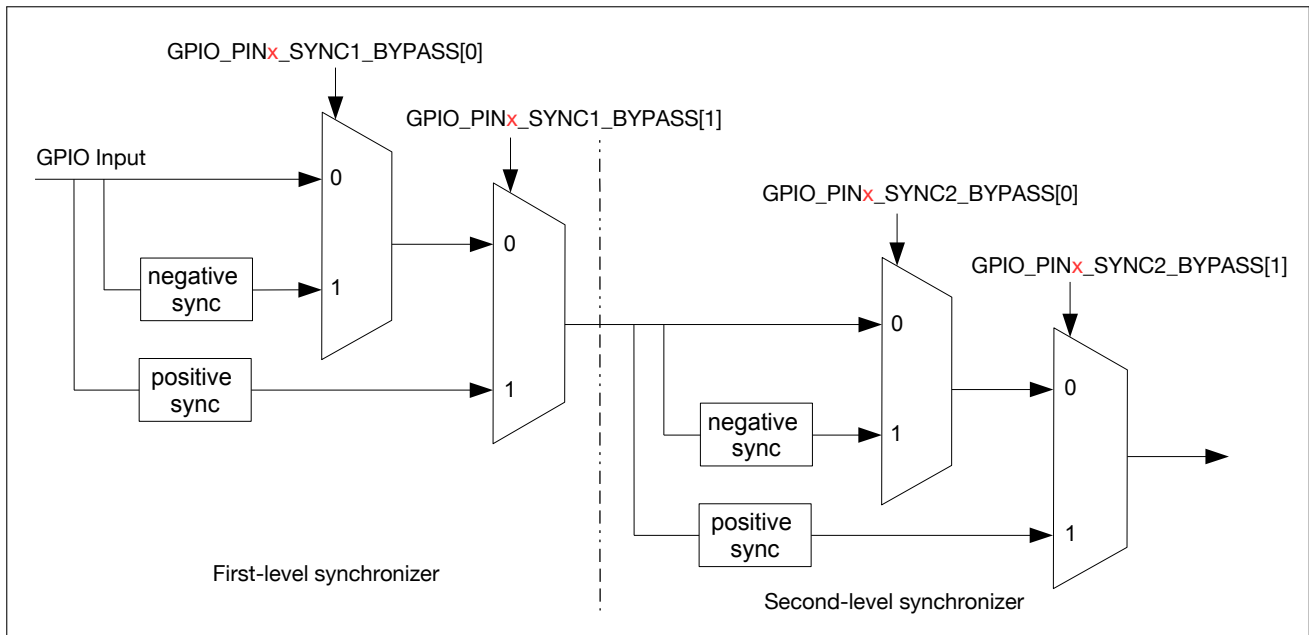

Figure 8.4-1. GPIO Input Synchronized on Rising Edge or on Falling Edge of HP IO MUX Operating Clock

The synchronization function is disabled by default by the synchronizer. But when an asynchronous peripheral signal is connected to the pin, the signal should be synchronized by the two-level synchronizer (i.e., the first-level synchronizer and the second-level synchronizer as shown in Figure 8.4-1) to lower the probability of causing metastability.

### 8.4.3 GPIO Filter

Both the HP GPIO matrix and LP GPIO matrix support GPIO Filter function. When this function is enabled, only signals with a valid width of more than two clock cycles can be sampled, as illustrated in Figure 8.4-2.

Figure 8.4-2. GPIO Filter Timing of GPIO Input Signals

### 8.4.4 Glitch Filter

The Glitch Filter function is exclusive to the HP GPIO matrix. The Glitch Filter hardware supports eight channels, each of which selects one signal from the 55 (0 ~ 54) output signals generated by the GPIO Filter hardware. It then conducts a second round of filtering on the selected signal. This Glitch Filter hardware can be used to filter slow-speed signals. For more information, see Step 3 in Section 8.4.71.

### 8.4.5 Simple GPIO Input

Both the HP GPIO matrix and LP GPIO matrix support the Simple GPIO Input function. Enabling this function allows the direct reading of the input value of a GPIO pin at any time, without the need to route the GPIO input to any peripherals.

For HP GPIO matrix, to implement simple GPIO input, follow the steps below:

- Set `IO_MUX_GPIOx_MCU_IE` in `IO_MUX_GPIOx_REG`, to enable pin input.
- Read the GPIO input from `GPIO_IN_REG[x]`.

For LP GPIO matrix, to implement simple GPIO input, follow the steps below:

- Set `LP_IOMUX_PADx_FUN_IE` in `LP_IO_MUX_PADx_REG`, to enable pin input.
- Read the GPIO input from `LP_GPIO_IN_REG[x]`.

### 8.4.6 GPIO Wakeup

#### 8.4.6.1 HP GPIO Wakeup

The HP GPIO wakeup feature is designed to awaken the system from Light-sleep when the HP system is in clock gating mode. HP GPIO wakeup is not available when the HP system is powered down.

GPIO0 ~ GPIO54 can be used to generate HP GPIO wakeup by enabling `GPIO_PINx_WAKEUP_ENABLE` ( $x$ : 0 ~ 54).

HP GPIO wakeup supports both high-voltage sensitive and low-voltage sensitive wakeups, with specific conditions based on the GPIO configuration.

**Table 8.4-1. HP GPIO Wakeup Signal Trigger and Clear Conditions**

| <code>GPIO_PINx_INT_TYPE</code> <sup>1,2</sup> | Wakeup is generated when      | Wakeup is cleared when        |
|--|-------------------------------|-------------------------------|
| 5  | the input GPIO is high-level. | the input GPIO is low-level.  |
| 4  | the input GPIO is low-level.  | the input GPIO is high-level. |

<sup>1</sup>  $x$  ranges from 0 to 54.

<sup>2</sup> If the register is configured to any other value, HP GPIO wakeup feature is disabled.

#### 8.4.6.2 LP GPIO Wakeup

The LP GPIO wakeup feature is designed to awaken the system from Deep-sleep when the LP peripherals are not in power gating mode. LP GPIO wakeup is not available when the LP peripherals are powered down.

GPIO0 ~ GPIO15 can be used to generate LP GPIO wakeup by enabling `LP_GPIO_PINn_WAKEUP_ENABLE` ( $n$ : 0 ~ 15).

LP GPIO wakeup supports posedge sensitive, negedge sensitive, both posedge and negedge sensitive, high-voltage sensitive and low-voltage sensitive wakeups, with specific conditions based on the GPIO configuration.

Table 8.4-2. LP GPIO Wakeup Signal Trigger and Clear Conditions

| LP_GPIO_PIN $x$ _INT_TYPE <sup>1,2</sup> | Wakeup is generated when  | Wakeup is cleared when                   |
|--|---|--|
| 1  | the input GPIO toggles from low-level to high-level.                | LP_GPIO_PIN $x$ _EDGE_WAKEUP_CLR is set. |
| 2  | the input GPIO toggles from high-level to low-level.                | LP_GPIO_PIN $x$ _EDGE_WAKEUP_CLR is set. |
| 3  | the input GPIO toggles from high-level to low-level, or vice versa. | LP_GPIO_PIN $x$ _EDGE_WAKEUP_CLR is set. |
| 4  | the input GPIO is low-level.  | the input GPIO is high-level.            |
| 5  | the input GPIO is high-level.                                       | the input GPIO is low-level.             |

<sup>1</sup>  $x$  ranges from 0 to 15.

<sup>2</sup> If the register is configured to any other value, LP GPIO wakeup feature is disabled.

## 8.4.7 Programming Procedure

### 8.4.7.1 HP GPIO Matrix

To read GPIO pin  $X$ <sup>1</sup> into HP peripheral signal  $Y$ , follow the steps below:

1. Configure GPIO\_FUNC $y$ \_IN\_SEL\_CFG\_REG corresponding to HP peripheral signal  $Y$  in HP GPIO matrix:

- Set GPIO\_SIG $y$ \_IN\_SEL to enable peripheral signal input via HP GPIO matrix.
- Set GPIO\_FUNC $y$ \_IN\_SEL to the desired GPIO pin, i.e.,  $X$  here.

**Note that** some peripheral signals have no valid GPIO\_SIG $y$ \_IN\_SEL bit, namely, these peripherals can only receive input signals via HP GPIO matrix.

2. Optionally enable the GPIO Filter for pin input signals by setting IO\_MUX\_GPIO $n$ \_FILTER\_EN.

3. Enable Glitch Filter feature as follows:

- Configure GPIO\_EXT\_FILTER\_CH $n$ \_INPUT\_IO\_NUM to  $m$ .  $n$  (0 ~ 7) represents the channel number.  $m$  (0 ~ 54) represents the GPIO pin number.
- Configure GPIO\_EXT\_FILTER\_CH $n$ \_WINDOW\_WIDTH to **VALUE1** and GPIO\_EXT\_FILTER\_CH $n$ \_WINDOW\_THRES to **VALUE2**. During **VALUE1** + 1 cycles, if there are **VALUE2** + 1 input signals that do not match the current output signal value, the Glitch Filter hardware inverts the output signal. GPIO\_EXT\_FILTER\_CH $n$ \_WINDOW\_WIDTH and GPIO\_EXT\_FILTER\_CH $n$ \_WINDOW\_THRES can be configured to the same value **VALUE3**, then only signals with a width greater than **VALUE3** + 1 clock cycles will be sampled.
- Set GPIO\_EXT\_FILTER\_CH $n$ \_EN to enable channel  $n$ .

An example is shown in Figure 8.4-3, where GPIO\_EXT\_FILTER\_CH $x$ \_WINDOW\_WIDTH is configured to 3 and GPIO\_EXT\_FILTER\_CH $x$ \_WINDOW\_THRES to 2. The output signal value (signal\_out) keeps as “0” in the four clock cycles before T1. The input signal value (signal\_in) has been “1” for three clock cycles in the same period, then the output signal is inverted to “1” after T1.

Figure 8.4-3. Glitch Filter Timing Example

4. Synchronize GPIO input signals. To do so, please set `GPIO_PINx_REG` corresponding to GPIO pin  $X$  as follows:
  - Set `GPIO_PINx_SYNC1_BYPASS` to enable input signal synchronized on rising edge or on falling edge in the first-level synchronization, see Figure 8.4-1.
  - Set `GPIO_PINx_SYNC2_BYPASS` to enable input signal synchronized on rising edge or on falling edge in the second-level synchronization, see Figure 8.4-1.
5. Configure HP IO MUX register to enable pin input. For this end, please set `IO_MUX_GPIOx_REG` corresponding to GPIO pin  $X$  as follows:
  - Set `IO_MUX_GPIOx_FUN_IE` to enable input<sup>2</sup>.
  - Set or clear `IO_MUX_GPIOx_FUN_WPU` and `IO_MUX_GPIOx_FUN_WPD` as desired to enable or disable pull-up and pull-down resistors.

For example, to connect UART0 TXD input signal<sup>3</sup> (`uart0_rxd_pad_in`, signal index 10) to GPIO7, please follow the steps below.

1. Set `GPIO_SIG10_IN_SEL` in `GPIO_FUNC10_IN_SEL_CFG_REG` to enable peripheral signal input via HP GPIO matrix.
2. Set `GPIO_FUNC10_IN_SEL` in `GPIO_FUNC10_IN_SEL_CFG_REG` to 7, i.e., select GPIO7.
3. Set `IO_MUX_GPIO7_FUN_IE` in `IO_MUX_GPIO7_REG` to enable pin input.

**Note:**

1. One input pin can be connected to multiple peripheral input signals.
2. The input signal can be inverted by configuring `GPIO_FUNCy_IN_INV_SEL`.
3. It is possible to have a HP peripheral read a constantly low or constantly high input value without connecting this input to a pin. This can be done by selecting a special `GPIO_FUNCy_IN_SEL` input, instead of a GPIO number:
  - When `GPIO_FUNCy_IN_SEL` is set to 62, input signal is always 0.
  - When `GPIO_FUNCy_IN_SEL` is set to 63, input signal is always 1.

### 8.4.7.2 LP GPIO Matrix

The programming procedure for peripheral input via the LP GPIO matrix resembles that of Section 8.4.7.1. However, it's worth noting that:

- the LP GPIO matrix lacks a Glitch Filter function.
- The control and status registers must use LP GPIO related registers. See Section [8.19.4](#) and Section [8.19.5](#).

**Note:**

It is possible to have a LP peripheral read a constantly low or constantly high input value without connecting this input to a pin. This can be done by selecting a special `LP_GPIO_SIGy_IN_SEL` input, instead of a GPIO number:

- When `LP_GPIO_SIGy_IN_SEL` is set to 16, input signal is always 0.
- When `LP_GPIO_SIGy_IN_SEL` is set to 24, input signal is always 1.

## 8.5 Peripheral Output via GPIO Matrix

### 8.5.1 Overview

To output a signal from a peripheral via GPIO matrix,

- configure the HP GPIO matrix to route HP peripheral output signals (only signals with a name assigned in the column “Output signal” in Table [8.12-1](#)) to one of the 55 GPIOs (0 ~ 54).
- Or configure the LP GPIO matrix to route LP peripherals (only signals with a name assigned in the column “Output signal” in Table [8.13-1](#)) to one of the 16 LP GPIOs (0 ~ 15).
- The output signal is routed from the peripheral into GPIO matrix and then into IO MUX. IO MUX must be configured to set the chosen pin to GPIO function. This enables the GPIO output signal to be connected to the pin.

**Note:**

There is a range of peripheral output signals (250 ~ 255 in Table [8.12-1](#)) which are not connected to any peripheral, but to the input signals (250 ~ 255) directly.

### 8.5.2 Simple GPIO Output

GPIO matrix can also be used for simple GPIO output. For this case, one GPIO pin can be configured to directly output the desired value, without routing any peripheral output to this pin.

Follow the steps below to configure HP GPIO matrix for simple GPIO output:

- Set `GPIO_FUNCx_OUT_SEL` with a special peripheral index 256 (0x100).
- Configure the corresponding bit in `GPIO_OUT_REG`/`GPIO_OUT1_REG` to the desired GPIO output value.

**Note:**

- `GPIO_OUT_REG[0] ~ GPIO_OUT_REG[31]` correspond to GPIO0 ~ GPIO31, and `GPIO_OUT1_REG[0] ~ GPIO_OUT1_REG[22]` to GPIO32 ~ GPIO54.
- Recommended operation: use `GPIO_OUT/OUT1_W1TS` and `GPIO_OUT/OUT1_W1TC` to set or clear `GPIO_OUT/OUT1_REG`.

Follow the steps below to configure LP GPIO matrix for simple GPIO output:

- Set `LP_GPIO_FUNCx_OUT_SEL` with a special peripheral index 32 (0x20).
- Configure the corresponding bit in `LP_GPIO_OUT_REG` to the desired GPIO output value.

**Note:**

Recommended operation: use `LP_GPIO_OUT_DATA_WITS` and `LP_GPIO_OUT_DATA_WITC` to set or clear `LP_GPIO_OUT_REG`.

## 8.5.3 Sigma Delta Modulated Output (SDM)

### 8.5.3.1 Functional Description

Eight HP peripheral output signals (index: 72 ~ 79 in Table 8.12-1) support 1-bit second-order sigma delta modulation. By default the output is enabled for these eight channels. This Sigma Delta modulator can also output PDM (pulse density modulation) signal with configurable duty cycle. The function is:

$$H(z) = X(z)z^{-1} + E(z)(1-z^{-1})^2$$

$E(z)$  is quantization error and  $X(z)$  is the input.

This modulator supports scaling down of IO MUX operating clock by divider 1 ~ 256:

- Set `GPIO_EXT_SD_FUNCTION_CLK_EN` to enable the modulator clock.
- Configure `GPIO_EXT_SDn_PRESCALE` ( $n = 0 \sim 7$  for the eight channels).

After scaling, the clock cycle is equal to one pulse output cycle from the modulator.

`GPIO_EXT_SDn_IN` is a signed number with a range of [-128, 127] and is used to control the duty cycle<sup>1</sup> of PDM output signal.

- `GPIO_EXT_SDn_IN` = -128, the duty cycle of the output signal is 0%.
- `GPIO_EXT_SDn_IN` = 0, the duty cycle of the output signal is near 50%.
- `GPIO_EXT_SDn_IN` = 127, the duty cycle of the output signal is near 100%.

The formula for calculating PDM signal duty cycle is shown as below:

$$Duty\_Cycle = \frac{GPIO\_EXT\_SDn\_IN + 128}{256}$$

**Note:**

For PDM signals, duty cycle refers to the percentage of high level cycles to the whole statistical period (several pulse cycles, for example, 256 pulse cycles).

### 8.5.3.2 SDM Configuration

The configuration of SDM is shown below:

- Route one of SDM outputs to a pin via HP GPIO matrix, see Section 8.5.4.1.

- Enable the modulator clock by setting [GPIO\\_EXT\\_SD\\_FUNCTION\\_CLK\\_EN](#).
- Configure the divider value by setting [GPIO\\_EXT\\_SD \$n\$ \\_PRESCALE](#).
- Configure the duty cycle of SDM output signal by setting [GPIO\\_EXT\\_SD \$n\$ \\_IN](#).

## 8.5.4 Programming Procedure

### 8.5.4.1 HP GPIO Matrix

The output signals with a name assigned in the column “Output signal” in Table 8.12-1 can be set to go through the HP GPIO matrix into HP IO MUX and then to a pin. Figure 8.3-1 illustrates the configuration.

To output peripheral signal  $Y$  to a particular GPIO pin  $X$ , follow the steps below:

1. Configure [GPIO\\_FUNC \$x\$ \\_OUT\\_SEL\\_CFG\\_REG](#) and [GPIO\\_ENABLE\\_REG\[ \$x\$ \]](#) corresponding to GPIO pin  $X$  in HP GPIO matrix. Recommended operation: use corresponding [WITS](#) (write 1 to set) and [WITC](#) (write 1 to clear) registers to set or clear [GPIO\\_ENABLE\\_REG](#).
  - Set the [GPIO\\_FUNC \$x\$ \\_OUT\\_SEL](#) field in register [GPIO\\_FUNC \$x\$ \\_OUT\\_SEL\\_CFG\\_REG](#) to the index of the desired peripheral output signal  $Y$ .
  - If the signal should always be enabled as an output, set the [GPIO\\_FUNC \$x\$ \\_OE\\_SEL](#) bit in register [GPIO\\_FUNC \$x\$ \\_OUT\\_SEL\\_CFG\\_REG](#) and the bit in register [GPIO\\_ENABLE\\_WITS\\_REG](#), corresponding to GPIO pin  $X$ . To have the output enable signal decided by internal logic (for example, the `spi2_dqs_pad_oe` in column “Output enable signal when [GPIO\\_FUNC \$n\$ \\_OE\\_SEL](#) = 0” in Table 8.12-1), clear the [GPIO\\_FUNC \$x\$ \\_OE\\_SEL](#) bit instead.
  - Set the corresponding bit in register [GPIO\\_ENABLE\\_WITC\\_REG](#) to disable the output from the GPIO pin.
2. For an open drain output, set the [GPIO\\_PIN \$x\$ \\_PAD\\_DRIVER](#) bit in register [GPIO\\_PIN \$x\$ \\_REG](#) corresponding to GPIO pin  $X$ .
3. Configure HP IO MUX register to enable output via HP GPIO matrix. Set [IO\\_MUX\\_GPIO \$x\$ \\_REG](#) corresponding to GPIO pin  $X$  as follows:
  - Set the field [IO\\_MUX\\_GPIO \$x\$ \\_MCU\\_SEL](#) to desired HP IO MUX function corresponding to GPIO pin  $X$ . This is Function 1 (GPIO function), numeric value 1, for all pins.
  - Set the [IO\\_MUX\\_GPIO \$x\$ \\_FUN\\_DRV](#) field to the desired value for output strength (0 ~ 3). The higher the drive strength, the more current can be sourced/sunk from the pin.
  - If using open drain mode, set/clear the [IO\\_MUX\\_GPIO \$x\$ \\_FUN\\_WPU](#) and [IO\\_MUX\\_GPIO \$x\$ \\_FUN\\_WPD](#) bits to enable/disable the internal pull-up/pull-down resistors.
4. Enable hysteresis function:
  - GPIO00 ~ GPIO15: set [LP\\_IOMUX\\_LP\\_GPIO\\_HYS\[ \$x\$ \]](#) ( $x$ : 0 ~ 15, corresponding to GPIO00 ~ GPIO15).
  - GPIO16 ~ GPIO47: set [HP\\_SYSTEM\\_GPIO\\_O\\_HYS\\_LOW\[ \$x\$ \]](#) ( $x$ : 0 ~ 31, corresponding to GPIO16 ~ GPIO47).
  - GPIO48 ~ GPIO54: set [HP\\_SYSTEM\\_GPIO\\_O\\_HYS\\_HIGH\[ \$x\$ \]](#) ( $x$ : 0 ~ 6, corresponding to GPIO48 ~ GPIO54).

**Note:**

- The output signal from a single peripheral can be sent to multiple pins simultaneously.
- The output signal can be inverted by setting `GPIO_FUNCx_OUT_INV_SEL`.

### 8.5.4.2 LP GPIO Matrix

The programming procedure for peripheral input via the LP GPIO matrix resembles that of 8.5.4.1. However, it's worth noting that the control and status registers must use LP GPIO matrix registers. See Section 8.19.4 and Section 8.19.5.

## 8.6 Direct Input and Output via IO MUX

### 8.6.1 Overview

Some digital signals (SDMMC, EMAC, etc.) can bypass GPIO matrix for better high-frequency digital performance. In this case, IO MUX is used to connect these pins directly to peripherals. This option is less flexible than routing signals via GPIO matrix, as the IO MUX register for each GPIO pin can only select from a limited number of functions, but high-frequency digital performance can be improved.

ESP32-P4 provides 16 GPIO pins with low power (LP) capabilities. These pins can be controlled by either HP IO MUX or LP IO MUX. If controlled by LP IO MUX, these pins will bypass HP IO MUX and HP GPIO matrix for the use by peripherals in LP system.

When configured as LP GPIOs, the pins can still be controlled by the peripherals in LP system during chip Deep-sleep, and wake up the chip from Deep-sleep.

### 8.6.2 Functional Description

The pins with LP functions (GPIO0 ~ GPIO15) are controlled by `LP_IOMUX_PADn_MUX_SEL` ( $n$ : 0 ~ 15) in register `LP_IOMUX_PADn_REG`. By default, all bits in these registers are set to 0, routing all input/output signals via HP IO MUX.

If `LP_IOMUX_PADn_MUX_SEL` is set, then input/output signals are controlled by LP IO MUX. In this mode, `LP_IOMUX_PADn_REG` is used to control the LP GPIO pins. See 8.15-1 for the LP functions of each LP GPIO pin. Note that `LP_IOMUX_PADn_REG` applies the LP GPIO pin numbering, not the HP GPIO pin numbering.

#### 8.6.2.1 HP IO MUX

Two fields must be configured in order to bypass HP GPIO matrix for HP peripheral input signals:

1. `IO_MUX_GPIOn_MCU_SEL` for the GPIO pin must be set to the required pin function. For the list of pin functions, please refer to Table 8.14-1.
2. Clear `GPIO_SIGn_IN_SEL` to route the input directly to the peripheral.

To bypass HP GPIO matrix for HP peripheral output signals, `IO_MUX_GPIOn_MCU_SEL` for the GPIO pin must be set to the required pin function.

### 8.6.2.2 LP IO MUX

Two fields must be configured in order to bypass LP GPIO matrix for LP peripheral input signals:

1. [LP\\_IOMUX\\_PAD \$n\$ \\_MUX\\_SEL](#) for the GPIO pin must be set to the required pin function. For the list of pin functions, please refer to Table 8.15-1.
2. Clear [LP\\_GPIO\\_GPIO\\_SIG \$n\$ \\_IN\\_SEL](#) to route the input directly to the peripheral.

To bypass LP GPIO matrix for LP peripheral output signals, [LP\\_IOMUX\\_PAD \$n\$ \\_MUX\\_SEL](#) for the GPIO pin must be set to the required pin function.

**Note:**

Not all signals can be directly connected to peripheral via IO MUX. Some input/output signals can only be connected to peripheral via GPIO matrix.

## 8.7 Analog Functions

### 8.7.1 Overview

ESP32-P4 provides 34 GPIO pins with analog functions, including 16 LP GPIO pins and 18 HP GPIO pins. See Table 8.16-1.

### 8.7.2 Analog Functions

When the pin is used for analog purpose, make sure this pin is left floating by configuring registers. By such way, the external analog signal is directly connected to internal analog signal via GPIO pin. The configuration is as follows:

- Clear [IO\\_MUX\\_GPIO \$n\$ \\_FUN\\_IE](#), [IO\\_MUX\\_GPIO \$n\$ \\_FUN\\_WPU](#), and [IO\\_MUX\\_GPIO \$n\$ \\_FUN\\_WPD](#), to set the pin floating.
- Write 1 to the corresponding bit in [GPIO\\_ENABLE\\_W1TC](#) and [GPIO\\_ENABLE1\\_W1TC](#), to clear output enable.

To use these functions listed in Table 8.16-1, please refer to the following related chapters:

- For XTAL\_32K related functions, see Chapter 13 *Low-Power Management*.
- For TOUCH related functions, see Chapter 55 *Touch Sensor (TOUCH)*.
- For ADC related functions, see Chapter 57 *ADC Controller (ADC)*.
- For COMP related functions, see Chapter 58 *Analog Voltage Comparator*.

**Note:**

GPIO51 ~ GPIO54 each has two different analog functions, which can be used simultaneously.

## 8.8 Pin Functions in Light-sleep

Pins may provide different functions when ESP32-P4 is in Light-sleep mode. If `IO_MUX_GPIO $n$ _SLP_SEL` in register `IO_MUX_GPIO $n$ _REG` for a GPIO pin is set to 1, a different set of bits will be used to control the pin when the chip is in Light-sleep mode.

**Table 8.8-1. Bit Used to Control IO MUX Functions in Light-sleep Mode**

| IO MUX Function       | Normal Execution<br>OR <code>IO_MUX_GPIO<math>n</math>_SLP_SEL</code> = 0 | Light-sleep Mode<br>AND <code>IO_MUX_GPIO<math>n</math>_SLP_SEL</code> = 1 |
|-----------------------|---|--|
| Output Drive Strength | <code>IO_MUX_GPIO<math>n</math>_FUN_DRV</code>                            | <code>IO_MUX_GPIO<math>n</math>_MCU_DRV</code>                             |
| Pull-up Resistor      | <code>IO_MUX_GPIO<math>n</math>_FUN_WPU</code>                            | <code>IO_MUX_GPIO<math>n</math>_MCU_WPU</code>                             |
| Pull-down Resistor    | <code>IO_MUX_GPIO<math>n</math>_FUN_WPD</code>                            | <code>IO_MUX_GPIO<math>n</math>_MCU_WPD</code>                             |
| Input Enable          | <code>IO_MUX_GPIO<math>n</math>_FUN_IE</code>                             | <code>IO_MUX_GPIO<math>n</math>_MCU_IE</code>                              |
| Output Enable         | <code>OE_SEL</code> from GPIO matrix*                                     | <code>IO_MUX_GPIO<math>n</math>_MCU_OE</code>                              |

**Note:**

If `IO_MUX_GPIO $n$ _SLP_SEL` is set to 0, pin functions remain the same in both normal execution and in Light-sleep mode. Please refer to Section 8.5.4.1 for how to enable output in normal execution.

## 8.9 Pin Hold Feature

Each GPIO pin has an individual hold function controlled by Power Management Unit (PMU) or registers. When the pin is set to hold, the state is latched at that moment and will not change no matter how the internal signals change or how the IO MUX/GPIO configuration is modified. Users can use the hold function for the pins to retain the pin state through a core reset triggered by watchdog time-out or Deep-sleep events.

### Digital Pins (GPIO16 ~ GPIO54):

The Hold state of each digital pin is controlled by the result of OR operation of the pin's Hold enable signal and the global Hold enable signal.

- `HP_SYSREG_GPIO_O_HOLD_LOW_REG[ $n$ ]` ( $n = 0 \sim 31$ ), controls the Hold signal of each pin of GPIO16 ~ GPIO47. `HP_SYSREG_GPIO_O_HOLD_HIGH_REG[ $n$ ]` ( $n = 0 \sim 7$ ), controls the Hold signal of each pin of GPIO48 ~ GPIO54.
- `PMU_TIE_HIGH_HP_PAD_HOLD_ALL`, controls the global Hold signal of all digital pins.

To use this feature, follow the steps below:

- To maintain the pin's input/output status in Deep-sleep, set `HP_SYSREG_GPIO_O_HOLD_LOW_REG[ $n$ ]` (where  $n = 0 \sim 31$  corresponds to GPIO16 ~ GPIO47) or `HP_SYSREG_GPIO_O_HOLD_HIGH_REG[ $n$ ]` (where  $n = 0 \sim 7$  corresponds to GPIO48 ~ GPIO54) before powering down. To disable the hold function after waking up, clear both registers.
- Alternatively, set `PMU_TIE_HIGH_HP_PAD_HOLD_ALL` to maintain the input/output status of all digital pins and set `PMU_TIE_LOW_HP_PAD_HOLD_ALL` to disable the hold function for all digital pins.

- Alternatively, configure the PMU task to hold the HP pins before Deep-sleep. In Deep-sleep, the HP pins would be hold automatically by the PMU.

#### LP Pins (GPIO0 ~ GPIO15):

The Hold state of each LP pin is controlled by the result of OR operation of the pin's Hold enable signal and the global Hold enable signal.

- [LP\\_IOMUX\\_LP\\_PAD\\_HOLD\\_REG\[n\]](#), controls the Hold signal of each pin of GPIO0 ~ GPIO15.
- [PMU\\_TIE\\_HIGH\\_LP\\_PAD\\_HOLD\\_ALL](#), controls the global Hold signal of all LP pins.

To use this feature, follow the steps below:

- To maintain the pin's input/output status in Deep-sleep, set [LP\\_IOMUX\\_LP\\_PAD\\_HOLD\\_REG\[n\]](#) to hold the value of GPIO $n$ , or clear [LP\\_IOMUX\\_LP\\_PAD\\_HOLD\\_REG\[n\]](#) to disable the hold function of GPIO $n$ .
- Alternatively, set [PMU\\_TIE\\_HIGH\\_LP\\_PAD\\_HOLD\\_ALL](#) to hold the values of all LP pins, and set [PMU\\_TIE\\_LOW\\_LP\\_PAD\\_HOLD\\_ALL](#) to disable the hold function of all LP pins.
- Alternatively, configure the PMU task to hold LP pins before Deep-sleep. In Deep-sleep, LP pins will be hold automatically by the PMU.

## 8.10 Hysteresis Characteristics of GPIO Pins

Each GPIO pin has hysteresis functionality. When hysteresis is not enabled, as shown in Figure 8.10-1, the level flip of the signal (C) input to the chip from the PAD has only one threshold ( $V_t$ , about 1.7 V). When the voltage on the PAD is higher than  $V_t$ , the level on the C is high. Otherwise, it is low. However, noise on the PAD may affect the signal on C.

Figure 8.10-1. Example of Level Flip on the Chip Pad — Hysteresis Function Not Enabled

When hysteresis is enabled, as shown in Figure 8.10-2, the level flip of C has two thresholds, high-level threshold ( $V_{th}$ , about 1.7 V) and low-level threshold ( $V_{tl}$ , about 1.4 V). When the voltage of pad goes from low to high, if the voltage is higher than  $V_{th}$ , the level of C is high. When the voltage of PAD goes from high to low, if the voltage is lower than  $V_{tl}$ , the level of C is low. When the voltage of PAD is between  $V_{th}$  and  $V_{tl}$ , the level of C does not change. The hysteresis function plays an anti-interference role by mitigating the impact of noise, consequently reducing the level flip time of C.

To enable the hysteresis function, follow the steps below:

- Set [LP\\_IOMUX\\_LP\\_GPIO\\_HYS\[n\]](#) ( $n$  ranges from 0 ~ 15, corresponding to GPIO0 ~ GPIO15), [HP\\_SYS\\_GPIO0\\_HYS\\_LOW\[n\]](#) ( $n$  ranges from 0 ~ 31, corresponding to GPIO16 ~ GPIO47) or

HP\_SYS\_GPIO0\_HYS\_HIGH[*n*] (*n* ranges from 0 ~ 6, corresponding to GPIO48 ~ GPIO54) to 1 to enable the hysteresis function for GPIO*n*.

- Set LP\_IOMUX\_LP\_GPIO\_HYS[*n*] (*n* ranges from 0 ~ 15, corresponding to GPIO0 ~ GPIO15), HP\_SYS\_GPIO0\_HYS\_LOW[*n*] (*n* ranges from 0 ~ 31, corresponding to GPIO16 ~ GPIO47) or HP\_SYS\_GPIO0\_HYS\_HIGH[*n*] (*n* ranges from 0 ~ 6, corresponding to GPIO48 ~ GPIO54) to 0 to disable the hysteresis function for GPIO*n*.

Figure 8.10-2. Example of Level Flip on the Chip Pad — Hysteresis Function Enabled

## 8.11 Power Supplies and Management of GPIO Pins

### 8.11.1 Power Supplies of GPIO Pins

For more information on the power supply for GPIO pins, please refer to Pin Definition in [ESP32-P4 Datasheet](#). All the pins can be used to wake up the chip from Light-sleep, but only the pins (GPIO0 ~ GPIO15) in VDD\_LP domain can be used to wake up the chip from Deep-sleep.

### 8.11.2 Power Supply Management

Each ESP32-P4 pin is connected to one of the following power domains.

- VDD\_LP: the input power supply for LP GPIO pins
- VDD\_IO\_0, VDD\_FLASHIO, VDD\_IO\_4 ~ VDD\_IO\_6: the input power supply for HP GPIO pins

## 8.12 HP Peripheral Signal List

Table 8.12-1 shows the peripheral input/output signals via HP GPIO matrix.

Please pay attention to the configuration of the bit `GPIO_FUNCn_OE_SEL`:

- `GPIO_FUNCn_OE_SEL` = 1: the output enable is controlled by the corresponding bit *n* of `GPIO_ENABLE/ENABLE1_REG`:
  - `GPIO_ENABLE/ENABLE1_REG` = 0: output is disabled.
  - `GPIO_ENABLE/ENABLE1_REG` = 1: output is enabled.
- `GPIO_FUNCn_OE_SEL` = 0: use the output enable signal from peripheral, for example `spi2_dqs_pad_oe` in the column “Output enable signal when `GPIO_FUNCn_OE_SEL` = 0” of Table 8.12-1. Note that the signals such as `spi2_dqs_pad_oe` can be 1 (1'd1) or 0 (1'd0), depending on the configuration of

corresponding peripherals. If it's 1'd1 in column "Output enable signal when `GPIO_FUNCn_OE_SEL` = 0", it indicates that once `GPIO_FUNCn_OE_SEL` is cleared, the output signal is always enabled by default.

**Note:**

Signals are numbered consecutively, but not all signals are valid.

- Only the signals with a name assigned in the column "Input signal" in Table 8.12-1 are valid input signals.
- Only the signals with a name assigned in the column "Output signal" in Table 8.12-1 are valid output signals.

Table 8.12-1. Peripheral Signals via HP GPIO Matrix

| Signal No. | Input Signal            | Default Value | Direct Input via HP IO MUX | Output Signal            | Output Enable Signal when GPIO_FUNCn_OE_SEL = 0 | Direct Output via HP IO MUX |
|------------|-------------------------|---------------|----------------------------|--------------------------|---|-----------------------------|
| 0          | -                       | -             | -                          | sd_card_cclk_2_pad_out   | 1'd1  | no                          |
| 1          | sd_card_ccmd_2_pad_in   | 1             | no                         | sd_card_ccmd_2_pad_out   | sd_card_ccmd_2_pad_oe                           | no                          |
| 2          | sd_card_cdata0_2_pad_in | 1             | no                         | sd_card_cdata0_2_pad_out | sd_card_cdata0_2_pad_oe                         | no                          |
| 3          | sd_card_cdata1_2_pad_in | 1             | no                         | sd_card_cdata1_2_pad_out | sd_card_cdata1_2_pad_oe                         | no                          |
| 4          | sd_card_cdata2_2_pad_in | 1             | no                         | sd_card_cdata2_2_pad_out | sd_card_cdata2_2_pad_oe                         | no                          |
| 5          | sd_card_cdata3_2_pad_in | 1             | no                         | sd_card_cdata3_2_pad_out | sd_card_cdata3_2_pad_oe                         | no                          |
| 6          | sd_card_cdata4_2_pad_in | 1             | no                         | sd_card_cdata4_2_pad_out | sd_card_cdata4_2_pad_oe                         | no                          |
| 7          | sd_card_cdata5_2_pad_in | 1             | no                         | sd_card_cdata5_2_pad_out | sd_card_cdata5_2_pad_oe                         | no                          |
| 8          | sd_card_cdata6_2_pad_in | 1             | no                         | sd_card_cdata6_2_pad_out | sd_card_cdata6_2_pad_oe                         | no                          |
| 9          | sd_card_cdata7_2_pad_in | 1             | no                         | sd_card_cdata7_2_pad_out | sd_card_cdata7_2_pad_oe                         | no                          |
| 10         | uart0_rxd_pad_in        | 0             | yes                        | uart0_txd_pad_out        | 1'd1  | yes                         |
| 11         | uart0_cts_pad_in        | 0             | yes                        | uart0_rts_pad_out        | 1'd1  | yes                         |

## 8.13 LP Peripheral Signal List

Table 8.13-1 shows the peripheral input/output signals via LP GPIO matrix.

Please pay attention to the configuration of the bit `LP_GPIO_FUNC $n$ _OE_SEL`:

- `LP_GPIO_FUNC $n$ _OE_SEL` = 1: the output enable is controlled by the corresponding bit $n$  of `LP_GPIO_ENABLE_REG`:
  - `LP_GPIO_ENABLE_REG` = 0: output is disabled.
  - `LP_GPIO_ENABLE_REG` = 1: output is enabled.
- `LP_GPIO_FUNC $n$ _OE_SEL` = 0: use the output enable signal from peripheral, for example `lp_spi_clk_pad_oe` in the column “Output enable signal when `LP_GPIO_FUNC $n$ _OE_SEL` = 0” of Table 8.13-1. Note that the signals such as `lp_spi_clk_pad_oe` can be 1 (1'd1) or 0 (1'd0), depending on the configuration of corresponding peripherals. If it's 1'd1 in column “Output enable signal when `LP_GPIO_FUNC $n$ _OE_SEL` = 0”, it indicates that once `LP_GPIO_FUNC $n$ _OE_SEL` is cleared, the output signal is always enabled by default.

**Note:**

Signals are numbered consecutively, but not all signals are valid.

- Only the signals with a name assigned in the column “Input signal” in Table 8.13-1 are valid input signals.
- Only the signals with a name assigned in the column “Output signal” in Table 8.13-1 are valid output signals.

Table 8.13-1. Peripheral Signals via LP GPIO Matrix

| Signal No. | Input Signal        | Default value | Direct Input via LP IO MUX | Output Signal        | Output enable signal when LP_GPIO_FUNCn_OE_SEL = 0 | Direct Output via LP IO MUX |
|------------|---------------------|---------------|----------------------------|----------------------|--|-----------------------------|
| 0          | lp_i2c_scl_pad_in   | 1             | no                         | lp_i2c_scl_pad_out   | lp_i2c_scl_pad_oe                                  | no                          |
| 1          | lp_i2c_sda_pad_in   | 1             | no                         | lp_i2c_sda_pad_out   | lp_i2c_sda_pad_oe                                  | no                          |

| GPIO54 | GPIO54          | GPIO54     | —            | GMAC_PHY_RXER_PAD | 2   | 0     | R     |

## Drive Strength

“DRV” column shows the drive strength of each pin after reset:

- **0** - Drive current = ~5 mA
- **1** - Drive current = ~10 mA
- **2** - Drive current = ~20 mA
- **3** - Drive current = ~40 mA

## Reset

The default configuration of each pin after reset:

- **0** - input disabled, in high impedance state (IE = 0)
- **1** - input enabled, in high impedance state (IE = 1)
- **1\*** - When the value of eFuse bit EFUSE\_DIS\_PAD\_JTAG is  
0 (default), input enabled, pull-up resistor enabled (IE = 1, WPU = 1)  
1, input disabled, in high impedance state (IE = 1)
- **3\*** - input disabled, pull-up resistor enabled (IE = 0, USB\_PU = 1). See details in Notes.
- **5** - input disabled (IE = 0). Output is controlled by the peripheral of Function 0, and the default output is 1.

We recommend pulling high or low GPIO pins in high impedance state to avoid unnecessary power consumption. You may add pull-up and pull-down resistors in your PCB design, or enable internal pull-up and pull-down resistors during software initialization.

## Notes

- **R** - These pins have analog functions.
- **USB** - The pull-up value of a USB pin is controlled by the pin's pull-up value together with the USB pull-up value. If any of the two pull-up values is 1, the pin's pull-up resistor will be enabled.

### Notice:

In HP IO MUX, unused pins must be configured to GPIO function.

## 8.15 LP IO MUX Functions List

Table 8.15-1 shows the LP IO MUX functions of each GPIO pin. GPIO pins are default controlled by HP IO MUX, so Table 8.15-1 only show functions of LP IO MUX.

Table 8.15-1. LP IO MUX Pin Functions

| Name  | Function 0 | Function 1 |
|-------|------------|------------|
| GPIO0 | LP_GPIO0   | LP_GPIO0   |
| GPIO1 | LP_GPIO1   | LP_GPIO1   |
| GPIO2 | LP_GPIO2   | LP_GPIO2   |

| Name   | Function 0      | Function 1 |
|--------|-----------------|------------|
| GPIO3  | LP_GPIO3        | LP_GPIO3   |
| GPIO4  | LP_GPIO4        | LP_GPIO4   |
| GPIO5  | LP_GPIO5        | LP_GPIO5   |
| GPIO6  | LP_GPIO6        | LP_GPIO6   |
| GPIO7  | LP_GPIO7        | LP_GPIO7   |
| GPIO8  | LP_GPIO8        | LP_GPIO8   |
| GPIO9  | LP_GPIO9        | LP_GPIO9   |
| GPIO10 | LP_GPIO10       | LP_GPIO10  |
| GPIO11 | LP_GPIO11       | LP_GPIO11  |
| GPIO12 | LP_GPIO12       | LP_GPIO12  |
| GPIO13 | LP_GPIO13       | LP_GPIO13  |
| GPIO14 | LP_UART_TXD_PAD | LP_GPIO14  |
| GPIO15 | LP_UART_RXD_PAD | LP_GPIO15  |

**Notice:**

In LP IO MUX, unused pins must be configured to LP\_GPIO function.

## 8.16 GPIO Pin Analog Functions List

Table 8.16-1 shows the GPIO pins and their correspond analog functions.

**Table 8.16-1. GPIO Pin Analog Functions**

| Name   | Analog Function 0 | Analog Function 1 |
|--------|-------------------|-------------------|
| GPIO0  | XTAL_32K_N        | —                 |
| GPIO1  | XTAL_32K_P        | —                 |
| GPIO2  | TOUCH_CHANNEL0    | —                 |
| GPIO3  | TOUCH_CHANNEL1    | —                 |
| GPIO4  | TOUCH_CHANNEL2    | —                 |
| GPIO5  | TOUCH_CHANNEL3    | —                 |
| GPIO6  | TOUCH_CHANNEL4    | —                 |
| GPIO7  | TOUCH_CHANNEL5    | —                 |
| GPIO8  | TOUCH_CHANNEL6    | —                 |
| GPIO9  | TOUCH_CHANNEL7    | —                 |
| GPIO10 | TOUCH_CHANNEL8    | —                 |
| GPIO11 | TOUCH_CHANNEL9    | —                 |
| GPIO12 | TOUCH_CHANNEL10   | —                 |
| GPIO13 | TOUCH_CHANNEL11   | —                 |

| GPIO15 | TOUCH_CHANNEL13   | —                 |
| GPIO16 | ADC1_CHANNEL0     | —                 |
| GPIO17 | ADC1_CHANNEL1     | —                 |

| Name   | Analog Function 0 | Analog Function 1 |
|--------|-------------------|-------------------|
| GPIO18 | ADC1_CHANNEL2     | —                 |
| GPIO19 | ADC1_CHANNEL3     | —                 |
| GPIO20 | ADC1_CHANNEL4     | —                 |
| GPIO21 | ADC1_CHANNEL5     | —                 |
| GPIO22 | ADC1_CHANNEL6     | —                 |
| GPIO23 | ADC1_CHANNEL7     | —                 |
| GPIO24 | USB1P1_N0         | —                 |
| GPIO25 | USB1P1_PO         | —                 |
| GPIO26 | USB1P1_N1         | —                 |
| GPIO27 | USB1P1_P1         | —                 |
| GPIO49 | ADC2_CHANNEL2     | —                 |
| GPIO50 | ADC2_CHANNEL3     | —                 |
| GPIO51 | ADC2_CHANNEL4     | ANA_COMP0         |
| GPIO52 | ADC2_CHANNEL5     | ANA_COMP0         |
| GPIO53 | ADC2_CHANNEL6     | ANA_COMP1         |
| GPIO54 | ADC2_CHANNEL7     | ANA_COMP1         |

## 8.17 Event Task Matrix Function

In ESP32-P4, GPIO supports ETM function, that is, the ETM task of GPIO can be triggered by the ETM event of any peripheral, or the ETM task of any peripheral can be triggered by the ETM event of GPIO. For more details about ETM, please refer to Chapter 12 [Event Task Matrix \(ETM\)](#). Only ETM tasks and ETM events related to GPIO are introduced here.

The GPIO ETM provides eight task channels  $x$  (0 ~ 7). The ETM tasks that each task channel can receive are:

- GPIO\_TASK\_CH $x$ \_SET: GPIO goes high when triggered.
- GPIO\_TASK\_CH $x$ \_CLEAR: GPIO goes low when triggered.
- GPIO\_TASK\_CH $x$ \_TOGGLE: GPIO toggles level when triggered.

Below is an example to configure task channel  $x$  to control GPIO $y$ :

- Configure [IO\\_MUX\\_GPIO \$y\$ \\_MCU\\_SEL](#) to 1, to select Function 1 listed in Table 8.14-1.
- Configure [GPIO\\_ENABLE\\_REG \$\[y\]\$](#)  to 1.
- Configure [GPIO\\_EXT\\_ETM\\_TASK\\_GPIO \$y\$ \\_SEL](#) to  $x$ .
- Set [GPIO\\_EXT\\_ETM\\_TASK\\_GPIO \$y\$ \\_EN](#), to enable ETM task channel  $x$  to control GPIO $y$ .

### Note:

- One task channel can be selected by one or more GPIOs.
- When two or three of the signals GPIO\_TASK\_CH $x$ \_SET, GPIO\_TASK\_CH $x$ \_CLEAR, and GPIO\_TASK\_CH $x$ \_TOGGLE of the task channel  $x$  selected by GPIO $y$  are valid at the same time, then GPIO\_TASK\_CH $x$ \_SET has the highest priority, GPIO\_TASK\_CH $x$ \_CLEAR takes the second higher priority, and GPIO\_TASK\_CH $x$ \_TOGGLE has the

lowest priority.

- When GPIO $y$  is controlled by ETM task channel, the values of `GPIO_OUT_REG`, `GPIO_FUNC $n$ _OUT_INV_SEL`, and `GPIO_FUNC $n$ _OUT_SEL` may be modified by the hardware. For such reason, it's recommended to reconfigure these registers when the GPIO is free from the control of ETM task channel.

GPIO has eight event channels, and the ETM events that each event channel can generate are:

- `GPIO_EVT_CH $x$ _RISE_EDGE`: Indicates that the output signal of the corresponding GPIO Filter (see Figure 8.3-1) has a rising edge.
- `GPIO_EVT_CH $x$ _FALL_EDGE`: Indicates that the output signal of the corresponding GPIO Filter (see Figure 8.3-1) has a falling edge.
- `GPIO_EVT_CH $x$ _ANY_EDGE`: Indicates that the output signal of the corresponding GPIO Filter (see Figure 8.3-1) is reversed.

The specific configuration of the event channel is as follows:

- Set `GPIO_EXT_ETM_CH $x$ _EVENT_EN` to enable event channel  $x$  (0 ~ 7).
- Configure `GPIO_EXT_ETM_CH $x$ _EVENT_SEL` to  $y$  (0 ~ 54), i.e., select one from the 55 GPIOs.

**Note:**

One GPIO can be selected by one or more event channels.

In specific applications, GPIO ETM events can be used to trigger GPIO ETM tasks. For example, event channel 0 selects GPIO0, GPIO1 selects task channel 0, and the `GPIO_EVT_CH0_RISE_EDGE` event is used to trigger the `GPIO_TASK_CH0_TOGGLE` task. When a square wave signal is input to the chip through GPIO0, the chip outputs a square wave signal with a frequency divided by 2 through GPIO1.

## 8.18 Interrupts

ESP32-P4's HP IO MUX and HP GPIO matrix can generate the following interrupt signals that will be sent to the [Interrupt Matrix](#).

- `GPIO_INTRO`
- `GPIO_INTR1`
- `GPIO_INTR2`
- `GPIO_INTR3`
- `GPIO_PAD_COMP_INTR`

There are several internal interrupt sources from HP IO MUX and HP GPIO matrix that can generate the above interrupt signals. The interrupt sources from HP IO MUX and HP GPIO matrix are listed with their trigger conditions and the resulted interrupt signals in Table 8.18-1. For more detailed information about `GPIO_PAD_COMP_INTR`, please refer to Chapter 58 [Analog Voltage Comparator](#).

**Table 8.18-1. HP IO MUX and HP GPIO Matrix's Internal Interrupt Sources**

| Internal Interrupt Source | Trigger Condition | Interrupt Signal |
|---------------------------|-------------------|------------------|
|---------------------------|-------------------|------------------|

|            |   |            |
|------------|---|------------|
| GPIO_INTRO | GPIO_STATUS_INTERRUPT[n] & GPIO_PINn_INT_ENA[0] (n: 0 ~ 31)     | GPIO_INTRO |
| GPIO_INTRO | GPIO_STATUS1_INTERRUPT[n] & GPIO_PINn+32_INT_ENA[0] (n: 0 ~ 22) | GPIO_INTRO |
| GPIO_INTR1 | GPIO_STATUS_INTERRUPT[n] & GPIO_PINn_INT_ENA[1] (n: 0 ~ 31)     | GPIO_INTR1 |
| GPIO_INTR1 | GPIO_STATUS1_INTERRUPT[n] & GPIO_PINn+32_INT_ENA[1] (n: 0 ~ 22) | GPIO_INTR1 |
| GPIO_INTR2 | GPIO_STATUS_INTERRUPT[n] & GPIO_PINn_INT_ENA[3] (n: 0 ~ 31)     | GPIO_INTR2 |
| GPIO_INTR2 | GPIO_STATUS1_INTERRUPT[n] & GPIO_PINn+32_INT_ENA[3] (n: 0 ~ 22) | GPIO_INTR2 |
| GPIO_INTR3 | GPIO_STATUS_INTERRUPT[n] & GPIO_PINn_INT_ENA[4] (n: 0 ~ 31)     | GPIO_INTR3 |
| GPIO_INTR3 | GPIO_STATUS1_INTERRUPT[n] & GPIO_PINn+32_INT_ENA[4] (n: 0 ~ 22) | GPIO_INTR3 |

ESP32-P4's LP IO MUX and GPIO matrix can generate the following interrupt signals that will be sent to the [Interrupt Matrix](#).

- LP\_GPIO\_INTRO

The interrupt source from LP IO MUX and LP GPIO matrix are listed with their trigger conditions and the resulted interrupt signals in Table 8.18-2.

Table 8.18-2. LP IO MUX and LP GPIO Matrix's Internal Interrupt Sources

| Internal Interrupt Source | Trigger Condition                  | Interrupt Signal |
|---------------------------|------------------------------------|------------------|
| LP_GPIO_INTR              | LP_GPIO_STATUS_DATA[n] (n: 0 ~ 15) | LP_GPIO_INTR     |

## 8.19 Register Summary

### 8.19.1 HP GPIO Matrix Register Summary

The addresses in this section are relative to HP GPIO matrix base address provided in Table 6.3-2 in Chapter 6 [System and Memory](#).

The abbreviations given in Column **Access** are explained in Section [Access Types for Registers](#).

| Name                               | Description                          | Address | Access     |
|------------------------------------|--------------------------------------|---------|------------|
| <b>Configuration Registers</b>     |                                      |         |            |
| <a href="#">GPIO_OUT_REG</a>       | GPIO0 ~ GPIO31 output register       | 0x0004  | R/W/SC/WTC |
| <a href="#">GPIO_OUT_W1TS_REG</a>  | GPIO0 ~ GPIO31 output set register   | 0x0008  | WT         |
| <a href="#">GPIO_OUT_W1TC_REG</a>  | GPIO0 ~ GPIO31 output clear register | 0x000C  | WT         |

## 8.19.2 HP IO MUX Register Summary

The addresses in this section are relative to the HP IO MUX base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name                                  | Description                              | Address | Access |
|---------------------------------------|--|---------|--------|
| <b>IO MUX Configuration Registers</b> |  |         |        |
| <a href="#">IO_MUX_GPIO0_REG</a>      | IO MUX configuration register for GPIO0  | 0x0004  | R/W    |
| <a href="#">IO_MUX_GPIO1_REG</a>      | IO MUX configuration register for GPIO1  | 0x0008  | R/W    |
| <a href="#">IO_MUX_GPIO2_REG</a>      | IO MUX configuration register for GPIO2  | 0x000C  | R/W    |
| <a href="#">IO_MUX_GPIO3_REG</a>      | IO MUX configuration register for GPIO3  | 0x0010  | R/W    |
| <a href="#">IO_MUX_GPIO4_REG</a>      | IO MUX configuration register for GPIO4  | 0x0014  | R/W    |
| <a href="#">IO_MUX_GPIO5_REG</a>      | IO MUX configuration register for GPIO5  | 0x0018  | R/W    |
| <a href="#">IO_MUX_GPIO6_REG</a>      | IO MUX configuration register for GPIO6  | 0x001C  | R/W    |

### 8.19.3 GPIO EXT Register Summary

GPIO EXT registers consist of SDM registers, Glitch Filter registers, and ETM registers.

The addresses in this section are relative to (HP GPIO matrix base address + 0x0F00). GPIO base address is provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name   | Description  | Address | Access |
|--|--|---------|--------|
| <b>SDM Configuration Registers</b>             |  |         |        |
| <a href="#">GPIO_EXT_SIGMADELTA0_REG</a>       | SDM channel 0 duty cycle configuration register    | 0x0000  | R/W    |
| <a href="#">GPIO_EXT_SIGMADELTA1_REG</a>       | SDM channel 1 duty cycle configuration register    | 0x0004  | R/W    |
| <a href="#">GPIO_EXT_SIGMADELTA2_REG</a>       | SDM channel 2 duty cycle configuration register    | 0x0008  | R/W    |
| <a href="#">GPIO_EXT_SIGMADELTA3_REG</a>       | SDM channel 3 duty cycle configuration register    | 0x000C  | R/W    |
| <a href="#">GPIO_EXT_SIGMADELTA4_REG</a>       | SDM channel 4 duty cycle configuration register    | 0x0010  | R/W    |
| <a href="#">GPIO_EXT_SIGMADELTA5_REG</a>       | SDM channel 5 duty cycle configuration register    | 0x0014  | R/W    |
| <a href="#">GPIO_EXT_SIGMADELTA6_REG</a>       | SDM channel 6 duty cycle configuration register    | 0x0018  | R/W    |
| <a href="#">GPIO_EXT_SIGMADELTA7_REG</a>       | SDM channel 7 duty cycle configuration register    | 0x001C  | R/W    |
| <a href="#">GPIO_EXT_SIGMADELTA_MISC_REG</a>   | MISC register                                      | 0x0024  | R/W    |
| <b>Glitch Filter Configuration Registers</b>   |  |         |        |
| <a href="#">GPIO_EXT_GLITCH_FILTER_CH0_REG</a> | Glitch Filter configuration register for channel 0 | 0x0030  | R/W    |
| <a href="#">GPIO_EXT_GLITCH_FILTER_CH1_REG</a> | Glitch Filter configuration register for channel 1 | 0x0034  | R/W    |
| <a href="#">GPIO_EXT_GLITCH_FILTER_CH2_REG</a> | Glitch Filter configuration register for channel 2 | 0x0038  | R/W    |
| <a href="#">GPIO_EXT_GLITCH_FILTER_CH3_REG</a> | Glitch Filter configuration register for channel 3 | 0x003C  | R/W    |
| <a href="#">GPIO_EXT_GLITCH_FILTER_CH4_REG</a> | Glitch Filter configuration register for channel 4 | 0x0040  | R/W    |
| <a href="#">GPIO_EXT_GLITCH_FILTER_CH5_REG</a> | Glitch Filter configuration register for channel 5 | 0x0044  | R/W    |
| <a href="#">GPIO_EXT_GLITCH_FILTER_CH6_REG</a> | Glitch Filter configuration register for channel 6 | 0x0048  | R/W    |
| <a href="#">GPIO_EXT_GLITCH_FILTER_CH7_REG</a> | Glitch Filter configuration register for channel 7 | 0x004C  | R/W    |
| <b>ETM Configuration Registers</b>             |  |         |        |
| <a href="#">GPIO_EXT_ETM_EVENT_CH0_CFG_REG</a> | ETM configuration register for channel 0           | 0x0060  | R/W    |

| Name   | Description                              | Address | Access |
|--|--|---------|--------|
| <a href="#">GPIO_EXT_ETM_EVENT_CH1_CFG_REG</a> | ETM configuration register for channel 1 | 0x0064  | R/W    |
| <a href="#">GPIO_EXT_ETM_EVENT_CH2_CFG_REG</a> | ETM configuration register for channel 2 | 0x0068  | R/W    |

### 8.19.5 LP IO MUX Register Summary

The addresses in this section are relative to LP IO MUX base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name                                     | Description                                 | Address | Access |
|--|---|---------|--------|

## 8.20 Registers

## 8.20.1 HP GPIO Matrix Registers

The addresses in this section are relative to HP GPIO matrix base address provided in Table 6.3-2 in Chapter 6 [System and Memory](#).

For how to program reserved fields, please refer to Section IX.

**Register 8.1. GPIO\_OUT\_REG (0x0004)**

**GPIO\_OUT\_DATA\_ORIG** Configures the output value of GPIO0 ~ GPIO31 output in simple GPIO output mode.

0: Low level

1: High level

The value of bit0 ~ bit31 correspond to the output value of GPIO0 ~ GPIO31 respectively.

(R/W/SC/WTC)

**Register 8.2. GPIO\_OUT\_W1TS\_REG (0x0008)**

**GPIO\_OUT\_W1TS** Configures whether or not to set the output register [GPIO\\_OUT\\_REG](#) of GPIO0 ~ GPIO31.

0: Not set

1: The corresponding bit in [GPIO\\_OUT\\_REG](#) will be set to 1

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. Recommended operation: use this register to set [GPIO\\_OUT\\_REG](#).

(WT)

Register 8.3. GPIO\_OUT\_W1TC\_REG (0x000C)

**GPIO\_OUT\_W1TC** Configures whether or not to clear the output register **GPIO\_OUT\_REG** of GPIO0 ~ GPIO31 output.

0: Not clear

1: The corresponding bit in **GPIO\_OUT\_REG** will be cleared.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. Recommended operation: use this register to clear **GPIO\_OUT\_REG**.

(WT)

Register 8.4. GPIO\_OUT1\_REG (0x0010)

**GPIO\_OUT1\_DATA\_ORIG** Configures the output value of GPIO32 ~ GPIO54 output in simple GPIO output mode.

0: Low level

1: High level

The value of bit0 ~ bit22 correspond to the output value of GPIO32 ~ GPIO54 respectively.

(R/W/SC/WTC)

(reserved)

GPIO\_OUT1\_WTS

0: Not set

1: The corresponding bit in `GPIO_OUT1_REG` will be set to 1

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. Recommended operation: use this register to set `GPIO_OUT1_REG`.

(WT)

(reserved)

GPIO\_OUT1\_WTTC

0: Not clear

1: The corresponding bit in `GPIO_OUT1_REG` will be cleared.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. Recommended operation: use this register to clear `GPIO_OUT_REG`.

(WT)

Register 8.7. GPIO\_ENABLE\_REG (0x0020)

**GPIO\_ENABLE\_DATA** Configures whether or not to enable the output of GPIO0 ~ GPIO31.

- 0: Not enable
- 1: Enable

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31  
(R/W/WTC)

Register 8.8. GPIO\_ENABLE\_WITS\_REG (0x0024)

**GPIO\_ENABLE\_WITS** Configures whether or not to set the output enable register [GPIO\\_ENABLE\\_REG](#) of GPIO0 ~ GPIO31.

- 0: Not set
- 1: The corresponding bit in [GPIO\\_ENABLE\\_REG](#) will be set to 1

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. Recommended operation: use this register to set [GPIO\\_ENABLE\\_REG](#).  
(WT)

Register 8.9. GPIO\_ENABLE\_W1TC\_REG (0x0028)

**GPIO\_ENABLE\_W1TC** Configures whether or not to clear the output enable register [GPIO\\_ENABLE\\_REG](#) of GPIO0 ~ GPIO31.

0: Not clear

1: The corresponding bit in [GPIO\\_ENABLE\\_REG](#) will be cleared

Bit0 ~ bit31 are corresponding to GPIO0 ~ 31. Recommended operation: use this register to clear [GPIO\\_ENABLE\\_REG](#).

(WT)

Register 8.10. GPIO\_ENABLE1\_REG (0x002C)

**GPIO\_ENABLE1\_DATA** Configures whether or not to enable the output of GPIO32 ~ GPIO54.

0: Not enable

1: Enable

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54.

(R/W/WTC)

(reserved)

GPIO\_ENABLE1\_WTS

0: Not set

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. Recommended operation: use this register to set `GPIO_ENABLE1_REG`.

(WT)

(reserved)

GPIO\_ENABLE1\_WITC

0: Not clear

Bit0 ~ bit22 are corresponding to GPIO32 ~ 54. Recommended operation: use this register to clear `GPIO_ENABLE1_REG`.

(WT)

### Register 8.13. GPIO\_STRAP\_REG (0x0038)

|                                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|---------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|----------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| (reserved)                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | GPIO_STRAPPING |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 31                              |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0              |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0x00           |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|                                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset          |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

**GPIO\_STRAPPING** Represents the values of GPIO strapping pins.

bit0: GPIO38

bit1: GPIO37

bit2: GPIO36

bit3: GPIO35

bit4: GPIO34

bit5 ~ bit15: invalid

For more information about the functions controlled by strapping pins, see [ESP32-P4 Datasheet](#)

> Section *Strapping Pins*. (RO)

### Register 8.14. GPIO\_IN\_REG (0x003C)

Diagram of the `GPIO_IN_DATA_NEXT` register. The register is 32 bits wide, with bit 31 on the left and bit 0 on the right. The value `0x0000000` is shown in the center, and the word "Reset" is at the bottom right.

**GPIO\_IN\_DATA\_NEXT** Represents the input value of GPIO0 ~ GPIO31. Each bit represents a pin

input value:

0: Low level

1: High level

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31.

(RO)

(reserved)

GPIO\_IN1\_DATA\_NEXT

input value:

0: Low level

1: High level

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54.

(RO)

GPIO\_STATUS\_INTERRUPT

GPIO\_STATUS\_INTERRUPT

ware.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31.

Each bit represents the status of its corresponding GPIO:

0: Represents the GPIO does not generate the interrupt configured by `GPIO_PIN $n$ _INT_TYPE`, or this bit is configured to 0 by the software.

1: Represents the GPIO generates the interrupt configured by `GPIO_PINn_INT_TYPE`, or this bit is configured to 1 by the software.

(R/W/WTC)

**Register 8.17. GPIO\_STATUS\_W1TS\_REG (0x0048)**

**GPIO\_STATUS\_W1TS** Configures whether or not to set the interrupt status register [GPIO\\_STATUS\\_INTERRUPT](#) of GPIO0 ~ GPIO31.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31.

If the value 1 is written to a bit here, the corresponding bit in [GPIO\\_STATUS\\_INTERRUPT](#) will be set to 1.

Recommended operation: use this register to set [GPIO\\_STATUS\\_INTERRUPT](#).

(WT)

**Register 8.18. GPIO\_STATUS\_W1TC\_REG (0x004C)**

**GPIO\_STATUS\_W1TC** Configures whether or not to clear the interrupt status register [GPIO\\_STATUS\\_INTERRUPT](#) of GPIO0 ~ GPIO31.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31.

If the value 1 is written to a bit here, the corresponding bit in [GPIO\\_STATUS\\_INTERRUPT](#) will be cleared.

Recommended operation: use this register to clear [GPIO\\_STATUS\\_INTERRUPT](#).

(WT)

### Register 8.19. GPIO\_STATUS1\_REG (0x0050)

Diagram illustrating the structure of the `GPIO_STATUS1` register. The register is 32 bits wide, divided into a 7-bit reserved field (bits 31-25) and a 25-bit field for `GPIO_STATUS1_INTERRUPT` (bits 24-0). The initial value is 0x00000.

**GPIO\_STATUS1\_INTERRUPT** The interrupt status of GPIO32 ~ GPIO54, can be configured by the software.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54.

Each bit represents the status of its corresponding GPIO:

0: Represents the GPIO does not generate the interrupt configured by `GPIO_PINn_INT_TYPE`, or this bit is configured to 0 by the software.

1: Represents the GPIO generates the interrupt configured by `GPIO_PINn_INT_TYPE`, or this bit is configured to 1 by the software.

(R/W/WTC)

### Register 8.20. GPIO\_STATUS1\_W1TS\_REG (0x0054)

**GPIO\_STATUS1\_WITS** Configures whether or not to set the interrupt status register **GPIO\_STATUS1\_INTERRUPT** of GPIO32 ~ GPIO54.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54.

If the value 1 is written to a bit here, the corresponding bit in `GPIO_STATUS1_INTERRUPT` will be set to 1.

Recommended operation: use this register to set `GPIO_STATUS1_INTERRUPT`.

(WT)

### Register 8.21. GPIO\_STATUS1\_W1TC\_REG (0x0058)

|                 |  |  |  |  |  |  |  |                  |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |
|-----------------|--|--|--|--|--|--|--|------------------|--|--|--|--|--|--|--|----|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|
| (reserved)      |  |  |  |  |  |  |  | GPIO_STATUS1_WTC |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |
|                 |  |  |  |  |  |  |  |                  |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |
| 31              |  |  |  |  |  |  |  | 25               |  |  |  |  |  |  |  | 24 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |
| 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  | 0x00000          |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |

**GPIO\_STATUS1\_W1TC** Configures whether or not to clear the interrupt status register **GPIO\_STATUS1\_INTERRUPT** of GPIO32 ~ GPIO54.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54.

If the value 1 is written to a bit here, the corresponding bit in `GPIO_STATUS1_INTERRUPT` will be cleared.

Recommended operation: use this register to clear `GPIO_STATUS1_INTERRUPT`.

(WT)

### Register 8.22. GPIO\_INTR\_0\_REG (0x005C)

Diagram of the GPIO\_INT\_0 register. The register is 32 bits wide, with bit positions 31 to 0 labeled. The value 0x00000000 is shown, indicating all bits are 0. A 'Reset' label is at the bottom right.

**GPIO\_INT\_0** Represents the CPU interrupt 0 status of GPIO0 ~ GPIO31. Each bit represents:

0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by `GPIO_PIN $n$ _INT_TYPE`.

1: Represents the GPIO generates an interrupt configured by `GPIO_PINn_INT_TYPE` after the CPU interrupt is enabled.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. This interrupt status is corresponding to the bit in `GPIO_STATUS_REG` when assert (high) enable signal (bit13 of `GPIO_PIN $n$ _REG`).

(RO)

### Register 8.23. GPIO\_INTR1\_O\_REG (0x0060)

|            |   |   |   |   |   |   |    |             |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |   |
|------------|---|---|---|---|---|---|----|-------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|---|
| (reserved) |   |   |   |   |   |   |    | GPIO_INT1_0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |   |
| 31         |   |   |   |   |   |   | 25 | 24          |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       | 0 |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0  | 0x00000     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |   |

**GPIO\_INT1\_0** Represents the CPU interrupt 0 status of GPIO32 ~ GPIO54. Each bit represents:

0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by `GPIO_PINn_INT_TYPE`.

1: Represents the GPIO generates an interrupt configured by `GPIO_PINn_INT_TYPE` after the CPU interrupt is enabled.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. This interrupt status is corresponding to the bit in `GPIO_STATUS1_REG` when assert (high) enable signal (bit13 of `GPIO_PINn_REG`).

(RO)

### Register 8.24. GPIO\_INTR\_1\_REG (0x0064)

Diagram of the GPIO\_INT\_1 register. The register is 32 bits wide, with bit 31 on the left and bit 0 on the right. The value 0x0000000 is shown in the register box, and the label "Reset" is next to it.

**GPIO\_INT\_1** Represents the CPU interrupt 1 status of GPIO0 ~ GPIO31. Each bit represents:

0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by `GPIO_PINn INT_TYPE`.

1: Represents the GPIO generates an interrupt configured by `GPIO_PINn_INT_TYPE` after the CPU interrupt is enabled.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. This interrupt status is corresponding to the bit in `GPIO_STATUS_REG` when assert (high) enable signal (bit14 of `GPIO_PINn_REG`).

(RO)

**Register 8.25. GPIO\_INTR1\_1\_REG (0x0068)**

|            |   |   |   |   |   |   |    |              |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |
|------------|---|---|---|---|---|---|----|--------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|
| (reserved) |   |   |   |   |   |   |    | GPIO_INTR1_1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |
| 31         |   |   |   |   |   |   | 25 | 24           |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0     |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0  |              |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0     |
|            |   |   |   |   |   |   |    | 0x00000      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |

**GPIO\_INTR1\_1** Represents the CPU interrupt 1 status of GPIO32 ~ GPIO54. Each bit represents:

0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by [GPIO\\_PIN \$n\$ \\_INT\\_TYPE](#).

1: Represents the GPIO generates an interrupt configured by [GPIO\\_PIN \$n\$ \\_INT\\_TYPE](#) after the CPU interrupt is enabled.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. This interrupt status is corresponding to the bit in [GPIO\\_STATUS1\\_REG](#) when assert (high) enable signal (bit14 of [GPIO\\_PIN \$n\$ \\_REG](#)).

(RO)

**Register 8.26. GPIO\_STATUS\_NEXT\_REG (0x006C)**

|                            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |
|----------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|
| GPIO_STATUS_INTERRUPT_NEXT |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |
| 31                         |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0     |
| 0x000000                   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |
|                            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |

**GPIO\_STATUS\_INTERRUPT\_NEXT** Represents the interrupt source signal of GPIO0 ~ GPIO31.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. Each bit represents:

0: The GPIO does not generate the interrupt configured by [GPIO\\_PIN \$n\$ \\_INT\\_TYPE](#).

1: The GPIO generates an interrupt configured by [GPIO\\_PIN \$n\$ \\_INT\\_TYPE](#).

The interrupt could be rising edge interrupt, falling edge interrupt, level sensitive interrupt and any edge interrupt.

(RO)

Register 8.27. GPIO\_STATUS\_NEXT1\_REG (0x0070)

**GPIO\_STATUS\_INTERRUPT\_NEXT1** Represents the interrupt source signal of GPIO32 ~ GPIO54. Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. Each bit represents:

- 0: The GPIO does not generate the interrupt configured by `GPIO_PINn_INT_TYPE`.
- 1: The GPIO generates an interrupt configured by `GPIO_PINn_INT_TYPE`.

The interrupt could be rising edge interrupt, falling edge interrupt, level sensitive interrupt and any edge interrupt.

(RO)

**Register 8.28. GPIO\_PIN $n$ \_REG ( $n$ : 0 - 54) (0x0074+0x4\* $n$ )**

|                               |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                |  |  |  |            |  |   |  |                                      |  |   |  |            |  |     |  |                                     |  |     |  |                                   |  |     |  |                                     |  |   |  |   |  |   |  |   |  |   |  |
|-------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--------------------------------|--|--|--|------------|--|---|--|--------------------------------------|--|---|--|------------|--|-----|--|-------------------------------------|--|-----|--|-----------------------------------|--|-----|--|-------------------------------------|--|---|--|---|--|---|--|---|--|---|--|

**GPIO\_PIN $n$ \_SYNC2\_BYPASS** Configures whether or not to synchronize GPIO input data on either edge of HP IO MUX operating clock for the second-level synchronization.

0: Not synchronize

1: Synchronize on falling edge

2: Synchronize on rising edge

3: Synchronize on rising edge

(R/W)

**GPIO\_PIN $n$ \_PAD\_DRIVER** Configures to select pin drive mode.

0: Normal output

1: Open drain output

(R/W)

**GPIO\_PIN $n$ \_SYNC1\_BYPASS** Configures whether or not to synchronize GPIO input data on either edge of HP IO MUX operating clock for the first-level synchronization.

0: Not synchronize

1: Synchronize on falling edge

2: Synchronize on rising edge

3: Synchronize on rising edge

(R/W)

**GPIO\_PIN $n$ \_INT\_TYPE** Configures GPIO interrupt type.

0: GPIO interrupt disabled

1: Rising edge trigger

2: Falling edge trigger

3: Any edge trigger

4: Low level trigger

5: High level trigger

(R/W)

**GPIO\_PIN $n$ \_WAKEUP\_ENABLE** Configures whether or not to enable GPIO wake-up function.

0: Disable

1: Enable

This function only wakes up the CPU from Light-sleep.

(R/W)

Continued on the next page...

**Register 8.28. GPIO\_PIN $n$ \_REG ( $n$ : 0 - 54) (0x0074+0x4\* $n$ )**

Continued from the previous page...

**GPIO\_PIN $n$ \_INT\_ENA** Configures whether or not to enable CPU interrupt or CPU non-maskable interrupt.

bit13: Configures whether or not to enable CPU interrupt 0:

0: Disable

1: Enable

bit14: Configures whether or not to enable CPU interrupt 1:

0: Disable

1: Enable

bit15: invalid

bit16: Configures whether or not to enable CPU interrupt 2:

0: Disable

1: Enable

bit17: Configures whether or not to enable CPU interrupt 3:

0: Disable

1: Enable

(R/W)

Register 8.29. GPIO\_FUNCn\_IN\_SEL\_CFG\_REG (n: 0 - 255) (0x015C+4\*n)

GPIO\_FUNCn\_IN\_SEL Configures to select a pin from the 55 GPIO pins to connect the input signal n.

- 0: Select GPIO0
- 1: Select GPIO1
- .....
- 53: Select GPIO53
- 54: Select GPIO54
- 55 ~ 61: invalid
- Or
- 62: A constantly low input
- 63: A constantly high input
- (R/W)

GPIO\_FUNCn\_IN\_INV\_SEL Configures whether or not to invert the input value.

- 0: Not invert
- 1: Invert
- (R/W)

GPIO\_SIGn\_IN\_SEL Configures whether or not to route signals via HP GPIO matrix.

- 0: Bypass HP GPIO matrix, i.e., connect signals directly to peripheral configured in HP IO MUX.
- 1: Route signals via HP GPIO matrix.
- (R/W)

**Register 8.30. GPIO\_FUNC $n$ \_OUT\_SEL\_CFG\_REG ( $n$ : 0 - 54) (0x0558+0x4\* $n$ )**

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                    |   |   |       |                                |    |   |   |                                     |  |  |  |                                 |  |  |  |  |  |  |       |  |  |  |  |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|------------------------------------|---|---|-------|--------------------------------|----|---|---|-------------------------------------|--|--|--|---------------------------------|--|--|--|--|--|--|-------|--|--|--|--|
| (reserved)                                  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | GPIO_FUNC <sub>n</sub> _OE_INV_SEL |   |   |       | GPIO_FUNC <sub>n</sub> _OE_SEL |    |   |   | GPIO_FUNC <sub>n</sub> _OUT_INV_SEL |  |  |  | GPIO_FUNC <sub>n</sub> _OUT_SEL |  |  |  |  |  |  |       |  |  |  |  |
| 31  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 12                                 |   |   |       | 11                             | 10 | 9 | 8 | 0                                   |  |  |  |                                 |  |  |  |  |  |  |       |  |  |  |  |
| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0                                  | 0 | 0 | 0x100 |                                |    |   |   |                                     |  |  |  |                                 |  |  |  |  |  |  | Reset |  |  |  |  |

**GPIO\_FUNC $n$ \_OUT\_SEL** Configures to select a signal  $Y$  ( $0 \leq Y < 256$ ) from 256 peripheral signals to be output to GPIO $n$ .

0: Select signal 0

1: Select signal 1

.....

254: Select signal 254

255: Select signal 255

Or

256: Bit $n$  of [GPIO\\_OUT\\_REG](#) and [GPIO\\_OUT1\\_REG](#) are selected as the output value, [GPIO\\_ENABLE\\_REG](#) and [GPIO\\_ENABLE1\\_REG](#) are selected as the output enable.

257 ~ 511: invalid

For the detailed signal list, see Table 8.12-1.

(R/W/SC)

**GPIO\_FUNC $n$ \_OUT\_INV\_SEL** Configures whether or not to invert the output value.

0: Not invert

1: Invert

(R/W/SC)

**GPIO\_FUNC $n$ \_OE\_SEL** Configures to select the source of output enable signal.

0: Use output enable signal from peripheral.

1: Force the output enable signal to be sourced from bit $n$  ( $n$ : 0 ~ 31) of [GPIO\\_ENABLE\\_REG](#) and bit $n-32$  ( $n$ : 32 ~ 54) of [GPIO\\_ENABLE1\\_REG](#).

(R/W)

**GPIO\_FUNC $n$ \_OE\_INV\_SEL** Configures whether or not to invert the output enable signal.

0: Not invert

1: Invert

(R/W)

**Register 8.31. GPIO\_INTR\_2\_REG (0x063C)**

|             |   |
|-------------|---|
| GPIO_INTR_2 |   |
| 31          | 0 |
| 0x000000    |   |
| Reset       |   |

**GPIO\_INT\_2** Represents the CPU interrupt 2 status of GPIO0 ~ GPIO31. Each bit represents:

0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by [GPIO\\_PIN<sub>n</sub>\\_INT\\_TYPE](#).

1: Represents the GPIO generates an interrupt configured by [GPIO\\_PIN<sub>n</sub>\\_INT\\_TYPE](#) after the CPU interrupt is enabled.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. This interrupt status is corresponding to the bit in [GPIO\\_STATUS\\_REG](#) when assert (high) enable signal (bit16 of [GPIO\\_PIN<sub>n</sub>\\_REG](#)).

(RO)

**Register 8.32. GPIO\_INTR1\_2\_REG (0x0640)**

|               |  |  |  |  |  |  |  |             |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |
|---------------|--|--|--|--|--|--|--|-------------|--|--|--|--|--|--|--|----|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|
| (reserved)    |  |  |  |  |  |  |  | GPIO_INT1_2 |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |
| 31            |  |  |  |  |  |  |  | 25          |  |  |  |  |  |  |  | 24 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |
| 0 0 0 0 0 0 0 |  |  |  |  |  |  |  | 0x00000     |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |

**GPIO\_INT1\_2** Represents the CPU interrupt 2 status of GPIO32 ~ GPIO54. Each bit represents:

0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by [GPIO\\_PIN<sub>n</sub>\\_INT\\_TYPE](#).

1: Represents the GPIO generates an interrupt configured by [GPIO\\_PIN<sub>n</sub>\\_INT\\_TYPE](#) after the CPU interrupt is enabled.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. This interrupt status is corresponding to the bit in [GPIO\\_STATUS1\\_REG](#) when assert (high) enable signal (bit16 of [GPIO\\_PIN<sub>n</sub>\\_REG](#)).

(RO)

GPIO\_INT\_3

**GPIO\_INT\_3** Represents the CPU interrupt 3 status of GPIO0 ~ GPIO31. Each bit represents:

- 0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by **GPIO\_PIN $n$ \_INT\_TYPE**.
- 1: Represents the GPIO generates an interrupt configured by **GPIO\_PIN $n$ \_INT\_TYPE** after the CPU interrupt is enabled.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. This interrupt status is corresponding to the bit in **GPIO\_STATUS\_REG** when assert (high) enable signal (bit17 of **GPIO\_PIN $n$ \_REG**).

(RO)

(reserved)

GPIO\_INT1\_3

**GPIO\_INT1\_3** Represents the CPU interrupt 3 status of GPIO32 ~ GPIO54. Each bit represents:

- 0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by **GPIO\_PIN $n$ \_INT\_TYPE**.
- 1: Represents the GPIO generates an interrupt configured by **GPIO\_PIN $n$ \_INT\_TYPE** after the CPU interrupt is enabled.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. This interrupt status is corresponding to the bit in **GPIO\_STATUS1\_REG** when assert (high) enable signal (bit17 of **GPIO\_PIN $n$ \_REG**).

(reserved)

GPIO\_CLK\_EN

**GPIO\_CLK\_EN** Configures whether or not to enable clock gate.  
0: Not enable  
1: Enable, the clock is free running.  
(R/W)

Register 8.36. GPIO\_ZERO\_DET0\_FILTER\_CNT\_REG (0x0710)

**GPIO\_ZERO\_DET0\_FILTER\_CNT** Configures to change GPIO analog comparator0 zero detect filter’s threshold.  
Interrupts in [GPIO\\_ZERO\\_DET0\\_FILTER\\_CNT](#) iomux\_core\_clk cycles after one interrupt will be filtered, and not be seen by CPU. (R/W)

Register 8.37. GPIO\_ZERO\_DET1\_FILTER\_CNT\_REG (0x0714)

**GPIO\_ZERO\_DET1\_FILTER\_CNT** Configures to change GPIO analog comparator1 zero detect filter’s threshold.  
Interrupts in [GPIO\\_ZERO\\_DET0\\_FILTER\\_CNT](#) iomux\_core\_clk cycles after one interrupt will be filtered, and not be seen by CPU. (R/W)

Register 8.38. GPIO\_DATE\_REG (0x07FC)

**GPIO\_DATE** Version control register.  
(R/W)

### Register 8.39. GPIO\_INT\_RAW\_REG (0x0700)

[illegible]

**GPIO\_COMPO\_NEG\_INT\_RAW** The raw interrupt status of [GPIO\\_COMPO\\_NEG\\_INT](#). (R/WTC/SS)

**GPIO** **COMPO** **POS** **INT** **RAW** The raw interrupt status of **GPIO** **COMPO** **POS** **INT**. (R/WTC/SS)

**GPIO\_COMPO\_ALL\_INT\_RAW** The raw interrupt status of [GPIO\\_COMPO\\_ALL\\_INT](#). (R/WTC/SS)

**GPIO\_COMP1\_NEG\_INT\_RAW** The raw interrupt status of **GPIO\_COMP1\_NEG\_INT**. (R/WTC/SS)

**GPIO\_COMP1\_POS\_INT\_RAW** The raw interrupt status of **GPIO\_COMP1\_POS\_INT**. (R/WTC/SS)

**GPIO\_COMP1\_ALL\_INT\_RAW** The raw interrupt status of [GPIO\\_COMP1\\_ALL\\_INT](#). (R/WTC/SS)

### Register 8.40. GPIO\_INT\_ST\_REG (0x0704)

[illegible]

**GPIO\_COMPO\_NEG\_INT\_ST** The masked interrupt status of [GPIO\\_COMPO\\_NEG\\_INT](#). (RO)

**GPIO\_COMP0\_POS\_INT\_ST** The masked interrupt status of [GPIO\\_COMP0\\_POS\\_INT](#). (RO)

**GPIO\_COMPO\_ALL\_INT\_ST** The masked interrupt status of [GPIO\\_COMPO\\_ALL\\_INT](#). (RO)

**GPIO\_COMP1\_NEG\_INT\_ST** The masked interrupt status of [GPIO\\_COMP1\\_NEG\\_INT](#). (RO)

**GPIO\_COMP1\_POS\_INT\_ST** The masked interrupt status of [GPIO\\_COMP1\\_POS\\_INT](#). (RO)

**GPIO\_COMP1\_ALL\_INT\_ST** The masked interrupt status of **GPIO\_COMP1\_ALL\_INT**. (RO)

Register 8.41. GPIO\_INT\_ENA\_REG (0x0708)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |  |   |   |   |   |   |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|--|---|---|---|---|---|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | GPIO_COMP1_ALL_INT_ENA<br>GPIO_COMP1_POS_INT_ENA<br>GPIO_COMP1_NEG_INT_ENA<br>GPIO_COMPO_ALL_INT_ENA<br>GPIO_COMPO_POS_INT_ENA<br>GPIO_COMPO_NEG_INT_ENA |   |   |   |   |   |   |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 6  | 5 | 4 | 3 | 2 | 1 | 0 |       |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0  | 1 | 1 | 1 | 1 | 1 | 1 | Reset |

GPIO\_COMPO\_NEG\_INT\_ENA Write 1 to enable [GPIO\\_COMPO\\_NEG\\_INT](#). (R/W)

GPIO\_COMPO\_POS\_INT\_ENA Write 1 to enable [GPIO\\_COMPO\\_POS\\_INT](#). (R/W)

GPIO\_COMPO\_ALL\_INT\_ENA Write 1 to enable [GPIO\\_COMPO\\_ALL\\_INT](#). (R/W)

GPIO\_COMP1\_NEG\_INT\_ENA Write 1 to enable [GPIO\\_COMP1\\_NEG\\_INT](#). (R/W)

GPIO\_COMP1\_POS\_INT\_ENA Write 1 to enable [GPIO\\_COMP1\\_POS\\_INT](#). (R/W)

GPIO\_COMP1\_ALL\_INT\_ENA Write 1 to enable [GPIO\\_COMP1\\_ALL\\_INT](#). (R/W)

Register 8.42. GPIO\_INT\_CLR\_REG (0x070C)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |  |   |   |   |   |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|--|---|---|---|---|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | GPIO_COMP1_ALL_INT_CLR<br>GPIO_COMP1_POS_INT_CLR<br>GPIO_COMP1_NEG_INT_CLR<br>GPIO_COMPO_ALL_INT_CLR<br>GPIO_COMPO_POS_INT_CLR<br>GPIO_COMPO_NEG_INT_CLR |   |   |   |   |   |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 6  | 5 | 4 | 3 | 2 | 1 | 0     |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0  | 0 | 0 | 0 | 0 | 0 | Reset |

GPIO\_COMPO\_NEG\_INT\_CLR Write 1 to clear [GPIO\\_COMPO\\_NEG\\_INT](#). (WT)

GPIO\_COMPO\_POS\_INT\_CLR Write 1 to clear [GPIO\\_COMPO\\_POS\\_INT](#). (WT)

GPIO\_COMPO\_ALL\_INT\_CLR Write 1 to clear [GPIO\\_COMPO\\_ALL\\_INT](#). (WT)

GPIO\_COMP1\_NEG\_INT\_CLR Write 1 to clear [GPIO\\_COMP1\\_NEG\\_INT](#). (WT)

GPIO\_COMP1\_POS\_INT\_CLR Write 1 to clear [GPIO\\_COMP1\\_POS\\_INT](#). (WT)

GPIO\_COMP1\_ALL\_INT\_CLR Write 1 to clear [GPIO\\_COMP1\\_ALL\\_INT](#). (WT)

## 8.20.2 HP IO MUX Registers

The addresses in this section are relative to the HP IO MUX base address provided in Table 6.3-2 in Chapter 6 [System and Memory](#).

For how to program reserved fields, please refer to Section IX.

Register 8.43. IO\_MUX\_GPIO $n$ \_REG ( $n$ : 0 - 54) (0x0004+4\* $n$ )

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |     |    |    |   |     |    |   |   |   |   |       |   |   |   |   |   |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----|----|----|---|-----|----|---|---|---|---|-------|---|---|---|---|---|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | IO_MUX_GPIO <sub>n</sub> _FILTER_EN<br>IO_MUX_GPIO <sub>n</sub> _MCU_SEL<br>IO_MUX_GPIO <sub>n</sub> _FUN_DRV<br>IO_MUX_GPIO <sub>n</sub> _FUN_IE<br>IO_MUX_GPIO <sub>n</sub> _FUN_WPU<br>IO_MUX_GPIO <sub>n</sub> _FUN_WPD<br>IO_MUX_GPIO <sub>n</sub> _MCU_DRV<br>IO_MUX_GPIO <sub>n</sub> _MCU_IE<br>IO_MUX_GPIO <sub>n</sub> _MCU_WPU<br>IO_MUX_GPIO <sub>n</sub> _MCU_WPD<br>IO_MUX_GPIO <sub>n</sub> _SLP_SEL<br>IO_MUX_GPIO <sub>n</sub> _MCU_OE |     |    |    |   |     |    |   |   |   |   |       |   |   |   |   |   |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 16  | 15  | 14 | 12 |   | 11  | 10 | 9 | 8 | 7 | 6 | 5     | 4 | 3 | 2 | 1 | 0 |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0   | 0x0 | 0  | 0  | 0 | 0x0 | 0  | 0 | 0 | 0 | 0 | Reset |   |   |   |   |   |

**IO\_MUX\_GPIO $n$ \_MCU\_OE** Configures whether or not to enable the output of GPIO $n$  in sleep mode.

0: Disable

1: Enable

(R/W)

**IO\_MUX\_GPIO $n$ \_SLP\_SEL** Configures whether or not to enter sleep mode for GPIO $n$ .

0: Not enter

1: Enter

(R/W)

**IO\_MUX\_GPIO $n$ \_MCU\_WPD** Configure whether or not to enable pull-down resistor of GPIO $n$  during sleep mode.

0: Disable

1: Enable

(R/W)

**IO\_MUX\_GPIO $n$ \_MCU\_WPU** Configures whether or not to enable pull-up resistor of GPIO $n$  during sleep mode.

0: Disable

1: Enable

(R/W)

**IO\_MUX\_GPIO $n$ \_MCU\_IE** Configures whether or not to enable the input of GPIO $n$  during sleep mode.

0: Disable

1: Enable

(R/W)

**IO\_MUX\_GPIO $n$ \_MCU\_DRV** Configures the drive strength of GPIO $n$  during sleep mode.

0: ~5 mA

1: ~10 mA

2: ~20 mA

3: ~40 mA

(R/W)

Continued on the next page...

**Register 8.43. IO\_MUX\_GPIO $n$ \_REG ( $n$ : 0 - 54) (0x0004+4\* $n$ )**

Continued from the previous page...

**IO\_MUX\_GPIO $n$ \_FUN\_WPD** Configures whether or not to enable pull-down resistor of GPIO $n$ .

0: Disable

1: Enable

(R/W)

**IO\_MUX\_GPIO $n$ \_FUN\_WPU** Configures whether or not enable pull-up resistor of GPIO $n$ .

0: Disable

1: Enable

(R/W)

**IO\_MUX\_GPIO $n$ \_FUN\_IE** Configures whether or not to enable input of GPIO $n$ .

0: Disable

1: Enable

(R/W)

**IO\_MUX\_GPIO $n$ \_FUN\_DRV** Configures the drive strength of GPIO $n$ .

0: ~5 mA

1: ~10 mA

2: ~20 mA

3: ~40 mA

(R/W)

**IO\_MUX\_GPIO $n$ \_MCU\_SEL** Configures to select IO MUX function for this pin.

0: Select Function 0

1: Select Function 1

.....

(R/W)

**IO\_MUX\_GPIO $n$ \_FILTER\_EN** Configures whether or not to enable filter for pin input signals.

0: Disable

1: Enable

(R/W)

**Register 8.44. IO\_MUX\_DATE\_REG (0x0104)**

|            |    |    |   |             |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |
|------------|----|----|---|-------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|
| (reserved) |    |    |   | IO_MUX_DATE |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |
| 31         | 28 | 27 |   |             |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0     |
| 0          | 0  | 0  | 0 | 0x201222    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |

**IO\_MUX\_DATE** Version control register.

(R/W)

**Register 8.47. GPIO\_EXT\_GLITCH\_FILTER\_CH $n$ \_REG ( $n$ : 0 - 7) (0x0030+0x4\* $n$ )**

**GPIO\_EXT\_FILTER\_CH $n$ \_EN** Configures whether or not to enable channel  $n$  of Glitch Filter.

0: Not enable

1: Enable

(R/W)

**GPIO\_EXT\_FILTER\_CH $n$ \_INPUT\_IO\_NUM** Configures to select the input GPIO for Glitch Filter.

0: Select GPIO0

1: Select GPIO1

.....

53: Select GPIO53

54: Select GPIO54

(R/W)

**GPIO\_EXT\_FILTER\_CH $n$ \_WINDOW\_THRES** Configures the window threshold for Glitch Filter. The window threshold should be less than or equal to [GPIO\\_EXT\\_FILTER\\_CH \$n\$ \\_WINDOW\\_WIDTH](#).

Measurement unit: HP IO MUX operating clock cycle

(R/W)

**GPIO\_EXT\_FILTER\_CH $n$ \_WINDOW\_WIDTH** Configures the window width for Glitch Filter. The effective value of window width is 0 ~ 62. 63 is a reserved value and can not be used.

Measurement unit: HP IO MUX operating clock cycle

(R/W)

Register 8.48. GPIO\_EXT\_ETM\_EVENT\_CHn\_CFG\_REG (n: 0 - 7) (0x0060+0x4\*n)

GPIO\_EXT\_ETM\_CHn\_EVENT\_SEL Configures to select GPIO for ETM event channel.

- 0: Select GPIO0
  - 1: Select GPIO1
  - .....
  - 53: Select GPIO53
  - 54: Select GPIO54
- (R/W)

GPIO\_EXT\_ETM\_CHn\_EVENT\_EN Configures whether or not to enable ETM event send.

- 0: Not enable
  - 1: Enable
- (R/W)

### Register 8.49. GPIO\_EXT\_ETM\_TASK\_PO\_CFG\_REG (0x00A0)

|            |  |  |  |                             |  |  |  |                            |  |  |  |            |  |  |  |                             |  |  |  |                            |  |  |  |            |  |  |  |                             |  |  |  |                            |  |  |  |            |  |  |  |                             |  |  |  |                            |  |  |  |    |  |  |  |   |  |  |  |   |  |  |  |     |  |  |  |   |  |  |  |       |  |  |  |   |  |  |  |   |  |  |  |
|------------|--|--|--|-----------------------------|--|--|--|----------------------------|--|--|--|------------|--|--|--|-----------------------------|--|--|--|----------------------------|--|--|--|------------|--|--|--|-----------------------------|--|--|--|----------------------------|--|--|--|------------|--|--|--|-----------------------------|--|--|--|----------------------------|--|--|--|----|--|--|--|---|--|--|--|---|--|--|--|-----|--|--|--|---|--|--|--|-------|--|--|--|---|--|--|--|---|--|--|--|
| (reserved) |  |  |  | GPIO_EXT_ETM_TASK_GPIO3_SEL |  |  |  | GPIO_EXT_ETM_TASK_GPIO3_EN |  |  |  | (reserved) |  |  |  | GPIO_EXT_ETM_TASK_GPIO2_SEL |  |  |  | GPIO_EXT_ETM_TASK_GPIO2_EN |  |  |  | (reserved) |  |  |  | GPIO_EXT_ETM_TASK_GPIO1_SEL |  |  |  | GPIO_EXT_ETM_TASK_GPIO1_EN |  |  |  | (reserved) |  |  |  | GPIO_EXT_ETM_TASK_GPIO0_SEL |  |  |  | GPIO_EXT_ETM_TASK_GPIO0_EN |  |  |  |    |  |  |  |   |  |  |  |   |  |  |  |     |  |  |  |   |  |  |  |       |  |  |  |   |  |  |  |   |  |  |  |
| 31         |  |  |  | 28                          |  |  |  | 27                         |  |  |  | 25         |  |  |  | 24                          |  |  |  | 23                         |  |  |  | 20         |  |  |  | 19                          |  |  |  | 17                         |  |  |  | 16         |  |  |  | 15                          |  |  |  | 12                         |  |  |  | 11 |  |  |  | 9 |  |  |  | 8 |  |  |  | 7   |  |  |  | 4 |  |  |  | 3     |  |  |  | 1 |  |  |  | 0 |  |  |  |
| 0          |  |  |  | 0                           |  |  |  | 0                          |  |  |  | 0          |  |  |  | 0x0                         |  |  |  | 0                          |  |  |  | 0          |  |  |  | 0                           |  |  |  | 0                          |  |  |  | 0          |  |  |  | 0x0                         |  |  |  | 0                          |  |  |  | 0  |  |  |  | 0 |  |  |  | 0 |  |  |  | 0x0 |  |  |  | 0 |  |  |  | Reset |  |  |  |   |  |  |  |   |  |  |  |

**GPIO\_EXT\_ETM\_TASK\_GPIO $n$ \_EN ( $n$ : 0 - 3)** Configures whether or not to enable GPIO $n$  to response ETM task.

0: Not enable

1: Enable

(R/W)

**GPIO\_EXT\_ETM\_TASK\_GPIO $n$ \_SEL** ( $n$ : 0 - 3) Configures to select an ETM task channel for GPIO $n$ .

0: Select channel 0

1: Select channel 1

• • • • •

7: Select channel 7

(R/W)

### Register 8.50. GPIO\_EXT\_ETM\_TASK\_P1\_CFG\_REG (0x00A4)

| 31         | 28 | 27 | 25 | 24                           | 23 | 20 | 19 | 17         | 16 | 15  | 12 | 11                           | 9 | 8 | 7 | 4          | 3 | 1 | 0 |                              |     |   |       |            |  |  |  |                              |  |  |  |
| 0          | 0  | 0  | 0  | 0x0                          | 0  | 0  | 0  | 0          | 0  | 0x0 | 0  | 0                            | 0 | 0 | 0 | 0x0        | 0 | 0 | 0 | 0                            | 0x0 | 0 | Reset |            |  |  |  |                              |  |  |  |

**GPIO\_EXT\_ETM\_TASK\_GPIO $n$ \_EN ( $n$ : 44 - 47)** Configures whether or not to enable GPIO $n$  to response ETM task.

0: Not enable

1: Enable

(R/W)

**GPIO\_EXT\_ETM\_TASK\_GPIO $n$ \_SEL** ( $n$ : 44 - 47) Configures to select an ETM task channel for GPIO $n$ .

0: Select channel 0

1: Select channel 1

• • • • •

7: Select channel 7

(R/W)

Register 8.61. GPIO\_EXT\_ETM\_TASK\_P12\_CFG\_REG (0x00D0)

|            |    |    |    |                              |    |    |    |                             |    |     |    |            |   |   |   |                              |   |   |   |                             |   |   |   |            |   |       |  |                              |  |  |  |                             |  |  |  |            |  |  |  |                              |  |  |  |                             |  |  |  |

**GPIO\_EXT\_ETM\_TASK\_GPIO $n$ \_EN ( $n$ : 48 - 51)** Configures whether or not to enable GPIO $n$  to re-  
sponse ETM task.  
0: Not enable  
1: Enable  
(R/W)

**GPIO\_EXT\_ETM\_TASK\_GPIO $n$ \_SEL ( $n$ : 48 - 51)** Configures to select an ETM task channel for GPIO $n$ .  
0: Select channel 0  
1: Select channel 1  
.....  
7: Select channel 7  
(R/W)

### Register 8.62. GPIO\_EXT\_ETM\_TASK\_P13\_CFG\_REG (0x00D4)

|                         |  |  |  |  |  |  |  |  |  |  |  |                              |  |    |           |                             |     |    |   |            |  |     |   |                              |   |       |  |                             |  |   |   |            |   |  |  |                              |  |  |  |                             |  |  |  |

| 0 0 0 0 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  |  |  |  |  | 0x0                          |  | 0  | 0 0 0 0 0 |                             | 0x0 |    | 0 | 0 0 0 0 0  |  | 0x0 |   | 0                            |   | Reset |  |                             |  |   |   |            |   |  |  |                              |  |  |  |                             |  |  |  |

**GPIO\_EXT\_ETM\_TASK\_GPIO $n$ \_EN ( $n$ : 52 - 54)** Configures whether or not to enable GPIO $n$  to response ETM task.

0: Not enable

1: Enable

(R/W)

**GPIO\_EXT\_ETM\_TASK\_GPIO $n$ \_SEL** ( $n$ : 52 - 54) Configures to select an ETM task channel for GPIO $n$ .

0: Select channel 0

1: Select channel 1

• • • • •

7: Select channel 7

(R/W)

### Register 8.63. GPIO\_EXT\_VERSION\_REG (0x00FC)

|            |    |    |   |               |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |       |
|------------|----|----|---|---------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|---|--|--|-------|
| (reserved) |    |    |   | GPIO_EXT_DATE |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |       |
| 31         | 28 | 27 |   |               |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |       |
| 0          | 0  | 0  | 0 | 0x2203050     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  | Reset |

**GPIO\_EXT\_DATE** Version control register.

(R/W)

#### 8.20.4 LP GPIO Matrix Registers

The addresses in this section are relative to LP GPIO matrix base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section IX.

(reserved)

LP\_GPIO\_CLK\_EN

(R/W)

(reserved)

LP\_GPIO\_VER\_DATE

(R/W)

(reserved)

LP\_GPIO\_OUT\_DATA

(R/W/WTC)

**Register 8.67. LP\_GPIO\_OUT\_W1TS\_REG (0x000C)**

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|----|-----------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    | LP_GPIO_OUT_DATA_W1TS |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 16 | 15                    |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |       |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0  | 0                     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |       |
|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    | 0                     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   | Reset |
|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |       |

**LP\_GPIO\_OUT\_DATA\_W1TS** Configures whether or not to set the output register [LP\\_GPIO\\_OUT\\_REG](#) of GPIO0 ~ GPIO15.

0: Not set

1: The corresponding bit in [LP\\_GPIO\\_OUT\\_REG](#) will be set to 1

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid. Recommended operation: use this register to set [LP\\_GPIO\\_OUT\\_REG](#).

(WT)

**Register 8.68. LP\_GPIO\_OUT\_W1TC\_REG (0x0010)**

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|----|-----------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    | LP_GPIO_OUT_DATA_W1TC |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |       |

| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0  | 0                     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |       |
|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   | Reset |

**LP\_GPIO\_OUT\_DATA\_W1TC** Configures whether or not to clear the output register [LP\\_GPIO\\_OUT\\_REG](#) of GPIO0 ~ GPIO15 output.

0: Not clear

1: The corresponding bit in [LP\\_GPIO\\_OUT\\_REG](#) will be cleared.

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid. Recommended operation: use this register to clear [LP\\_GPIO\\_OUT\\_REG](#).

(WT)

**Register 8.69. LP\_GPIO\_ENABLE\_REG (0x0014)**

**LP\_GPIO\_ENABLE\_DATA** Configures whether or not to enable the output of GPIO0 ~ GPIO15.

0: Not enable

1: Enable

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid.

(R/W/WTC)

**Register 8.70. LP\_GPIO\_ENABLE\_W1TS\_REG (0x0018)**

**LP\_GPIO\_ENABLE\_DATA\_W1TS** Configures whether or not to set the output enable register [LP\\_GPIO\\_ENABLE\\_REG](#) of GPIO0 ~ GPIO15.

0: Not set

1: The corresponding bit in [LP\\_GPIO\\_ENABLE\\_REG](#) will be set to 1

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid. Recommended operation: use this register to set [LP\\_GPIO\\_ENABLE\\_REG](#).

(WT)

### Register 8.71. LP\_GPIO\_ENABLE\_W1TC\_REG (0x001C)

|                                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                          |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|---------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| (reserved)                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | LP_GPIO_ENABLE_DATA_W1TC |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 31                              |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0                        |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0                        |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

**LP\_GPIO\_ENABLE\_DATA\_W1TC** Configures whether or not to clear the output enable register **LP\_GPIO\_ENABLE\_REG** of GPIO0 ~ GPIO15.

0: Not clear

1: The corresponding bit in `LP_GPIO_ENABLE_REG` will be cleared

Bit0 ~ bit15 are corresponding to GPIO0 ~ 15. Bit16 ~ bit31 are invalid. Recommended operation: use this register to clear [LP\\_GPIO\\_ENABLE\\_REG](#).

(WT)

### Register 8.72. LP\_GPIO\_STATUS\_REG (0x0020)

Diagram illustrating the structure of the LP\_GPIO\_STATUS register:

- Bits 31 to 16: (reserved)
- Bits 15 to 0: LP\_GPIO\_STATUS\_DATA
- Bit 0: Reset

**LP\_GPIO\_STATUS\_DATA** The interrupt status of GPIO0 ~ GPIO15, can be configured by the software.  
Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid.

Each bit represents the status of its corresponding GPIO:

0: Represents the GPIO does not generate the interrupt configured by `LP_GPIO_PIN $n$ _INT_TYPE`, or this bit is configured to 0 by the software.

1: Represents the GPIO generates the interrupt configured by `LP_GPIO_PIN $n$ _INT_TYPE`, or this bit is configured to 1 by the software.

(R/W/WTC)

**Register 8.73. LP\_GPIO\_STATUS\_WITS\_REG (0x0024)**

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                          |    |  |  |  |  |  |  |  |  |  |  |  |  |       |  |   |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|--------------------------|----|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|---|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | LP_GPIO_STATUS_DATA_WITS |    |  |  |  |  |  |  |  |  |  |  |  |  |       |  |   |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 16                       | 15 |  |  |  |  |  |  |  |  |  |  |  |  |       |  | 0 |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0                        |    |  |  |  |  |  |  |  |  |  |  |  |  | Reset |  |   |

**LP\_GPIO\_STATUS\_DATA\_WITS** Configures whether or not to set the interrupt status register [LP\\_GPIO\\_STATUS\\_DATA](#) of GPIO0 ~ GPIO15.

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid.

If the value 1 is written to a bit here, the corresponding bit in [LP\\_GPIO\\_STATUS\\_DATA](#) will be set to 1.

Recommended operation: use this register to set [LP\\_GPIO\\_STATUS\\_DATA](#).

(WT)

**Register 8.74. LP\_GPIO\_STATUS\_W1TC\_REG (0x0028)**

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                          |    |  |  |  |  |  |  |  |  |  |  |  |  |  |       |   |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|--------------------------|----|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|---|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | LP_GPIO_STATUS_DATA_W1TC |    |  |  |  |  |  |  |  |  |  |  |  |  |  |       |   |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 16                       | 15 |  |  |  |  |  |  |  |  |  |  |  |  |  |       | 0 |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0                        |    |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |   |

**LP\_GPIO\_STATUS\_DATA\_W1TC** Configures whether or not to clear the interrupt status register [LP\\_GPIO\\_STATUS\\_DATA](#) of GPIO0 ~ GPIO15.

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid.

If the value 1 is written to a bit here, the corresponding bit in [LP\\_GPIO\\_STATUS\\_DATA](#) will be cleared.

Recommended operation: use this register to clear [LP\\_GPIO\\_STATUS\\_DATA](#).

(WT)

**Register 8.75. LP\_GPIO\_STATUS\_NEXT\_REG (0x002C)**

**LP\_GPIO\_STATUS\_INTERRUPT\_NEXT** Represents the interrupt source signal of GPIO0 ~ GPIO15.

Bit0 ~ bit15 are corresponding to GPIO0 ~ 15. Bit16 ~ bit31 are invalid. Each bit represents:

0: The GPIO does not generate the interrupt configured by [LP\\_GPIO\\_PIN<sub>n</sub>\\_INT\\_TYPE](#).

1: The GPIO generates an interrupt configured by [LP\\_GPIO\\_PIN<sub>n</sub>\\_INT\\_TYPE](#).

The interrupt could be rising edge interrupt, falling edge interrupt, level sensitive interrupt and any edge interrupt.

(RO)

**Register 8.76. LP\_GPIO\_IN\_REG (0x0030)**

**LP\_GPIO\_IN\_DATA\_NEXT** Represents the input value of GPIO0 ~ GPIO15. Each bit represents a pin input value:

0: Low level

1: High level

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid.

(RO)

Register 8.77. LP\_GPIO\_PIN $n$ \_REG ( $n$ : 0 - 15) (0x0034+4\* $n$ )

**LP\_GPIO\_PIN $n$ \_WAKEUP\_ENABLE** Configures whether or not to enable GPIO wake-up function.

0: Disable

1: Enable

This function only wakes up system from Deep-sleep.

(R/W)

**LP\_GPIO\_PIN $n$ \_INT\_TYPE** Configures GPIO interrupt type.

0: GPIO interrupt disabled

1: Rising edge trigger

2: Falling edge trigger

3: Any edge trigger

4: Low level trigger

5: High level trigger

(R/W)

**LP\_GPIO\_PIN $n$ \_PAD\_DRIVER** Configures to select pin drive mode.

0: Normal output

1: Open drain output

(R/W)

**LP\_GPIO\_PIN $n$ \_EDGE\_WAKEUP\_CLR** Configures to clear edge-triggered GPIO wake-up source in PMU.

1: The corresponding bit in LP\_PMU\_xxx will be cleared.

0: No effect.

(WT)

Register 8.78. LP\_GPIO\_FUNC $n$ \_IN\_SEL\_CFG\_REG ( $n$ : 0 - 15) (0x0074+4\* $n$ )

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                           |   |        |  |                           |   |        |  |                           |  |            |  |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|---------------------------|---|--------|--|---------------------------|---|--------|--|---------------------------|--|------------|--|
| (reserved)  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | LP_GPIO_FUNC <sub>n</sub> |   | IN_SEL |  | LP_GPIO_FUNC <sub>n</sub> |   | IN_SEL |  | LP_GPIO_FUNC <sub>n</sub> |  | IN_INV_SEL |  |
| 31  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 8                         | 7 | 2      |  | 1                         | 0 |        |  |                           |  |            |  |
| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0x30                      |   |        |  | 0                         | 0 | Reset  |  |                           |  |            |  |

**LP\_GPIO\_FUNC $n$ \_IN\_INV\_SEL** Configures whether or not to invert the input value.

0: Not invert

1: Invert

(R/W)

**LP\_GPIO\_SIG<sub>n</sub>\_IN\_SEL** Configures whether or not to route signals via LP GPIO matrix.

0: Bypass LP GPIO matrix, i.e., connect signals directly to peripheral configured in LP IO MUX.

1: Route signals via LP GPIO matrix.

(R/W)

**LP\_GPIO\_FUNC*n*\_IN\_SEL** Configures to select a pin from the 16 LP GPIO pins to connect the input signal *n*.

0: Select GPIO0

1: Select GPIO1

• • • • •

14: Select GPIO14

15: Select GPIO15

16 ~ 31: Invalid

32 ~ 47: A constantly low input

48 ~ 63: A constantly high input

(R/W)

Register 8.79. LP\_GPIO\_FUNC $n$ \_OUT\_SEL\_CFG\_REG ( $n$ : 0 - 15) (0x00F4+4\* $n$ )

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                    |   |  |  |  |   |   |       |                                   |  |  |  |                                       |  |  |  |  |  |  |  |  |  |  |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|------------------------------------|---|--|--|--|---|---|-------|-----------------------------------|--|--|--|---------------------------------------|--|--|--|--|--|--|--|--|--|--|
| (reserved)                                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | LP_GPIO_FUNC <sub>n</sub> _OUT_SEL |   |  |  | LP_GPIO_FUNC <sub>n</sub> _OUT_INV_SEL |   |   |       | LP_GPIO_FUNC <sub>n</sub> _OE_SEL |  |  |  | LP_GPIO_FUNC <sub>n</sub> _OE_INV_SEL |  |  |  |  |  |  |  |  |  |  |
| 31  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 9                                  | 8 |  |  |  | 3 | 2 | 1     | 0                                 |  |  |  |                                       |  |  |  |  |  |  |  |  |  |  |
| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0x20                               |   |  |  | 0                                      | 0 | 0 | Reset |                                   |  |  |  |                                       |  |  |  |  |  |  |  |  |  |  |

**LP\_GPIO\_FUNC $n$ \_OE\_INV\_SEL** Configures whether or not to invert the output enable signal.

0: Not invert

1: Invert

(R/W)

**LP\_GPIO\_FUNC $n$ \_OE\_SEL** Configures to select the source of output enable signal.

0: Use output enable signal from peripheral.

1: Force the output enable signal to be sourced from bit $n$  of [LP\\_GPIO\\_ENABLE\\_REG](#).

(R/W)

**LP\_GPIO\_FUNC $n$ \_OUT\_INV\_SEL** Configures whether or not to invert the output value.

0: Not invert

1: Invert

(R/W)

**LP\_GPIO\_FUNC $n$ \_OUT\_SEL** Configures to select a signal  $Y$  ( $0 \leq Y < 32$ ) from 31 peripheral signals to be output to GPIO $n$ .

0: Select signal 0

1: Select signal 1

.....

30: Select signal 30

31: Select signal 31

Or

32: Bit $n$  of [LP\\_GPIO\\_OUT\\_REG](#) and [LP\\_GPIO\\_ENABLE\\_REG](#) are selected as the output value and output enable.

For the detailed signal list, see Table 8.13-1.

(R/W)

## 8.20.5 LP IO MUX Registers

The addresses in this section are relative to LP IO MUX base address provided in Table 6.3-2 in Chapter 6 [System and Memory](#).

For how to program reserved fields, please refer to Section IX.

Register 8.80. LP\_IOMUX\_CLK\_EN\_REG (0x0000)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                 |   |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-----------------|---|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | LP_IOMUX_CLK_EN |   |   |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 1               | 0 |   |       |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0               | 0 | 1 | Reset |

**LP\_IOMUX\_CLK\_EN** Configures whether or not to enable clock gate.

0: Not enable

1: Enable, the clock is free running.

(R/W)

Register 8.81. LP\_IOMUX\_VER\_DATE\_REG (0x0004)

|            |   |   |    |                   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |
|------------|---|---|----|-------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|
| (reserved) |   |   |    | LP_IOMUX_VER_DATE |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |
| 31         |   |   | 28 | 27                |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0     |  |  |
| 0          | 0 | 0 | 0  | 0x230313          |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |  |  |

**LP\_IOMUX\_VER\_DATE** Version control register.

(R/W)

Register 8.82. LP\_IOMUX\_PAD $n$ \_REG ( $n = 0 - 15$ ) (0x0008+4\* $n$ )

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |    |    |   |   |   |   |   |   |   |   |   |       |  |  |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|---|----|----|---|---|---|---|---|---|---|---|---|-------|--|--|
| (reserved)                                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | LP_IOMUX_PAD <sub>n</sub> _FILTER_EN<br>LP_IOMUX_PAD <sub>n</sub> _FUN_IE<br>LP_IOMUX_PAD <sub>n</sub> _SLP_OE<br>LP_IOMUX_PAD <sub>n</sub> _SLP_IE<br>LP_IOMUX_PAD <sub>n</sub> _FUN_SEL<br>LP_IOMUX_PAD <sub>n</sub> _MUX_SEL<br>LP_IOMUX_PAD <sub>n</sub> _RUE<br>LP_IOMUX_PAD <sub>n</sub> _RDE<br>LP_IOMUX_PAD <sub>n</sub> _DRV |    |    |   |   |   |   |   |   |   |   |   |       |  |  |
| 31  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 12  | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0     |  |  |
| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0   | 0  | 0  | 0 | 0 | 0 |   | 0 | 0 | 0 | 0 | 2 | Reset |  |  |

**LP\_IOMUX\_PAD $n$ \_DRV** Configures the drive strength of GPIO $n$ .

- 0: ~5 mA
- 1: ~10 mA
- 2: ~20 mA
- 3: ~40 mA
- (R/W)

**LP\_IOMUX\_PAD $n$ \_RDE** Configures whether or not enable pull-down resistor of GPIO $n$ .

- 0: Disable
- 1: Enable
- (R/W)

**LP\_IOMUX\_PAD $n$ \_RUE** Configures whether or not to enable pull-up resistor of GPIO $n$ .

- 0: Disable
- 1: Enable
- (R/W)

**LP\_IOMUX\_PAD $n$ \_MUX\_SEL** Configures to decide GPIO $n$  is used by HP IO MUX or LP IO MUX.

- 0: GPIO $n$  is used by HP IO MUX
- 1: GPIO $n$  is used by LP IO MUX
- (R/W)

**LP\_IOMUX\_PAD $n$ \_FUN\_SEL** Configures to select LP IO MUX function for this signal.

- 0: Select Function 0
- 1: Select Function 1
- .....
- (R/W)

**LP\_IOMUX\_PAD $n$ \_SLP\_SEL** Configures whether or not to enter sleep mode for GPIO $n$ .

- 0: Not enter
- 1: Enter
- (R/W)

**LP\_IOMUX\_PAD $n$ \_SLP\_IE** Configures whether or not to enable the input of GPIO $n$  during sleep mode.

- 0: Disable
- 1: Enable
- (R/W)

Continued on the next page...

Register 8.83. LP\_IOMUX\_PADn\_REG (n = 0 - 15) (0x0008+4\*n)

Continued from the previous page...

**LP\_IOMUX\_PADn\_SLP\_OE** Configures whether or not to enable the output of GPIO $n$  in sleep mode.  
0: Disable  
1: Enable  
(R/W)

**LP\_IOMUX\_PADn\_FUN\_IE** Configures whether or not to enable input of GPIO $n$ .  
0: Disable  
1: Enable  
(R/W)

**LP\_IOMUX\_PADn\_FILTER\_EN** Configures whether or not to enable filter for pin input signals.  
0: Disable  
1: Enable  
(R/W)

Register 8.84. LP\_IOMUX\_LP\_PAD\_HOLD\_REG (0x004C)

**LP\_IOMUX\_LP\_GPIO\_HOLD** Configures whether or not to enable hold function of GPIO $n$ .  
0: Disable  
1: Enable  
(R/W)

Register 8.85. LP\_IOMUX\_LP\_PAD\_HYS\_REG (0x0050)

**LP\_IOMUX\_LP\_GPIO\_HYS** Configures whether or not to enable hysteresis function of GPIO<sub>n</sub>.  
0: Disable  
1: Enable  
Bit0 bit15 are corresponding to GPIO0 GPIO15.  
(R/W)

## Chapter 9

## Reset and Clock

### 9.1 Reset

#### 9.1.1 Overview

ESP32-P4 provides four types of reset that occur at different levels, namely CPU Reset, Core Reset, System Reset, and Chip Reset. All reset types mentioned above (except Chip Reset) preserve the data stored in internal memory. Figure 9.1-1 shows the scopes of affected subsystems by each type of reset.

#### 9.1.2 Architectural Overview

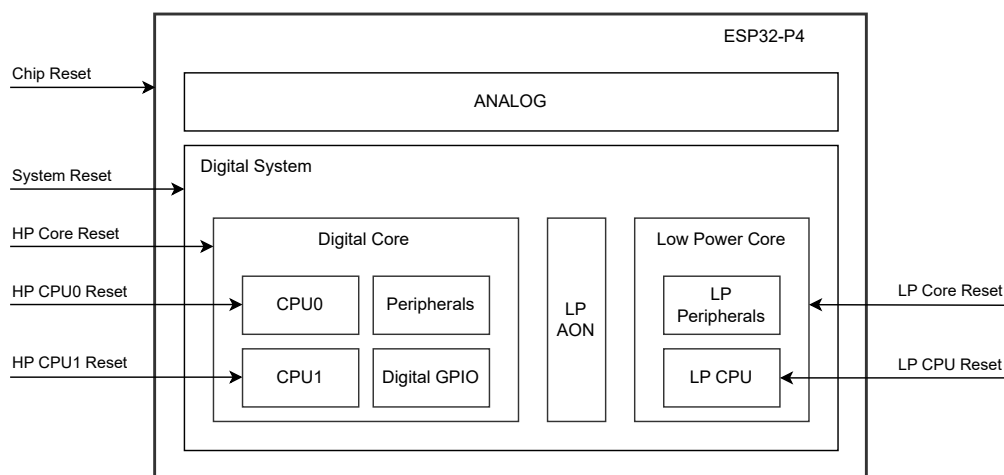

Figure 9.1-1. Reset Types

ESP32-P4's Digital System consists of [High Performance System \(HP system\)](#) that includes Digital Core and HP memory, and [Low Power System \(LP system\)](#) that includes the Low Power Always On (LP AON) system, LP Core, and LP memory. See Figure 9.1-1 for details (note that HP memory and LP memory would not be reset, so they are not shown in the figure).

#### 9.1.3 Features

- Four reset types:
  - CPU Reset: resets CPU core. HP CPU0, HP CPU1, and LP CPU can be reset independently:
    - \* HP CPU0 will be automatically released from reset after chip power-up, and start execution from CPU Reset Vector (0x30100000).

- \* HP CPU1 is at reset by default after chip power-up, and needs to be manually released from reset by writing 0 to [HP\\_SYS\\_CLKRST\\_RST\\_EN\\_CORE1\\_GLOBAL](#). Once released from reset, HP CPU1 will start execution from CPU Reset Vector (0x30100000).
- \* LP CPU is at reset after chip power-up, and needs to be manually released from reset by configuring the power management unit (PMU). Once released from reset, LP CPU will start execution from LP\_SYSTEM\_LP\_CPU\_BOOT\_ADDR (0x50100000 by default). For details, see Chapter 13 [Low-Power Management](#).
- Core Reset: resets the whole digital system except for LP AON. HP core and LP core can be reset independently: HP Core Reset resets HP CPU0, HP CPU1, HP peripherals, HP GPIO, etc., and LP Core Reset resets LP CPU and LP peripherals.
- System Reset: resets the whole digital system, including the LP system.
- Chip Reset: resets the whole chip.
- Software reset and hardware reset:
  - Software Reset: triggered via software by configuring the corresponding registers of CPU, see Chapter 13 [Low-Power Management](#).
  - Hardware Reset: triggered directly by the hardware.

## 9.1.4 Functional Description

CPU will be reset immediately when any type of reset above occurs. After the reset is released, users can retrieve reset source codes by reading the following fields:

- HP CPU0: [LP\\_CLKRST\\_HPCORE0\\_RESET\\_CAUSE](#)
- HP CPU1: [LP\\_CLKRST\\_HPCORE1\\_RESET\\_CAUSE](#)
- LP CPU: [LP\\_CLKRST\\_LPCORE\\_RESET\\_CAUSE](#)

Table 9.1-1 and Table 9.1-2 list possible reset sources and the types of reset they trigger.

**Table 9.1-1. HP CPU Reset Source**

| Code | Source                       | Reset Type      | Note  |
|------|------------------------------|-----------------|---|
| 0x01 | Chip reset <sup>1</sup>      | Chip Reset      | —   |
| 0x03 | Software system reset        | HP Core Reset   | Triggered by configuring <a href="#">LP_SYSTEM_SYS_SW_RST</a>   |
| 0x05 | PMU core reset               | HP Core Reset   | See Chapter 13 <a href="#">Low-Power Management</a>   |
| 0x07 | MWDT core reset <sup>2</sup> | HP Core Reset   | See Chapter 16 <a href="#">Watchdog Timers (WDT)</a>  |
| 0x09 | RWDT core reset              | HP Core Reset   | See Chapter 16 <a href="#">Watchdog Timers (WDT)</a>  |
| 0x0B | MWDT CPU reset               | HP CPU0/1 Reset | See Chapter 16 <a href="#">Watchdog Timers (WDT)</a>  |
| 0x0C | Software CPU reset           | HP CPU0/1 Reset | Triggered by configuring <a href="#">LP_CLKRST_HPCORE0_SW_RESET</a> or <a href="#">LP_CLKRST_HPCORE1_SW_RESET</a> |
| 0x0D | RWDT CPU reset               | HP CPU0/1 Reset | See Chapter 16 <a href="#">Watchdog Timers (WDT)</a>  |

| Code | Source                 | Reset Type                 | Note   |
|------|------------------------|----------------------------|--|
| 0x0F | Brown-out system reset | Chip Reset or System Reset | Triggered by the brown-out detector. Once brown-out status is detected, the detector will trigger System Reset or Chip Reset, depending on the register configuration. See Chapter 13 <a href="#">Low-Power Management</a> |
| 0x10 | RWDT system reset      | System Reset               | See Chapter 16 <a href="#">Watchdog Timers (WDT)</a>   |
| 0x12 | Super Watchdog reset   | System Reset               | See Chapter 16 <a href="#">Watchdog Timers (WDT)</a>   |
| 0x13 | Power glitch reset     | System Reset               | See Chapter 21 <a href="#">Brown-out Detector</a>  |
| 0x14 | eFuse reset            | HP Core Reset              | Triggered by eFuse CRC error   |
| 0x16 | USB (JTAG) reset       | HP Core Reset              | Triggered when external USB host sends a specific command to the JTAG interface of USB Serial/JTAG Controller. See Chapter 46 <a href="#">USB Serial/JTAG Controller (USB_SERIAL_JTAG)</a>                                 |
| 0x17 | USB (UART) reset       | HP Core Reset              | Triggered when external USB host sends a specific command to the serial interface of USB Serial/JTAG Controller. See Chapter 46 <a href="#">USB Serial/JTAG Controller (USB_SERIAL_JTAG)</a>                               |
| 0x18 | JTAG CPU reset         | HP CPU0/1 Reset            | Triggered when a “GDB Resetting CPU” instruction is received   |
| 0x1A | Lockup reset           | HP CPU0/1 Reset            | Triggered when the CPU enters lockup. HP CPU0 and HP CPU1 can be reset in lockup state by configuring <a href="#">LP_CLKRST_HPCORE<sub>x</sub>_LOCKUP_RESET_EN</a>   |

<sup>1</sup> Chip Reset can be triggered by the following sources:

- Chip power-up
- Brown-out detector

<sup>2</sup> The HP system contains two watchdog timers called Main System Watchdog Timers (MWDT), and the MWDT that can trigger reset can be configured via [HP\\_SYS\\_CLKRST\\_HPCORE0\\_WDT\\_RESET\\_SOURCE\\_SEL](#) and [HP\\_SYS\\_CLKRST\\_HPCORE0\\_WDT\\_RESET\\_SOURCE\\_SEL](#) for HP CPU0 and HP CPU1 respectively.

Cont'd on next page

Table 9.1-2 – cont'd from previous page

| Code | Source | Reset Type | Note |
|------|--------|------------|------|
|------|--------|------------|------|

<sup>1</sup> LP CPU is reset by PMU after chip power-up. To retrieve the correct reset source code (0x01) when the LP CPU runs for the first time, the source code for PMU LP CPU reset (0x0A) will be masked. After the CPU's first run, clear [LP\\_CLKRST\\_LPCORE\\_RESET\\_CAUSE\\_PMU\\_LP\\_CPU\\_MASK](#) to unmask the 0x0A source code.

## 9.1.5 Peripheral Reset

Peripherals can be reset individually by configuring corresponding registers, or globally by Core Reset, System Reset, or Chip Reset.

ESP32-P4 has three groups of peripheral reset registers, prefixed with HP\_SYS\_CLKRST, LP\_CLKRST, and LPPERI. See Section [9.4 Register Summary](#) for detailed information.

## 9.2 Clock

### 9.2.1 Overview

ESP32-P4 clocks are mainly sourced from oscillator (OSC, including Resistor-Capacitor circuit), crystal (XTAL), and PLL circuit, and then processed by the dividers or selectors, which allows most functional modules to select their working clock according to their power consumption and performance requirements. Figure [9.2-1](#) shows the HP and LP system clock structure, including the main clock path and typical peripheral clock generator circuit. ESP32-P4 has a large number of peripherals, and limited by space, not all peripheral clocks are shown in the figure.

## 9.2.2 Architectural Overview

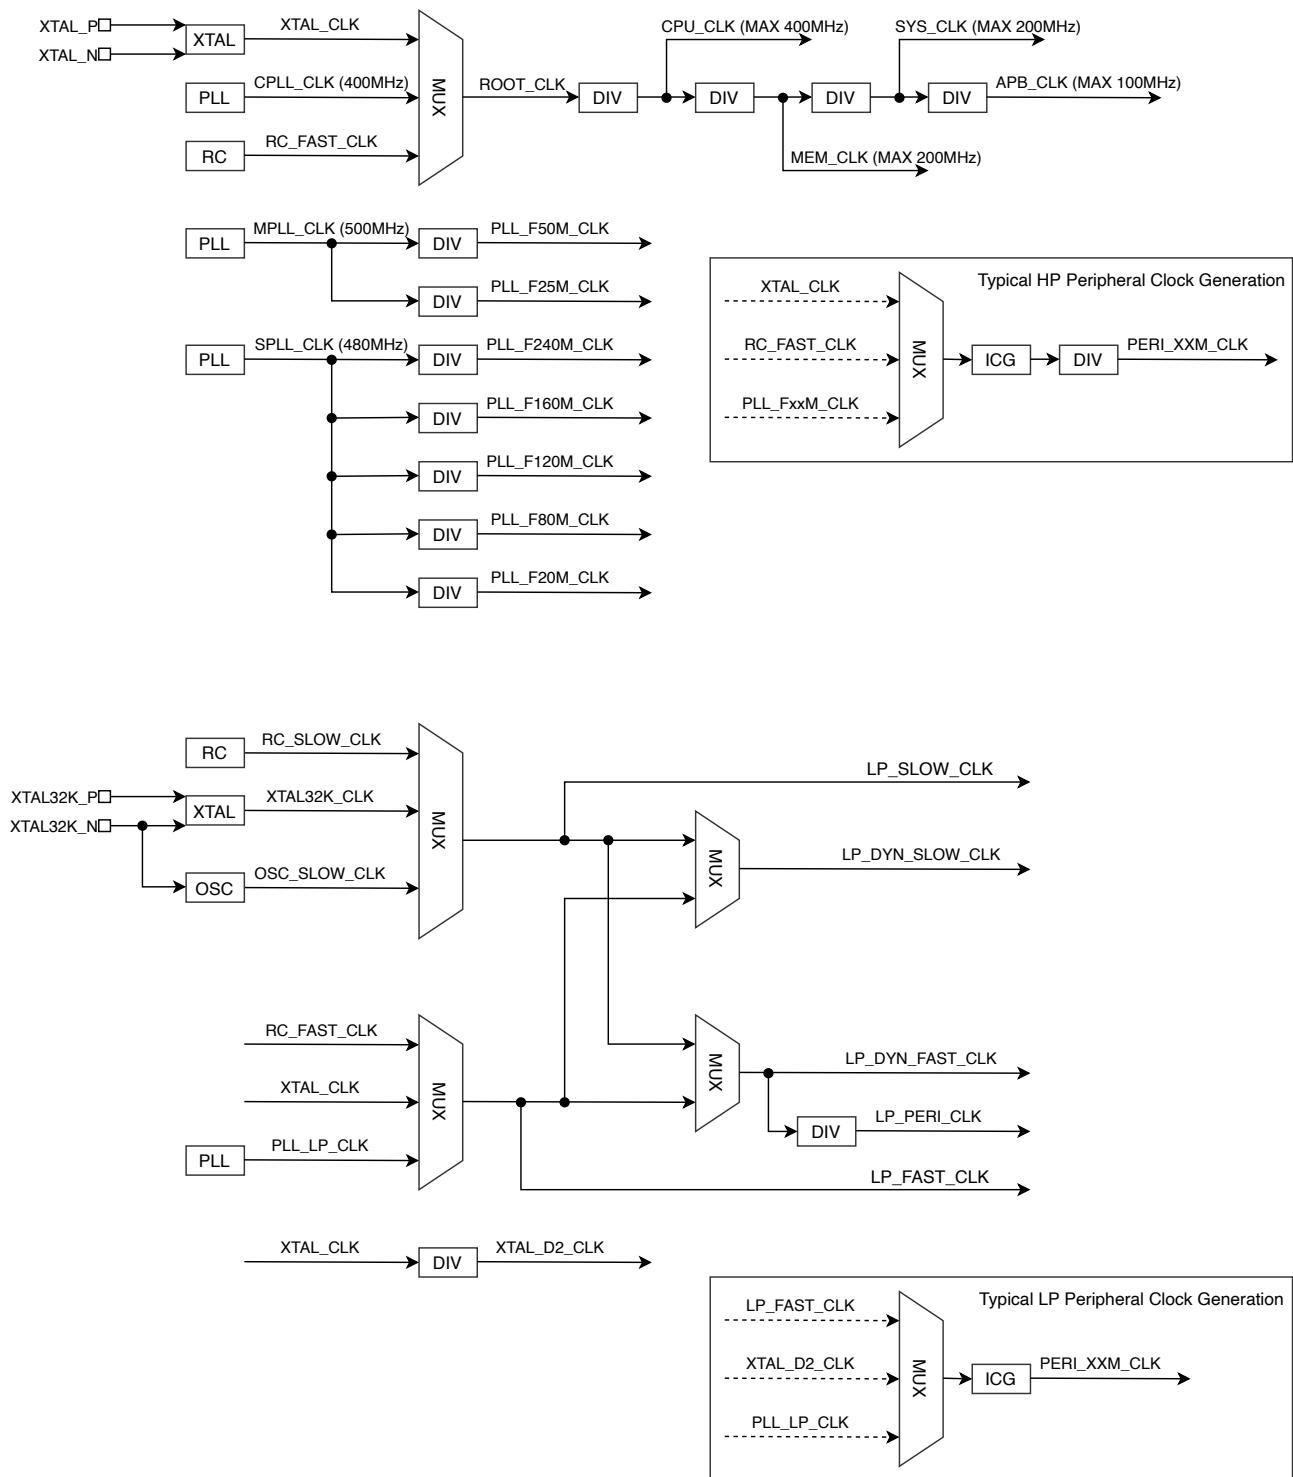

Figure 9.2-1. HP and LP System Clock

## 9.2.3 Features

ESP32-P4 clocks can be classified into two types depending on their frequencies:

- High speed clocks for devices working at a higher frequency, such as HP CPU0/1 and digital peripherals

- CPLL\_CLK: internal 360 MHz PLL clock. Its reference clock is XTAL\_CLK
- MPLL\_CLK: internal 500 MHz PLL clock. Its reference clock is XTAL\_CLK
- SPLL\_CLK: internal 480 MHz PLL clock. Its reference clock is XTAL\_CLK
- Slow speed clocks for LP system and some peripherals working in low-power mode
  - XTAL32K\_CLK: external 32 kHz crystal clock
  - RC\_SLOW\_CLK: internal 150 kHz slow RC oscillator
  - OSC\_SLOW\_CLK: external slow clock input through [XTAL\\_32K\\_N](#), with a frequency of 32 kHz by default. After configuring this GPIO, also configure the Hold function (see Chapter 8 [GPIO Matrix and IO MUX](#) > 8.9 [Pin Hold Feature](#))
  - XTAL\_CLK: 40 MHz external crystal clock
  - RC\_FAST\_CLK: internal fast RC oscillator with adjustable frequency (20 MHz by default)
  - PLL\_LP\_CLK: internal PLL clock with a frequency of 8 MHz by default. Its reference clock can be XTAL32K\_CLK

## 9.2.4 Functional Description

### 9.2.4.1 HP System Clock

As Figure 9.2-1 shows, XTAL\_CLK, CPLL\_CLK, and RC\_FAST\_CLK are the multiplexer inputs to generate ROOT\_CLK. For selecting which input, see Table 9.2-1.

Table 9.2-1. ROOT\_CLK Clock Source

| LP_CLKRST_HP_ROOT_CLK_SRC_SEL | Clock Source |
|-------------------------------|--------------|
| 0                             | XTAL_CLK     |
| 1                             | CPLL_CLK     |
| 2                             | RC_FAST_CLK  |

ROOT\_CLK is then divided by a series of dividers, and sequentially derives:

- CPU\_CLK, which drives HP CPUs and their logic
- MEM\_CLK, which drives the internal memories (L2 Cache, L2MEM, ROM) and their logic
- SYS\_CLK, which is the HP high-speed bus clock that drives the AXI and AHB bus logic
- APB\_CLK, which is the HP low-speed bus clock that drives the APB bus logic

The above four derived clocks are synchronous SoC clocks, asynchronous to peripheral clocks described in Section 9.2.4.3 [Peripheral Clocks](#). Peripheral clocks are asynchronous with each other unless otherwise stated.

The maximum frequencies allowed for these SoC clocks are as follows. Software should ensure that the frequencies of these clocks do not exceed the maximum frequency.

- CPU\_CLK: 360 MHz
- MEM\_CLK: 200 MHz

- SYS\_CLK: 200 MHz
- APB\_CLK: 100 MHz

Each module has an individual clock gate for the SoC clock it uses. For example, users can enable the clock for HP CPU0 and disable the clock for HP CPU1 by setting the [HP\\_SYS\\_CLKRST\\_CORE0\\_CPU\\_CLK\\_EN](#) bit and clearing the [HP\\_SYS\\_CLKRST\\_CORE1\\_CPU\\_CLK\\_EN](#) bit. “CPU\_CLK” in bit names indicates that the corresponding clock belongs to the CPU\_CLK group shown in Figure 9.2-1.

The internal PLL clocks of ESP32-P4, namely MPLL\_CLK and SPLL\_CLK, generate reference clocks for peripherals through a set of parallel clock dividers.

Besides these two PLL clocks, there are two additional PLL clocks dedicated to specific modules:

- SDIO\_PLL, which generates three clocks:
  - SDIO\_PLLO\_CLK, used for SDIO’s high-speed SDIO\_SLF\_CLK (internal signal clock) and the source of SDIO’s low-speed clock
  - SDIO\_PLL1\_CLK, users for SDIO’s high-speed SDIO\_DRV\_CLK (output signal driving clock)
  - SDIO\_PLL2\_CLK, used for SDIO’s high-speed SDIO\_SAM\_CLK (input signal sampling clock)
- APLL\_CLK, which is dedicated to I2S

A typical peripheral clock generation circuit consists of a clock selector, a clock gating unit, and a divider. In high-performance mode, the peripheral can select a high-speed clock source without division for higher processing speed. In low-power mode, the peripheral can select a low-speed clock source or divide it by a large divisor to lower power consumption. When the peripheral is disabled, its clock can be directly disabled.

**Note:**

Updates to [HP\\_SYS\\_CLKRST\\_ROOT\\_CLK\\_CTRL0/1/2/3\\_REG](#) will take effect only after [HP\\_SYS\\_CLKRST\\_SOC\\_CLK\\_DIV\\_UPDATE](#) is set.

### 9.2.4.2 LP System Clock

The LP system can operate when most other clocks are disabled. LP system clocks include LP\_SLOW\_CLK, LP\_FAST\_CLK, LP\_DYN\_SLOW\_CLK, LP\_DYN\_FAST\_CLK, and XTAL\_D2\_CLK.

The clock sources for LP\_SLOW\_CLK and LP\_FAST\_CLK are low-frequency clocks:

- LP\_SLOW\_CLK has four clock sources, see Table 9.2-2:

**Table 9.2-2. LP\_SLOW\_CLK Clock Source Selection**

| <a href="#">LP_CLKRST_SLOW_CLK_SEL</a> | Clock Source |
|--|--------------|
| 0                                      | RC_SLOW_CLK  |
| 1                                      | XTAL32K_CLK  |
| 2                                      | Invalid      |
| 3                                      | OSC_SLOW_CLK |

- LP\_FAST\_CLK has three clock sources, see Table 9.2-3:

**Table 9.2-3. LP\_FAST\_CLK Clock Source Selection**

| <a href="#">LP_CLKRST_FAST_CLK_SEL</a> | Clock Source |
|--|--------------|
| 0                                      | XTAL_CLK     |
| 1                                      | RC_FAST_CLK  |
| 2                                      | PLL_LP_CLK   |

LP\_DYN\_SLOW\_CLK and LP\_DYN\_FAST\_CLK can be derived from LP\_SLOW\_CLK or LP\_FAST\_CLK depending on the chip's power mode (see Chapter [13 Low-Power Management](#)), and should be able to operate in all power modes to drive LP AON modules. These two clocks are always synchronous with each other.

- In Active mode, select LP\_FAST\_CLK as the clock source. In this case, LP\_DYN\_SLOW\_CLK has the same frequency with LP\_SLOW\_CLK, and the same phase with LP\_FAST\_CLK;
- In Deep-sleep mode, select the clock source according to PMU configurations. If the LP CPU is off, LP\_SLOW\_CLK is the clock source, and has the same frequency and phase as LP\_DYN\_FAST\_CLK in this case; if the LP CPU is on, LP\_FAST\_CLK is the clock source.

LP\_PERI\_CLK is derived from LP\_DYN\_FAST\_CLK and drives all the buses for LP peripherals.

XTAL\_D2\_CLK is derived from XTAL\_CLK divided by 2.

### 9.2.4.3 Peripheral Clocks

Table [9.2-4](#), Table [9.2-5](#), Table [9.2-6](#), and Table [9.2-7](#) list the derived HP/LP clock sources and HP clocks/LP clocks for each peripheral.

Table 9.2-4. Derived HP Clock sources

| Derived Clock | Source Clock |          |          |          |          |          |               | Derived Clock |         |         |         |              |               |               |
|---------------|--------------|----------|----------|----------|----------|----------|---------------|---------------|---------|---------|---------|--------------|---------------|---------------|
|               | RC_FAST_CLK  | XTAL_CLK | CPLL_CLK | MPLL_CLK | SPLL_CLK | APLL_CLK | SDIO_PLL0_CLK | ROOT_CLK      | CPU_CLK | MEM_CLK | SYS_CLK | PLL_F80M_CLK | PLL_F160M_CLK | PLL_F240M_CLK |
| ROOT_CLK      | Y            | Y        | Y        |          |          |          |               |               | Y       |         |         |              |               |               |
| CPU_CLK       |              |          |          |          |          |          |               |               |         | Y       |         |              |               |               |
| MEM_CLK       |              |          |          |          |          |          |               |               |         | Y       |         |              |               |               |
| SYS_CLK       |              |          |          |          |          |          |               |               |         |         | Y       |              |               |               |
| APB_CLK       |              |          |          |          |          |          |               |               |         |         | Y       |              |               |               |
| PLL_F50M_CLK  |              |          |          | Y        |          |          |               |               |         |         |         |              |               |               |
| PLL_F25M_CLK  |              |          |          | Y        |          |          |               |               |         |         |         |              |               |               |
| PLL_F240M_CLK |              |          |          |          | Y        |          |               |               |         |         |         |              |               |               |
| PLL_F160M_CLK |              |          |          |          | Y        |          |               |               |         |         |         |              |               |               |
| PLL_F120M_CLK |              |          |          |          | Y        |          |               |               |         |         |         |              |               |               |

| LP I2S Controller           |                        |                       |                        |                       |                    | Y                   |               |             |                 | Y               |             | Y           |                    |
| LP ADC Controller           |                        |                       |                        |                       |                    |                     |               |             |                 |                 | Y           |             |                    |

**Note:**

To protect the encryption and decryption peripherals from DPA (Differential Power Analysis) attacks, a random divider strategy is implemented for its function clock. Four security levels are available, depending on the range of the random divider. Users can select the security level by configuring [HP\\_SYS\\_CLKRST\\_SEC\\_DPA\\_CFG\\_SEL](#).

If [HP\\_SYS\\_CLKRST\\_SEC\\_DPA\\_CFG\\_SEL](#) is set to 1, the security level is determined by the configuration of [HP\\_SYS\\_CLKRST\\_SEC\\_DPA\\_LEVEL](#). Otherwise, the security level is determined by the value of [EFUSE\\_SEC\\_DPA\\_LEVEL](#).

## 9.3 Programming Procedures

### 9.3.1 HP System Clock Configuration

- Configure the clock divisor for CPU\_CLK: [HP\\_SYS\\_CLKRST\\_CPU\\_CLK\\_DIV\\_NUM](#) for the integral part, [HP\\_SYS\\_CLKRST\\_CPU\\_CLK\\_DIV\\_NUMERATOR](#) for the numerator of the fractional part, and [HP\\_SYS\\_CLKRST\\_CPU\\_CLK\\_DIV\\_DENOMINATOR](#) for the denominator of the fractional part. Write 1 to [HP\\_SYS\\_CLKRST\\_SOC\\_CLK\\_DIV\\_UPDATE](#) to apply the frequency divisor configurations for CPU\_CLK.
- Configure the clock divisor for MEM\_CLK: [HP\\_SYS\\_CLKRST\\_MEM\\_CLK\\_DIV\\_NUM](#) for the integral part, [HP\\_SYS\\_CLKRST\\_MEM\\_CLK\\_DIV\\_NUMERATOR](#) for the numerator of the fractional part, and [HP\\_SYS\\_CLKRST\\_MEM\\_CLK\\_DIV\\_DENOMINATOR](#) for the denominator of the fractional part. Write 1 to [HP\\_SYS\\_CLKRST\\_SOC\\_CLK\\_DIV\\_UPDATE](#) to apply the frequency divisor configurations for MEM\_CLK.
- Configure the clock divisor for SYS\_CLK: [HP\\_SYS\\_CLKRST\\_SYS\\_CLK\\_DIV\\_NUM](#) for the integral part, [HP\\_SYS\\_CLKRST\\_SYS\\_CLK\\_DIV\\_NUMERATOR](#) for the numerator of the fractional part, and [HP\\_SYS\\_CLKRST\\_SYS\\_CLK\\_DIV\\_DENOMINATOR](#) for the denominator of the fractional part. Write 1 to [HP\\_SYS\\_CLKRST\\_SOC\\_CLK\\_DIV\\_UPDATE](#) to apply the frequency divisor configurations for SYS\_CLK.
- Configure the clock divisor for APB\_CLK: [HP\\_SYS\\_CLKRST\\_APB\\_CLK\\_DIV\\_NUM](#) for the integral part, [HP\\_SYS\\_CLKRST\\_APB\\_CLK\\_DIV\\_NUMERATOR](#) for the numerator of the fractional part, and [HP\\_SYS\\_CLKRST\\_APB\\_CLK\\_DIV\\_DENOMINATOR](#) for the denominator of the fractional part. Write 1 to [HP\\_SYS\\_CLKRST\\_SOC\\_CLK\\_DIV\\_UPDATE](#) to apply the frequency divisor configurations for APB\_CLK.
- Configure the clock source for ROOT\_CLK via [LP\\_CLKRST\\_HP\\_ROOT\\_CLK\\_SRC\\_SEL](#).

**Notice:**

1. It is recommended to first configure the frequency divisors for the SoC clocks and apply the configurations, and then configure the clock source for ROOT\_CLK.
2. Before changing the clock source for ROOT\_CLK, software needs to ensure that the configured clock divisors do not result in clock frequencies exceeding the allowed maximum frequencies.
3. Writing 1 to [HP\\_SYS\\_CLKRST\\_SOC\\_CLK\\_DIV\\_UPDATE](#) will apply the frequency divisor configurations for CPU\_CLK, MEM\_CLK, SYS\_CLK, and APB\_CLK at one go, but it is not recommended to do so. It would be better to apply the configuration for each clock individually.
4. When switching from a high divisor to a low divisor, the recommended configuration order is APB\_CLK

→ SYS\_CLK → MEM\_CLK → CPU\_CLK. When switching from a low divisor to a high divisor, the recommended configuration order is CPU\_CLK → MEM\_CLK → SYS\_CLK → APB\_CLK. This helps to prevent high-frequency clock glitches.

### 9.3.2 LP System Clock Configuration

- Configure the clock source of LP\_SLOW\_CLK via [LP\\_CLKRST\\_SLOW\\_CLK\\_SEL](#)
- Configure the clock source of LP\_FAST\_CLK via [LP\\_CLKRST\\_FAST\\_CLK\\_SEL](#)
- Configure the clock divisor of LP\_PERI\_CLK via [LP\\_CLKRST\\_LP\\_PERI\\_DIV\\_NUM](#)

### 9.3.3 Peripheral Clock Reset and Configuration

**Notice:**

ESP32-P4 features low power consumption. This is why some peripheral clocks are gated (disabled) by default. Before using any of these peripherals, it is mandatory to enable the clock for the given peripheral by setting the corresponding CLK\_EN bit to 1, and release the peripheral from the reset state to make it operational by setting the RST\_EN bit to 0.

The clocks of most peripherals can be classified into two types:

- Bus clock: used to configure peripheral registers.
- Function clock: such as UART's reference clock, used by peripherals to operate.

The function clock of most peripherals can be selected from multiple clock sources. In the description of the gating registers, it will be stated whether a register is a bus clock (SYS\_CLK, APB\_CLK) gating register or a function clock gating register.

Bus clock enable/disable registers, function clock enable/disable registers, clock source selection registers, and clock frequency division registers are grouped into the HP\_SYS\_CLKRST, LP\_CLKRST, and LPPERI modules. Except for EMA, SDMMAC, USB Serial/JTAG, Full-Speed USB 2.0 OTG, and High-Speed USB 2.0 OTG, whose reset configuration registers are in the LP\_CLKRST module, all the other HP clock and reset registers are in the HP\_SYS\_CLKRST module. For more information, see Section [9.4 Register Summary](#).

When changing the clock configuration, it is recommended to turn off the corresponding clock gate first, update the clock divider configurations, clock sources, and other configurations, and then turn it on again.

When a peripheral is not working, users can turn off its function clock by configuring related registers. Turning off the peripheral's function clock does not affect the rest of the system.

Take I2C clock configuration as an example.

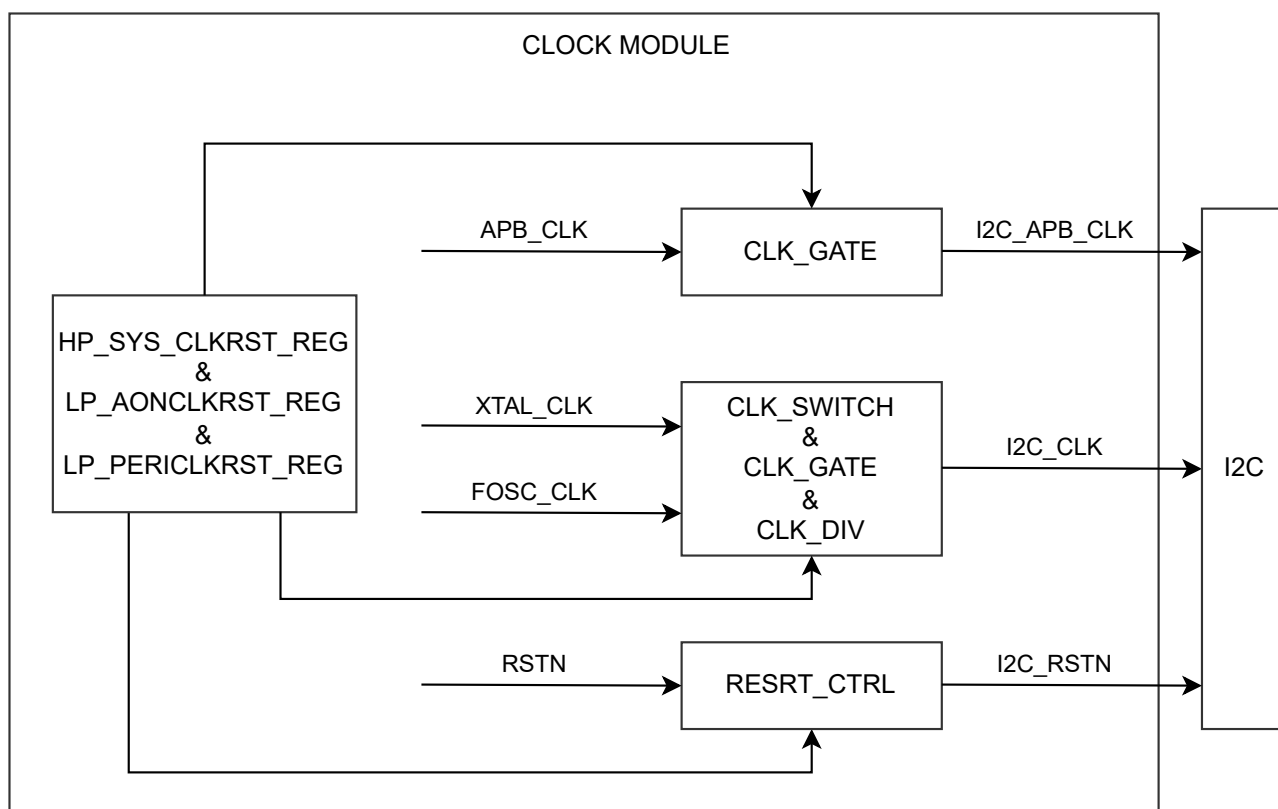

Figure 9.3-1. Clock Configuration Example

Figure 9.3-1 shows the clock structure of I2C. The clock structure of other peripherals is similar to this one. CLK\_SWITCH is used to select a clock output and CLK\_GATE to turn on/off the clock.

In scenarios that require low power consumption, when the peripheral is not in use, in addition to turning off the function clock, the bus clock of the peripheral can also be turned off to further lower power consumption.

Note that if you turn off the bus clock first, the functional clock may continue working. Therefore, when turning off clocks, it is recommended to turn off the functional clock first and then the bus clock; when turning on clocks, it is recommended to turn on the bus clock first and then the functional clock.

**Note:**

In this chapter, all divisor configuration registers are configured with the actual divisor minus 1.

## 9.4 Register Summary

### 9.4.1 Reset and Clock (HP\_SYS\_CLKRST) Register Summary

The addresses in this section are relative to HP\_SYS\_CLKRST base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name   | Description   | Address | Access |
|--|---|---------|--------|
| <b>Clock gate enable register</b>                    |   |         |        |
| <a href="#">HP_SYS_CLKRST_CLK_ENO_REG</a>            | Register clock gate enable register                     | 0x0000  | R/W    |
| <a href="#">HP_SYS_CLKRST_CLK_FORCE_ON_CTRL0_REG</a> | System and peripheral clock gate configuration register | 0x00B4  | R/W    |
| <b>Root clock configuration register</b>             |   |         |        |
| <a href="#">HP_SYS_CLKRST_ROOT_CLK_CTRL0_REG</a>     | Root clock configuration register 0                     | 0x0004  | varies |

### 9.4.2 LP Always on Clock and Reset (LP\_CLKRST) Register Summary

The addresses in this section are relative to LP\_CLKRST base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section [Access Types for Registers](#).

| Name   | Description  | Address | Access |
|--|--|---------|--------|
| <b>Configuration registers</b>                       |  |         |        |
| <a href="#">LP_CLKRST_LP_CLK_CONF_REG</a>            | LP root clock configuration register                 | 0x0000  | R/W    |
| <a href="#">LP_CLKRST_LP_CLK_EN_REG</a>              | LP always on peripheral clock configuration register | 0x0008  | R/W    |
| <a href="#">LP_CLKRST_LP_RST_EN_REG</a>              | LP always on peripheral reset configuration register | 0x000C  | R/W    |
| <a href="#">LP_CLKRST_RESET_CAUSE_REG</a>            | HP CPU and LP CPU reset cause register               | 0x0010  | varies |
| <a href="#">LP_CLKRST_HPCPU_RESET_CTRL0_REG</a>      | HP CPU reset configuration register 0                | 0x0014  | varies |
| <a href="#">LP_CLKRST_HPCPU_RESET_CTRL1_REG</a>      | HP CPU reset configuration register 1                | 0x0018  | R/W    |
| <a href="#">LP_CLKRST_FOSC_CNTL_REG</a>              | RC_FAST_CLK frequency configuration register         | 0x001C  | R/W    |
| <a href="#">LP_CLKRST_XTAL32K_REG</a>                | XTAL32K_CLK configuration register                   | 0x0030  | R/W    |
| <a href="#">LP_CLKRST_HP_CLK_CTRL_REG</a>            | HP clock control register                            | 0x0040  | R/W    |
| <a href="#">LP_CLKRST_HP_USB_CLKRST_CTRL0_REG</a>    | USB clock and reset control register 0               | 0x0044  | R/W    |
| <a href="#">LP_CLKRST_HP_USB_CLKRST_CTRL1_REG</a>    | USB clock and reset control register 1               | 0x0048  | R/W    |
| <a href="#">LP_CLKRST_HP_SDMMC_EMAC_RST_CTRL_REG</a> | SDMMC and EMAC reset control register                | 0x004C  | R/W    |
| <b>Version register</b>                              |  |         |        |
| <a href="#">LP_CLKRST_DATE_REG</a>                   | Version control register                             | 0x03FC  | R/W    |

### 9.4.3 LP Peripheral Clock and Reset (LPPERI) Register Summary

The addresses in this section are relative to LPPERI base address provided in Table 6.3-2 in Chapter 6 [System and Memory](#).

The abbreviations given in Column **Access** are explained in Section [Access Types for Registers](#).

| Name  | Description   | Address | Access |
|---|---|---------|--------|
| <b>Configuration registers</b>                  |   |         |        |
| <a href="#">LPPERI_CLK_EN_REG</a>               | LP peripheral bus clock configuration register      | 0x0000  | R/W    |
| <a href="#">LPPERI_CORE_CLK_SEL_REG</a>         | LP peripheral function clock configuration register | 0x0004  | R/W    |
| <a href="#">LPPERI_RESET_EN_REG</a>             | LP peripheral reset configuration register          | 0x0008  | varies |
| <a href="#">LPPERI_CPU_REG</a>                  | LP CPU access configuration register                | 0x000C  | R/W    |
| <a href="#">LPPERI_MEM_CTRL_REG</a>             | LP UART miscellaneous control register              | 0x0028  | varies |
| <a href="#">LPPERI_ADC_CTRL_REG</a>             | LP ADC clock configuration register                 | 0x002C  | R/W    |
| <a href="#">LPPERI_LP_I2S_RXCLK_DIV_NUM_REG</a> | LP I2S RX clock configuration register              | 0x0030  | R/W    |
| <a href="#">LPPERI_LP_I2S_RXCLK_DIV_XYZ_REG</a> | LP I2S RX clock configuration register              | 0x0034  | R/W    |
| <b>Version register</b>                         |   |         |        |
| <a href="#">LPPERI_DATE_REG</a>                 | Version control register                            | 0x03FC  | R/W    |

## 9.5 Registers

### 9.5.1 Reset and Clock (HP\_SYS\_CLKRST) Registers

The addresses in this section are relative to HP\_SYS\_CLKRST base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

Register 9.1. HP\_SYS\_CLKRST\_CLK\_ENO\_REG (0x0000)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                      |   |   |   |   |   |   |   |   |   |   |   |   |   |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|----------------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | HP_SYS_CLKRST_CLK_EN |   |   |   |   |   |   |   |   |   |   |   |   |   |   |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                      |   |   |   |   |   |   |   |   |   |   |   |   |   | 1 | 0     |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0                    | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | Reset |

**HP\_SYS\_CLKRST\_CLK\_EN** Configures resister clock gating.  
0: Support clock only when application writes registers  
1: Force on clock gating for registers  
(R/W)

### Register 9.2. HP\_SYS\_CLKRST\_ROOT\_CLK\_CTRL0\_REG (0x0004)

|            |    |    |                                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                     |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                               |  |    |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                  |  |  |  |   |   |   |   |  |  |  |  |  |  |  |  |  |  |                                |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |
|------------|----|----|---------------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------------------------------------|----|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------------------------------|--|----|----|--|--|--|--|--|--|--|--|--|--|--|--|--|--|----------------------------------|--|--|--|---|---|---|---|--|--|--|--|--|--|--|--|--|--|--------------------------------|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|
| (reserved) |    |    | HP_SYS_CLKRST_CPU_CLK_DIV_DENOMINATOR |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | HP_SYS_CLKRST_CPU_CLK_DIV_NUMERATOR |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | HP_SYS_CLKRST_CPU_CLK_DIV_NUM |  |    |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  | HP_SYS_CLKRST_SOC_CLK_DIV_UPDATE |  |  |  |   |   |   |   |  |  |  |  |  |  |  |  |  |  | HP_SYS_CLKRST_CPUICM_DELAY_NUM |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |
| 31         | 29 | 28 |                                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 21                                  | 20 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                               |  | 13 | 12 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                  |  |  |  | 5 | 4 | 3 | 0 |  |  |  |  |  |  |  |  |  |  |                                |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |
| 0          | 0  | 0  | 0                                     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0                                   |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0                             |  |    |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0                                |  |  |  |   |   |   |   |  |  |  |  |  |  |  |  |  |  | 0                              | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |

**HP\_SYS\_CLKRST\_CPUICM\_DELAY\_NUM** Configures the time required from entering WFI mode to the actual shutdown of the CPU clock.

Measurement unit: clock cycles. (R/W)

**HP\_SYS\_CLKRST\_SOC\_CLK\_DIV\_UPDATE** Configures whether to update the divisors for CPU\_CLK, MEM\_CLK, SYS\_CLK, APB\_CLK.

0: Not update

1: Update

(WT)

**HP\_SYS\_CLKRST\_CPU\_CLK\_DIV\_NUM** Configures the integer part of the CPU\_CLK clock divisor.  
(R/W)

**HP\_SYS\_CLKRST\_CPU\_CLK\_DIV\_NUMERATOR** Configures the numerator of the divisor's fractional part for CPU\_CLK. (R/W)

**HP\_SYS\_CLKRST\_CPU\_CLK\_DIV\_DENOMINATOR** Configures the denominator of the divisor's fractional part for CPU\_CLK. (R/W)

Register 9.3. HP\_SYS\_CLKRST\_ROOT\_CLK\_CTRL1\_REG (0x0008)

- HP\_SYS\_CLKRST\_MEM\_CLK\_DIV\_NUM**    Configures the integer part of the MEM\_CLK clock divisor.  
(R/W)
- HP\_SYS\_CLKRST\_MEM\_CLK\_DIV\_NUMERATOR**    Configures the numerator of the divisor’s fractional part for MEM\_CLK. (R/W)
- HP\_SYS\_CLKRST\_MEM\_CLK\_DIV\_DENOMINATOR**    Configures the denominator of the divisor’s fractional part for MEM\_CLK . (R/W)
- HP\_SYS\_CLKRST\_SYS\_CLK\_DIV\_NUM**    Configures the integer part of the SYS\_CLK clock divisor.  
(R/W)

#### Register 9.4. HP\_SYS\_CLKRST\_ROOT\_CLK\_CTRL2\_REG (0x000C)

| 31 | 24 | 23 | 16 | 15 | 8 | 7 | 0 |       |
|----|----|----|----|----|---|---|---|-------|
|    |    |    |    |    |   |   |   | Reset |
|    |    |    |    |    |   |   |   |       |

**HP\_SYS\_CLKRST\_SYS\_CLK\_DIV\_NUMERATOR** Configures the numerator of the divisor's fractional part for SYS\_CLK. (R/W)

**HP\_SYS\_CLKRST\_SYS\_CLK\_DIV\_DENOMINATOR** Configures the denominator of the divisor's fractional part for SYS\_CLK. (R/W)

**HP\_SYS\_CLKRST\_APB\_CLK\_DIV\_NUM** Configures the integer part of the APB\_CLK fclock divisor.  
(R/W)

**HP\_SYS\_CLKRST\_APB\_CLK\_DIV\_NUMERATOR** Configures the numerator of the divisor's fractional part for APB\_CLK. (R/W)

### Register 9.5. HP\_SYS\_CLKRST\_ROOT\_CLK\_CTRL3\_REG (0x0010)

|    |   |   |  |   |                                       |   |
|----|---|---|--|---|---------------------------------------|---|
| 31 |   | 8 |  | 7 |                                       | 0 |
|    | (reserved)                                      |   |  |   | HP_SYS_CLKRST_APB_CLK_DIV_DENOMINATOR |   |
|    | 0 |   |  |   | 0                                     |   |

**Reset**

**HP\_SYS\_CLKRST\_APB\_CLK\_DIV\_DENOMINATOR** Configures the denominator of the divisor's fractional part for APB\_CLK. (R/W)

Register 9.6. HP\_SYS\_CLKRST\_SOC\_CLK\_CTRL0\_REG (0x0014)

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_BITSRAMBLER\_TX\_SYS\_CLK\_EN** Configures whether to enable the bus clock of the Bit Scrambler TX (SYS\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_H264\_SYS\_CLK\_EN** Configures whether to enable the bus clock of H264 (SYS\_CLK clock domain).

0: Disable

1: Enable

(R/W)

Register 9.8. HP\_SYS\_CLKRST\_SOC\_CLK\_CTRL2\_REG (0x001C)

Reset

**HP\_SYS\_CLKRST\_RMT\_SYS\_CLK\_EN** Configures whether to enable the bus clock of RMT (SYS\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_HP\_CLKRST\_APB\_CLK\_EN** Configures whether to enable the bus clock of the Reset and Clock module (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_SYSREG\_APB\_CLK\_EN** Configures whether to enable the bus clock of the HP System Registers (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_ICM\_APB\_CLK\_EN** Configures the bus clock of the bus module (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_INTRMTX\_APB\_CLK\_EN** Configures whether to enable the bus clock of the Interrupt Matrix (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_ADC\_APB\_CLK\_EN** Configures whether to enable the bus clock of the ADC (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_UHCI\_APB\_CLK\_EN** Configures whether to enable the bus clock of the UHCI (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_UART0\_APB\_CLK\_EN** Configures whether to enable the bus clock of UART0 (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_UART1\_APB\_CLK\_EN** Configures whether to enable the bus clock of UART1 (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_UART2\_APB\_CLK\_EN** Configures whether to enable the bus clock of UART2 (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_UART3\_APB\_CLK\_EN** Configures whether to enable the bus clock of UART3 (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_UART4\_APB\_CLK\_EN** Configures whether to enable the bus clock of UART4 (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_I2CO\_APB\_CLK\_EN** Configures whether to enable the bus clock of I2CO (APB\_CLK clock domain).

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_UART0\_SCLK\_DIV\_NUM** Configures the integer part of the UART0\_SCLK clock divisor. (R/W)

**HP\_SYS\_CLKRST\_UART0\_SCLK\_DIV\_NUMERATOR** Configures the numerator of the divisor's fractional part for UART0\_SCLK. (R/W)

**HP\_SYS\_CLKRST\_UART0\_SCLK\_DIV\_DENOMINATOR** Configures the denominator of the divisor's fractional part for UART0\_SCLK. (R/W)

**HP\_SYS\_CLKRST\_UART1\_CLK\_SRC\_SEL** Configures the clock source for UART1\_CLK.

0: XTAL\_CLK

1: RC\_FAST\_CLK

2: PLL\_F80M\_CLK

3: Invalid

(R/W)

**HP\_SYS\_CLKRST\_UART1\_CLK\_EN** Configures whether to enable UART1\_CLK.

0: Disable

1: Enable

(R/W)

**Register 9.29. HP\_SYS\_CLKRST\_PERI\_CLK\_CTRL112\_REG (0x0070)**

**HP\_SYS\_CLKRST\_PARLIO\_RX\_CLK\_DIV\_NUMERATOR** Configures the numerator of the divisor's fractional part for clock divisor for PARLIO\_RX\_CLK. (R/W)

**HP\_SYS\_CLKRST\_PARLIO\_RX\_CLK\_DIV\_DENOMINATOR** Configures the denominator of the divisor's fractional part for clock divisor for PARLIO\_RX\_CLK. (R/W)

**HP\_SYS\_CLKRST\_PARLIO\_TX\_CLK\_SRC\_SEL** Configures the clock source for PARLIO\_TX\_CLK.

0: XTAL\_CLK

1: RC\_FAST\_CLK

2: PLL\_F160M\_CLK

3: PAD\_PARLIO\_TX\_CLK

(R/W)

**HP\_SYS\_CLKRST\_PARLIO\_TX\_CLK\_EN** Configures whether to enable PARLIO\_TX\_CLK.

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_PARLIO\_TX\_CLK\_DIV\_NUM** Configures the integer part of the clock divisor for PARLIO\_TX\_CLK. (R/W)

**Register 9.36. HP\_SYS\_CLKRST\_PERI\_CLK\_CTRL119\_REG (0x008C)**

Reset

**HP\_SYS\_CLKRST\_PARLIO\_TX\_CLK\_DIV\_NUMERATOR** Configures the numerator of the divisor's fractional part for PARLIO\_TX\_CLK. (R/W)

**HP\_SYS\_CLKRST\_PARLIO\_TX\_CLK\_DIV\_DENOMINATOR** Configures the denominator of the divisor's fractional part for PARLIO\_TX\_CLK. (R/W)

**HP\_SYS\_CLKRST\_I3C\_MST\_CLK\_SRC\_SEL** Configures the clock source for I3C\_MST\_CLK.

0: XTAL\_CLK

1: PLL\_F160M\_CLK

2: PLL\_F120M\_CLK

3: Invalid

(R/W)

**HP\_SYS\_CLKRST\_I3C\_MST\_CLK\_EN** Configures whether to enable I3C\_MST\_CLK.

0: Disable

1: Enable

(R/W)

**HP\_SYS\_CLKRST\_I3C\_MST\_CLK\_DIV\_NUM** Configures the integer part of the I3C\_MST\_CLK clock divisor. (R/W)

**HP\_SYS\_CLKRST\_CAM\_CLK\_SRC\_SEL** Configures the clock source for the output clock CAM\_CLK.

0: XTAL\_CLK

1: PLL\_F160M\_CLK

2: APLL\_CLK

3: Invalid

(R/W)

**HP\_SYS\_CLKRST\_CAM\_CLK\_EN** Configures whether to enable the output clock CAM\_CLK.

0: Disable

1: Enable

(R/W)

Register 9.37. HP\_SYS\_CLKRST\_PERI\_CLK\_CTRL120\_REG (0x0090)

**HP\_SYS\_CLKRST\_CAM\_CLK\_DIV\_NUM**    Configures the integer part of the CAM\_CLK clock divisor.  
(R/W)

**HP\_SYS\_CLKRST\_CAM\_CLK\_DIV\_NUMERATOR**    Configures the numerator of the divisor’s fractional part for CAM\_CLK. (R/W)

**HP\_SYS\_CLKRST\_CAM\_CLK\_DIV\_DENOMINATOR**    Configures the denominator of the divisor’s fractional part for CAM\_CLK. (R/W)

Register 9.38. HP\_SYS\_CLKRST\_PERI\_CLK\_CTRL20\_REG (0x0094)

**HP\_SYS\_CLKRST\_PLLA\_CAL\_END** Represents whether the APLL\_CLK calibration is finished.

0: Calibration in progress

1: Calibration done

(RO)

**HP\_SYS\_CLKRST\_PLLA\_CAL\_STOP** Configures whether to start or stop the APLL\_CLK calibration.

0: Start calibration

1: Stop calibration

(R/W)

**HP\_SYS\_CLKRST\_CPU\_PLL\_CAL\_END** Represents whether the CPLL\_CLK calibration is finished.

0: Calibration in progress

1: Calibration done

(RO)

**HP\_SYS\_CLKRST\_CPU\_PLL\_CAL\_STOP** Configures whether to start or stop the CPLL\_CLK calibration.

0: Start calibration

1: Stop calibration

(R/W)

**HP\_SYS\_CLKRST\_SDIO\_PLL\_CAL\_END** Represents whether the SDIO\_PLL calibration is finished.

0: Calibration in progress

1: Calibration done

(RO)

**HP\_SYS\_CLKRST\_SDIO\_PLL\_CAL\_STOP** Configures whether to start or stop the SDIO\_PLL calibration.

0: Start calibration

1: Stop calibration

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_CORE0** Configures whether HP CPU0 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_CORE1** Configures whether HP CPU1 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_CORETRACE0** Configures whether RISC-V Trace Encoder 0 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_CORETRACE1** Configures whether RISC-V Trace Encoder 1 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_L2MEMMON** Configures whether L2 MEM monitor can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_SPMMON** Configures whether SPM monitor can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**Register 9.51. HP\_SYS\_CLKRST\_HP\_FORCE\_NORSTO\_REG (0x00CC)**

Continued from the previous page...

**HP\_SYS\_CLKRST\_FORCE\_NORST\_GDMA** Configures whether VDMA can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_MSPI\_AXI** Configures whether FLASH MSPI can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_DUAL\_MSPI\_AXI** Configures whether PSRAM MSPI can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_MSPI\_APB** Configures whether FLASH MSPI APB can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_DUAL\_MSPI\_APB** Configures whether PSRAM MSPI APB can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_DSI\_BRG** Configures whether DSI Bridge can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_CSI\_HOST** Configures whether CSI Host can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_CSI\_BRG** Configures whether CSI Bridge, ISP can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

Continued on the next page...

**Register 9.51. HP\_SYS\_CLKRST\_HP\_FORCE\_NORSTO\_REG (0x00CC)**

Continued from the previous page...

**HP\_SYS\_CLKRST\_FORCE\_NORST\_JPEG** Configures whether JPEG can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_DMA2D** Configures whether 2DDMA can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_PPA** Configures whether PPA can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_AHB\_PDMA** Configures whether GDMA-AHB can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_AXI\_PDMA** Configures whether GDMA-AXI can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_IOMUX** Configures whether IO MUX can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_STIMER** Configures whether the System Timer can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_TIMERGRP0** Configures whether Timer Group 0 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_TIMERGRP1** Configures whether Timer Group 1 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

Continued from the previous page...

**HP\_SYS\_CLKRST\_FORCE\_NORST\_UART0** Configures whether UART0 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_UART1** Configures whether UART1 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_UART2** Configures whether UART2 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_UART3** Configures whether UART3 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_UART4** Configures whether UART4 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_UHCI** Configures whether UHCI can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_I3CMST** Configures whether I3C Master can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_BITSRAMBLER\_RX** Configures whether the Bit Scrambler RX can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_BITSRAMBLER\_TX** Configures whether the Bit Scrambler TX can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

**HP\_SYS\_CLKRST\_FORCE\_NORST\_H264** Configures whether H264 can be reset.

0: Can be reset

1: Force not to be reset

(R/W)

Register 9.53. HP\_SYS\_CLKRST\_HPWDT\_CORE0\_RST\_CTRL0\_REG (0x00D4)

**HP\_SYS\_CLKRST\_HPCORE0\_STALL\_EN**    Configures the behavior when MWDT triggers HP CPU0 reset.

0: Immediately reset HP CPU0

1: Stall HP CPU0 first

(R/W)

**HP\_SYS\_CLKRST\_HPCORE0\_STALL\_WAIT\_NUM**    Configures the duration of HP CPU0 stall when MWDT triggers HP CPU0 reset and HP\_SYS\_CLKRST\_HPCORE0\_STALL\_EN is set to 1.

Measurement unit: Clock cycles. (R/W)

**HP\_SYS\_CLKRST\_WDT\_HPCORE0\_RST\_LEN**    Configures the duration of the reset when MWDT triggers HP CPU0 reset.

Measurement unit: Clock cycles. (R/W)

Register 9.54. HP\_SYS\_CLKRST\_HPWDT\_CORE1\_RST\_CTRL0\_REG (0x00D8)

**HP\_SYS\_CLKRST\_HPCORE1\_STALL\_EN** Configures the behavior when MWDT triggers HP CPU1 reset.

- 0: Immediately reset HP CPU1
- 1: Stall HP CPU1 first

(R/W)

**HP\_SYS\_CLKRST\_HPCORE1\_STALL\_WAIT\_NUM** Configures the duration of HP CPU1 stall when MWDT triggers HP CPU1 reset and HP\_SYS\_CLKRST\_HPCORE1\_STALL\_EN is set to 1.

Measurement unit: Clock cycles. (R/W)

**HP\_SYS\_CLKRST\_WDT\_HPCORE1\_RST\_LEN** Configures the duration of the reset when MWDT triggers HP CPU1 reset.

Measurement unit: Clock cycles. (R/W)

Register 9.55. HP\_SYS\_CLKRST\_CPU\_SRC\_FREQ0\_REG (0x00DC)

**HP\_SYS\_CLKRST\_CPU\_SRC\_FREQ** Represents the CPU source clock frequency.

- 80: RC\_FAST\_CLK
- 160: XTAL\_CLK
- 1600: CPLL\_CLK

(RO)

Register 9.56. HP\_SYS\_CLKRST\_CPU\_CLK\_STATUS0\_REG (0x00E0)

- HP\_SYS\_CLKRST\_CPU\_DIV\_NUM\_CUR

Represents the integer part of the current CPU\_CLK clock divisor. (RO)
- HP\_SYS\_CLKRST\_CPU\_DIV\_NUMERATOR\_CUR

Represents the current numerator of the divisor's fractional part for the CPU\_CLK. (RO)
- HP\_SYS\_CLKRST\_CPU\_DIV\_DENOMINATOR\_CUR

Represents the current denominator of the divisor's fractional part for the CPU\_CLK. (RO)

Register 9.57. HP\_SYS\_CLKRST\_HPCORE0\_WDT\_RESET\_SOURCE0\_REG (0x00EC)

**HP\_SYS\_CLKRST\_HPCORE0\_WDT\_RESET\_SOURCE\_SEL** Configures the MWDT used to trigger the HP CPU0 reset.  
0: MWDTO  
1: MWDT1  
(R/W)

**HP\_SYS\_CLKRST\_HPCORE1\_WDT\_RESET\_SOURCE\_SEL** Configures the MWDT used to trigger the HP CPU1 reset.  
0: MWDTO  
1: MWDT1  
(R/W)

9.5.2 LP Always on Clock and Reset (LP\_CLKRST) Registers

The addresses in this section are relative to LP\_CLKRST base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

Register 9.58. LP\_CLKRST\_LP\_CLK\_CONF\_REG (0x0000)

**LP\_CLKRST\_SLOW\_CLK\_SEL** Configures the clock source of LP\_SLOW\_CLK.

- 0: RC\_SLOW\_CLK
  - 1: XTAL32K\_CLK
  - 2: Invalid
  - 3: OSC\_SLOW\_CLK
- (R/W)

**LP\_CLKRST\_FAST\_CLK\_SEL** Configures the clock source of LP\_FAST\_CLK.

- 0: XTAL\_CLK
  - 1: RC\_FAST\_CLK
  - 2: PLL\_LP\_CLK
  - 3: Invalid
- (R/W)

**LP\_CLKRST\_LP\_PERI\_DIV\_NUM** Configures the clock divisor for LP\_PERI\_CLK. (R/W)

**LP\_CLKRST\_ANA\_SEL\_REF\_PLL8M** Configures the reference clock of PLL\_LP\_CLK.

- 0: Invalid
  - 1: XTAL32K\_CLK
- (R/W)

**LP\_CLKRST\_LP\_RTC\_XTAL\_FORCE\_ON** Configures whether to force on the XTAL\_CLK control of LP CALI.

0: Controlled by hardware

1: Force on, bypassing hardware control

(R/W)

**LP\_CLKRST\_CK\_EN\_LP\_RAM** Configure whether to enable the clock of LP RAM.

0: Disable

1: Enable

(R/W)

**LP\_CLKRST\_ETM\_EVENT\_TICK\_EN** Configures whether to enable the ETM event timer.

0: Disable

1: Enable

(R/W)

**LP\_CLKRST\_PLL8M\_CLK\_FORCE\_ON** Configures whether to force on PLL\_LP\_CLK as LP\_FAST\_CLK source.

0: Controlled by hardware

1: Force on, bypassing hardware control

(R/W)

**LP\_CLKRST\_XTAL\_CLK\_FORCE\_ON** Configures whether to force on XTAL\_CLK as LP\_FAST\_CLK source.

0: Controlled by hardware

1: Force on, bypassing hardware control

(R/W)

**LP\_CLKRST\_FOSC\_CLK\_FORCE\_ON** Configures whether to force on RC\_FAST\_CLK as LP\_FAST\_CLK source.

0: Controlled by hardware

1: Force on, bypassing hardware control

(R/W)

**LP\_CLKRST\_RST\_EN\_LP\_ANAPERI** Configures whether to reset LP analog peripherals.

0: Release from reset

1: Reset

(R/W)

**LP\_CLKRST\_RST\_EN\_LP\_WDT** Configures whether to reset RWDT.

0: Release from reset

1: Reset

(R/W)

**LP\_CLKRST\_RST\_EN\_LP\_TIMER** Configures whether to reset LP timer.

0: Release from reset

1: Reset

(R/W)

**LP\_CLKRST\_RST\_EN\_LP\_RTC** Configures whether to reset the LP clock calibration module.

0: Release from reset

1: Reset

(R/W)

**LP\_CLKRST\_RST\_EN\_LP\_MAILBOX** Configures whether to reset LP Mailbox.

0: Release from reset

1: Reset

(R/W)

**LP\_CLKRST\_RST\_EN\_LP\_AONEFUSEREG** Configures whether to reset LP eFuse.

0: Release from reset

1: Reset

(R/W)

**LP\_CLKRST\_RST\_EN\_LP\_RAM** Configures whether to reset LP RAM.

0: Release from reset

1: Reset

(R/W)

**Register 9.61. LP\_CLKRST\_RESET\_CAUSE\_REG (0x0010)**

Reset

**LP\_CLKRST\_HPCORE0\_LOCKUP\_RESET\_EN** Configures whether to enable Lockup to trigger HP CPU0 reset.

0: Disable

1: Enable

(R/W)

**LP\_CLKRST\_LP\_WDT\_HPCORE0\_RESET\_LENGTH** Configures the duration of the reset when RWDT and software trigger HP CPU0 reset.

Measurement unit: Clock cycles. (R/W)

**LP\_CLKRST\_LP\_WDT\_HPCORE0\_RESET\_EN** Configures whether to enable RWDT to trigger HP CPU0 reset.

0: Disable

1: Enable

(R/W)

**LP\_CLKRST\_HPCORE0\_STALL\_WAIT** Configures the time HP CPU0 stalls when RWDT and software trigger HP CPU0 reset.

Measurement unit: Clock cycles. (R/W)

**LP\_CLKRST\_HPCORE0\_STALL\_EN** Configures the behavior when RWDT and software trigger HP CPU0 reset.

0: Immediately reset HP CPU0

1: Stall HP CPU0 first

(R/W)

**LP\_CLKRST\_HPCORE0\_SW\_RESET** Write 1 to trigger HP CPU0 software reset. (WT)

**LP\_CLKRST\_HPCORE0\_OCD\_HALT\_ON\_RESET** Configures whether HP CPU0 halts at the first instruction after released from reset.

0: No halt

1: Halt

(R/W)
