|  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | **LP\_I2C\_SCL\_MAIN\_ST\_TO\_I2C** Configures the threshold value of SCL\_MAIN\_FSM state unchanged period. It should be no more than 23.

Measurement unit: i2c\_sclk

(R/W)

Register 39.46. LP\_I2C\_CTR\_REG (0x0004)

**LP\_I2C\_SAMPLE\_SCL\_LEVEL** Configures the sample mode for SDA.

1: Sample SDA data on the SCL low level.

0: Sample SDA data on the SCL high level.

(R/W)

**LP\_I2C\_RX\_FULL\_ACK\_LEVEL** Configures the ACK value that needs to be sent by master when the rx\_fifo\_cnt has reached the threshold. (R/W)

**LP\_I2C\_TRANS\_START** Configures to start sending the data in txfifo for slave.

0: No effect

1: Start

(WT)

**LP\_I2C\_TX\_LSB\_FIRST** Configures to control the sending order for data to be sent.

1: send data from the least significant bit

0: send data from the most significant bit

(R/W)

**LP\_I2C\_RX\_LSB\_FIRST** Configures to control the storage order for received data.

1: receive data from the least significant bit

0: receive data from the most significant bit

(R/W)

**LP\_I2C\_CLK\_EN** Configures whether to gate clock signal for registers.

0: Support clock only when registers are read or written to by software

1: Force clock on for registers.

(R/W)

**LP\_I2C\_ARBITRATION\_EN** Configures to enable I2C bus arbitration detection.

0: No effect

1: Enable

(R/W)

**LP\_I2C\_FSM\_RST** Configures to reset the SCL\_FSM.

0: No effect

1: Reset

(WT)

**LP\_I2C\_CONF\_UPGATE** Configures this bit for synchronization.

0: No effect

1: Synchronize

(WT)

Register 39.47. LP\_I2C\_TO\_REG (0x000C)

**LP\_I2C\_TIME\_OUT\_VALUE** Configures the timeout threshold period for SCL sticking at high or low level. The actual period is 2^(reg\_time\_out\_value).  
Measurement unit: i2c\_sclk.  
(R/W)

**LP\_I2C\_TIME\_OUT\_EN** Configures to enable time out control.  
0: No effect  
1: Enable  
(R/W)

Register 39.48. LP\_I2C\_FIFO\_CONF\_REG (0x0018)

Reset

**LP\_I2C\_RXFIFO\_WM\_THRHD** Configures the water mark threshold of RXFIFO in nonfifo access mode. When LP\_I2C\_FIFO\_PRT\_EN is 1 and rx FIFO counter is bigger than LP\_I2C\_RXFIFO\_WM\_THRHD[4:0], LP\_I2C\_RXFIFO\_WM\_INT\_RAW bit will be valid. (R/W)

**LP\_I2C\_TXFIFO\_WM\_THRHD** Configures the water mark threshold of TXFIFO in nonfifo access mode. When LP\_I2C\_FIFO\_PRT\_EN is 1 and rx FIFO counter is bigger than LP\_I2C\_TXFIFO\_WM\_THRHD[4:0], LP\_I2C\_TXFIFO\_WM\_INT\_RAW bit will be valid. (R/W)

**LP\_I2C\_NONFIFO\_EN** Configures to enable APB nonfifo access. (R/W)

**LP\_I2C\_RX\_FIFO\_RST** Configures to reset RXFIFO.

0: No effect

1: Reset

(R/W)

**LP\_I2C\_TX\_FIFO\_RST** Configures to reset TXFIFO. 0: No effect

1: Reset

(R/W)

**LP\_I2C\_FIFO\_PRT\_EN** Configures to enable FIFO pointer in non-fifo access mode. This bit controls the valid bits and the TX/RX FIFO overflow, underflow, full and empty interrupts.

0: No effect

1: Enable

(R/W)

Register 39.49. LP\_I2C\_FILTER\_CFG\_REG (0x0050)

Reset

**LP\_I2C\_SCL\_FILTER\_THRES** Configures the threshold pulse width to be filtered on SCL. When a pulse on the SCL input has smaller width than this value, the I2C controller will ignore that pulse.

Measurement unit: i2c\_sclk

(R/W)

**LP\_I2C\_SDA\_FILTER\_THRES** Configures the threshold pulse width to be filtered on SDA. When a pulse on the SDA input has smaller width than this value, the I2C controller will ignore that pulse.

Measurement unit: i2c\_sclk

(R/W)

**LP\_I2C\_SCL\_FILTER\_EN** Configures to enable the filter function for SCL.

0: No effect

1: Enable

(R/W)

**LP\_I2C\_SDA\_FILTER\_EN** Configures to enable the filter function for SDA.

0: No effect

1: Enable

(R/W)

Reset

**LP\_I2C\_SCL\_RST\_SLV\_EN** Configures to send out SCL pulses when I2C master is IDLE. The number of pulses equals to LP\_I2C\_SCL\_RST\_SLV\_NUM[4:0]. (R/W/SC)

**LP\_I2C\_SCL\_RST\_SLV\_NUM** Configure the pulses of SCL generated in I2C master mode.

Valid when LP\_I2C\_SCL\_RST\_SLV\_EN is 1.

Measurement unit: i2c\_sclk

(R/W)

Register 39.51. LP\_I2C\_SR\_REG (0x0008)

**LP\_I2C\_RESP\_REC** Represents the received ACK value in master mode or slave mode.

0: ACK

1: NACK

(RO)

**LP\_I2C\_ARB\_LOST** Represents whether the I2C controller loses control of SCL line.

0: No arbitration lost

1: Arbitration lost

(RO)

**LP\_I2C\_BUS\_BUSY** Represents the I2C bus state.

1: The I2C bus is busy transferring data

0: The I2C bus is in idle state

(RO)

**LP\_I2C\_RXFIFO\_CNT** Represents the number of data bytes received in RAM. (RO)

**LP\_I2C\_TXFIFO\_CNT** Represents the number of data bytes to be sent. (RO)

**LP\_I2C\_SCL\_MAIN\_STATE\_LAST** Represents the states of the I2C module state machine.

0: Idle

1: Address shift

2: ACK address

3: Rx data

4: Tx data

5: Send ACK

6: Wait ACK

(RO)

**LP\_I2C\_SCL\_STATE\_LAST** Represents the states of the state machine used to produce SCL.

0: Idle

1: Start

2: Negative edge

3: Low

4: Positive edge

5: High

6: Stop

(RO)

Register 39.52. LP\_I2C\_FIFO\_ST\_REG (0x0014)

Register map diagram showing bit fields for the I2C module. The register is 32 bits wide. Bit 31 is reserved. Bits 19-18 are LP\_I2C\_TXFIFO\_WADDR. Bits 15-14 are reserved. Bits 13-10 are LP\_I2C\_TXFIFO\_RADDR. Bit 9 is reserved. Bits 8-5 are LP\_I2C\_RXFIFO\_WADDR. Bit 4 is reserved. Bits 3-0 are LP\_I2C\_RXFIFO\_RADDR. Below the register map, a row of bits 0-31 is shown, with bits 0-3 labeled 'Reset'.

**LP\_I2C\_RXFIFO\_RADDR** Represents the offset address of the APB reading from RXFIFO (RO)

**LP\_I2C\_RXFIFO\_WADDR** Represents the offset address of i2c module receiving data and writing to RXFIFO. (RO)

**LP\_I2C\_TXFIFO\_RADDR** Represents the offset address of i2c module reading from TXFIFO. (RO)

**LP\_I2C\_TXFIFO\_WADDR** Represents the offset address of APB bus writing to TXFIFO. (RO)

### Register 39.53. LP\_I2C\_DATA\_REG (0x001C)

[illegible]

**LP\_I2C\_FIFO\_RDATA** Represents the value of RXFIFO read data. (RO)

Register 39.54. LP\_I2C\_INT\_RAW\_REG (0x0020)

**Register 39.58. LP\_I2C\_CMD0\_REG (0x0058)**

**LP\_I2C\_COMMAND0** Configures command 0.

It consists of three parts:

op\_code is the command

1: WRITE

2: STOP

3: READ

4: END

6: RSTART

Byte\_num represents the number of bytes that need to be sent or received.

ack\_check\_en, ack\_exp and ack are used to control the ACK bit. See I2C cmd structure [39.4-2](#) for more information. (R/W)

**LP\_I2C\_COMMAND0\_DONE** Represents whether command 0 is done in I2C Master mode.

0: Not done

1: Done

Reset

**LP\_I2C\_COMMAND5** Configures command 5. See details in I2C\_CMD0\_REG[13:0]. (R/W)

**LP\_I2C\_COMMAND5\_DONE** Represents whether command 5 is done in I2C Master mode.

0: Not done

1: Done

(R/W/SS)

### Register 39.64. LP\_I2C\_COMD6\_REG (0x0070)

|    |    |    |    |   |
|----|----|----|----|---|
| 31 | 30 | 14 | 13 | 0 |
| 0  | 0  | 0  | 0  | 0 |

LP\_I2C\_COMMAND6\_DONE (reserved) LP\_I2C\_COMMAND6 Reset

**LP\_I2C\_COMMAND6** Configures command 6. See details in I2C\_CMD0\_REG[13:0]. (R/W)

**LP\_I2C\_COMMAND6\_DONE** Represents whether command 6 is done in I2C Master mode.

0: Not done

1: Done

(R/W/SS)

LP\_I2C\_COMMAND7\_DONE

(reserved)

LP\_I2C\_COMMAND7

Reset

LP\_I2C\_DATE

Reset

LP\_I2C\_TXFIFO\_START\_ADDR

Reset

Register 39.68. LP\_I2C\_RXFIFO\_START\_ADDR\_REG (0x0180)

LP\_I2C\_RXFIFO\_START\_ADDR Represents the I2C rxfifo first address. (HRO)

## Chapter 40

### Analog I2C Controller

#### 40.1 Introduction

The Analog I2C Controller contains two I2C masters dedicated to configuring and communicating with certain analog circuit modules. Those modules can adjust their operating states by configuring their internal registers to better suit the current application scenario of the chip. For example, the Analog I2C Controller can configure an analog sensor to add a uniform offset to the ADC sampling values, thereby extending the sampling voltage range. Each configurable analog module has an I2C slave internally, which is assigned with an independent address. The Analog I2C Controller supports the configuration of the following analog modules:

- CPU\_PLL: This mainly includes the configuration register for CPLL\_CLK, with a slave address of 0x67. For more information on CPLL\_CLK, refer to Chapter [9 Reset and Clock](#).
- SYS\_PLL: This mainly includes the configuration register for SPLL\_CLK, with a slave address of 0x66. For more information on SPLL\_CLK, refer to Chapter [9 Reset and Clock](#).
- MSPI: This mainly includes the configuration register for MPLL\_CLK, with a slave address of 0x63. For more information on MPLL\_CLK, refer to Chapter [9 Reset and Clock](#).
- PLLA: This mainly includes the configuration register for APLL\_CLK, with a slave address of 0x6f. For more information on APLL\_CLK, refer to Chapter [9 Reset and Clock](#).
- ANA\_SENSOR: This mainly includes the configuration register for analog sensors (such as [Temperature Sensor \(TSENS\)](#) and [ADC Controller \(ADC\)](#)), with a slave address of 0x69.
- BIAS: This mainly includes the voltage detection configuration register, with a slave address of 0x6a. For more information, refer to Chapter [21 Brown-out Detector](#).

#### 40.2 Feature List

The Analog I2C Controller has the following features:

- Master mode only
- 7-bit addressing
- Adjustable transmission rate
- Communication in the sleep modes supported by the Low-Power CPU
- Dual master operation mode

## 40.3 Architectural Overview

The figure below shows the architecture of the Analog I2C Controller.

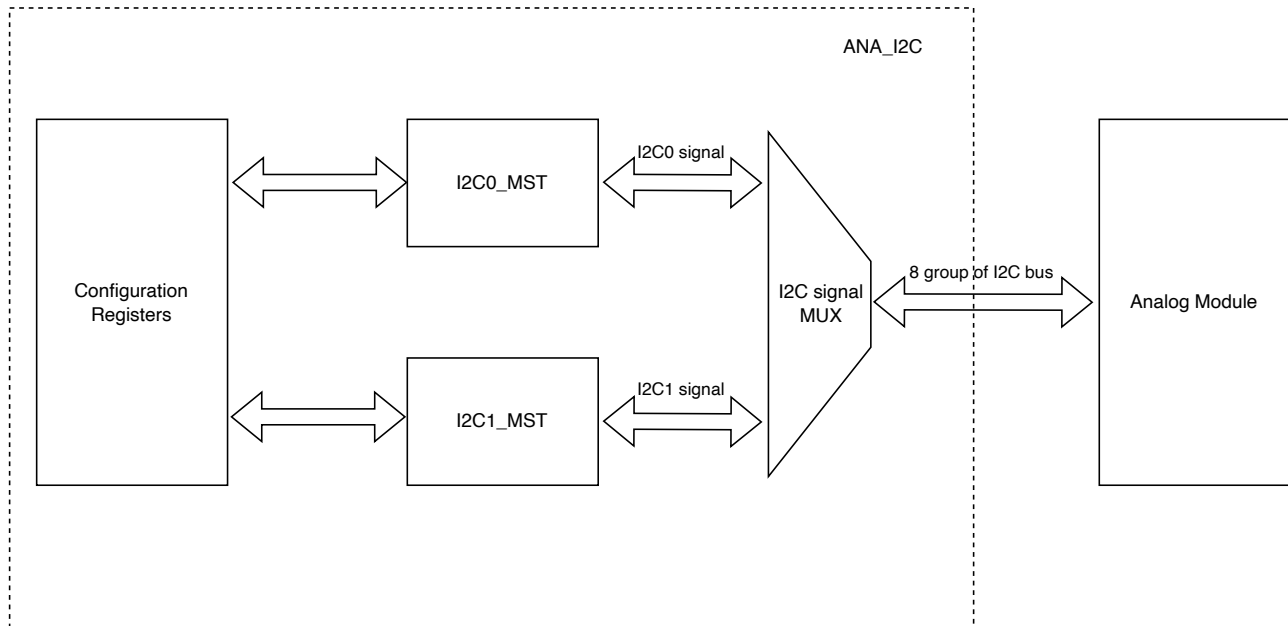

Figure 40.3-1. Analog I2C Controller Architecture

- **Configuration Registers:** A register module interfacing with the software, providing relevant configurations for the operation of the I2C master. This module controls the transmission address, data, etc., and monitors this transmission process by reading the status registers of I2C0/1\_MST.
- **I2C0/1\_MST:** Two I2C masters that can independently configure analog modules in parallel. The I2C signals they generate will be selected by a subsequent MUX and output to the analog modules.
- **I2C signal MUX:** A module that determines which analog master, I2C0\_MST or I2C1\_MST, configures a particular analog module.

## 40.4 Functional Description

### Transmission Rate Adjustment

The transmission rate and signal phase of the I2C signal can be configured by [ANA\\_I2C\\_MST\\_I2Cx\\_SDA\\_SIDE\\_GUARD](#) and [ANA\\_I2C\\_MST\\_I2Cx\\_SCL\\_PULSE\\_DUR](#). The relationship between the register values and the waveform is shown in the following figure.

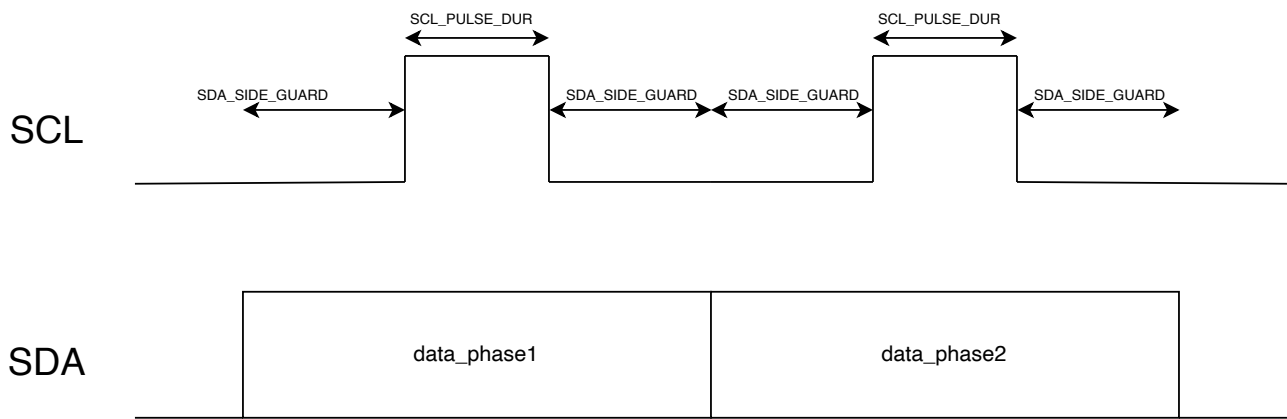

Figure 40.4-1. Signal Phase

### Operation in Sleep Modes

In chip sleep modes, the operation of the Analog I2C Controller can be driven by the Low-Power CPU (see Chapter 2 [Low-Power CPU](#)).

### Dual Master Operation Mode

The module integrates two independent master modules, each with its own set of configurations. The two masters can operate independently, configuring different analog modules, thereby improving operational efficiency.

## 40.5 Programming Procedures

The following is the process for configuring analog modules using the Analog I2C Controller.

- Write 1 to `LPPERI_CK_EN_LP_I2CMST` to enable the clock of the Controller.
- Configure `ANA_I2C_MST_ANA_CONF2` to select the module for communication.
- Configure `ANA_I2C_MST_I2Cx_SDA_SIDE_GUARD` and `ANA_I2C_MST_I2Cx_SCL_PULSE_DUR` to determine the transmission rate and signal phase of the I2C signal.
- Configure `ANA_I2C_MST_I2Cx_CTRL` to select relevant information for the current communication.
- Read `ANA_I2C_MST_I2Cx_BUSY`. A low state indicates the end of the current communication for I2Cx.

## 40.6 Register Summary

The addresses in this section are relative to Analog I2C Controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name                                       | Description  | Address | Access |
|--|--|---------|--------|
| <b>Configuration Registers</b>             |  |         |        |
| <a href="#">ANA_I2C_MST_I2CO_CTRL_REG</a>  | I2C0 transmission configuration register                       | 0x0000  | varies |
| <a href="#">ANA_I2C_MST_I2C1_CTRL_REG</a>  | I2C1 transmission configuration register                       | 0x0004  | varies |
| <a href="#">ANA_I2C_MST_ANA_CONF2_REG</a>  | I2C master selection register                                  | 0x0020  | varies |
| <a href="#">ANA_I2C_MST_I2CO_CTRL1_REG</a> | I2C0 transmission rate and signal phase configuration register | 0x0024  | R/W    |
| <a href="#">ANA_I2C_MST_I2C1_CTRL1_REG</a> | I2C1 transmission rate and signal phase configuration register | 0x0028  | R/W    |
| <a href="#">ANA_I2C_MST_DATE_REG</a>       | Version control register                                       | 0x0038  | R/W    |

## 40.7 Registers

The addresses in this section are relative to Analog I2C Controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program registers that contain reserved fields, please refer to Section [Programming Reserved Register Field](#).

Register 40.1. ANA\_I2C\_MST\_I2CO\_CTRL\_REG (0x0000)

|            |   |   |   |   |   |    |                       |         |  |  |  |  |  |                       |  |  |  |  |       |   |
|------------|---|---|---|---|---|----|-----------------------|---------|--|--|--|--|--|-----------------------|--|--|--|--|-------|---|
| (reserved) |   |   |   |   |   |    | ANA_I2C_MST_I2CO_BUSY |         |  |  |  |  |  | ANA_I2C_MST_I2CO_CTRL |  |  |  |  |       |   |
| 31         |   |   |   |   |   | 26 | 25                    | 24      |  |  |  |  |  |                       |  |  |  |  |       | 0 |
| 0          | 0 | 0 | 0 | 0 | 0 | 0  | 0                     | 0x00000 |  |  |  |  |  |                       |  |  |  |  | Reset |   |

**ANA\_I2C\_MST\_I2CO\_CTRL** Configures the transmission information for I2CO.

- Bit[0:7]: Configures the slave address
- Bit[8:15]: Configures the slave register address
- Bit[16:23]: Configures the transmitted data
- Bit[24]: Configures the read or write operation
- 0: Write
- 1: Read

Once this register is configured, the I2CO master will generate I2C read or write signals.

(R/W)

**ANA\_I2C\_MST\_I2CO\_BUSY** Represents whether I2CO is currently transferring data.

- 0: I2CO is not transferring data
- 1: I2CO is transferring data

(RO)

Register 40.2. ANA\_I2C\_MST\_I2C1\_CTRL\_REG (0x0004)

|            |    |   |   |   |   |                       |         |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                       |  |  |  |  |  |   |       |  |  |  |  |  |  |  |  |
|------------|----|---|---|---|---|-----------------------|---------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-----------------------|--|--|--|--|--|---|-------|--|--|--|--|--|--|--|--|
| (reserved) |    |   |   |   |   | ANA_I2C_MST_I2C1_BUSY |         |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | ANA_I2C_MST_I2C1_CTRL |  |  |  |  |  |   |       |  |  |  |  |  |  |  |  |
| 31         | 26 |   |   |   |   | 25                    | 24      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                       |  |  |  |  |  | 0 |       |  |  |  |  |  |  |  |  |
| 0          | 0  | 0 | 0 | 0 | 0 | 0                     | 0x00000 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                       |  |  |  |  |  |   | Reset |  |  |  |  |  |  |  |  |

**ANA\_I2C\_MST\_I2C1\_CTRL** Configures the transmission information for I2C1. Its subfields have the same meaning with [ANA\\_I2C\\_MST\\_I2CO\\_CTRL](#). (R/W)

**ANA\_I2C\_MST\_I2C1\_BUSY** Represents whether I2C1 is currently transferring data

0: I2C1 is not transferring data

1: I2C1 is transferring data

(RO)

Register 40.3. ANA\_I2C\_MST\_ANA\_CONF2\_REG (0x0020)

|          |    |  |  |  |  |        |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |    |                       |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |  |  |  |  |  |  |   |
|----------|----|--|--|--|--|--------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|----|-----------------------|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|--|--|--|--|--|--|---|
| reserved |    |  |  |  |  |        |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |    | ANA_I2C_MST_ANA_CONF2 |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |  |  |  |  |  |  |   |
| 31       | 24 |  |  |  |  |        |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 23 |                       |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |
| 0x0      |    |  |  |  |  | 0x0000 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |    |                       |  |  |  |  |  |  |  | Reset |  |  |  |  |  |  |  |  |  |  |  |  |  |   |

**ANA\_I2C\_MST\_ANA\_CONF2** Configures which I2C master the following analog modules uses. If the corresponding bit is set to 1, I2C0 master is used for communication; if set to 0, I2C1 master is used. Since the slave address has already been defined, erroneous communication will not be caused.

Bit5: SYS\_PLL

Bit6: SDIO\_PLL

Bit7: ANA\_SENSOR

Bit8: PLLA

Bit9: MSPI

Bit10: DIG\_REG

Bit11: CPU\_PLL

Bit12: BIAS

(R/W)

**Register 40.4. ANA\_I2C\_MST\_I2CO\_CTRL1\_REG (0x0024)**

**ANA\_I2C\_MST\_I2CO\_SCL\_PULSE\_DUR** Configures the duration of the high-level period of the SCL driven by I2CO. The duration is measured by the counter operating on the LP\_FAST\_CLK clock. (R/W)

**ANA\_I2C\_MST\_I2CO\_SDA\_SIDE\_GUARD** Configures the duration of the low-level period of the SCL driven by I2CO. The duration is measured by the counter operating on the LP\_FAST\_CLK clock. (R/W)

**Register 40.5. ANA\_I2C\_MST\_I2C1\_CTRL1\_REG (0x0028)**

**ANA\_I2C\_MST\_I2C1\_SCL\_PULSE\_DUR** Configures the duration of the high-level period of the SCL driven by I2C1. The duration is measured by the counter operating on the LP\_FAST\_CLK clock. (R/W)

**ANA\_I2C\_MST\_I2C1\_SDA\_SIDE\_GUARD** Configures the duration of the low-level period of the SCL driven by I2C1. The duration is measured by the counter operating on the LP\_FAST\_CLK clock. (R/W)

Register 40.6. ANA\_I2C\_MST\_DATE\_REG (0x0038)

|            |    |    |    |                  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|------------|----|----|----|------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| (reserved) |    |    |    | ANA_I2C_MST_DATE |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

# Chapter 41

## I2S Controller (I2S)

### 41.1 Overview

ESP32-P4 has three built-in I2S interfaces (i.e., I2S0, I2S1, and I2S2), which provide flexible communication interfaces for streaming digital data in multimedia applications, especially digital audio applications.

The I2S standard bus defines three signals, namely, a bit clock signal (BCK), a channel/word select signal (WS), and a serial data signal (SD). A basic I2S data bus has one master and one slave. The roles remain unchanged throughout the communication. The I2S module on ESP32-P4 provides separate transmit (TX) and receive (RX) units for high performance.

**Note:**

The information provided in this chapter applies to I2S0, I2S1, and I2S2. Unless otherwise indicated, I2S or I2S<sub>n</sub> in this chapter refer to I2S0, I2S1, and I2S2.

### 41.2 Terminology

To better illustrate the functionality of I2S, the following terms are used in this chapter.

|                                       |  |
|---------------------------------------|--|
| <b>Master mode</b>                    | As a master, I2S <sub>n</sub> drives BCK/WS signals and transmits data to or receives data from a slave.   |
| <b>Slave mode</b>                     | As a slave, I2S <sub>n</sub> is driven by BCK/WS signals and receives data from or transmits data to a master.   |
| <b>Full-duplex</b>                    | There are two separate data lines. The transmitted and received data is carried simultaneously.  |
| <b>Half-duplex</b>                    | Only one side, the master or the slave, transmits data first, and the other side receives data. Data transmission and reception cannot occur simultaneously.   |
| <b>A-law and <math>\mu</math>-law</b> | A-law and $\mu$ -law are compression/decompression algorithms in digital pulse code modulated (PCM) non-uniform quantization, which can effectively improve the signal-to-quantization noise ratio.  |
| <b>TDM RX mode</b>                    | In this mode, pulse code modulated (PCM) data is received utilizing time division multiplexing (TDM). The signal lines include BCK, WS, and SD. Data from 16 channels at most can be received. TDM Philips standard, TDM MSB alignment standard, and TDM PCM standard are supported in this mode, depending on user configuration. |

|  |   |
|--|---|
| <b>PDM RX mode</b>                     | In this mode, pulse density modulation (PDM) data is received. Used signals include WS and DATA. PDM standard is supported in this mode by user configuration.  |
| <b>TDM TX mode</b>                     | In this mode, pulse code modulated (PCM) data is sent in a way of time division multiplexing (TDM). The signal lines include BCK, WS, and DATA. Data up to 16 channels can be sent. TDM Philips standard, TDM MSB alignment standard, and TDM PCM standard are supported in this mode, depending on user configuration.                     |
| <b>PDM TX mode</b>                     | In this mode, pulse density modulation (PDM) data is sent. The signal lines include WS and DATA. PDM standard is supported in this mode by user configuration.  |
| <b>PCM-to-PDM Data</b>                 |   |
| <b>Format Converter (for I2S only)</b> | A data format converter that converts PCM data into PDM data (hereinafter referred to as PCM-to-PDM converter), which can be enabled in PDM TX master mode. When the converter is enabled, I2S fetches pulse code modulated (PCM) data from storage via GDMA, converts it to pulse density modulation (PDM) data, and then transmits it.    |
| <b>PDM-to-PCM Data</b>                 |   |
| <b>Format Converter (for I2S only)</b> | A data format converter that converts PDM data into PCM data (hereinafter referred to as PDM-to-PCM converter), which can be enabled in PDM RX master or slave mode. When the converter is enabled, I2S receives pulse density modulation (PDM) data, converts it into pulse code modulated (PCM) data, and stores it into memory via GDMA. |

## 41.3 Features

The I2S module has the following features:

- Master mode and slave mode
- Full-duplex and half-duplex communications
- Separate TX and RX units that can work independently or simultaneously
- A variety of audio standards supported:
  - TDM Philips standard
  - TDM MSB alignment standard
  - TDM PCM standard
  - PDM standard
- Various TX/RX modes supported:
  - TDM TX mode, up to 16 channels supported
  - TDM RX mode, up to 16 channels supported

- PDM TX mode
  - \* Raw PDM data transmission
  - \* PCM-to-PDM data format conversion (for I2S<sub>0</sub> only), up to 2 channels supported
- PDM RX mode
  - \* Raw PDM data reception
  - \* PDM-to-PCM data format conversion (for I2S<sub>0</sub> only), up to 8 channels supported
- Configurable APLL clock with frequencies up to 240 MHz
- Configurable high-precision sample clock with a variety of sampling frequencies supported (refer to the note below for more details)
- 8/16/24/32-bit data width
- Synchronous counter in TX mode
- ETM feature
- Direct Memory Access (GDMA-AHB only)
- Standard I2S interface interrupts

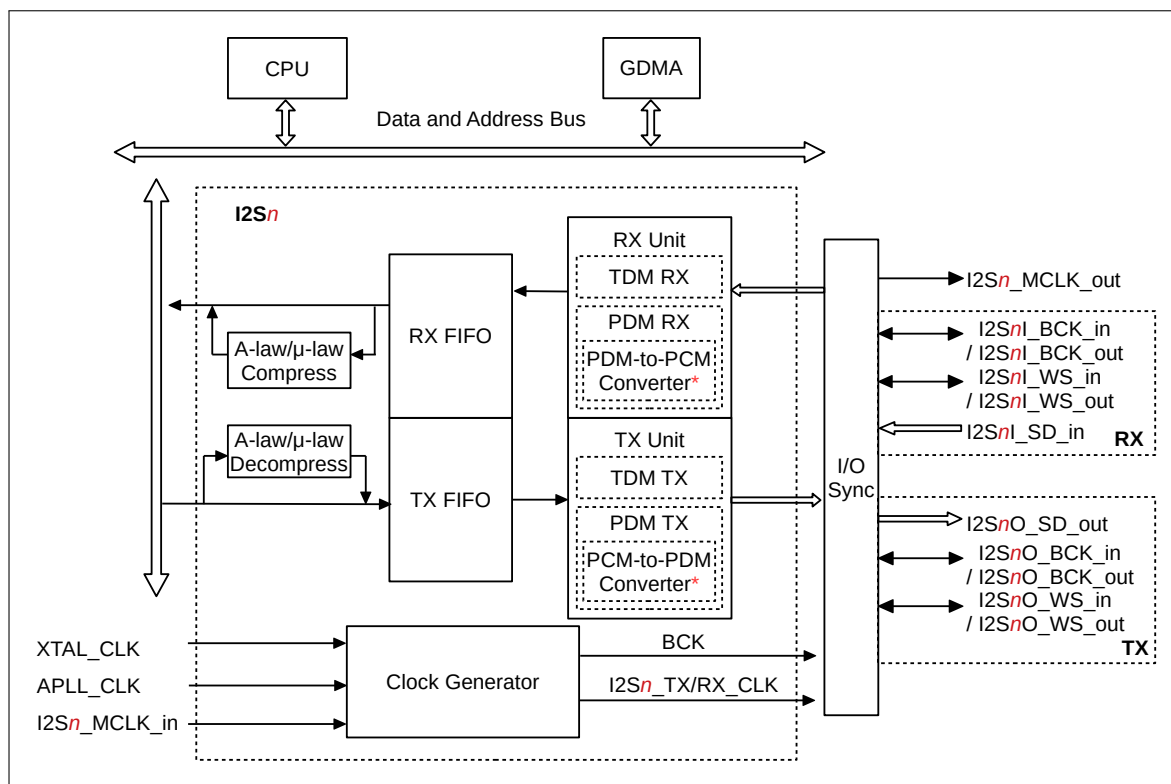

**Note:**

In slave mode, to ensure the sampling accuracy, the module clock frequency must be greater than or equal to 8 times the BCK clock frequency. Therefore, the maximum sampling frequency of I2S<sub>n</sub> is limited by the data bit width and the number of channels. For example, since the clock source frequency is up to 240 MHz, the module clock can be configured up to 120 MHz, and the BCK clock can be configured up to 15 MHz. Therefore, when transmitting dual-channel 32-bit width data, I2S<sub>n</sub> supports sample frequencies up to 234.375 kHz, e.g., 8 kHz, 16 kHz, 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, 128 kHz, and 192 kHz. Please refer to Section 41.6 *I2S TX/RX Clock* for detailed information.

## 41.4 System Architecture

Figure 41.4-1 shows the structure of the ESP32-P4 I2S<sub>n</sub> module, consisting of:

- Transmit control unit (TX Unit)
- Receive control unit (RX Unit)
- Input and output timing unit (I/O Sync)
- Clock divider (Clock Generator)
- 64 x 32-bit TX FIFO
- 64 x 32-bit RX FIFO
- Compress/Decompress units

Note: The PDM-to-PCM converter and PCM-to-PDM converter are only supported by I2S0.

Figure 41.4-1. ESP32-P4 I2S System Diagram

The I2Sn module supports direct memory access (DMA) to internal memory. For more information, see Chapter 3 [GDMA Controller \(GDMA-AHB, GDMA-AXI\)](#).

Both the TX unit and the RX unit have a three-line interface that uses a bit clock line (BCK), a word select line (WS), and a serial data line (SD). The SD line of the TX unit is used for data output and the SD line of the RX unit for data input. The BCK and WS signal lines of the TX and RX units are used for data output in master mode, and the BCK and WS signal lines of the TX and RX units are used for data input in slave mode.

The signal bus of the I2Sn module is shown at the right part of Figure 41.4-1. The naming of these signals in RX and TX units follows the pattern of I2SnA\_B\_C such as I2SnI\_BCK\_in.

- “A” indicates that the signal belongs to the I2Sn TX or RX unit, which includes:
  - “I”: Signal input to/output from the RX unit
  - “O”: Signal input to/output from the TX unit
- “B” represents the signal function, which includes:
  - BCK
  - WS
  - SD
- “C” represents the signal direction, which includes:
  - “in”: Input signal into the I2Sn module
  - “out”: Output signal from the I2Sn module

Table 41.4-1 provides a detailed description of I2S signals.

**Table 41.4-1. I2S<sub>n</sub> Signal Description**

| Signal                        | Direction | Function  |
|-------------------------------|-----------|---|
| I2S <sub>n</sub> I_BCK_in     | Input     | In I2S <sub>n</sub> slave mode, inputs BCK signal for RX unit.                              |
| I2S <sub>n</sub> I_BCK_out    | Output    | In I2S <sub>n</sub> master mode, outputs BCK signal for RX unit.                            |
| I2S <sub>n</sub> I_WS_in      | Input     | In I2S <sub>n</sub> slave mode, inputs WS signal for RX unit.                               |
| I2S <sub>n</sub> I_WS_out     | Output    | In I2S <sub>n</sub> master mode, outputs WS signal for RX unit.                             |
| I2S <sub>n</sub> I_Data_in    | Input     | Works as the serial input data bus for I2S <sub>n</sub> RX unit.                            |
| I2S <sub>n</sub> O_Data_out   | Output    | Works as the serial output data bus for I2S <sub>n</sub> TX unit.                           |
| I2S <sub>n</sub> O_BCK_in     | Input     | In I2S <sub>n</sub> slave mode, inputs BCK signal for TX unit.                              |
| I2S <sub>n</sub> O_BCK_out    | Output    | In I2S <sub>n</sub> master mode, outputs BCK signal for TX unit.                            |
| I2S <sub>n</sub> O_WS_in      | Input     | In I2S <sub>n</sub> slave mode, inputs WS signal for TX unit.                               |
| I2S <sub>n</sub> O_WS_out     | Output    | In I2S <sub>n</sub> master mode, outputs WS signal for TX unit.                             |
| I2S <sub>n</sub> _MCLK_in     | Input     | In I2S <sub>n</sub> slave mode, works as a clock source from the external master.           |
| I2S <sub>n</sub> _MCLK_out    | Output    | In I2S <sub>n</sub> master mode, works as a clock source for the external slave.            |
| I2S <sub>n</sub> OI_Data1_in  | Input     | When the PDM-to-PCM converter is enabled, works as the serial input data line for RX unit.  |
| I2S <sub>n</sub> OI_Data2_in  | Input     | When the PDM-to-PCM converter is enabled, works as the serial input data line for RX unit.  |
| I2S <sub>n</sub> OI_Data3_in  | Input     | When the PDM-to-PCM converter is enabled, works as the serial input data line for RX unit.  |
| I2S <sub>n</sub> OO_Data1_out | Output    | When the PCM-to-PDM converter is enabled, works as the serial output data line for TX unit. |

\* Any required signals of I2S<sub>n</sub> must be mapped to the chip's pins via HP GPIO matrix, see Chapter 8 [GPIO Matrix and IO MUX](#).

## 41.5 Supported Audio Standards

ESP32-P4 I2S<sub>n</sub> supports multiple audio standards, including TDM Philips standard, TDM MSB alignment standard, TDM PCM standard, and PDM standard.

Select the needed standard by configuring the following bits:

- [I2S\\_TX/RX\\_TDM\\_EN](#)
  - 0: Disable TDM mode
  - 1: Enable TDM mode
- [I2S\\_TX/RX\\_PDM\\_EN](#)
  - 0: Disable PDM mode
  - 1: Enable PDM mode
- [I2S\\_TX/RX\\_MSB\\_SHIFT](#)
  - 0: WS and SD signals change simultaneously, i.e., enable MSB alignment standard

- 1: WS signal changes one BCK clock cycle earlier than SD signal, i.e., enable Philips standard or select PCM standard

**Note:**

`I2S_TX/RX_TDM_EN` and `I2S_TX/RX_PDM_EN` must not be configured to 1 or 0 at the same time, otherwise ESP32-P4 I2S<sub>n</sub> will transmit data incorrectly in a mode that is neither TDM nor PDM.

### 41.5.1 TDM Philips Standard

Philips specifications require that WS signal changes one BCK clock cycle earlier than SD signal on BCK falling edge, which means that WS signal is valid from one clock cycle before transmitting the first bit of channel data and changes one clock before the end of channel data transfer. SD signal line transmits the most significant bit of audio data first.

Compared with the Philips standard, TDM Philips standard supports multiple channels. See Figure 41.5-1.

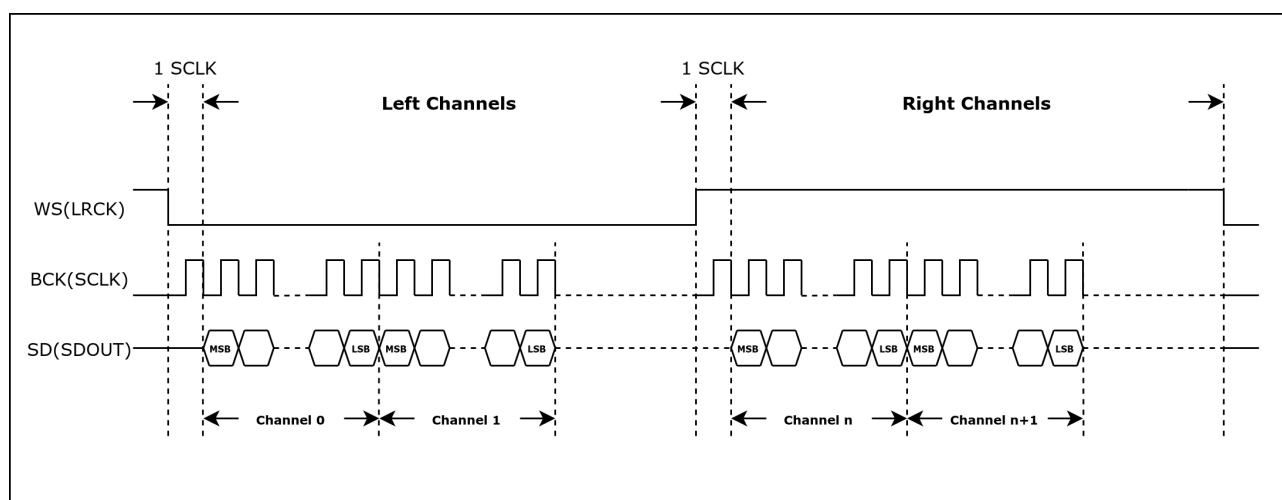

Figure 41.5-1. TDM Philips Standard Timing Diagram

### 41.5.2 TDM MSB Alignment Standard

MSB alignment specifications require that WS and SD signals change simultaneously on the falling edge of BCK. The WS signal is valid until the end of the channel data transfer. The SD signal line transmits the most significant bit of audio data first.

Compared with MSB alignment standard, TDM MSB alignment standard supports multiple channels. See Figure 41.5-2.

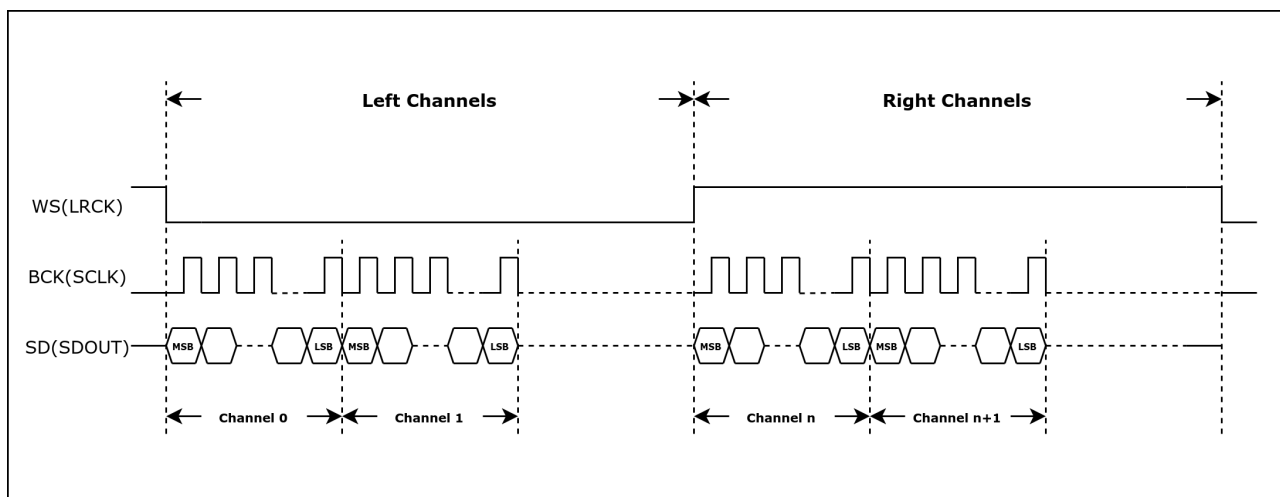

Figure 41.5-2. TDM MSB Alignment Standard Timing Diagram

### 41.5.3 TDM PCM Standard

Short frame synchronization under the PCM standard requires that the WS signal changes one BCK clock cycle earlier than the SD signal on the falling edge of BCK, which means that the WS signal becomes valid one clock cycle before transferring the first bit of channel data and remains unchanged in this BCK clock cycle. SD signal line first transmits the most significant bit of audio data.

Compared with PCM standard, TDM PCM standard supports multiple channels. See Figure 41.5-3.

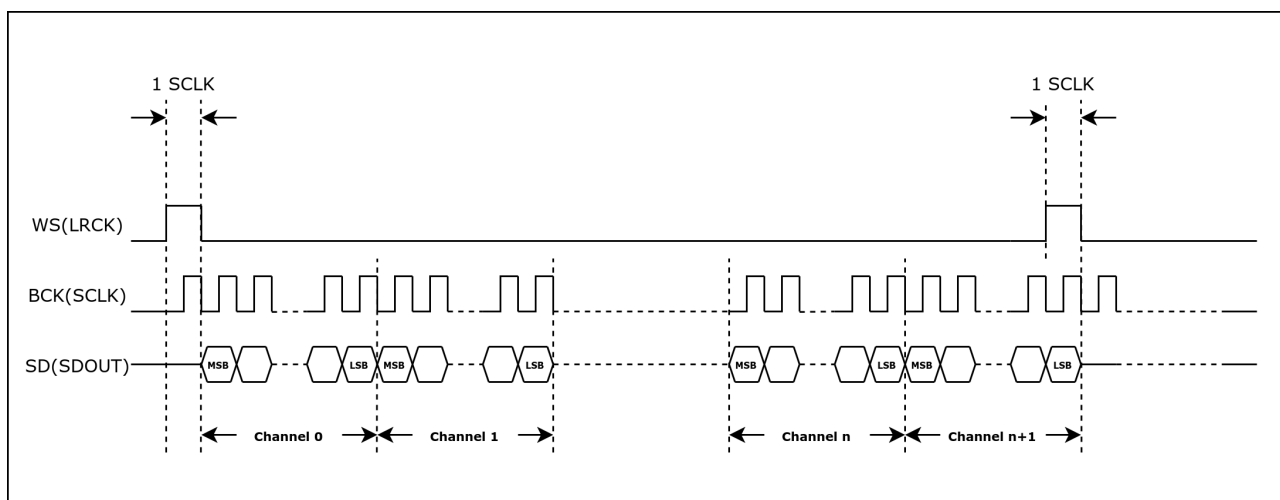

Figure 41.5-3. TDM PCM Standard Timing Diagram

### 41.5.4 PDM Standard

Under PDM standard, WS signal changes continuously during data transmission. The low-level and high-level of this signal indicates the left channel and right channel respectively. WS and SD signals change simultaneously. See Figure 41.5-4.

Figure 41.5-4. PDM Standard Timing Diagram

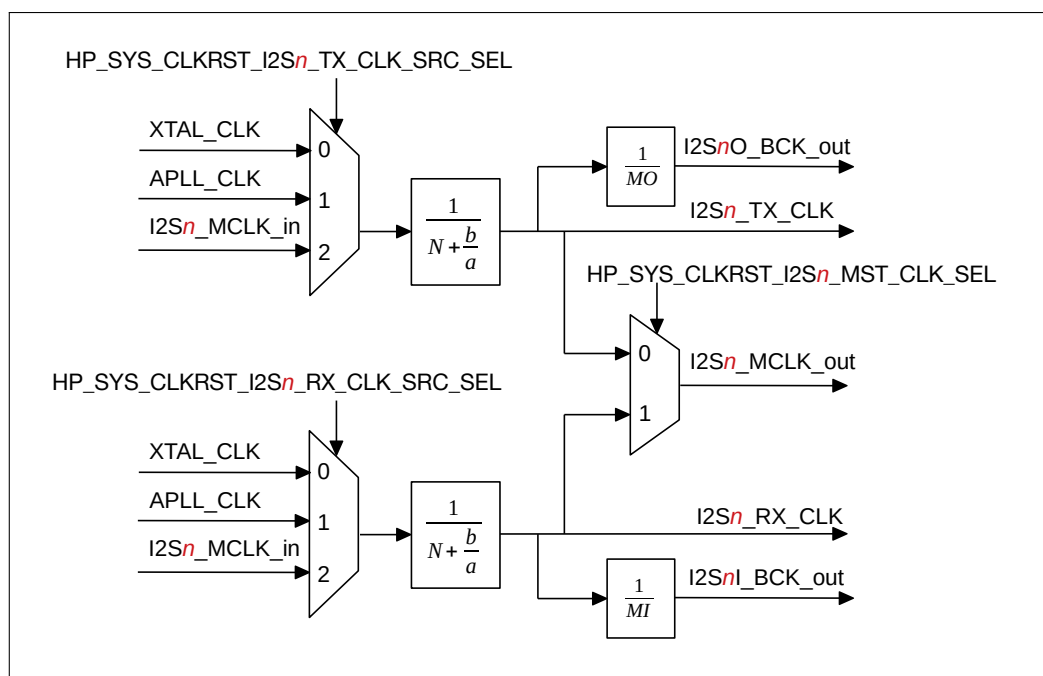

## 41.6 I2S TX/RX Clock

I2S<sub>n</sub>\_TX/RX\_CLK is the master clock of I2S<sub>n</sub> TX/RX unit, divided from:

- 40 MHz XTAL\_CLK
- APLL\_CLK with adjustable frequency
- I2S<sub>n</sub>\_MCLK\_in (external input clock)

The serial clock (BCK) of the I2S<sub>n</sub> TX/RX unit is divided from I2S<sub>n</sub>\_TX/RX\_CLK, as shown in Figure 41.6-1.

HP\_SYS\_CLKRST\_I2S<sub>n</sub>\_TX/RX\_CLK\_SRC\_SEL is used to select clock source for TX/RX unit, and HP\_SYS\_CLKRST\_I2S<sub>n</sub>\_TX/RX\_CLK\_EN to enable or disable the clock source.

Figure 41.6-1. I2S<sub>n</sub> Clock Generator

The following formula shows the relation between I2S<sub>n</sub>\_TX/RX\_CLK frequency  $f_{\text{I2S}_n\text{TX/RX\_CLK}}$  and the divider

clock source frequency  $f_{I2Sn\_CLK\_S}$ :

$$f_{I2Sn\_TX/RX\_CLK} = \frac{f_{I2Sn\_CLK\_S}}{N + \frac{b}{a}}$$

N is an integer value between 2 and 256. The value of N is mapped to that of `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_N` as follows:

- When `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_N` = 0, N = 256;
- When `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_N` = 1, N = 2;
- When `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_N` has any other value, N = `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_N`.

The values of “a” and “b” in fractional divider depend only on x, y, z, and yn1. The corresponding formulas are as follows:

- When  $b \leq \frac{a}{2}$ ,  $yn1 = 0$ ,  $x = \text{floor}(\lceil \frac{a}{b} \rceil) - 1$ ,  $y = a \% b$ ,  $z = b$ ;
- When  $b > \frac{a}{2}$ ,  $yn1 = 1$ ,  $x = \text{floor}(\lceil \frac{a}{a-b} \rceil) - 1$ ,  $y = a \% (a - b)$ ,  $z = a - b$ .

The values of x, y, z, and yn1 are configured in `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_X`, `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_Y`, `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_Z`, and `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_YN1`.

To configure the integer divider, clear `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_X` and `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_Z`, then set `HP_SYS_CLKRST_I2Sn_TX/RX_DIV_Y` to 1.

**Note:**

Using fractional divider may introduce some clock jitter.

In master TX mode, the serial clock BCK for I2Sn TX unit is `I2SnO_BCK_out` divided from `I2Sn_TX_CLK` which is:

$$f_{I2SnO\_BCK\_out} = \frac{f_{I2Sn\_TX\_CLK}}{MO}$$

“MO” is an integer value:

$$MO = I2Sn\_TX\_BCK\_DIV\_NUM + 1$$

**Note:**

Note that `I2Sn_TX_BCK_DIV_NUM` must not be configured as 1.

In master RX mode, the serial clock BCK for I2Sn RX unit is `I2SnI_BCK_out` divided from `I2Sn_RX_CLK`, which is:

$$f_{I2SnI\_BCK\_out} = \frac{f_{I2Sn\_RX\_CLK}}{MI}$$

“MI” is an integer value:

$$MI = I2Sn\_RX\_BCK\_DIV\_NUM + 1$$

**Note:**

- `I2S_RX_BCK_DIV_NUM` must not be configured as 1.
- In I2S slave mode, make sure  $f_{I2S\_TX/RX\_CLK} \geq 8 * f_{BCK}$ . The I2S<sub>n</sub> module can output I2S<sub>n</sub>\_MCLK\_out as the master clock for peripherals.

## 41.7 I2S Reset

The units and FIFOs in the I2S<sub>n</sub> module are reset by the following bits.

- I2S<sub>n</sub> TX/RX units: Reset by the bits `I2S_TX_RESET` and `I2S_RX_RESET`;
- I2S<sub>n</sub> TX/RX FIFO: Reset by the bits `I2S_TX_FIFO_RESET` and `I2S_RX_FIFO_RESET`.

**Note:**

The I2S<sub>n</sub> module clock must be configured first before the module and FIFO are reset.

## 41.8 I2S Master/Slave Mode

The ESP32-P4 I2S<sub>n</sub> module can operate as a master or a slave in half-duplex and full-duplex communications, depending on the configuration of `I2S_RX_SLAVE_MOD` and `I2S_TX_SLAVE_MOD`.

- `I2S_TX_SLAVE_MOD`
  - 0: Master TX mode
  - 1: Slave TX mode
- `I2S_RX_SLAVE_MOD`
  - 0: Master RX mode
  - 1: Slave RX mode

### 41.8.1 Master/Slave TX Mode

- I2S<sub>n</sub> works as a master transmitter:
  - Set `I2S_TX_START` to start transmitting data. When this bit is set, the TX unit keeps driving the clock signal and serial data.
  - If `I2S_TX_STOP_EN` is set and all the data in FIFO is transmitted, the master stops transmitting data and clock signals.
  - If `I2S_TX_STOP_EN` is cleared and all the data in FIFO is transmitted, meanwhile no new data is filled into FIFO, the TX unit keeps transmitting the last data frame and clock signal.
  - Master stops transmitting data when the bit `I2S_TX_START` is cleared.
- I2S<sub>n</sub> works as a slave transmitter:
  - Set `I2S_TX_START`. Wait for the master BCK clock to enable a transmit operation.

- If [I2S\\_TX\\_STOP\\_EN](#) is set and all the data in FIFO is transmitted, then the slave keeps transmitting zeros, till the master stops providing BCK signal.
- If [I2S\\_TX\\_STOP\\_EN](#) is cleared and all the data in FIFO is transmitted, meanwhile no new data is filled into FIFO, the TX unit keeps transmitting the last data frame.
- If [I2S\\_TX\\_START](#) is cleared, slave keeps transmitting zeros till the master stops providing BCK clock signal.

## 41.8.2 Master/Slave RX Mode

- I2Sn works as a master receiver:
  - Set [I2S\\_RX\\_START](#) to start receiving data. When this bit is set, the RX unit keeps outputting clock signal and sampling input data.
  - Configure [I2S\\_RX\\_STOP\\_MODE](#) to control the suspension of data reception:
    - \* 0: The RX unit only suspends data reception when [I2S\\_RX\\_START](#) is cleared.
    - \* 1: The RX unit suspends data reception when [I2S\\_RX\\_START](#) is cleared or the number of received bytes is greater than the value configured in [I2S\\_RX\\_EOF\\_NUM\\_REG](#). When [I2S\\_RX\\_START](#) is not cleared, data reception can be restarted by setting [I2S\\_RX\\_RESET](#) to 1.
    - \* 2: The RX unit suspends data reception when [I2S\\_RX\\_START](#) is cleared or GDMA RX FIFO is full. When [I2S\\_RX\\_START](#) is not cleared and the GDMA RX FIFO is no longer full, data reception can be restarted by setting [I2S\\_RX\\_RESET](#) to 1.
  - RX unit stops receiving data when the bit [I2S\\_RX\\_START](#) is cleared.
- I2Sn works as a slave receiver:
  - Set [I2S\\_RX\\_START](#). Wait for the master BCK signal to start receiving data.
  - Configure [I2S\\_RX\\_STOP\\_MODE](#) to control data reception suspension:
    - \* 0: The RX unit only suspends data reception when [I2S\\_RX\\_START](#) is cleared.
    - \* 1: The RX unit suspends data reception when the number of received bytes is greater than the value configured in [I2S\\_RX\\_EOF\\_NUM\\_REG](#). When [I2S\\_RX\\_START](#) is not cleared, data reception can be restarted by setting [I2S\\_RX\\_RESET](#) to 1.
    - \* 2: The RX unit suspends data reception when [I2S\\_RX\\_START](#) is cleared or GDMA RX FIFO is full. When [I2S\\_RX\\_START](#) is not cleared and the GDMA RX FIFO is no longer full, data reception can be restarted by setting [I2S\\_RX\\_RESET](#) to 1.
  - The RX unit stops receiving data when the bit [I2S\\_RX\\_START](#) is cleared.

## 41.9 Transmitting Data

### Note:

Updating the configuration described in this and subsequent sections requires to set [I2S\\_TX\\_UPDATE](#) accordingly to synchronize registers from APB clock domain to TX clock domain. For more detailed configurations, see Section [41.13.1](#).

In TX mode, I2S<sub>n</sub> first reads data through GDMA and transmits these data out via output signals according to the configured data mode and channel mode.

### 41.9.1 Data Format Control

Data format is controlled in the following phases:

- Phase I: Read data from memory and write it to TX FIFO;
- Phase II: Read the TX data from TX FIFO and convert the data according to the output data mode;
- Phase III: Clock out the TX data serially.

#### 41.9.1.1 Bit Width Control of Channel Valid Data

The bit width of the valid data in each channel is determined by [I2S\\_TX\\_BITS\\_MOD](#) and [I2S\\_TX\\_24\\_FILL\\_EN](#). For details, see the table below.

Table 41.9-1. Bit Width of Channel Valid Data

| Channel Valid Data Width | I2S_TX_BITS_MOD | I2S_TX_24_FILL_EN |
|--------------------------|-----------------|-------------------|
| 32                       | 31              | x <sup>*</sup>    |
|                          | 23              | 1                 |
| 24                       | 23              | 0                 |
| 16                       | 15              | x                 |
| 8                        | 7               | x                 |

\* "x" represents that this value is ignored.

#### 41.9.1.2 Endian Control of Channel Valid Data

When I2S<sub>n</sub> reads data through GDMA, the data endian under various data width is controlled by [I2S\\_TX\\_BIG\\_ENDIAN](#). Table 41.9-2 shows how [I2S\\_TX\\_BIG\\_ENDIAN](#) controls the reading of the data with different valid data widths of the channel.

Table 41.9-2. Endian of Channel Valid Data

| Channel Valid Data Width | Original Data    | Endian of Processed Data | I2S_TX_BIG_ENDIAN |
|--------------------------|------------------|--------------------------|-------------------|
| 32                       | {B3, B2, B1, B0} | {B3, B2, B1, B0}         | 0                 |
|                          |                  | {B0, B1, B2, B3}         | 1                 |
| 24                       | {B2, B1, B0}     | {B2, B1, B0}             | 0                 |
|                          |                  | {B0, B1, B2}             | 1                 |
| 16                       | {B1, B0}         | {B1, B0}                 | 0                 |
|                          |                  | {B0, B1}                 | 1                 |
| 8                        | {B0}             | {B0}                     | x                 |

**Note:**

B0, B1, B2, B3 each represents an 8-bit data, and the symbol {} indicates that the bytes are combined together. For

example, {B3, B2, B1, B0} represents a 32-bit data, wherein B0 represents bit 0-7, B1 represents bit 8-15, B2 represents bit 16-23, and B3 represents bit 24-31.

### 41.9.1.3 A-law/ $\mu$ -law Compression and Decompression

ESP32-P4 I2S<sub>n</sub> compresses/decompresses the valid data into 32-bit by A-law or by  $\mu$ -law. If the bit width of valid data is smaller than 32, zeros are filled to the extra high bits of the data to be compressed/decompressed by default.

**Note:**

Extra high bits here mean the bits[31: channel valid data width] of the data to be compressed/decompressed.

Configure [I2S\\_TX\\_PCM\\_BYPASS](#):

- 0: Compress or decompress the data
- 1: Do not compress or decompress the data

Configure [I2S\\_TX\\_PCM\\_CONF](#):

- 0: Decompress the data using A-law
- 1: Compress the data using A-law
- 2: Decompress the data using  $\mu$ -law
- 3: Compress the data using  $\mu$ -law

At this point, the first phase of data format control is completed.

### 41.9.1.4 Bit Width Control of Channel TX Data

The TX data width in each channel is determined by [I2S\\_TX\\_TDM\\_CHAN\\_BITS](#).

- If TX data width in each channel is larger than the valid data width, zeros will be filled to these extra bits.  
Configure [I2S\\_TX\\_LEFT\\_ALIGN](#):

- 0: The valid data is at the lower bits of TX data. Zeros are filled into higher bits of TX data;
- 1: The valid data is at the higher bits of TX data. Zeros are filled into lower bits of TX data.

- If the TX data width in each channel is smaller than the valid data width, only the lower bits of valid data are sent out, and the higher bits are discarded.

At this point, the second phase of data format control is completed.

### 41.9.1.5 Bit Order Control of Channel Data

The data bit order in each channel is controlled by [I2S\\_TX\\_BIT\\_ORDER](#):

- 0: Not reverse the valid data bit order;
- 1: Reverse the valid data bit order.

At this point, the data format control is completed. The data after format control will be sent sequentially from high to low. Figure [41.9-1](#) shows the complete process of TX data format control.

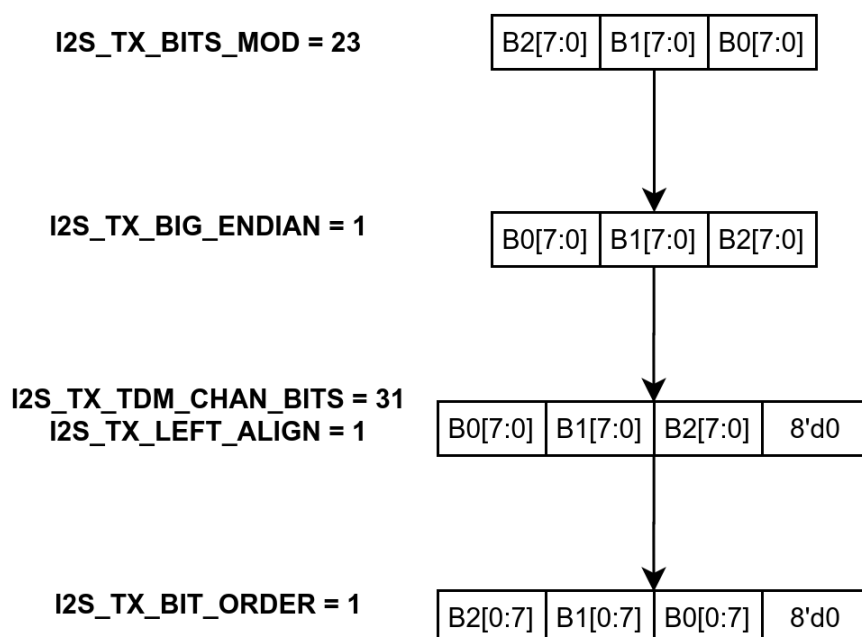

Figure 41.9-1. TX Data Format Control

## 41.9.2 Channel Mode Control

ESP32-P4 I2S<sub>n</sub> supports both TDM TX mode and PDM TX mode. Set [I2S\\_TX\\_TDM\\_EN](#) to enable TDM TX mode, or set [I2S\\_TX\\_PDM\\_EN](#) to enable PDM TX mode.

**Note:**

[I2S\\_TX\\_TDM\\_EN](#) and [I2S\\_TX\\_PDM\\_EN](#) must not be cleared or set simultaneously.

### 41.9.2.1 TDM TX Mode

In TDM TX mode, I2S<sub>n</sub> supports up to 16 channels to transmit data. The total number of TX channels in use is controlled by [I2S\\_TX\\_TDM\\_TOT\\_CHAN\\_NUM](#). For example, If [I2S\\_TX\\_TDM\\_TOT\\_CHAN\\_NUM](#) is set to 5, six channels in total (channel 0 ~ 5) will be used to transmit data. See Figure 41.9-2.

In these TX channels, if [I2S\\_TX\\_TDM\\_CHAN<sub>n</sub>\\_EN](#) is set to:

- 1: This channel transmits the channel data out;
- 0: The TX data to be sent by this channel is controlled by [I2S\\_TX\\_CHAN\\_EQUAL](#):
  - 1: The data of the previous channel is sent out;
  - 0: The data stored in [I2S\\_SINGLE\\_DATA](#) is sent out.

**Note:**

Most stereo I2S<sub>n</sub> codecs can be controlled by setting the I2S<sub>n</sub> module into 2-channel mode under TDM standard.

In TDM TX master mode, WS signal is controlled by [I2S\\_TX\\_WS\\_IDLE\\_POL](#) and [I2S\\_TX\\_TDM\\_WS\\_WIDTH](#):

- [I2S\\_TX\\_WS\\_IDLE\\_POL](#): The default level of WS signal;
- [I2S\\_TX\\_TDM\\_WS\\_WIDTH](#): The cycles the WS default level lasts for when transmitting all channel data.

[I2S\\_TX\\_HALF\\_SAMPLE\\_BITS](#) x 2 is equal to the BCK cycles in one WS period.

### TDM Channel Configuration Example

In this example, the register configuration is as follows:

- [I2S\\_TX\\_TDM\\_CHAN\\_NUM](#) = 5, i.e., channel 0 ~ 5 are used to transmit data.
- [I2S\\_TX\\_CHAN\\_EQUAL](#) = 1, i.e., data of the previous channel will be transmitted if the bit [I2S\\_TX\\_TDM\\_CHAN \$n\$ \\_EN](#) ( $n$  = 0 ~ 5) is cleared.
- [I2S\\_TX\\_TDM\\_CHAN0/2/5\\_EN](#) = 1, i.e., these channels transmit their channel data out.
- [I2S\\_TX\\_TDM\\_CHAN1/3/4\\_EN](#) = 0, i.e., these channels transmit the previous channel's data out.

Once the configuration is done, data is transmitted as follows.

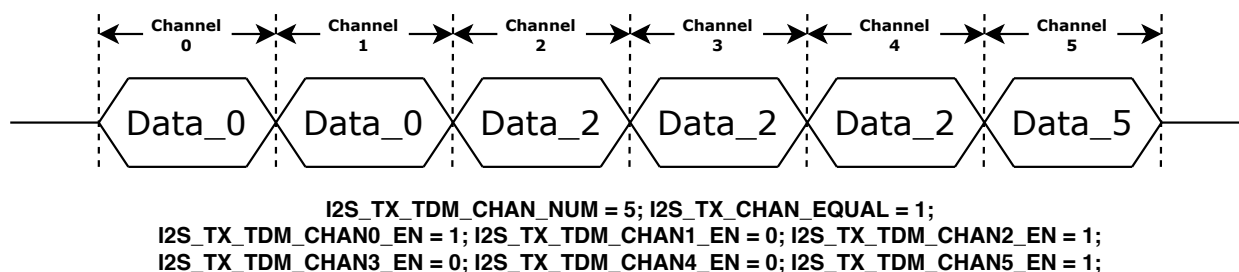

Figure 41.9-2. TDM Channel Control

### 41.9.2.2 PDM TX Mode

In PDM TX mode, [I2S \$n\$](#)  supports both PDM raw data transmission and PCM-to-PDM data format conversion (the latter only supported by [I2S0](#)).

In PDM TX mode, fetching data through GDMA is controlled by [I2S\\_TX\\_MONO](#) and [I2S\\_TX\\_MONO\\_FST\\_VLD](#). See Table 41.9-3. Configure the two bits according to the data stored in memory, be it the single-channel or dual-channel data.

Table 41.9-3. Data-Fetching Control in PDM Mode

| Data-Fetching Control Option   | Mode        | <a href="#">I2S_TX_MONO</a> | <a href="#">I2S_TX_MONO_FST_VLD</a> |
|--|-------------|-----------------------------|-------------------------------------|
| Post data-fetching request to GDMA at any edge of WS signal                    | Stereo mode | 0                           | x                                   |
| Post data-fetching request to GDMA only at the second half period of WS signal | Mono mode   | 1                           | 0                                   |
| Post data-fetching request to GDMA only at the first half period of WS signal  | Mono mode   | 1                           | 1                                   |

When [I2S \$n\$](#)  is in PDM TX master mode, the default level of WS signal is controlled by [I2S\\_TX\\_WS\\_IDLE\\_POL](#), and the WS signal frequency is half of the BCK signal frequency. The configuration of WS signal is similar to that of BCK signal. Please refer to Section 41.6 and Figure 41.6.

When **transmitting raw PDM data**, the I2S<sub>n</sub> channel mode is controlled by [I2S\\_TX\\_CHAN\\_MOD](#) and [I2S\\_TX\\_WS\\_IDLE\\_POL](#). See the table below.

**Table 41.9-4. I2S<sub>n</sub> Channel Control for Raw PDM Data**

| Channel Control Option | Left Channel                                | Right Channel                   | Mode Control Field <sup>1</sup> | Channel Select Bit <sup>2</sup> |
|------------------------|---|---------------------------------|---------------------------------|---------------------------------|
| Stereo mode            | Transmit the left channel data              | Transmit the right channel data | 0                               | x                               |
| Mono mode              | Transmit the left channel data              | Transmit the left channel data  | 1                               | 0                               |
|                        | Transmit the right channel data             | Transmit the right channel data | 1                               | 1                               |
|                        | Transmit the right channel data             | Transmit the right channel data | 2                               | 0                               |
|                        | Transmit the left channel data              | Transmit the left channel data  | 2                               | 1                               |
|                        | Transmit the value of "single" <sup>3</sup> | Transmit the right channel data | 3                               | 0                               |
|                        | Transmit the left channel data              | Transmit the value of "single"  | 3                               | 1                               |
|                        | Transmit the left channel data              | Transmit the value of "single"  | 4                               | 0                               |
|                        | Transmit the value of "single"              | Transmit the right channel data | 4                               | 1                               |

<sup>1</sup> [I2S\\_TX\\_CHAN\\_MOD](#)

<sup>2</sup> [I2S\\_TX\\_WS\\_IDLE\\_POL](#)

<sup>3</sup> The "single" value is equal to the value of [I2S\\_SINGLE\\_DATA](#).

If the **PCM-to-PDM converter is enabled** for I2S<sub>0</sub>, the PCM data through GDMA is converted to PDM data and then output in PDM signal format. Configure [I2S\\_PCM2PDM\\_CONV\\_EN](#) to enable the converter. The register configuration for the PCM-to-PDM converter is as follows:

- Configure 1-line PDM output format or 1-/2-line DAC output mode as the table below:

**Table 41.9-5. I2S<sub>0</sub> PCM-to-PDM Data Output**

| Channel Output Format                 | <a href="#">I2S_TX_PDM_DAC_MODE_EN</a> | <a href="#">I2S_TX_PDM_DAC_2OUT_EN</a> |
|---------------------------------------|--|--|
| 1-line PDM output format <sup>1</sup> | 0                                      | x                                      |
| 1-line DAC output format <sup>2</sup> | 1                                      | 0                                      |
| 2-line DAC output format              | 1                                      | 1                                      |

**Note:**

- In PDM output format, SD data of two channels is sent out in one WS period.
- In DAC output format, SD data of one channel is sent out in one WS period.
- 1-line PDM/DAC output format uses I2S<sub>n</sub>O\_Data\_out as the data output line.
- 2-line DAC output format uses I2S<sub>n</sub>O\_Data\_out and I2S<sub>n</sub>O\_Data1\_out as data output lines.
- In terms of application, the PDM output format is targeted at applications that require clock signals and can decode PDM format codecs, while the DAC output format is targeted at applications that do not rely on clock signals, do not have PDM format codecs, and can recover analog waveforms directly through low-pass filtering.

- Configure sampling frequency and upsampling rate as below:

When the I2S<sup>0</sup> PCM-to-PDM converter is enabled, PDM clock frequency is equal to BCK frequency. The relation of sampling frequency ( $f_{\text{Sampling}}$ , the sampling frequency of PCM data) and BCK frequency (the sampling frequency of PDM data) is as follows:

$$f_{\text{Sampling}} = \frac{f_{\text{BCK}}}{\text{OSR}}$$

Upsampling rate (OSR) is related to `I2S_TX_PDM_SINC_OSR2` as follows:

$$\text{OSR} = \text{I2S\_TX\_PDM\_SINC\_OSR2} \times 64$$

Sampling frequency  $f_{\text{Sampling}}$  is related to `I2S_TX_PDM_FS` as follows:

$$f_{\text{Sampling}} = \text{I2S\_TX\_PDM\_FS} \times 100$$

Configure the registers according to the needed sampling frequency, upsampling rate, and PDM clock frequency.

### PDM Channel Configuration Example

In this example of I2S<sup>0</sup>, the register configuration is as follows.

- `I2S_PCM2PDM_CONV_EN` = 0, i.e., transmit the raw PDM data.
- `I2S_TX_MONO` = 0, i.e., data is fetched from memory via GDMA in both the high and low levels of WS.
- `I2S_TX_CHAN_MOD` = 2, i.e., mono mode is selected.
- `I2S_TX_WS_IDLE_POL` = 1, i.e., both the left and right channels transmit the left channel data, and the right channel data will be discarded.

Once the configuration is done, assume that the data in memory **after data format control** is:

|      |       |      |       |     |      |       |
|------|-------|------|-------|-----|------|-------|
| Left | Right | Left | Right | ... | Left | Right |
|------|-------|------|-------|-----|------|-------|

#### Note:

1. The data above refers to the processed data after data format control instead of the original data.
2. “Left” and “Right” represent channel data, and their bit widths are channel valid data width. Please refer to Section 41.9.1.

Then the channel data is transmitted after channel mode control as follows.

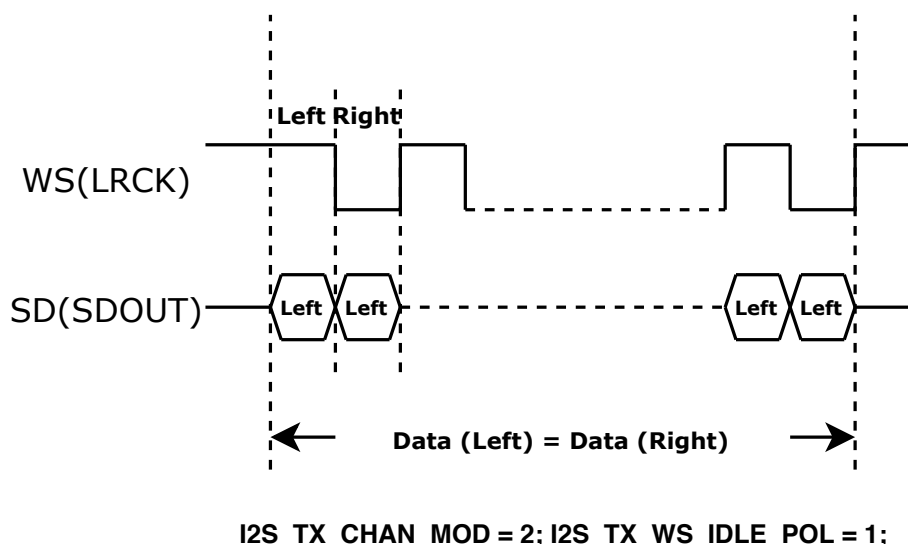

Figure 41.9-3. PDM Channel Control Example

### 41.9.3 Synchronous Counter

ESP32-P4 I2S<sub>n</sub> TX unit contains synchronous counters to reflect the current I2S<sub>n</sub> data transmission status. The counters can be used to detect I2S<sub>n</sub> transmit data errors or to synchronize data when multiple devices are using I2S<sub>n</sub> for data transmission.

ESP32-P4 I2S<sub>n</sub> contains two types of synchronous counters:

- [I2S\\_TX\\_FIFO\\_CNT](#)
  - Each time the I2S<sub>n</sub> TX FIFO reads data, the counter is incremented by 1.
  - The counter can be reset by setting [I2S\\_TX\\_FIFO\\_CNT\\_RST](#).
  - The counter is 31-bit wide and is automatically reset to zero on overflow.
- [I2S\\_TX\\_BCK\\_CNT](#)
  - Each time I2S<sub>n</sub> TX transmits a BCK cycle, the counter is incremented by 1.
  - The counter can be reset by setting [I2S\\_TX\\_BCK\\_CNT\\_RST](#).
  - The counter is 31-bit wide and is automatically reset to zero on overflow.

**Note:**

- Each time the I2S<sub>n</sub> TX FIFO transmits data, a channel data is sent. Therefore, when I2S<sub>n</sub> transmits the data correctly,  $I2S\_TX\_BCK\_CNT = I2S\_TX\_FIFO\_CNT \times \text{the bit width of channel TX data}$  (see Section 41.9.1.4).
- When the I2S<sub>n</sub> TX unit transmits the data, there is some delay between fetching data from the FIFO and transmitting it to the line, so the value of [I2S\\_TX\\_BCK\\_CNT](#) might be a little different from that of [I2S\\_TX\\_FIFO\\_CNT](#).

#### Application scenarios

##### 1. I2S TX synchronization for multiple devices

When multiple devices transmit data through the I2S TX at the same time, desynchronization may occur after a long period of time due to small frequency differences in the clock sources. In this case, read the

`I2S_TX_FIFO_CNT` value of each device to determine the location of the audio data being sent to perform synchronization.

## 2. I2S TX stability check

When the device is in an application scenario with high GDMA usage, there may be numbers missing in I2S TX occasionally due to multiplexing arbitration. In this case, check the ratio of `I2S_TX_BCK_CNT` to `I2S_TX_FIFO_CNT` to confirm the stability of the device when running I2S TX.

## 41.10 Receiving Data

In RX mode, I2S<sub>n</sub> first reads data from the peripheral interface and then stores the data in memory via GDMA according to the configured channel mode and data mode.

### 41.10.1 Channel Mode Control

ESP32-P4 I2S<sub>n</sub> supports both TDM RX mode and PDM RX mode. Set `I2S_RX_TDM_EN` to enable TDM RX mode, or set `I2S_RX_PDM_EN` to enable PDM RX mode.

**Note:**

`I2S_RX_TDM_EN` and `I2S_RX_PDM_EN` must not be cleared or set simultaneously.

#### 41.10.1.1 TDM RX Mode

In TDM RX mode, I2S<sub>n</sub> supports up to 16 channels to input data. The total number of RX channels in use is controlled by `I2S_RX_TDM_TOT_CHAN_NUM`. For example, if `I2S_RX_TDM_TOT_CHAN_NUM` is set to 5, channel 0 ~ 5 will be used to receive data.

In these RX channels, if `I2S_RX_TDM_CHANn_EN` is set to:

- 1: The channel data is valid and will be stored into RX FIFO;
- 0: The channel data is invalid and will not be stored into RX FIFO.

In TDM master mode, WS signal is controlled by `I2S_RX_WS_IDLE_POL` and `I2S_RX_TDM_WS_WIDTH`.

- `I2S_RX_WS_IDLE_POL`: The default level of WS signal;
- `I2S_RX_TDM_WS_WIDTH`: The cycles the WS default level lasts for when receiving all channel data.

`I2S_RX_HALF_SAMPLE_BITS` x 2 is equal to the BCK cycles in one WS period.

#### 41.10.1.2 PDM RX Mode

In PDM RX mode, I2S<sub>n</sub> supports both PDM raw data reception and PDM-to-PCM data format conversion (the latter only supported by I2S<sub>0</sub>).

In PDM RX mode, I2S<sub>n</sub> converts the serial data from channels to the data to be entered into memory.

In PDM RX master mode, the default level of the WS signal is controlled by `I2S_RX_WS_IDLE_POL`. WS frequency is half of the BCK frequency. The configuration of the BCK signal is similar to that of WS signal as described in Section 41.6. Note, in PDM RX mode, the value of `I2S_RX_HALF_SAMPLE_BITS` must be same as that of `I2S_RX_BITS_MOD`.

When the **PDM-to-PCM converter is enabled** for I2S0, the received PDM data is converted to PCM data and controlled according to the data mode. Configure [I2S\\_RX\\_PDM2PCM\\_EN](#) to enable this converter. The register configuration for PDM-to-PCM converter is as follows:

- Configure sampling frequency and downsampling rate.

When I2S0 PDM-to-PCM converter is enabled, PDM clock frequency is:

- in master mode: PDM clock frequency is equal to BCK frequency.
- in slave mode: PDM clock is provided by external device.

The sampling frequency ( $f_{\text{Sampling}}$ ) is related to PDM clock frequency as follows:

$$f_{\text{Sampling}} = \frac{f_{\text{PDM}}}{\text{DSR}}$$

Downsampling rate (DSR) is related to [I2S\\_RX\\_PDM\\_SINC\\_DSR\\_16\\_EN](#) as follows:

$$\text{DSR} = \text{I2S\_RX\_PDM\_SINC\_DSR\_16\_EN} \times 64$$

Configure the registers according to needed master/slave mode, sampling frequency, and downsampling rate.

- Configure valid channels.

When the PDM-to-PCM converter is enabled, input signals from eight channels are supported at most. See Table 41.10-1 for the register configuration and related channels.

**Table 41.10-1. PDM-to-PCM Data Input**

| Input Data Signal | Channel       | Enable Register                         |
|-------------------|---------------|---|
| I2S0I_Data_in     | Left channel  | <a href="#">I2S_RX_TDM_PDM_CHAN0_EN</a> |
|                   | Right channel | <a href="#">I2S_RX_TDM_PDM_CHAN1_EN</a> |
| I2S0I1_Data_in    | Left channel  | <a href="#">I2S_RX_TDM_PDM_CHAN2_EN</a> |
|                   | Right channel | <a href="#">I2S_RX_TDM_PDM_CHAN3_EN</a> |
| I2S0I2_Data_in    | Left channel  | <a href="#">I2S_RX_TDM_PDM_CHAN4_EN</a> |
|                   | Right channel | <a href="#">I2S_RX_TDM_PDM_CHAN5_EN</a> |
| I2S0I3_Data_in    | Left channel  | <a href="#">I2S_RX_TDM_PDM_CHAN6_EN</a> |
|                   | Right channel | <a href="#">I2S_RX_TDM_PDM_CHAN7_EN</a> |

## 41.10.2 Data Format Control

The data format of I2S<sub>n</sub> is controlled in the following phases:

- Phase I: Serial input data is converted into the data to be saved to RX FIFO;
- Phase II: The data is read from RX FIFO and converted according to the input data mode.

### 41.10.2.1 Bit Order Control of Channel Data

The channel data will be stored as the data to be input in order from high to low. The data bit order in each channel is controlled by [I2S\\_RX\\_BIT\\_ORDER](#):

- 0: The bit order of the data to be input is not reversed;
- 1: The bit order of the data to be input is reversed.

At this point, the first phase of data format control is completed. The data to be input after bit order control is stored in the RX FIFO.

#### 41.10.2.2 Bit Width Control of Channel Storage (Valid) Data

The storage data width in each channel is controlled by [I2S\\_RX\\_BITS\\_MOD](#) and [I2S\\_RX\\_24\\_FILL\\_EN](#). See the table below.

Table 41.10-2. Channel Storage Data Width

| Channel Storage Data Width | <a href="#">I2S_RX_BITS_MOD</a> | <a href="#">I2S_RX_24_FILL_EN</a> |
|----------------------------|---------------------------------|-----------------------------------|
| 32                         | 31                              | x                                 |
|                            | 23                              | 1                                 |
| 24                         | 23                              | 0                                 |
| 16                         | 15                              | x                                 |
| 8                          | 7                               | x                                 |

#### 41.10.2.3 Bit Width Control of Channel RX Data

The RX data width in each channel is determined by [I2S\\_RX\\_TDM\\_CHAN\\_BITS](#).

- If the storage data width in each channel is smaller than the received (RX) data width, then only the bits within the storage data width is saved into memory. Configure [I2S\\_RX\\_LEFT\\_ALIGN](#) to:
  - 0: Only the lower bits of the received data within the storage data width is stored to memory;
  - 1: Only the higher bits of the received data within the storage data width is stored to memory.
- If the received data width is smaller than the storage data width in each channel, the higher bits of the received data will be filled with zeros and then the data is saved to memory.

#### 41.10.2.4 Endian Control of Channel Storage Data

The received data is then converted into storage data (to be stored to memory) after some processing, such as discarding extra bits or filling zeros in missing bits. The endian of the storage data is controlled by [I2S\\_RX\\_BIG\\_ENDIAN](#) under various data width. See the table below.

Table 41.10-3. Channel Storage Data Endian

| Channel Storage Data Width | Original Data    | Endian of Processed Data | <a href="#">I2S_RX_BIG_ENDIAN</a> |
|----------------------------|------------------|--------------------------|-----------------------------------|
| 32                         | {B3, B2, B1, B0} | {B3, B2, B1, B0}         | 0                                 |
|                            |                  | {B0, B1, B2, B3}         | 1                                 |
| 24                         | {B2, B1, B0}     | {B2, B1, B0}             | 0                                 |
|                            |                  | {B0, B1, B2}             | 1                                 |
| 16                         | {B1, B0}         | {B1, B0}                 | 0                                 |
|                            |                  | {B0, B1}                 | 1                                 |
| 8                          | {B0}             | {B0}                     | x                                 |

### 41.10.2.5 A-law/ $\mu$ -law Compression and Decompression

ESP32-P4 I2S<sub>n</sub> compresses/decompresses the storage data in 32-bit by A-law or by  $\mu$ -law. By default, zeros are filled into high bits.

Configure [I2S\\_RX\\_PCM\\_BYPASS](#):

- 0: Compress or decompress the data
- 1: Do not compress or decompress the data

Configure [I2S\\_RX\\_PCM\\_CONF](#):

- 0: Decompress the data using A-law
- 1: Compress the data using A-law
- 2: Decompress the data using  $\mu$ -law
- 3: Compress the data using  $\mu$ -law

At this point, the data format control is completed. Data then is stored into memory via GDMA.

## 41.11 Event Task Matrix Feature

ESP32-P4 I2S<sub>n</sub> supports the Event Task Matrix (ETM) function, which allows I2S<sub>n</sub>'s ETM tasks to be triggered by any peripherals' ETM events, or I2S<sub>n</sub>'s ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM tasks and events related to I2S<sub>n</sub>. For more information, please refer to [Chapter 12 Event Task Matrix \(ETM\)](#).

I2S<sub>n</sub> can receive the following ETM tasks:

- I2S<sub>n</sub>\_TASK\_START\_TX: Enables I2S<sub>n</sub> TX for data transfer.
- I2S<sub>n</sub>\_TASK\_START\_RX: Enables I2S<sub>n</sub> RX for data transfer.
- I2S<sub>n</sub>\_TASK\_STOP\_TX: Stops I2S<sub>n</sub> TX data transfer.
- I2S<sub>n</sub>\_TASK\_STOP\_RX: Stops I2S<sub>n</sub> RX data transfer.

I2S<sub>n</sub> can generate the following ETM events:

- I2S<sub>n</sub>\_EVT\_TX\_DONE: Indicates that I2S<sub>n</sub> TX has completed data transmission.
- I2S<sub>n</sub>\_EVT\_RX\_DONE: Indicates that I2S<sub>n</sub> RX has completed data reception.
- I2S<sub>n</sub>\_EVT\_X\_WORDS\_SENT: Indicates that the word number sent by I2S<sub>n</sub> TX is equal to or larger than the value set by [I2S\\_ETM\\_TX\\_SEND\\_WORD\\_NUM](#).
- I2S<sub>n</sub>\_EVT\_X\_WORDS\_RECEIVED: Indicates that the word number received by I2S<sub>n</sub> RX is equal to or larger than the value set by [I2S\\_ETM\\_RX\\_RECEIVE\\_WORD\\_NUM](#).

In practical applications, I2S<sub>n</sub>'s ETM events can trigger its own ETM tasks. For example, the I2S<sub>n</sub>\_EVT\_X\_WORDS\_SENT event can trigger the I2S<sub>n</sub>\_TASK\_STOP\_TX task, and in this way stop the I2S<sub>n</sub> operation through ETM.

## 41.12 I2S Interrupts

ESP32-P4's I2S $n$  can generate the I2S $n$ \_INTR interrupt signal that will be sent to the [Interrupt Matrix](#). There are several internal interrupt sources from I2S $n$  that can generate the above interrupt signal(s) as follows:

- I2S $n$ \_TX\_HUNG\_INT: Triggered when data transmission is timed out. For example, if the I2S $n$  module is configured as TX slave mode, but the master does not provide BCK or WS signals for a long time (specified in [I2S\\_LC\\_HUNG\\_CONF\\_REG](#)), this interrupt will be triggered.
- I2S $n$ \_RX\_HUNG\_INT: Triggered when the data reception is timed out. For example, if the I2S $n$  module is configured as RX slave mode, but the master does not transmit data for a long time (specified in [I2S\\_LC\\_HUNG\\_CONF\\_REG](#)), this interrupt will be triggered.
- I2S $n$ \_TX\_DONE\_INT: Triggered when data transmission is completed.
- I2S $n$ \_RX\_DONE\_INT: Triggered when the data reception is completed.

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter [11 Interrupt Matrix](#) > Section [11.2 Interrupt Terminology in ESP32-P4](#).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section [41.14 Register Summary](#).

## 41.13 Software Configuration Process

### 41.13.1 Configure I2S as TX Mode

Follow the steps below to configure I2S $n$  as TX mode via software:

1. Configure the clock as described in Section [41.6](#).
2. Configure signal pins according to Table [41.4-1](#).
3. Select the mode needed by configuring [I2S\\_TX\\_SLAVE\\_MOD](#).
  - 0: Master TX mode
  - 1: Slave TX mode
4. Set needed TX data mode and TX channel mode as described in Section [41.9](#), and then set [I2S\\_TX\\_UPDATE](#).
5. Reset TX unit and TX FIFO as described in Section [41.7](#).
6. Enable corresponding interrupts. See Section [41.12](#).
7. Configure GDMA outlink.
8. Set [I2S\\_TX\\_STOP\\_EN](#) if needed. For more information, please refer to Section [41.8.1](#).
9. Start transmitting data:
  - In master mode, wait till I2S $n$  slave gets ready, then set [I2S\\_TX\\_START](#) to start transmitting data;

- In slave mode, set [I2S\\_TX\\_START](#). When the I2S<sub>n</sub> master supplies BCK and WS signals, I2S<sub>n</sub> slave starts transmitting data.
10. Wait for the interrupt signals set in Step 6, or check whether the transfer is completed by querying [I2S\\_TX\\_IDLE](#):
    - 0: Transmitter is working;
    - 1: Transmitter is in idle state.
  11. Clear [I2S\\_TX\\_START](#) to stop data transfer.

### 41.13.2 Configure I2S as RX Mode

Follow the steps below to configure I2S<sub>n</sub> as RX mode via software:

1. Configure the clock as described in Section 41.6.
2. Configure signal pins according to Table 41.4-1.
3. Select the mode needed by configuring [I2S\\_RX\\_SLAVE\\_MOD](#).
  - 0: Master RX mode
  - 1: Slave RX mode
4. Set needed RX data mode and RX channel mode as described in Section 41.10, and then set [I2S\\_RX\\_UPDATE](#).
5. Reset the RX unit and its FIFO according to Section 41.7.
6. Enable the corresponding interrupts. See Section 41.12.
7. Configure GDMA inlink and set the length of RX data by configuring [I2S\\_RX\\_EOF\\_NUM\\_REG](#).
8. Start receiving data:
  - In master mode, when the slave is ready, set [I2S\\_RX\\_START](#) to start receiving data.
  - In slave mode, set [I2S\\_RX\\_START](#) to start receiving data when BCK and WS signals are received from the master.
9. The received data is then stored to the specified memory address according to the configuration of GDMA. Then the corresponding interrupt set in step 6 is generated.

## 41.14 Register Summary

The addresses in this section are relative to I2S<sub>n</sub> base address provided in Table 6.3-2 in Chapter 6 [System and Memory](#).

The abbreviations given in Column **Access** are explained in Section [Access Types for Registers](#).

| Name  | Description  | Address | Access   |
|---|--|---------|----------|
| <b>Interrupt registers</b>                    |  |         |          |
| <a href="#">I2S_INT_RAW_REG</a>               | I2S interrupt raw register   | 0x000C  | R/SS/WTC |
| <a href="#">I2S_INT_ST_REG</a>                | I2S interrupt status register  | 0x0010  | RO       |
| <a href="#">I2S_INT_ENA_REG</a>               | I2S interrupt enable register  | 0x0014  | R/W      |
| <a href="#">I2S_INT_CLR_REG</a>               | I2S interrupt clear register   | 0x0018  | WT       |
| <b>RX control and configuration registers</b> |  |         |          |
| <a href="#">I2S_RX_CONF_REG</a>               | I2S RX configuration register  | 0x0020  | varies   |
| <a href="#">I2S_RX_CONF1_REG</a>              | I2S RX configuration register 1  | 0x0028  | R/W      |
| <a href="#">I2S_RX_PDM2PCM_CONF_REG</a>       | I2S RX PDM-to-PCM configuration register                               | 0x0048  | R/W      |
| <a href="#">I2S_RX_TDM_CTRL_REG</a>           | I2S TX TDM mode control register                                       | 0x0050  | R/W      |
| <a href="#">I2S_RXEOF_NUM_REG</a>             | I2S RX data number control register                                    | 0x0064  | R/W      |
| <b>TX control and configuration registers</b> |  |         |          |

**I2S\_RX\_DONE\_INT\_CLR** Write 1 to clear the [I2S\\_RX\\_DONE\\_INT](#) interrupt. (WT)

**I2S\_TX\_DONE\_INT\_CLR** Write 1 to clear the [I2S\\_TX\\_DONE\\_INT](#) interrupt. (WT)

**I2S\_RX\_HUNG\_INT\_CLR** Write 1 to clear the [I2S\\_RX\\_HUNG\\_INT](#) interrupt. (WT)

**I2S\_TX\_HUNG\_INT\_CLR** Write 1 to clear the [I2S\\_TX\\_HUNG\\_INT](#) interrupt. (WT)

### Register 41.5. I2S\_RX\_CONF\_REG (0x0020)

[illegible]

**I2S\_RX\_RESET** Configures whether to reset RX unit.

0: No effect

1: Reset

(WT)

**I2S\_RX\_FIFO\_RESET** Configures whether to reset RX FIFO.

0: No effect

1: Reset

(WT)

**I2S\_RX\_START** Configures whether to start receiving data.

0: No effect

1: Start

(R/W/SC)

**I2S\_RX\_SLAVE\_MOD** Configures whether to enable slave RX mode.

0: Enable master mode

## 1: Enable slave mode

(R/W)

**I2S\_RX\_STOP\_MODE** Configures when I2S RX stop data reception.

0: Only stops when I2S\_RX\_START is cleared

1: Stops when `I2S_RX_START` is cleared or the number of received bytes is greater than the value configured in `I2S_RX_EOF_NUM_REG`

2: Stops when `I2S_RX_START` is cleared or GDMA RX FIFO is full

(R/W)

**I2S\_RX\_MONO** Configures whether to enable RX unit in mono mode.

0: Disable

1: Enable

(R/W)

**I2S\_RX\_BIG\_ENDIAN** Configures I2S RX byte endian.

0: Low address data is saved to low address

1: Low address data is saved to high address

(R/W)

Continued on the next page...

**Register 41.5. I2S\_RX\_CONF\_REG (0x0020)**

Continued from the previous page...

**I2S\_RX\_UPDATE** Configures whether to update I2S RX registers from APB clock domain to I2S RX clock domain. This bit will be cleared by hardware after the register update is done.

0: No effect

1: Update

(R/W/SC)

**I2S\_RX\_MONO\_FST\_VLD** Configures the valid data channel in I2S RX mono mode.

0: The second channel data valid

1: The first channel data valid

(R/W)

**I2S\_RX\_PCM\_CONF** Configures I2S RX compress/decompress mode.

0 (atol): A-law decompress

1 (ltoa): A-law compress

2 (utol):  $\mu$ -law decompress

3 (ltou):  $\mu$ -law compress

(R/W)

**I2S\_RX\_PCM\_BYPASS** Configures whether to bypass the Compress/Decompress units for received data.

0: No effect

1: Bypass

(R/W)

**I2S\_RX\_MSB\_SHIFT** Configures the timing between the WS signal and the MSB of data.

0: Align at the rising edge

1: The WS signal changes one BCK clock earlier

(R/W)

**I2S\_RX\_LEFT\_ALIGN** Configures I2S RX alignment mode.

0: Right alignment mode

1: Left alignment mode

(R/W)

Continued on the next page...

**Register 41.5. I2S\_RX\_CONF\_REG (0x0020)**

Continued from the previous page...

**I2S\_RX\_24\_FILL\_EN** Configures the bit number that the 24-bit channel data is stored to.

0: Store 24-bit channel data to 24 bits

1: Store 24-bit channel data to 32 bits (Extra bits are filled with zeros)

(R/W)

**I2S\_RX\_WS\_IDLE\_POL** Configures the relationship between WS level and which channel data to receive.

0: WS remains low when receiving left channel data and high when receiving right channel data

1: WS remains high when receiving left channel data and low when receiving right channel data

(R/W)

**I2S\_RX\_BIT\_ORDER** Configures whether to reverse the bit order of the I2S RX data to be received.

0: Not reverse

1: Reverse

(R/W)

**I2S\_RX\_TDM\_EN** Configures whether to enable I2S TDM RX mode.

0: Disable

1: Enable

(R/W)

**I2S\_RX\_PDM\_EN** Configures whether to enable I2S PDM RX mode.

0: Disable

1: Enable

(R/W)

**I2S\_RX\_BCK\_DIV\_NUM** Configures the divider of BCK in RX mode. Note this divider must not be configured to 1. (R/W)

Register 41.6. I2S\_RX\_CONF1\_REG (0x0028)

|                      |    |     |    |    |    |     |   |                         |   |   |   |   |     |  |  |                 |       |  |  |  |  |  |  |            |  |  |  |  |  |  |  |                     |  |  |  |  |  |  |  |

| 0xf                  |    | 0xf |    |    |    | 0xf |   | 0                       | 0 | 0 | 0 | 0 | 0x0 |  |  |                 | Reset |  |  |  |  |  |  |            |  |  |  |  |  |  |  |                     |  |  |  |  |  |  |  |

**I2S\_RX\_TDM\_WS\_WIDTH** Configures the width of I2S<sub>nl</sub>\_WS\_out (WS default level) at idle level in TDM mode. Width of I2S<sub>nl</sub>\_WS\_out at idle level in TDM mode = (I2S\_RX\_TDM\_WS\_WIDTH[8:0] + 1) x T\_BCK. (R/W)

**I2S\_RX\_BITS\_MOD** Configures the valid data bit length of I2S RX channel.

- 7: All the valid channel data is in 8-bit mode
  - 15: All the valid channel data is in 16-bit mode
  - 23: All the valid channel data is in 24-bit mode
  - 31: All the valid channel data is in 32-bit mode
  - Other values are invalid.
- (R/W)

**I2S\_RX\_HALF\_SAMPLE\_BITS** Configures I2S RX sample bits. BCK cycles in one WS period = I2S\_RX\_HALF\_SAMPLE\_BITS x 2. (R/W)

**I2S\_RX\_TDM\_CHAN\_BITS** Configures RX bit number for each channel in TDM mode. Bit number expected = I2S\_RX\_TDM\_CHAN\_BITS + 1. (R/W)

### Register 41.7. I2S\_RX\_PDM2PCM\_CONF\_REG (for I2S0 only) (0x0048)

[illegible]

**I2S\_RX\_PDM2PCM\_EN** Configures whether to enable the PDM-to-PCM converter in RX mode.

0: Disable

1: Enable

(R/W)

**I2S\_RX\_PDM\_SINC\_DSR\_16\_EN** Configures the downsampling rate of PDM RX filter group 1 module.

0: 64

1: 128

(R/W)

**I2S\_RX\_PDM2PCM\_AMPLIFY\_NUM** Configures the PDM-to-PCM RX amplify number. PCM data will be multiplied by this value before outputting.

(R/W)

**I2S\_RX\_PDM\_HP\_BYPASS** Configures whether PDM-to-PCM RX bypasses the HP filter.

0: Not bypass

1: Bypass

(R/W)

### Register 41.8. I2S\_RX\_TDM\_CTRL\_REG (0x0050)

[illegible]

**I2S\_RX\_TDM\_PDM\_CHAN $n$ \_EN ( $n$ : 0-7)** Configures whether to enable the valid data input of I2S RX TDM or PDM channel  $n$ .

0: Disable. Channel *n* only inputs 0

1: Enable

(R/W)

**I2S\_RX\_TDM\_CHAN $n$ \_EN** ( $n$ : 8-15) Configures whether to enable the valid data input of I2S RX TDM channel  $n$ .

0: Disable. Channel *n* only inputs 0

1: Enable

(R/W)

**I2S\_RX\_TDM\_TOT\_CHAN\_NUM** Configures the total number of channels in use in I2S RX TDM mode. Total channel number in use = I2S\_RX\_TDM\_TOT\_CHAN\_NUM + 1. (R/W)

### Register 41.9. I2S\_RXEOF\_NUM\_REG (0x0064)

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|----------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| (reserved)                                  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | I2S_RX_EOF_NUM |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 31  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0              |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0x40           |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Reset                                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

**I2S\_RX\_EOF\_NUM** Configures the bit length of RX data. Bit length of RX data = (I2S\_RX\_BITS\_MOD + 1) x (I2S\_RX\_EOF\_NUM + 1). Once the received data reaches such bit length, an **AHB\_DMA\_IN\_SUC\_EOF\_CHn\_INT** interrupt is triggered in the configured GDMA RX channel. (R/W)

**Register 41.10. I2S\_TX\_CONF\_REG (0x0024)**

**I2S\_TX\_RESET** Configures whether to reset TX unit.

0: No effect

1: Reset

(WT)

**I2S\_TX\_FIFO\_RESET** Configures whether to reset TX FIFO.

0: No effect

1: Reset

(WT)

**I2S\_TX\_START** Configures whether to start transmitting data.

0: No effect

1: Start

(R/W/SC)

**I2S\_TX\_SLAVE\_MOD** Configures whether to enable slave TX mode.

0: Enable master mode

1: Enable slave mode

(R/W)

**I2S\_TX\_STOP\_EN** Configures whether to stop outputting the BCK signal and the WS signal when TX FIFO is empty.

0: No effect

1: Stop

(R/W)

**I2S\_TX\_CHAN\_EQUAL** Configures whether to equalize left channel data and right channel data in I2S TX mono mode or TDM mode.

0: The I2S\_SINGLE\_DATA is invalid channel data in I2S TX mono mode or TDM mode

1: The left channel data is equal to right channel data in I2S TX mono mode or TDM mode

(R/W)

**I2S\_TX\_MONO** Configures whether to enable TX unit in mono mode.

0: Disable

1: Enable

(R/W)

Continued on the next page...

**Register 41.10. I2S\_TX\_CONF\_REG (0x0024)**

Continued from the previous page...

**I2S\_TX\_BIG\_ENDIAN** Configures I2S TX byte endian.

0: Low address with low address value

1: Low address value to high address

(R/W)

**I2S\_TX\_UPDATE** Configures whether to update I2S TX registers from APB clock domain to I2S TX clock domain.

0: No effect

1: Update

This bit will be cleared by hardware after update register done.

(R/W/SC)

**I2S\_TX\_MONO\_FST\_VLD** Configures the valid data channel in I2S TX mono mode.

0: The second channel data valid

1: The first channel data valid

(R/W)

**I2S\_TX\_PCM\_CONF** Configures the I2S TX compress/decompress mode.

0 (atol): A-law decompress

1 (ltoa): A-law compress

2 (utol):  $\mu$ -law decompress

3 (ltou):  $\mu$ -law compress

(R/W)

**I2S\_TX\_PCM\_BYPASS** Configures whether to bypass Compress/Decompress units for transmitted data.

0: No effect

1: Bypass

(R/W)

**I2S\_TX\_MSB\_SHIFT** Configures the timing between the WS signal and the MSB of data.

0: Align at the rising edge

1: WS signal changes one BCK clock earlier

(R/W)

**I2S\_TX\_BCK\_NO\_DLY** Configures the source of the BCK rising and falling edges in master mode.

0: Rising and falling edges are constructed based on the BCK input from I2S<sub>n</sub>O\_BCK\_in

1: Rising and falling edges are constructed by dividing the clock of I2S<sub>n</sub> TX

(R/W)

**I2S\_TX\_LEFT\_ALIGN** Configures I2S TX alignment mode.

0: Right alignment mode

1: Left alignment mode

(R/W)

Continued on the next page...

**Register 41.10. I2S\_TX\_CONF\_REG (0x0024)**

Continued from the previous page...

**I2S\_TX\_24\_FILL\_EN** Configures the bit number that the 24 channel bits are stored to.

0: Store 24-bit channel data to 24 bits

1: Store 24-bit channel data to 32 bits (Extra bits are filled with zeros)

(R/W)

**I2S\_TX\_WS\_IDLE\_POL** Configures the relationship between WS and which channel data to transmit.

0: WS remains low when transmitting left channel data and high when transmitting right channel data

1: WS remains high when transmitting left channel data and low when transmitting right channel data

(R/W)

**I2S\_TX\_BIT\_ORDER** Configures whether to reverse the bit order of valid data to be sent by the I2S TX.

0: Not reverse

1: Reverse

(R/W)

**I2S\_TX\_TDM\_EN** Configures whether to enable I2S TDM TX mode.

0: Disable

1: Enable

(R/W)

**I2S\_TX\_PDM\_EN** Configures whether to enable I2S PDM TX mode.

0: Disable

1: Enable

(R/W)

**I2S\_TX\_BCK\_DIV\_NUM** Configures the divider of BCK in TX mode. Note this divider must not be configured to 1. (R/W)

**I2S\_TX\_CHAN\_MOD** Configures I2S TX channel mode. For more information, see Table [41.9-4](#).

(R/W)

**I2S\_SIG\_LOOPBACK** Configures whether to enable TX unit and RX unit sharing the same WS and BCK signals.

0: Disable

1: Enable

(R/W)

### Register 41.11. I2S\_TX\_CONF1\_REG (0x002C)

|                      |  |    |  |  |  |                         |  |    |  |  |  |                 |  |    |  |  |  |            |  |   |  |  |  |                     |  |   |  |  |  |       |

**I2S\_TX\_PDM\_SINC\_OSR2** Configures I2S TX PDM OSR value. (R/W)

**I2S\_TX\_PDM\_DAC\_2OUT\_EN** Configures whether to enable I2S TX PDM DAC mode.

0: Enable 1-line DAC output mode

1: Enable 2-line DAC output mode

Only valid when I2S\_TX\_PDM\_DAC\_MODE\_EN is set.

(R/W)

**I2S\_TX\_PDM\_DAC\_MODE\_EN** Configures whether to enable 1-line PDM output mode or DAC output mode.

0: Enable 1-line PDM output mode

1: Enable DAC output mode

(R/W)

**I2S\_PCM2PDM\_CONV\_EN** Configures whether to enable the I2S TX PCM-to-PDM converter.

0: Disable

1: Enable

(R/W)

**Register 41.13. I2S\_TX\_PCM2PDM\_CONF1\_REG (0x0044)**

 |  |

**I2S\_TX\_TDM\_CHAN $n$ \_EN ( $n$ : 0-15)** Configures whether to enable the valid data output of I2S TX TDM channel  $n$ .

0: Channel TX data is controlled by [I2S\\_TX\\_CHAN\\_EQUAL](#) and [I2S\\_SINGLE\\_DATA](#). See Section [41.9.2.1](#)

1: Enable

(R/W)

**I2S\_TX\_TDM\_TOT\_CHAN\_NUM** Configures the total number of channels in use in I2S TX TDM mode.

Total channel number in use = I2S\_TX\_TDM\_TOT\_CHAN\_NUM + 1. (R/W)

**I2S\_TX\_TDM\_SKIP\_MSK\_EN** Configures the data to be sent in GDMA TX buffer.

0: Data stored in GDMA TX buffer is used by enabled channels and will not be read by channels that are not enabled.

1: Data stored in GDMA TX buffer is read by all channels and will be skipped by channels that are not enabled.

(R/W)

Reset

**I2S\_RX\_SD\_IN\_DM** Configures the delay mode of I2S RX SD input signal.

0: Bypass

1: Delay by rising edge

2: Delay by falling edge

3: Reserved

(R/W)

**I2S\_RX\_SD1\_IN\_DM (for I2S0 only)** Configures the delay mode of I2S RX SD1 input signal. For detailed configuration values, please refer to [I2S\\_RX\\_SD\\_IN\\_DM](#). (R/W)

**I2S\_RX\_SD2\_IN\_DM (for I2S0 only)** Configures the delay mode of I2S RX SD2 input signal. For detailed configuration values, please refer to [I2S\\_RX\\_SD\\_IN\\_DM](#). (R/W)

**I2S\_RX\_SD3\_IN\_DM (for I2S0 only)** Configures the delay mode of I2S RX SD3 input signal. For detailed configuration values, please refer to [I2S\\_RX\\_SD\\_IN\\_DM](#). (R/W)

**I2S\_RX\_WS\_OUT\_DM** Configures the delay mode of I2S RX WS output signal. For detailed configuration values, please refer to [I2S\\_RX\\_SD\\_IN\\_DM](#). (R/W)

**I2S\_RX\_BCK\_OUT\_DM** Configures the delay mode of I2S RX BCK output signal. For detailed configuration values, please refer to [I2S\\_RX\\_SD\\_IN\\_DM](#). (R/W)

**I2S\_RX\_WS\_IN\_DM** Configures the delay mode of I2S RX WS input signal. For detailed configuration values, please refer to [I2S\\_RX\\_SD\\_IN\\_DM](#). (R/W)

**I2S\_RX\_BCK\_IN\_DM** Configures the delay mode of I2S RX BCK input signal. For detailed configuration values, please refer to [I2S\\_RX\\_SD\\_IN\\_DM](#). (R/W)

**I2S\_TX\_SD\_OUT\_DM** Configures the delay mode of I2S TX SD output signal.

- 0: Bypass
  - 1: Delay by rising edge
  - 2: Delay by falling edge
  - 3: Reserved
- (R/W)

**I2S\_TX\_SD1\_OUT\_DM (for I2S0 only)** Configures the delay mode of I2S TX SD1 output signal. For detailed configuration values, please refer to [I2S\\_TX\\_SD\\_OUT\\_DM](#). (R/W)

**I2S\_TX\_WS\_OUT\_DM** Configures the delay mode of I2S TX WS output signal. For detailed configuration values, please refer to [I2S\\_TX\\_SD\\_OUT\\_DM](#). (R/W)

**I2S\_TX\_BCK\_OUT\_DM** Configures the delay mode of I2S TX BCK output signal. For detailed configuration values, please refer to [I2S\\_TX\\_SD\\_OUT\\_DM](#). (R/W)

**I2S\_TX\_WS\_IN\_DM** Configures the delay mode of I2S TX WS input signal. For detailed configuration values, please refer to [I2S\\_TX\\_SD\\_OUT\\_DM](#). (R/W)

**I2S\_TX\_BCK\_IN\_DM** Configures the delay mode of I2S TX BCK input signal. For detailed configuration values, please refer to [I2S\\_TX\\_SD\\_OUT\\_DM](#). (R/W)

## Chapter 42

### LP I2S Controller

#### 42.1 Introduction

ESP32-P4 has a built-in LP I2S interface, which provides a data reception communication interface for [Voice Activity Detection \(VAD\)](#) and some digital audio applications in low power mode.

The I2S standard bus defines three signals, namely, a bit clock signal (BCK), a channel/word select signal (WS), and a serial data signal (SD). A basic I2S data bus has one master and one slave. The roles remain unchanged throughout the communication.

The LP I2S module on ESP32-P4 provides an independent RX unit, which supports receiving data when the chip is running with the lowest power consumption. Compared to HP I2S, i.e., I2S<sub>O</sub>, I2S<sub>1</sub>, and I2S<sub>2</sub>, LP I2S does not support DMA access. Instead, it uses a separate internal memory to store data.

**Note:**

For I2S-related terminology, refer to the Section [41.2 Terminology](#) in Chapter [41 I2S Controller \(I2S\)](#).

#### 42.2 Feature List

The LP I2S module has the following features:

- RX master mode and slave mode
- A variety of audio standards supported:
  - TDM Philips standard
  - TDM MSB alignment standard
  - TDM PCM standard
  - PDM standard
- Various RX modes supported:
  - TDM RX mode, up to 2 channels supported
  - PDM RX mode
    - \* Raw PDM data reception
    - \* PDM-to-PCM data format conversion, up to 2 channels supported
- Configurable sample clock with a variety of sampling frequencies supported
- 16-bit data communication

- Standard LP I2S interface interrupts

## 42.3 Architectural Overview

Figure 42.3-1 shows the structure of the ESP32-P4 LP I2S module, consisting of:

- Receive control unit (RX Unit)
- Input and output timing unit (I/O Sync)
- Clock divider (Clock Generator)
- 64 x 32-bit RX FIFO
- 256 x 32-bit LP I2S Memory
- Communication interface for Voice Activity Detection (VAD)

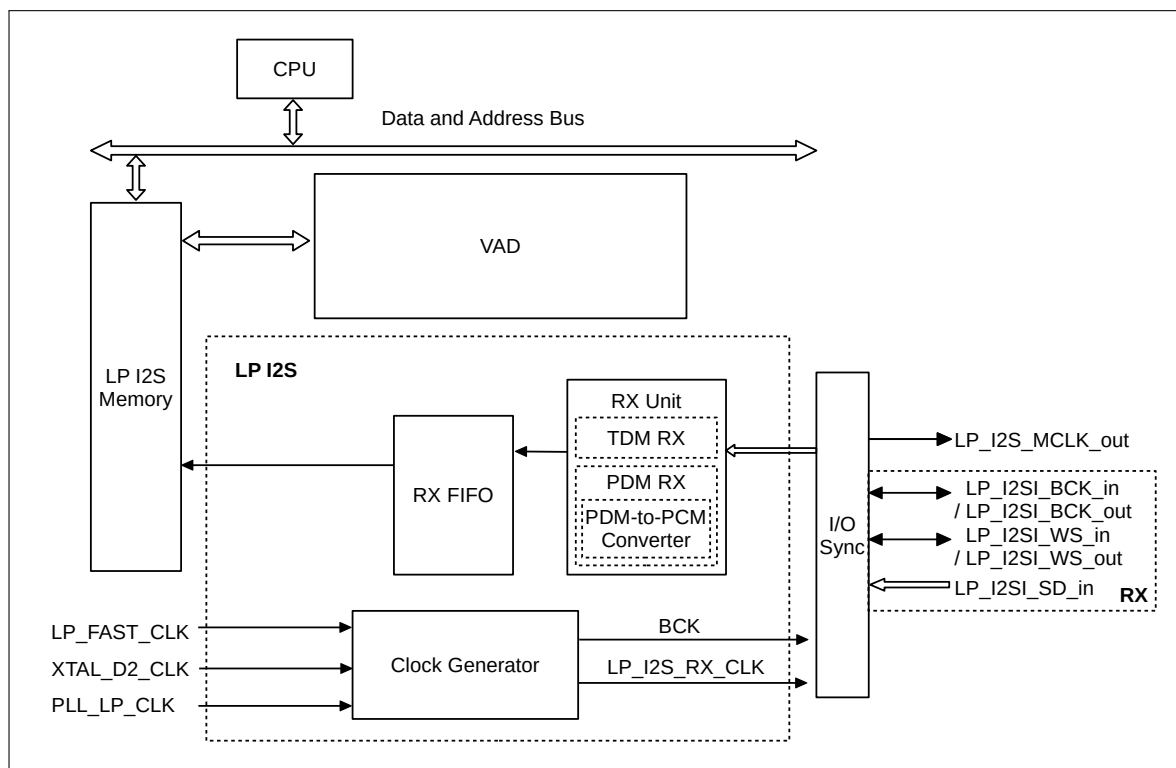

Figure 42.3-1. ESP32-P4 LP I2S Architecture

The RX unit have a three-line interface that uses a bit clock line (BCK), a word select line (WS), and a serial data line (SD). The SD line of the RX unit is dedicated for data input. BCK and WS signal lines for the RX unit can be configured as master output mode or slave input mode.

The signal bus of the LP I2S module is shown at the right part of Figure 42.3-1. The naming of these signals in RX units follows the pattern of LP\_I2SA\_B\_C, for example, LP\_I2SI\_BCK\_in.

- “A” is fixed to “I”, indicating that signals are input to the RX unit
- “B” represents the signal function, which includes:
  - BCK

- WS
- SD
- “C” represents the signal direction, which includes:
  - “in”: Input signal into the LP I2S module
  - “out”: Output signal from the LP I2S module

Table 42.3-1 provides a detailed description of LP I2S signals.

**Table 42.3-1. LP I2S Signal Description**

| Signal <sup>*</sup> | Direction | Function  |
|---------------------|-----------|---|
| LP_I2SI_BCK_in      | Input     | In LP I2S slave mode, inputs BCK signal for RX unit   |
| LP_I2SI_BCK_out     | Output    | In LP I2S master mode, outputs BCK signal for RX unit |
| LP_I2SI_WS_in       | Input     | In LP I2S slave mode, inputs WS signal for RX unit    |
| LP_I2SI_WS_out      | Output    | In LP I2S master mode, outputs WS signal for RX unit  |
| LP_I2SI_SD_in       | Input     | Serial input data bus for LP I2S RX unit              |
| LP_I2S_MCLK_out     | Output    | LP I2S master clock output                            |

<sup>\*</sup> Any required signals of LP I2S must be mapped to the chip's pins via LP GPIO matrix. See Chapter 8 [GPIO Matrix and IO MUX](#).

## 42.4 Supported Audio Standards

ESP32-P4 I2S supports multiple audio standards, including TDM Philips standard, TDM MSB alignment standard, TDM PCM standard, and PDM standard.

Select the needed standard by configuring the following bits:

- [LP\\_I2S\\_RX\\_TDM\\_EN](#)
  - 0: Disable TDM mode
  - 1: Enable TDM mode
- [LP\\_I2S\\_RX\\_PDM\\_EN](#)
  - 0: Disable PDM mode
  - 1: Enable PDM mode
- [LP\\_I2S\\_RX\\_MSB\\_SHIFT](#)
  - 0: WS and SD signals change simultaneously, i.e., enable MSB alignment standard
  - 1: WS signal changes one BCK clock cycle earlier than SD signal, i.e., enable Philips standard or select PCM standard

**Note:**

[LP\\_I2S\\_RX\\_TDM\\_EN](#) and [LP\\_I2S\\_RX\\_PDM\\_EN](#) must not be configured to 1 or 0 at the same time, otherwise LP I2S will transmit data incorrectly in a mode that is neither TDM nor PDM.

### 42.4.1 TDM Philips Standard

Philips standards require that WS signal changes one BCK clock cycle earlier than SD signal on BCK falling edge, which means that WS signal is valid from one clock cycle before transmitting the first bit of channel data and changes one clock before the end of channel data transfer. SD signal line transmits the most significant bit of audio data first.

Compared with the basic Philips standard, TDM Philips standard supports multiple channels. See Figure 42.4-1.

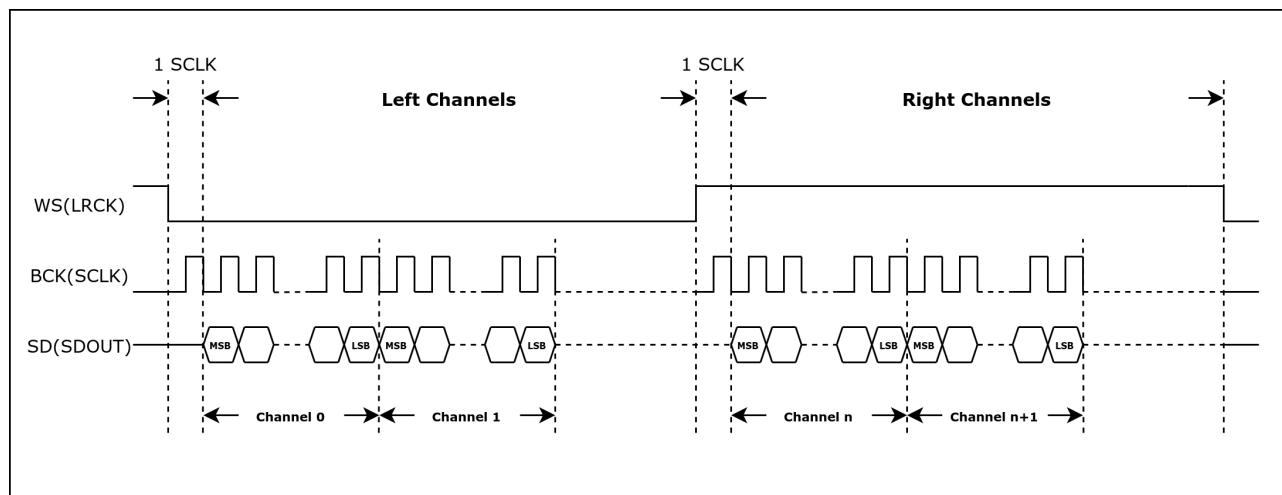

Figure 42.4-1. TDM Philips Standard Timing Diagram

### 42.4.2 TDM MSB Alignment Standard

MSB alignment standards require that WS and SD signals change simultaneously on the falling edge of BCK. The WS signal is valid until the end of the channel data transfer. The SD signal line transmits the most significant bit of audio data first.

Compared with the basic MSB alignment standard, TDM MSB alignment standard supports multiple channels. See Figure 42.4-2.

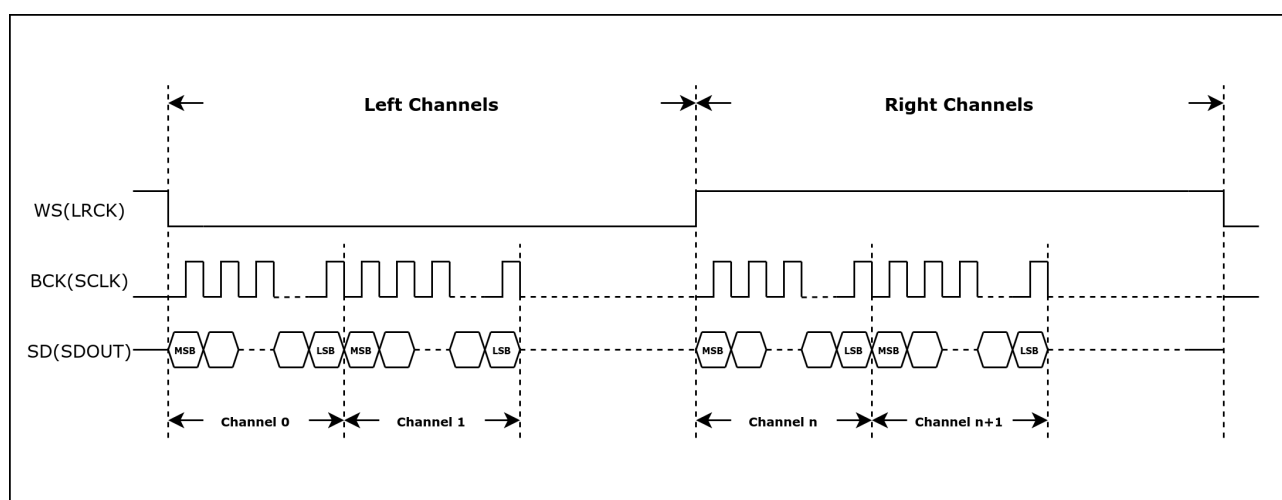

Figure 42.4-2. TDM MSB Alignment Standard Timing Diagram

### 42.4.3 TDM PCM Standard

Short frame synchronization under the PCM standards requires that the WS signal changes one BCK clock cycle earlier than the SD signal on the falling edge of BCK, which means that the WS signal becomes valid one clock cycle before transferring the first bit of channel data and remains unchanged in this BCK clock cycle. SD signal line first transmits the most significant bit of audio data.

Compared with the basic PCM standard, TDM PCM standard supports multiple channels. See Figure 42.4-3.

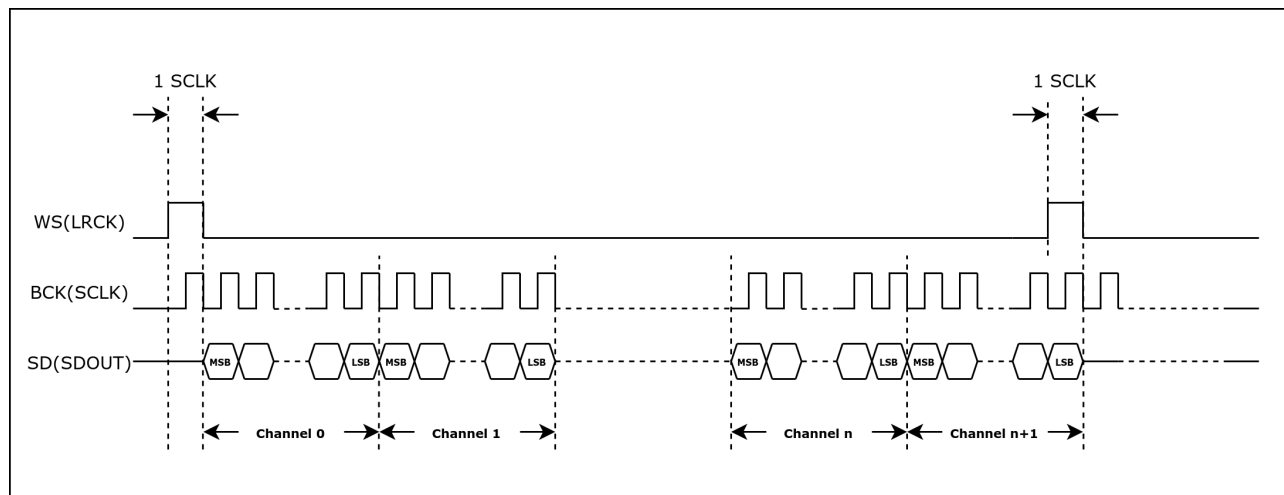

Figure 42.4-3. TDM PCM Standard Timing Diagram

### 42.4.4 PDM Standard

Under PDM standard, WS signal changes continuously during data transmission. The low-level and high-level of this signal indicates the left channel and right channel respectively. WS and SD signals change simultaneously on the falling edge of BCK. See Figure 42.4-4.

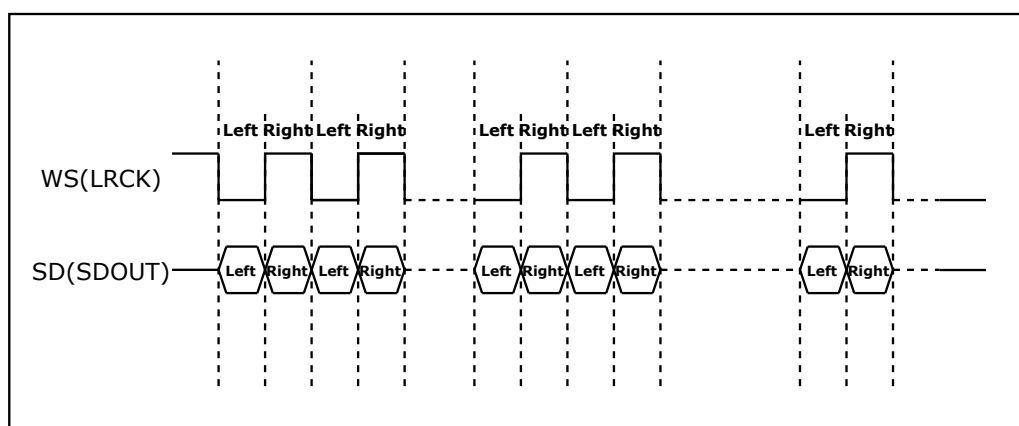

Figure 42.4-4. PDM Standard Timing Diagram

## 42.5 RX Clock

LP\_I2S\_RX\_CLK is the master clock of LP I2S RX unit, divided from:

- Up to 40 MHz LP\_FAST\_CLK with configurable clock source
- 20 MHz XTAL\_D2\_CLK
- 8 MHz PLL\_LP\_CLK

The serial clock (BCK) of the LP I2S RX unit is divided from LP\_I2S\_RX\_CLK, as shown in Figure 42.5-1.

[LPPERI\\_LP\\_I2S\\_RX\\_CLK\\_SEL](#) is used to select clock source for the LP I2S RX unit, and [LPPERI\\_CK\\_EN\\_LP\\_I2S\\_RX](#) to enable or disable the clock source.

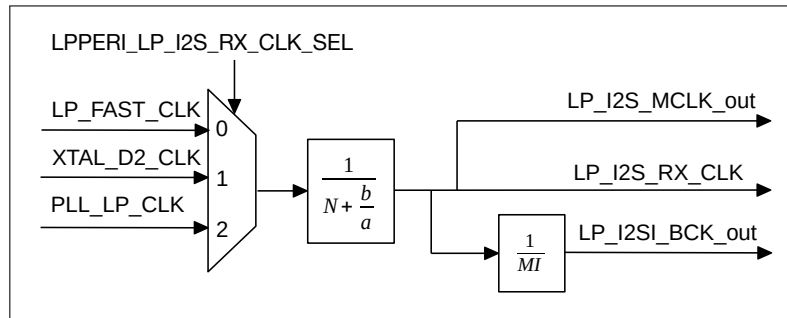

Figure 42.5-1. LP I2S Clock Generator

The following formula shows the relation between LP\_I2S\_RX\_CLK frequency  $f_{LP\_I2S\_RX\_CLK}$  and the divider clock source frequency  $f_{LP\_I2S\_CLK\_S}$ :

$$f_{LP\_I2S\_RX\_CLK} = \frac{f_{LP\_I2S\_CLK\_S}}{N + \frac{b}{a}}$$

N is an integer value between 2 and 256. The value of N is mapped to that of [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_N](#) as follows:

- When [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_N](#) = 0, N = 256;
- When [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_N](#) = 1, N = 2;
- When [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_N](#) has any other value, N = [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_NUM](#).

The values of “a” and “b” in fractional divider depend only on x, y, z, and yn1. The corresponding formulas are as follows:

- When  $b \leq \frac{a}{2}$ ,  $yn1 = 0$ ,  $x = \text{floor}(\lceil \frac{a}{b} \rceil) - 1$ ,  $y = a \% b$ ,  $z = b$ ;
- When  $b > \frac{a}{2}$ ,  $yn1 = 1$ ,  $x = \text{floor}(\lceil \frac{a}{a-b} \rceil) - 1$ ,  $y = a \% (a - b)$ ,  $z = a - b$ .

The values of x, y, z, and yn1 are configured by [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_X](#), [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_Y](#), [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_Z](#) and [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_YN1](#).

To configure the integer divider, clear [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_X](#) and [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_Z](#), then set [LPPERI\\_LP\\_I2S\\_RX\\_CLKM\\_DIV\\_Y](#) to 1.

**Note:**

Using fractional divider may introduce some clock jitter.

In master RX mode, the serial clock BCK for LP I2S RX unit is LP\_I2SI\_BCK\_out divided from LP\_I2S\_RX\_CLK, which is:

$$f_{LP\_I2S\_BCK\_out} = \frac{f_{LP\_I2S\_RX\_CLK}}{MI}$$

“MI” is an integer value:

$$MI = LP\_I2S\_RX\_BCK\_DIV\_NUM + 1$$

**Note:**

`LP_I2S_RX_BCK_DIV_NUM` must not be configured as 1.

In LP I2S slave mode, make sure  $f_{LP\_I2S\_RX\_CLK} \geq 8 \times f_{BCK}$  to ensure the sampling accuracy. The LP I2S module can output `LP_I2S_MCLK_out` as the master clock for peripherals.

Since in slave mode, the module clock frequency must be greater than or equal to 8 times the BCK clock frequency, the maximum sampling frequency of LP I2S is limited by the data bit width and the number of channels. For example, since the clock source frequency is up to 40 MHz, the module clock can be configured up to 20 MHz, and the BCK clock can be configured up to 5 MHz. Therefore, when transmitting dual-channel 16-bit width data, LP I2S supports sample frequencies up to 78.125 kHz, e.g., 8 kHz, 16 kHz, 32 kHz, 44.1 kHz, 48 kHz. For detailed information, please refer to Section [42.5 RX Clock](#).

In addition to the clock frequency limitation, LP I2S uses LP I2S internal memory for data storage instead of DMA. Therefore, users need to read data from the LP I2S internal memory in a timely manner. The reading rate may limit the sample frequencies that LP I2S supports. For detailed information, please refer to Section [42.8.3 Internal Memory](#).

## 42.6 Reset

The units and FIFOs in the LP I2S module are reset by the following bits.

- LP I2S RX units: Reset by the bit `LP_I2S_RX_RESET`;
- LP I2S RX FIFO: Reset by the bits `LP_I2S_RX_FIFO_RESET`.

**Note:**

The LP I2S module clock must be configured first before the units and FIFO are reset.

## 42.7 Master/Slave RX Mode

The LP I2S supports receiving data either as a master or as a slave in RX mode.

- LP I2S works as a master receiver:
  - Set `LP_I2S_RX_START` to start receiving data. When this bit is set, the RX unit keeps outputting clock signal and sampling input data.
  - Configure `LP_I2S_RX_STOP_MODE` to control the suspension of data reception:
    - \* 0: The RX unit only suspends data reception when `LP_I2S_RX_START` is cleared.
    - \* 1: The RX unit suspends data reception when `LP_I2S_RX_START` is cleared or the number of received bytes is greater than the value configured in `LP_I2S_RX_EOF_NUM_REG`. After data

reception is suspended, if `LP_I2S_RX_START` is not cleared, data reception can be restarted by setting `LP_I2S_RX_RESET` to 1.

- RX unit stops receiving data when the bit `LP_I2S_RX_START` is cleared.
- LP I2S works as a slave receiver:
  - Set `LP_I2S_RX_START`. Wait for the master BCK signal to start receiving data.
  - Configure `LP_I2S_RX_STOP_MODE` to control data reception suspension:
    - \* 0: The RX unit only suspends data reception when `LP_I2S_RX_START` is cleared.
    - \* 1: The RX unit suspends data reception when `LP_I2S_RX_START` is cleared or the number of received bytes is greater than the value configured in `LP_I2S_RX_EOF_NUM_REG`. After data reception is suspended, if `LP_I2S_RX_START` is not cleared, data reception can be restarted by setting `LP_I2S_RX_RESET` to 1.
  - The RX unit stops receiving data when the bit `LP_I2S_RX_START` is cleared.

## 42.8 Receiving Data

In RX mode, LP I2S first reads data from the peripheral interface and then stores the data in the LP I2S memory according to the configured channel mode and data mode.

### 42.8.1 Channel Mode Control

ESP32-P4 LP I2S supports both TDM RX mode and PDM RX mode. Set `LP_I2S_RX_TDM_EN` to enable TDM RX mode, or set `LP_I2S_RX_PDM_EN` to enable PDM RX mode.

**Note:**

`LP_I2S_RX_TDM_EN` and `LP_I2S_RX_PDM_EN` must not be cleared or set simultaneously.

#### 42.8.1.1 TDM RX Mode

In TDM RX mode, LP I2S supports up to 2 channels to input data. The total number of RX channels in use is controlled by `LP_I2S_RX_TDM_TOT_CHAN_NUM`. For example, if `LP_I2S_RX_TDM_TOT_CHAN_NUM` is set to 1, channel 0 ~ 1 will be used to receive data.

In these RX channels, if `LP_I2S_RX_TDM_PDM_CHANn_EN` is set to:

- 0: The channel data is invalid and will not be stored into RX FIFO;
- 1: The channel data is valid and will be stored into RX FIFO.

In TDM master mode, WS signal is controlled by `LP_I2S_RX_WS_IDLE_POL` and `LP_I2S_RX_TDM_WS_WIDTH`.

- `LP_I2S_RX_WS_IDLE_POL`: The default level of WS signal;
- `LP_I2S_RX_TDM_WS_WIDTH`: The cycles the WS default level lasts for when receiving all channel data.

`LP_I2S_RX_HALF_SAMPLE_BITS` x 2 is equal to the BCK cycles in one WS period.

### 42.8.1.2 PDM RX Mode

In PDM RX mode, LP I2S converts the serial data from channels to the data to be entered into memory. LP I2S supports both PDM raw data reception and PDM-to-PCM data format conversion.

In PDM RX master mode, the default level of the WS signal is controlled by [LP\\_I2S\\_RX\\_WS\\_IDLE\\_POL](#). WS frequency is half of the BCK frequency. The configuration of the BCK signal is similar to that of WS signal as described in Section 42.5. Note, in PDM RX mode, the value of [LP\\_I2S\\_RX\\_HALF\\_SAMPLE\\_BITS](#) must be same as that of [LP\\_I2S\\_RX\\_BITS\\_MOD](#).

When the PDM-to-PCM converter is enabled for LP I2S, the received PDM data is converted to PCM data and controlled according to the data mode. Configure [LP\\_I2S\\_RX\\_PDM2PCM\\_EN](#) to enable this converter. The register configuration for PDM-to-PCM converter is as follows:

- Configure sampling frequency and downsampling rate.

When LP I2S PDM-to-PCM converter is enabled, PDM clock frequency is:

- in master mode: PDM clock frequency is equal to BCK frequency.
- in slave mode: PDM clock is provided by external device.

The sampling frequency ( $f_{\text{Sampling}}$ ) is related to PDM clock frequency as follows:

$$f_{\text{Sampling}} = \frac{f_{\text{PDM}}}{\text{DSR}}$$

Downsampling rate (DSR) is related to [LP\\_I2S\\_RX\\_PDM\\_SINC\\_DSR\\_16\\_EN](#) as follows:

$$\text{DSR} = \text{LP\_I2S\_RX\_PDM\_SINC\_DSR\_16\_EN} \times 64$$

Configure the registers according to needed master/slave mode, sampling frequency, and downsampling rate.

- Configure valid channels.

When the PDM-to-PCM converter is enabled, input signals from eight channels are supported at most. See Table 42.8-1 for the register configuration and related channels.

Table 42.8-1. PDM-to-PCM Data Input

| Input Data Signal | Channel       | Enable Register                            |
|-------------------|---------------|--|
| LP_I2SI_SD_in     | Left channel  | <a href="#">LP_I2S_RX_TDM_PDM_CHANO_EN</a> |
|                   | Right channel | <a href="#">LP_I2S_RX_TDM_PDM_CHAN1_EN</a> |

## 42.8.2 Data Format Control

The data format of LP I2S is controlled in the following phases:

- Phase I: Serial input data is converted into the data to be saved to RX FIFO;
- Phase II: The data is read from RX FIFO and converted according to the input data mode.

### 42.8.2.1 Bit Order Control of Channel Data

The channel data will be stored as the data to be input in order from high to low. The data bit order in each channel is controlled by [LP\\_I2S\\_RX\\_BIT\\_ORDER](#):

- 0: The bit order of the data to be input is not reversed;
- 1: The bit order of the data to be input is reversed.

At this point, the first phase of data format control is completed.

#### 42.8.2.2 Bit Width Control of Channel RX Data

The storage data width in each channel is controlled by [LP\\_I2S\\_RX\\_BITS\\_MOD](#). For ESP32-P4 LP I2S, the value of [LP\\_I2S\\_RX\\_BITS\\_MOD](#) is fixed as 15. The corresponding channel storage data width is 16 bit.

#### 42.8.2.3 Bit Width Control of Channel RX Data

The RX data width in each channel is determined by [LP\\_I2S\\_RX\\_TDM\\_CHAN\\_BITS](#).

- If the storage data width in each channel is smaller than the received (RX) data width, then only the bits within the storage data width is saved into memory. Configure [LP\\_I2S\\_RX\\_LEFT\\_ALIGN](#) to:
  - 0: Only the lower bits of the received data within the storage data width is stored to memory;
  - 1: Only the higher bits of the received data within the storage data width is stored to memory.
- If the received data width is smaller than the storage data width in each channel, the higher bits of the received data will be filled with zeros and then the data is saved to memory.

#### 42.8.2.4 Endian Control of Channel Storage Data

The received data is then converted into storage data (to be stored to memory) after some processing, such as discarding extra bits or filling zeros in missing bits. The endian of the storage data is controlled by [LP\\_I2S\\_RX\\_BIG\\_ENDIAN](#) (the data bit width is fixed as 16). See the table below.

Table 42.8-2. Channel Storage Data Endian

| Original Data | Endian of Processed Data | <a href="#">LP_I2S_RX_BIG_ENDIAN</a> |
|---------------|--------------------------|--------------------------------------|
| {B1, B0}      | {B1, B0}                 | 0                                    |
|               | {B0, B1}                 | 1                                    |

At this point, the data format control is completed. Data then is stored into memory.

### 42.8.3 Internal Memory

All data after format control is stored in the LP I2S internal memory, which is a 16-bit wide circular buffer that supports RX unit write operations and system read operations. The LP I2S internal memory includes a pair of hardware-maintained read and write pointers to manage write and read operations.

1. When LP I2S writes data:

- If the memory is full: Overwrites the oldest data and increments the write and read pointers by 1 (the value of the read pointer is the value of the write pointer plus one at this point).
- If the memory is not full: Writes the data and increments the write pointer by 1. The read pointer remains unchanged.

2. When the system reads from the LP I2S memory:

- If the memory is empty: The read and write pointers remain unchanged (the value of the read pointer equals to the value of the write pointer at this point).
- If the memory is not empty: Increments the read pointer by 1. The write pointer remains unchanged.

**Note:**

- The incremental operation for the read and write pointers is in a circular manner, i.e., when the value of the read or write pointer reaches the boundary of the memory, the incremental operation resets the value of the pointer to zero.
- Within the LP I2S internal memory architecture, the system always reads the oldest data in the memory.

## 42.9 Interrupts

ESP32-P4's LP I2S can generate the LP\_I2S\_INTR interrupt signal that will be sent to the [Interrupt Matrix](#). There are several internal interrupt sources from LP I2S that can generate the above interrupt signals as follows:

- LP\_I2S\_RX\_HUNG\_INT: Triggered when the data reception is timed out. For example, if the LP I2S module is configured as RX slave mode, but the master does not transmit data for a long time (specified in [LP\\_I2S\\_LC\\_HUNG\\_CONF\\_REG](#)), this interrupt will be triggered.
- LP\_I2S\_RX\_DONE\_INT: Triggered when the data reception is completed.
- LP\_I2S\_RX\_FIFOMEM\_UDF\_INT: Triggered when the LP I2S memory is read empty.
- LP\_I2S\_RX\_MEM\_THRESHOLD\_INT: Triggered when the data in LP I2S memory is larger than the value configured in [LP\\_I2S\\_RX\\_MEM\\_THRESHOLD](#).

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter 11 [Interrupt Matrix](#) > Section 11.2 [Interrupt Terminology in ESP32-P4](#).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section [42.10 Register Summary](#).

## 42.10 Register Summary

The addresses in this section are relative to LP I2S base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name  | Description                               | Address | Access    |
|---|---|---------|-----------|
| <b>RX control and configuration registers</b> |   |         |           |
| <a href="#">LP_I2S_RX_MEM_CONF_REG</a>        | LP I2S memory configuration register      | 0x0008  | varies    |
| <a href="#">LP_I2S_RX_CONF_REG</a>            | LP I2S RX configuration register          | 0x0020  | varies    |
| <a href="#">LP_I2S_RX_CONF1_REG</a>           | LP I2S RX configuration register 1        | 0x0028  | R/W       |
| <a href="#">LP_I2S_RX_TDM_CTRL_REG</a>        | LP I2S RX TDM mode configuration register | 0x0050  | R/W       |
| <a href="#">LP_I2S_RXEOF_NUM_REG</a>          | LP I2S RX data number control register    | 0x0064  | R/W       |
| <a href="#">LP_I2S_RX_PDM_CONF_REG</a>        | LP I2S RX PDM mode configuration register | 0x0070  | R/W       |
| <b>Interrupt registers</b>                    |   |         |           |
| <a href="#">LP_I2S_INT_RAW_REG</a>            | LP I2S interrupt raw register             | 0x000C  | RO/WTC/SS |
| <a href="#">LP_I2S_INT_ST_REG</a>             | LP I2S interrupt status register          | 0x0010  | RO        |
| <a href="#">LP_I2S_INT_ENA_REG</a>            | LP I2S interrupt enable register          | 0x0014  | R/W       |
| <a href="#">LP_I2S_INT_CLR_REG</a>            | LP I2S interrupt clear register           | 0x0018  | WT        |
| <b>RX clock and timing register</b>           |   |         |           |
| <a href="#">LP_I2S_RX_TIMING_REG</a>          | LP I2S RX timing control register         | 0x0058  | R/W       |
| <b>Control and configuration registers</b>    |   |         |           |
| <a href="#">LP_I2S_LC_HUNG_CONF_REG</a>       | LP I2S timeout configuration register     | 0x0060  | R/W       |
| <a href="#">LP_I2S_CONF_SIGLE_DATA_REG</a>    | LP I2S single data register               | 0x0068  | R/W       |
| <b>Clock register</b>                         |   |         |           |
| <a href="#">LP_I2S_CLK_GATE_REG</a>           | Clock gate register                       | 0x00F8  | R/W       |
| <b>Version register</b>                       |   |         |           |
| <a href="#">LP_I2S_DATE_REG</a>               | Version control register                  | 0x00FC  | R/W       |

## 42.11 Registers

The addresses in this section are relative to LP I2S base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

Register 42.1. LP\_I2S\_RX\_MEM\_CONF\_REG (0x0008)

- LP\_I2S\_RX\_MEM\_FIFO\_CNT Configures the number of data in the RX memory. (RO)
- LP\_I2S\_RX\_MEM\_THRESHOLD Configures the RX memory threshold. LP I2S RX memory triggers an interrupt when the data in the memory exceeds (not including equals) this threshold. (R/W)

## Register 42.2. LP\_I2S\_RX\_CONF\_REG (0x0020)

|            |  |  |  |  |  |  |  |  |  |  |  |                  |  |  |  |                  |  |  |  |                     |  |  |  |            |    |    |    |                       |    |    |    |            |   |    |   |                        |   |   |   |                  |   |   |   |            |       |   |   |                      |   |   |   |                |  |  |  |                         |  |  |  |                     |  |  |  |                 |  |  |  |                      |  |  |  |
|------------|--|--|--|--|--|--|--|--|--|--|--|------------------|--|--|--|------------------|--|--|--|---------------------|--|--|--|------------|----|----|----|-----------------------|----|----|----|------------|---|----|---|------------------------|---|---|---|------------------|---|---|---|------------|-------|---|---|----------------------|---|---|---|----------------|--|--|--|-------------------------|--|--|--|---------------------|--|--|--|-----------------|--|--|--|----------------------|--|--|--|
| (reserved) |  |  |  |  |  |  |  |  |  |  |  | LP_I2S_RX_PDM_EN |  |  |  | LP_I2S_RX_TDM_EN |  |  |  | LP_I2S_RX_BIT_ORDER |  |  |  | (reserved) |    |    |    | LP_I2S_RX_WS_IDLE_POL |    |    |    | (reserved) |   |    |   | LP_I2S_RX_MONO_FST_VLD |   |   |   | LP_I2S_RX_UPDATE |   |   |   | (reserved) |       |   |   | LP_I2S_RX_BIG_ENDIAN |   |   |   | LP_I2S_RX_MONO |  |  |  | LP_I2S_RX_FIFOMEM_RESET |  |  |  | LP_I2S_RX_SLAVE_MOD |  |  |  | LP_I2S_RX_START |  |  |  | LP_I2S_RX_FIFO_RESET |  |  |  |
| 31         |  |  |  |  |  |  |  |  |  |  |  | 21               |  |  |  |                  |  |  |  |                     |  |  |  | 20         | 19 | 18 | 17 | 16                    | 15 | 14 | 13 | 12         |   | 10 | 9 | 8                      | 7 | 6 | 5 | 4                | 3 | 2 | 1 | 0          | Reset |   |   |                      |   |   |   |                |  |  |  |                         |  |  |  |                     |  |  |  |                 |  |  |  |                      |  |  |  |
| 0          |  |  |  |  |  |  |  |  |  |  |  | 0                |  |  |  |                  |  |  |  |                     |  |  |  | 0          | 0  | 0  | 0  | 0                     | 1  | 0  | 1  |            | 0 | 1  | 1 | 0                      | 0 | 0 | 0 | 0                | 0 | 0 | 0 | 0          | 0     | 0 | 0 | 0                    | 0 | 0 | 0 |                |  |  |  |                         |  |  |  |                     |  |  |  |                 |  |  |  |                      |  |  |  |

Reset

**LP\_I2S\_RX\_RESET** Configures whether to reset RX.

0: No effect

1: Reset

(WT)

**LP\_I2S\_RX\_FIFO\_RESET** Configures whether to reset RX FIFO.

0: No effect

1: Reset

(WT)

**LP\_I2S\_RX\_START** Configures whether to start receiving data.

0: No effect

1: Start

(R/W)

Continued on the next page...

**Register 42.2. LP\_I2S\_RX\_CONF\_REG (0x0020)**

Continued from the previous page...

**LP\_I2S\_RX\_SLAVE\_MOD** Configures whether to enable slave RX mode.

0: Disable

1: Enable

(R/W)

**LP\_I2S\_RX\_FIFOMEM\_RESET** Configures whether to reset RX Sync FIFO memory.

0: No effect

1: Reset

(WT)

**LP\_I2S\_RX\_MONO** Configures whether to enable RX unit in mono mode.

0: Disable

1: Enable

(R/W)

**LP\_I2S\_RX\_BIG\_ENDIAN** Configures LP I2S RX byte endian.

0: Low address data is saved to low address

1: Low address data is saved to high address

(R/W)

**LP\_I2S\_RX\_UPDATE** Configures whether to update LP I2S RX registers from APB clock domain to LP I2S RX clock domain. This bit will be cleared by hardware after the register update is done.

0: No effect

1: Update

(R/W/SC)

**LP\_I2S\_RX\_MONO\_FST\_VLD** Configures which channel data value is valid in LP I2S RX mono mode.

0: The second channel data value is valid

1: The first channel data value is valid

(R/W)

**LP\_I2S\_RX\_STOP\_MODE** Configures when LP I2S RX stops data reception.

0: Only stops when [LP\\_I2S\\_RX\\_START](#) is cleared

1: Stops when [LP\\_I2S\\_RX\\_START](#) is cleared or the number of received bytes is greater than the value configured in [LP\\_I2S\\_RX\\_EOF\\_NUM\\_REG](#)

Other values: Invalid

(R/W)

**LP\_I2S\_RX\_LEFT\_ALIGN** Configures the RX alignment mode

0: Right alignment

1: Left alignment

(R/W)

Continued on the next page...

**Register 42.2. LP\_I2S\_RX\_CONF\_REG (0x0020)**

Continued from the previous page...

**LP\_I2S\_RX\_WS\_IDLE\_POL** Configures the relationship between WS level and which channel data to receive.

0: WS remains low when receiving left channel data and high when receiving right channel data

1: WS remains high when receiving left channel data and low when receiving right channel data

(R/W)

**LP\_I2S\_RX\_BIT\_ORDER** Configures whether to reverse the bit order of the LP I2S RX data to be received.

0: Not reverse

1: Reverse

(R/W)

**LP\_I2S\_RX\_TDM\_EN** Configures whether to enable LP I2S TDM RX mode.

0: Disable

1: Enable

(R/W)

**LP\_I2S\_RX\_PDM\_EN** Configures whether to enable LP I2S PDM RX mode.

0: Disable

1: Enable

(R/W)

Register 42.3. LP\_I2S\_RX\_CONF1\_REG (0x0028)

|            |    |                     |    |                         |    |                            |    |                    |    |                       |   |                        |       |
|------------|----|---------------------|----|-------------------------|----|----------------------------|----|--------------------|----|-----------------------|---|------------------------|-------|
| (reserved) |    | LP_I2S_RX_MSB_SHIFT |    | LP_I2S_RX_TDM_CHAN_BITS |    | LP_I2S_RX_HALF_SAMPLE_BITS |    | LP_I2S_RX_BITS_MOD |    | LP_I2S_RX_BCK_DIV_NUM |   | LP_I2S_RX_TDM_WS_WIDTH |       |
| 31         | 30 | 29                  | 28 | 24                      | 23 | 18                         | 17 | 13                 | 12 | 7                     | 6 |                        | 0     |
| 0          | 0  | 1                   |    | 0xf                     |    | 0xf                        |    | 0xf                |    | 6                     |   | 0x0                    | Reset |

**LP\_I2S\_RX\_TDM\_WS\_WIDTH** Configures the width of LP\_I2SI\_WS\_out (WS default level) at idle level in TDM mode. Width of LP\_I2SI\_WS\_out at idle level in TDM mode = (LP\_I2S\_RX\_TDM\_WS\_WIDTH[6:0] + 1) x T\_BCK. (R/W)

**LP\_I2S\_RX\_BCK\_DIV\_NUM** Configures the divider of BCK in RX mode. Note this divider must not be configured to 1. (R/W)

**LP\_I2S\_RX\_BITS\_MOD** Configures the valid data bit length of LP I2S RX channel. Since the LP I2S only supports 16-bit mode, this field must be configured to 15. LP I2S cannot function properly if this field is configured to any other value. (R/W)

**LP\_I2S\_RX\_HALF\_SAMPLE\_BITS** Configures LP I2S RX sample bits. BCK cycles in one WS period = I2S\_RX\_HALF\_SAMPLE\_BITS x 2. (R/W)

**LP\_I2S\_RX\_TDM\_CHAN\_BITS** Configures RX bit number for each channel in TDM mode. Bit number expected = LP\_I2S\_RX\_TDM\_CHAN\_BITS + 1. (R/W)

**LP\_I2S\_RX\_MSB\_SHIFT** Configures the timing between the WS signal and the MSB of data.

0: Align at the rising edge

1: The WS signal changes one BCK clock earlier

(R/W)

#### Register 42.4. LP\_I2S\_RX\_TDM\_CTRL\_REG (0x0050)

Diagram illustrating the structure of the LP\_I2S\_RX\_TDM\_TOT\_CHAN\_NUM register (32 bits total):

- Bits 31 to 16: (reserved)
- Bits 15 to 0: LP\_I2S\_RX\_TDM\_TOT\_CHAN\_NUM
  - Bits 15 to 1: LP\_I2S\_RX\_TDM\_TOT\_CHAN\_NUM
  - Bit 0: LP\_I2S\_RX\_TDM\_TOT\_CHAN\_NUM

Reset values: 0x0 for bits 15 to 1, and 1 for bit 0.

**LP\_I2S\_RX\_TDM\_PDM\_CHAN0\_EN** Configures whether to enable the valid data input of LP I2S RX TDM or PDM channel 0.

0: Disable. Channel 0 only inputs 0

1: Enable

(R/W)

**LP\_I2S\_RX\_TDM\_PDM\_CHAN1\_EN** Configures whether to enable the valid data input of LP I2S RX TDM or PDM channel 1.

0: Disable. Channel 1 only inputs 0

1: Enable

(R/W)

**LP\_I2S\_RX\_TDM\_TOT\_CHAN\_NUM** Configures the total channel number of LP I2S RX TDM mode.

Total channel number in use = LP\_I2S\_RX\_TDM\_TOT\_CHAN\_NUM + 1. (R/W)

### Register 42.5. LP\_I2S\_RXEOF\_NUM\_REG (0x0064)

|   |  |                   |   |
|---|--|-------------------|---|
| 31  |  | 11                | 0 |

**LP\_I2S\_RX\_PDM2PCM\_EN** Configures whether to enable the PDM-to-PCM converter in RX mode.

0: Disable

1: Enable

(R/W)

**LP\_I2S\_RX\_PDM\_SINC\_DSR\_16\_EN** Configures the downsampling rate of PDM RX filter group 1 module.

0: 64

1: 128

(R/W)

**LP\_I2S\_RX\_PDM2PCM\_AMPLIFY\_NUM** Configures the PDM-to-PCM RX amplification coefficient.

PCM data will be multiplied by this value before outputting. (R/W)

**LP\_I2S\_RX\_PDM\_HP\_BYPASS** Configures whether PDM-to-PCM RX bypasses the HP filter.

0: Not bypass

1: Bypass

(R/W)

### Register 42.7. LP\_I2S\_INT\_RAW\_REG (0x000C)

[illegible]

**LP\_I2S\_RX\_DONE\_INT\_RAW** The raw interrupt status of the **LP\_I2S\_RX\_DONE\_INT** interrupt.  
(R/SS/WTC)

**LP\_I2S\_RX\_HUNG\_INT\_RAW** The raw interrupt status of the **LP\_I2S\_RX\_DONE\_INT** interrupt.  
(R/SS/WTC)

LP\_I2S\_RX\_FIFOMEM\_UDF\_INT\_RAW The raw interrupt status of the LP\_I2S\_RX\_FIFOMEM\_UDF\_INT interrupt. (R/SS/WTC)

**LP\_I2S\_VAD\_DONE\_INT\_RAW** The raw interrupt status of the [LP\\_I2S\\_VAD\\_DONE\\_INT](#) interrupt.  
(R/SS/WTC)

LP\_I2S\_VAD\_RESET\_DONE\_INT\_RAW The raw interrupt status of the LP\_I2S\_VAD\_RESET\_DONE\_INT interrupt. (R/SS/WTC)

**LP\_I2S\_RX\_MEM\_THRESHOLD\_INT\_RAW** The raw interrupt status of the [LP\\_I2S\\_RX\\_MEM\\_THRESHOLD\\_INT](#) interrupt. (R/SS/WTC)

Register 42.8. LP\_I2S\_INT\_ST\_REG (0x0010)

- LP\_I2S\_RX\_DONE\_INT\_ST

The masked interrupt status of the [LP\\_I2S\\_RX\\_DONE\\_INT](#) interrupt. (RO)
- LP\_I2S\_RX\_HUNG\_INT\_ST

The masked interrupt status of the [LP\\_I2S\\_RX\\_DONE\\_INT](#) interrupt. (RO)
- LP\_I2S\_RX\_FIFOMEM\_UDF\_INT\_ST

The masked interrupt status of the [LP\\_I2S\\_RX\\_FIFOMEM\\_UDF\\_INT](#) interrupt. (RO)
- LP\_I2S\_VAD\_DONE\_INT\_ST

The masked interrupt status of the [LP\\_I2S\\_VAD\\_DONE\\_INT](#) interrupt. (RO)
- LP\_I2S\_VAD\_RESET\_DONE\_INT\_ST

The masked interrupt status of the [LP\\_I2S\\_VAD\\_RESET\\_DONE\\_INT](#) interrupt. (RO)
- LP\_I2S\_RX\_MEM\_THRESHOLD\_INT\_ST

The masked interrupt status of the [LP\\_I2S\\_RX\\_MEM\\_THRESHOLD\\_INT](#) interrupt. (RO)

Register 42.9. LP\_I2S\_INT\_ENA\_REG (0x0014)

- LP\_I2S\_RX\_DONE\_INT\_ENA Write 1 to enable the LP\_I2S\_RX\_DONE\_INT interrupt. (R/W)
- LP\_I2S\_RX\_HUNG\_INT\_ENA Write 1 to enable the LP\_I2S\_RX\_DONE\_INT interrupt. (R/W)
- LP\_I2S\_RX\_FIFOEM\_UDF\_INT\_ENA Write 1 to enable the LP\_I2S\_RX\_FIFOEM\_UDF\_INT interrupt. (R/W)
- LP\_I2S\_VAD\_DONE\_INT\_ENA Write 1 to enable the LP\_I2S\_VAD\_DONE\_INT interrupt. (R/W)
- LP\_I2S\_VAD\_RESET\_DONE\_INT\_ENA Write 1 to enable the LP\_I2S\_VAD\_RESET\_DONE\_INT interrupt. (R/W)
- LP\_I2S\_RX\_MEM\_THRESHOLD\_INT\_ENA Write 1 to enable the LP\_I2S\_RX\_MEM\_THRESHOLD\_INT interrupt. (R/W)

### Register 42.10. LP\_I2S\_INT\_CLR\_REG (0x0018)

**LP\_I2S\_RX\_DONE\_INT\_CLR** Write 1 to clear the **LP\_I2S\_RX\_DONE\_INT** interrupt. (WT)

**LP\_I2S\_RX\_HUNG\_INT\_CLR** Write 1 to clear the **LP\_I2S\_RX\_DONE\_INT** interrupt. (WT)

LP\_I2S\_RX\_FIFOMEM\_UDF\_INT\_CLR Write 1 to clear the LP\_I2S\_RX\_FIFOMEM\_UDF\_INT interrupt.  
(WT)

**LP\_VAD\_DONE\_INT\_CLR** Write 1 to clear the **LP\_I2S\_VAD\_DONE\_INT** interrupt. (WT)

**LP\_VAD\_RESET\_DONE\_INT\_CLR** Write 1 to clear the [LP\\_I2S\\_VAD\\_RESET\\_DONE\\_INT](#) interrupt. (WT)

**LP\_I2S\_RX\_MEM\_THRESHOLD\_INT\_CLR** Write 1 to clear the [LP\\_I2S\\_RX\\_MEM\\_THRESHOLD\\_INT](#) interrupt. (WT)

**Register 42.11. LP\_I2S\_RX\_TIMING\_REG (0x0058)**

## Chapter 43

### Pulse Count Controller (PCNT)

The pulse count controller (PCNT) is designed to count input pulses.

#### 43.1 Introduction

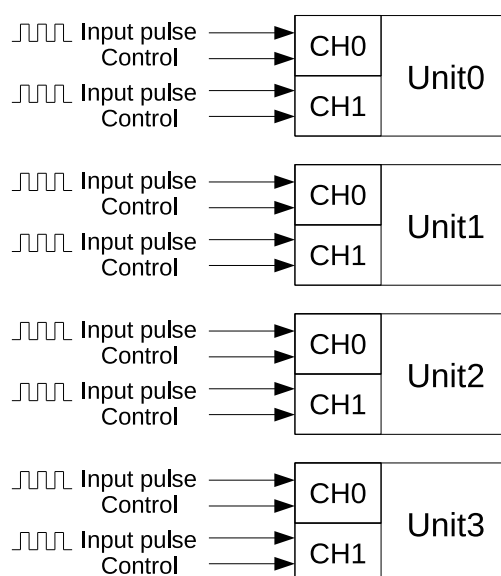

Figure 43.1-1. PCNT Overview

As shown in Figure 43.1-1, PCNT has four independent pulse counters called units, which have their groups of registers. Each unit includes two channels (ch0 and ch1) and a 16-bit signed counter. Each channel has an input pulse signal and an input signal filtering module. The 16-bit signed counter can be configured for incremental or decremental counting. The clock for PCNT module is APB\_CLK.

#### 43.2 Feature List

A PCNT has the following features:

- Four independent pulse counters (units) that count from 1 to 65535
- Each unit consists of two independent channels sharing one pulse counter
- All channels have input pulse signals (e.g., sig\_ch0\_un) with their corresponding control signals (e.g., ctrl\_ch0\_un)
- Independently filter glitches of input pulse signals (sig\_ch0\_un and sig\_ch1\_un) and control signals (ctrl\_ch0\_un and ctrl\_ch1\_un) on each unit

- Each channel has the following parameters:
  - Selection between counting on rising or falling edges of the input pulse signal
  - Configuration to Increment, Decrement, or Disable counter mode for control signal's high and low states
- Maximum frequency of pulses:  $\frac{f_{APB\_CLK}}{2}$

### 43.3 Architectural Overview

Each unit of PCNT includes two channels (ch0 and ch1) and the functionality of the two channels is identical. The remainder of the chapter will take channel 0 (ch0) as example and  $n$  denotes the number of a unit from 0 ~ 3. Each channel of PCNT has two input signals:

- One input pulse signal (e.g., sig\_ch0\_un, the input pulse signal for ch0 of unit  $n$  ch0)
- One control signal (e.g., ctrl\_ch0\_un, the control signal for ch0 of unit  $n$  ch0)

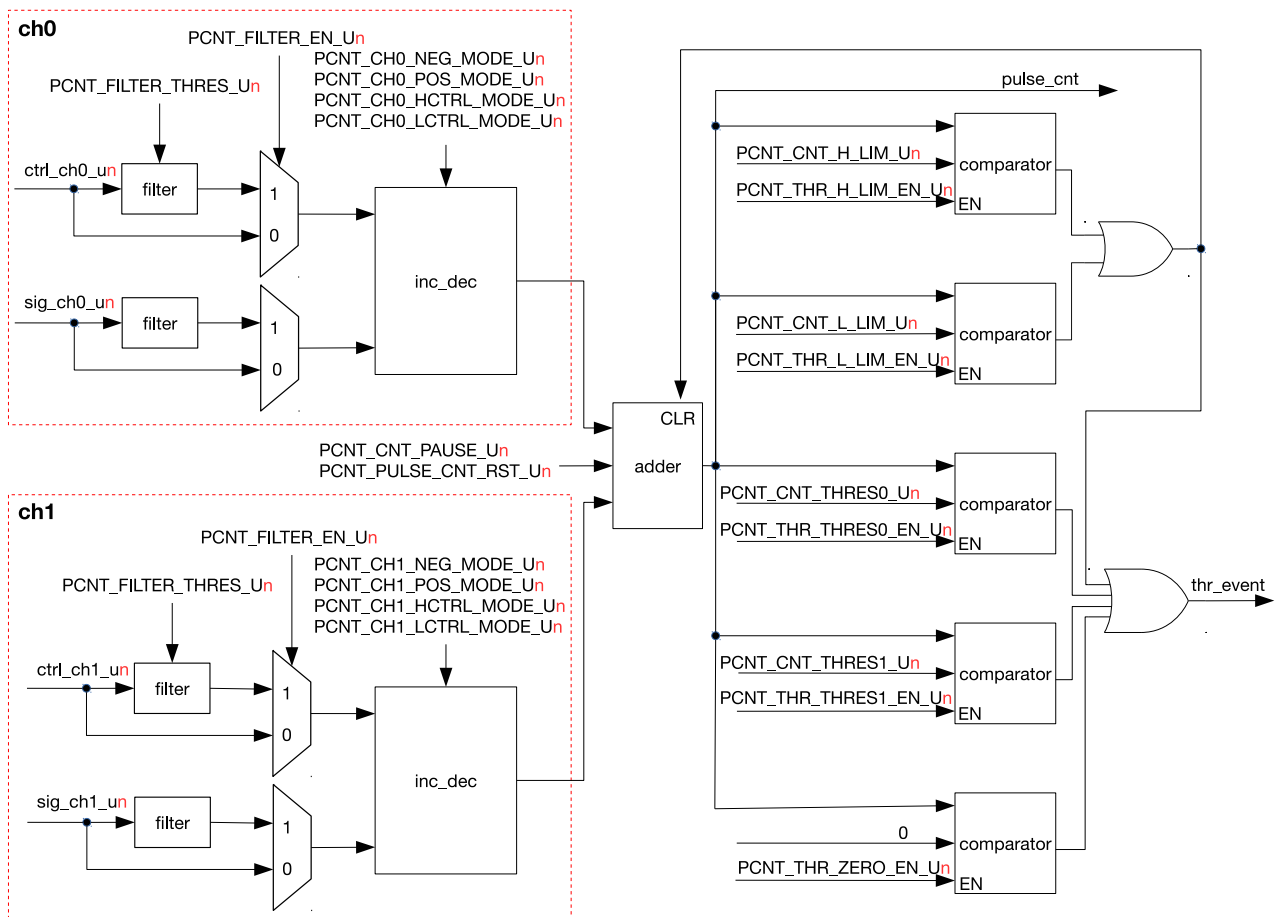

Figure 43.3-1. PCNT Architectural Overview

Figure 43.3-1 shows PCNT's architecture. As stated above, ctrl\_ch0\_un is the control signal for ch0 of unit  $n$ . Its high and low states can be assigned in different counter modes and used for pulse counting of the channel's input pulse signal sig\_ch0\_un on falling or rising edges.

## 43.4 Functional Description

The available counter modes of PCNT are as follows:

- Increment mode: When a channel detects an active edge of sig\_ch0\_un (can be configured by software), the counter value pulse\_cnt increases by 1. Upon reaching PCNT\_CNT\_H\_LIM\_Un, pulse\_cnt is cleared. If PCNT\_CNT\_PAUSE\_Un is set to 1, then pulse\_cnt freezes.
- Decrement mode: When a channel detects an active edge of sig\_ch0\_un (can be configured by software), the counter value pulse\_cnt decreases by 1. Upon reaching PCNT\_CNT\_L\_LIM\_Un, pulse\_cnt is cleared. If PCNT\_CNT\_PAUSE\_Un is set to 1, then pulse\_cnt freezes.
- Disable mode: Counting is disabled, and the counter value pulse\_cnt freezes.

Table 43.4-1 to Table 43.4-4 provide information on how to configure the counter mode for channel 0.

**Table 43.4-1. Counter Mode. Rising edge of Input Pulse Signal. Control Signal in Low State**

|--------------------------------------|--|--------------|
| 1                                    | 0                                      | Increment    |
|                                      | 1                                      | Decrement    |
|                                      | Others                                 | Disable      |
| 2                                    | 0                                      | Decrement    |
|                                      | 1                                      | Increment    |
|                                      | Others                                 | Disable      |
| Others                               | N/A                                    | Disable      |

Each unit has one filter for all its control and input pulse signals. A filter can be enabled by setting the bit [PCNT\\_FILTER\\_EN\\_Un](#). The filter monitors the signals and ignores all the noise, i.e., the glitches with pulse widths shorter than [PCNT\\_FILTER\\_THRES\\_Un](#) APB clock cycles in length.

As shown on Figure 43.3-1, each unit has two channels which process different input pulse signals and increase or decrease values via their respective inc\_dec modules, then the two channels send these values to the counter module which has a 16-bit wide signed register. This counter can be suspended by setting [PCNT\\_CNT\\_PAUSE\\_Un](#), and cleared by setting [PCNT\\_PULSE\\_CNT\\_RST\\_Un](#).

The PCNT has five watchpoints that share one interrupt. The interrupt can be enabled or disabled by interrupt enable signals of each individual watchpoint.

- Maximum count value: When pulse\_cnt reaches [PCNT\\_CNT\\_H\\_LIM\\_Un](#), a high limit interrupt is triggered and [PCNT\\_CNT\\_THR\\_H\\_LIM\\_LAT\\_Un](#) is high.
- Minimum count value: When pulse\_cnt reaches [PCNT\\_CNT\\_L\\_LIM\\_Un](#), a low limit interrupt is triggered and [PCNT\\_CNT\\_THR\\_L\\_LIM\\_LAT\\_Un](#) is high.
- Two threshold values: When pulse\_cnt equals either [PCNT\\_CNT\\_THRES0\\_Un](#) or [PCNT\\_CNT\\_THRES1\\_Un](#), an interrupt is triggered and either [PCNT\\_CNT\\_THR\\_THRES0\\_LAT\\_Un](#) or [PCNT\\_CNT\\_THR\\_THRES1\\_LAT\\_Un](#) is high respectively.
- Zero: When pulse\_cnt is 0, an interrupt is triggered and [PCNT\\_CNT\\_THR\\_ZERO\\_LAT\\_Un](#) is valid.

If [PCNT\\_CNT\\_H\\_LIM\\_Un](#) and/or [PCNT\\_CNT\\_L\\_LIM\\_Un](#) are reconfigured by software when PCNT is working, the new configuration will take effect after pulse\_cnt counts to any of the above five watchpoints; If [PCNT\\_CNT\\_THRES0\\_Un](#) and/or [PCNT\\_CNT\\_THRES1\\_Un](#) are reconfigured by software, the new configuration will take effect immediately.

## 43.5 Interrupts

ESP32-P4's PCNT can generate the following interrupt signal that will be sent to the [Interrupt Matrix](#).

- [PCNT\\_INT](#)

There are several internal interrupt sources from PCNT that can generate the above interrupt signal. The interrupt sources from PCNT are listed with their trigger conditions and the resulted interrupt signal in Table 43.5-1.

Table 43.5-1. PCNT's Internal Interrupt Sources

| Internal Interrupt Source | Trigger Condition                      | Interrupt Signal |
|---------------------------|--|------------------|
| PCNT_CNT_THR_EVENT_U0_INT | reaching the watchpoint in PCNT unit 0 | PCNT_INT         |
| PCNT_CNT_THR_EVENT_U1_INT | reaching the watchpoint in PCNT unit 1 | PCNT_INT         |
| PCNT_CNT_THR_EVENT_U2_INT | reaching the watchpoint in PCNT unit 2 | PCNT_INT         |
| PCNT_CNT_THR_EVENT_U3_INT | reaching the watchpoint in PCNT unit 3 | PCNT_INT         |

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter 11 *Interrupt Matrix* > Section 11.2 *Interrupt Terminology in ESP32-P4*.

## 43.6 Programming Procedures

In each unit, channel 0 and channel 1 can be configured to work independently or together. The three subsections below provide details of channel 0 incrementing independently, channel 0 decrementing independently, and channel 0 and channel 1 incrementing together. For other working modes not elaborated in this section (e.g., channel 1 incrementing/decrementing independently, or one channel incrementing while the other decrementing), reference can be made to these three subsections.

### 43.6.1 Channel 0 Incrementing Independently

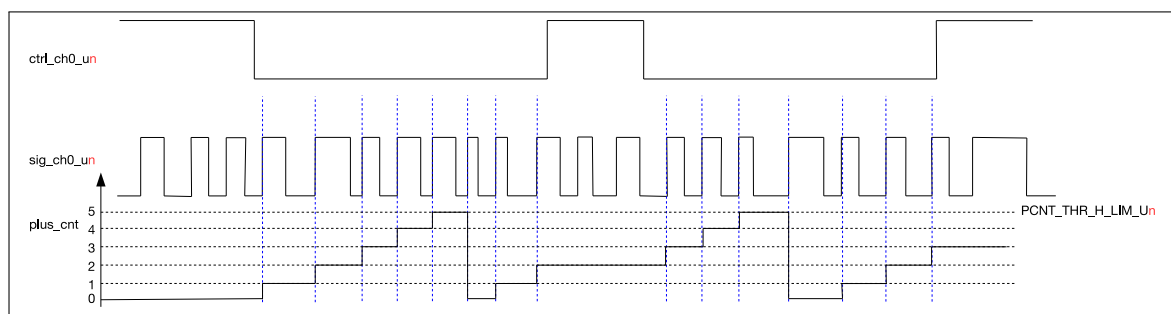

Figure 43.6-1. Channel 0 Up Counting Diagram

Figure 43.6-1 illustrates how channel 0 is configured to increment independently on the rising edge of sig\_ch0\_un while channel 1 is disabled (see Subsection 43.4 for how to disable channel 1). The configuration of channel 0 is shown below.

- **PCNT\_CHO\_LCTRL\_MODE\_Un=0**: When ctrl\_ch0\_un is low, the counter mode specified for the low state turns on, in this case it is Increment mode.
- **PCNT\_CHO\_HCTRL\_MODE\_Un=2**: When ctrl\_ch0\_un is high, the counter mode specified for the low state turns on, in this case it is Disable mode.
- **PCNT\_CHO\_POS\_MODE\_Un=1**: The counter increments on the rising edge of sig\_ch0\_un.

- `PCNT_CHO_NEG_MODE_Un=0`: The counter idles on the falling edge of `sig_ch0_un`.
- `PCNT_CNT_H_LIM_Un=5`: When `pulse_cnt` counts up to `PCNT_CNT_H_LIM_Un`, it is cleared.

### 43.6.2 Channel 0 Decrementing Independently

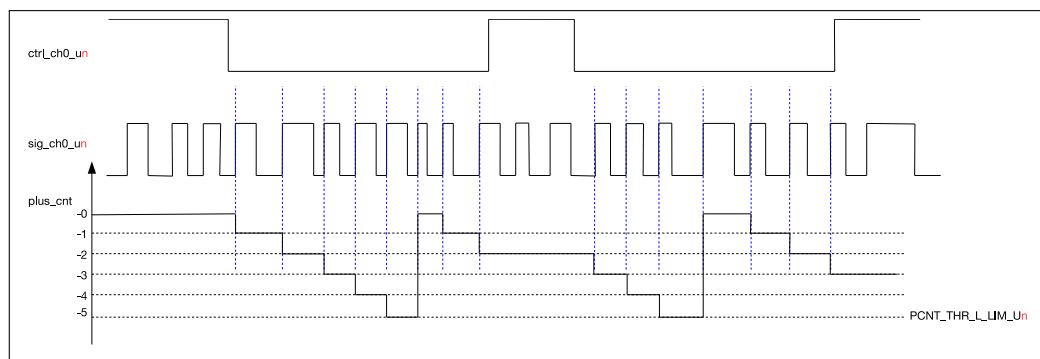

Figure 43.6-2. Channel 0 Down Counting Diagram

Figure 43.6-2 illustrates how channel 0 is configured to decrement independently on the rising edge of `sig_ch0_un` while channel 1 is disabled. The configuration of channel 0 in this case differs from that in Figure 43.6-1 in the following aspects:

- `PCNT_CHO_POS_MODE_Un=2`: the counter decrements on the rising edge of `sig_ch0_un`.
- `PCNT_CNT_L_LIM_Un=-5`: when `pulse_cnt` counts down to `PCNT_CNT_L_LIM_Un`, it is cleared.

### 43.6.3 Channel 0 and Channel 1 Incrementing Together

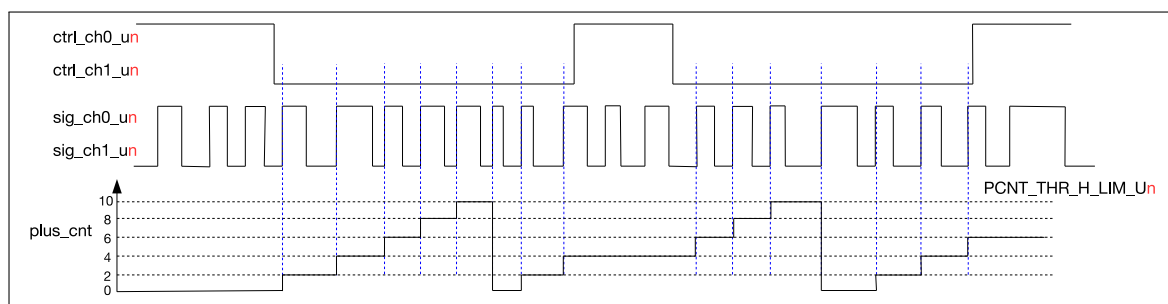

Figure 43.6-3. Two Channels Up Counting Diagram

Figure 43.6-3 illustrates how channel 0 and channel 1 are configured to increment on the rising edge of `sig_ch0_un` and `sig_ch1_un` respectively at the same time. It can be seen in Figure 43.6-3 that control signal `ctr_ch0_un` and `ctr_ch1_un` have the same waveform, so as input pulse signal `sig_ch0_un` and `sig_ch1_un`. The configuration procedure is shown below.

- For channel 0:
  - `PCNT_CHO_LCTRL_MODE_Un=0`: When `ctr_ch0_un` is low, the counter mode specified for the low state turns on, in this case it is Increment mode.

- `PCNT_CHO_HCTRL_MODE_Un`=2: When `ctrl_ch0_un` is high, the counter mode specified for the low state turns on, in this case it is Disable mode.
- `PCNT_CHO_POS_MODE_Un`=1: The counter increments on the rising edge of `sig_ch0_un`.
- `PCNT_CHO_NEG_MODE_Un`=0: The counter idles on the falling edge of `sig_ch0_un`.
- For channel 1:
  - `PCNT_CH1_LCTRL_MODE_Un`=0: When `ctrl_ch1_un` is low, the counter mode specified for the low state turns on, in this case it is Increment mode.
  - `PCNT_CH1_HCTRL_MODE_Un`=2: When `ctrl_ch1_un` is high, the counter mode specified for the low state turns on, in this case it is Disable mode.
  - `PCNT_CH1_POS_MODE_Un`=1: The counter increments on the rising edge of `sig_ch1_un`.
  - `PCNT_CH1_NEG_MODE_Un`=0: The counter idles on the falling edge of `sig_ch1_un`.
- `PCNT_CNT_H_LIM_Un`=10: When `pulse_cnt` counts up to `PCNT_CNT_H_LIM_Un`, it is cleared.

## 43.7 Register Summary

The addresses in this section are relative to **Pulse Count Controller** base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name                               | Description                         | Address | Access |
|------------------------------------|-------------------------------------|---------|--------|
| <b>Configuration Register</b>      |                                     |         |        |
| <a href="#">PCNT_U0_CONFO_REG</a>  | Configuration register 0 for unit 0 | 0x0000  | R/W    |
| <a href="#">PCNT_U0_CONF1_REG</a>  | Configuration register 1 for unit 0 | 0x0004  | R/W    |
| <a href="#">PCNT_U0_CONF2_REG</a>  | Configuration register 2 for unit 0 | 0x0008  | R/W    |
| <a href="#">PCNT_U1_CONFO_REG</a>  | Configuration register 0 for unit 1 | 0x000C  | R/W    |
| <a href="#">PCNT_U1_CONF1_REG</a>  | Configuration register 1 for unit 1 | 0x0010  | R/W    |
| <a href="#">PCNT_U1_CONF2_REG</a>  | Configuration register 2 for unit 1 | 0x0014  | R/W    |
| <a href="#">PCNT_U2_CONFO_REG</a>  | Configuration register 0 for unit 2 | 0x0018  | R/W    |
| <a href="#">PCNT_U2_CONF1_REG</a>  | Configuration register 1 for unit 2 | 0x001C  | R/W    |
| <a href="#">PCNT_U2_CONF2_REG</a>  | Configuration register 2 for unit 2 | 0x0020  | R/W    |
| <a href="#">PCNT_U3_CONFO_REG</a>  | Configuration register 0 for unit 3 | 0x0024  | R/W    |
| <a href="#">PCNT_U3_CONF1_REG</a>  | Configuration register 1 for unit 3 | 0x0028  | R/W    |
| <a href="#">PCNT_U3_CONF2_REG</a>  | Configuration register 2 for unit 3 | 0x002C  | R/W    |
| <a href="#">PCNT_CTRL_REG</a>      | Control register for all counters   | 0x0060  | R/W    |
| <b>Status Register</b>             |                                     |         |        |
| <a href="#">PCNT_U0_CNT_REG</a>    | Counter value for unit 0            | 0x0030  | RO     |
| <a href="#">PCNT_U1_CNT_REG</a>    | Counter value for unit 1            | 0x0034  | RO     |
| <a href="#">PCNT_U2_CNT_REG</a>    | Counter value for unit 2            | 0x0038  | RO     |
| <a href="#">PCNT_U3_CNT_REG</a>    | Counter value for unit 3            | 0x003C  | RO     |
| <a href="#">PCNT_U0_STATUS_REG</a> | PNCT UNIT0 status register          | 0x0050  | RO     |
| <a href="#">PCNT_U1_STATUS_REG</a> | PNCT UNIT1 status register          | 0x0054  | RO     |
| <a href="#">PCNT_U2_STATUS_REG</a> | PNCT UNIT2 status register          | 0x0058  | RO     |
| <a href="#">PCNT_U3_STATUS_REG</a> | PNCT UNIT3 status register          | 0x005C  | RO     |
| <b>Interrupt Register</b>          |                                     |         |        |
| <a href="#">PCNT_INT_RAW_REG</a>   | Interrupt raw status register       | 0x0040  | RO     |
| <a href="#">PCNT_INT_ST_REG</a>    | Interrupt status register           | 0x0044  | RO     |
| <a href="#">PCNT_INT_ENA_REG</a>   | Interrupt enable register           | 0x0048  | R/W    |
| <a href="#">PCNT_INT_CLR_REG</a>   | Interrupt clear register            | 0x004C  | WO     |
| <b>Version Register</b>            |                                     |         |        |
| <a href="#">PCNT_DATE_REG</a>      | PCNT version control register       | 0x00FC  | R/W    |

## 43.8 Registers

The addresses in this section are relative to **Pulse Count Controller** base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

**Register 43.1. PCNT\_UN\_CONF0\_REG (*n*: 0-3) (0x0000+0xC\**n*)**

|                        |    |    |    |     |    |    |    |     |    |    |    |     |    |    |    |     |    |    |    |    |    |   |  |   |  |  |  |                        |  |  |  |   |  |  |  |   |  |  |   |   |  |  |  |      |  |  |  |  |  |  |  |  |  |  |  |                      |  |  |  |       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                        |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                        |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

**PCNT\_FILTER\_THRES\_U*n*** Configures the maximum threshold for the filter. Any pulses with width less than this will be ignored when the filter is enabled.

Measurement unit: APB\_CLK cycles.

(R/W)

**PCNT\_FILTER\_EN\_U*n*** This is the enable bit for unit *n*'s input filter. (R/W)

**PCNT\_THR\_ZERO\_EN\_U*n*** This is the enable bit for unit *n*'s zero comparator. (R/W)

**PCNT\_THR\_H\_LIM\_EN\_U*n*** This is the enable bit for unit *n*'s thr\_h\_lim comparator. Configures it to enable the high limit interrupt. (R/W)

**PCNT\_THR\_L\_LIM\_EN\_U*n*** This is the enable bit for unit *n*'s thr\_l\_lim comparator. Configures it to enable the low limit interrupt. (R/W)

**PCNT\_THR\_THRES0\_EN\_U*n*** This is the enable bit for unit *n*'s thres0 comparator. (R/W)

**PCNT\_THR\_THRES1\_EN\_U*n*** This is the enable bit for unit *n*'s thres1 comparator. (R/W)

**PCNT\_CH0\_NEG\_MODE\_U*n*** Configures the behavior when the signal input of channel 0 detects a falling edge.

- 1: Increment the counter
- 2: Decrement the counter
- 0, 3: No effect

(R/W)

**PCNT\_CH0\_POS\_MODE\_U*n*** Configures the behavior when the signal input of channel 0 detects a rising edge.

- 1: Increment the counter
- 2: Decrement the counter
- 0, 3: No effect

(R/W)

**PCNT\_CH0\_HCTRL\_MODE\_U*n*** Configures how the CH*n*\_POS\_MODE/CH*n*\_NEG\_MODE settings will be modified when the control signal is high.

- 0: No modification
- 1: Invert behavior (increase → decrease, decrease → increase)
- 2, 3: Inhibit counter modification

(R/W)

Continued on the next page...

**Register 43.1. PCNT\_UN\_CONFO\_REG (*n*: 0-3) (0x0000+0xC\**n*)**

Continued from the previous page...

**PCNT\_CHO\_LCTRL\_MODE\_UN** Configures how the CH*n*\_POS\_MODE/CH*n*\_NEG\_MODE settings will be modified when the control signal is low.

0: No modification

1: Invert behavior (increase → decrease, decrease → increase)

2, 3: Inhibit counter modification

(R/W)

**PCNT\_CH1\_NEG\_MODE\_UN** Configures the behavior when the signal input of channel 1 detects a falling edge.

1: Increment the counter

2: Decrement the counter

0, 3: No effect

(R/W)

**PCNT\_CH1\_POS\_MODE\_UN** Configures the behavior when the signal input of channel 1 detects a rising edge.

1: Increment the counter

2: Decrement the counter

0, 3: No effect

(R/W)

**PCNT\_CH1\_HCTRL\_MODE\_UN** Configures how the CH*n*\_POS\_MODE/CH*n*\_NEG\_MODE settings will be modified when the control signal is high.

0: No modification

1: Invert behavior (increase → decrease, decrease → increase)

2, 3: Inhibit counter modification

(R/W)

**PCNT\_CH1\_LCTRL\_MODE\_UN** Configures how the CH*n*\_POS\_MODE/CH*n*\_NEG\_MODE settings will be modified when the control signal is low.

0: No modification

1: Invert behavior (increase → decrease, decrease → increase)

2, 3: Inhibit counter modification

(R/W)

**Register 43.2. PCNT\_UN\_CONF1\_REG (*n*: 0-3) (0x0004+0xC\**n*)**

**PCNT\_CNT\_THRES0\_UN** Configures the thres0 value for unit *n*. (R/W)

**PCNT\_CNT\_THRES1\_UN** Configures the thres1 value for unit *n*. (R/W)

**Register 43.3. PCNT\_UN\_CONF2\_REG (*n*: 0-3) (0x0008+0xC\**n*)**

**PCNT\_CNT\_H\_LIM\_UN** Configures the thr\_h\_lim value for unit *n*. When pulse\_cnt reaches this value, the counter will be cleared to 0. (R/W)

**PCNT\_CNT\_L\_LIM\_UN** Configures the thr\_l\_lim value for unit *n*. When pulse\_cnt reaches this value, the counter will be cleared to 0.(R/W)

Register 43.4. PCNT\_CTRL\_REG (0x0060)

Reset

**PCNT\_PULSE\_CNT\_RST\_U $n$**  Write 1 to clear unit  $n$ 's counter.

0: No effect

1: Clear

(R/W)

**PCNT\_CNT\_PAUSE\_U $n$**  Write 1 to freeze unit  $n$ 's counter.

0: No effect

1: Freeze

(R/W)

**PCNT\_CLK\_EN** Configures whether or not to enable the registers clock gate of PCNT module.

0: the clock for registers is enabled when registers are read and written

1: the clock for registers is always on

(R/W)

**PCNT\_PULSE\_CNT\_U $n$**  Represents the current pulse count value for unit  $n$ . (RO)

## Register 43.6. PCNT\_UN\_STATUS\_REG (n: 0-3) (0x0050+0x4\*n)

**PCNT\_CNT\_THR\_ZERO\_MODE\_UN** Represents the pulse counter status of PCNT\_UN corresponding to 0.

- 0: pulse counter decreases from positive to 0
  - 1: pulse counter increases from negative to 0
  - 2: pulse counter is negative
  - 3: pulse counter is positive
- (RO)

**PCNT\_CNT\_THR\_THRES1\_LAT\_UN** Represents whether the current value of PCNT\_UN equals to thres1 when thres1 comparator is enabled.

- 0: others
  - 1: the current pulse counter equals to thres1 and thres1 event is valid
- (RO)

**PCNT\_CNT\_THR\_THRES0\_LAT\_UN** Represents whether the current value of PCNT\_UN equals to thres0 when thres0 comparator is enabled.

- 0: others
  - 1: the current pulse counter equals to thres0 and thres0 event is valid
- (RO)

**PCNT\_CNT\_THR\_L\_LIM\_LAT\_UN** Represents whether the current value of PCNT\_UN is equal to the low limit threshold when the low limit comparator is enabled.

- 0: others
  - 1: the current pulse counter equals to thr\_l\_lim and low limit event is valid.
- (RO)

**PCNT\_CNT\_THR\_H\_LIM\_LAT\_UN** Represents whether the current value of PCNT\_UN is equal to the high limit threshold when the high limit comparator is enabled.

- 0: others
  - 1: the current pulse counter equals to thr\_h\_lim and high limit event is valid.
- (RO)

**PCNT\_CNT\_THR\_ZERO\_LAT\_UN** Represents whether the current value of PCNT\_UN is 0 when the over-zero comparator is enabled.

- 0: others
  - 1: the current pulse counter equals to 0 and zero threshold event is valid.
- (RO)

**PCNT\_CNT\_THR\_EVENT\_U $n$ \_INT\_ENA** Write 1 to enable the PCNT\_CNT\_THR\_EVENT\_U $n$ \_INT interrupt. (R/W)

Register 43.10. PCNT\_INT\_CLR\_REG (0x004C)

PCNT\_CNT\_THR\_EVENT\_U<sub>*n*</sub>\_INT\_CLR Write 1 to clear the PCNT\_CNT\_THR\_EVENT\_U<sub>*n*</sub>\_INT interrupt. (WO)

Register 43.11. PCNT\_DATE\_REG (0x00FC)

PCNT\_DATE Version control register. (R/W)

## Chapter 44

# USB 2.0 High-Speed OTG

## 44.1 Overview

The ESP32-P4 chip features a USB 2.0 High-Speed On-The-Go peripheral (OTG\_HS) with an integrated transceiver. This OTG\_HS complies with the USB 2.0 specification, OTG Revision 1.3, and OTG Revision 2.0 specifications. The interface supports USB 2.0 High-Speed mode (480 Mbit/s), Full-Speed mode (12 Mbit/s), and Low-Speed mode (1.5 Mbit/s).

- When OTG\_HS operates in High-Speed or Full-Speed modes, it can be configured as either a Host or a Device.
- When OTG\_HS operates in Low-Speed mode, it can only be configured as a Host.

## 44.2 Glossary

The following abbreviations and terms are used in this chapter.

|                                |  |
|--------------------------------|--|
| <b>Host</b>                    | The host computer system where the USB Host Controller is installed. This includes the host hardware platform (CPU, bus, etc.) and the operating system in use.  |
| <b>Device</b>                  | A logical or physical entity that performs a function. The actual entity described depends on the context of the reference. At the lowest level, device may refer to a single hardware component, as in a memory device. At a higher level, it may refer to a collection of hardware components that perform a particular function, such as a USB interface device. At an even higher level, device may refer to the function performed by an entity attached to the USB; for example, a data/FAX modem device. When used as a non-specific reference, a USB device is either a hub or a function. |
| <b>High-speed</b>              | USB operation at 480 Mbit/s.   |
| <b>Full-speed</b>              | USB operation at 12 Mbit/s.  |
| <b>Low-speed</b>               | USB operation at 1.5 Mbit/s.   |
| <b>Endpoint</b>                | A uniquely addressable portion of a USB device that is the source or sink of information in a communication flow between the host and device.  |
| <b>Scatter/Gather DMA mode</b> | Accesses discontinuous memory areas via DMA.   |
| <b>Buffer DMA mode</b>         | Accesses contiguous memory areas via DMA.  |
| <b>Slave mode</b>              | Accesses memory area through the CPU.  |
| <b>RX FIFO</b>                 | Stores the received data.  |

|                          |  |

| <b>Periodic FIFO</b>     | Stores Isochronous transfer data and Interrupt transfer data to be sent. |
| <b>Non-periodic FIFO</b> | Stores Control transfer data and Bulk transfer data to be sent.          |

## 44.3 Features

### 44.3.1 General Features

- USB 2.0 specification, OTG Revision 1.3 and OTG Revision 2.0 specifications
- High-Speed, Full-Speed, and Low-Speed data rates
- As a host and a device in High-Speed mode and Full-Speed mode
- Dynamic FIFO (DFIFO) sizing, each device EP/host channel can dynamically allocate a maximum of 4 KB FIFO.
- Multiple modes of memory access
  - Scatter/Gather DMA mode
  - Buffer DMA mode
  - Slave Mode
- Integrated UTMI High-Speed transceiver

### 44.3.2 Device Mode Features

- Endpoint 0 always present, bi-directional, consisting of EPO IN and EPO OUT
- 15 additional endpoints 1~15, configurable as IN or OUT
- Maximum of eight IN endpoints concurrently active at any time, including EPO IN
- All OUT endpoints share a single RX FIFO
- Each IN endpoint has a dedicated TX FIFO

### 44.3.3 Host Mode Features

- 16 host channels
- RX FIFO: shared by all periodic and non-periodic transactions
- Two TX FIFO:
  - One shared by all non-periodic transactions
  - One shared by all periodic transactions
- All of the above FIFOs share a 4 KB RAM.
- The size of each FIFO is configurable, with a maximum of 4 KB.

## 44.4 Functional Description

### 44.4.1 Controller Core and Interfaces

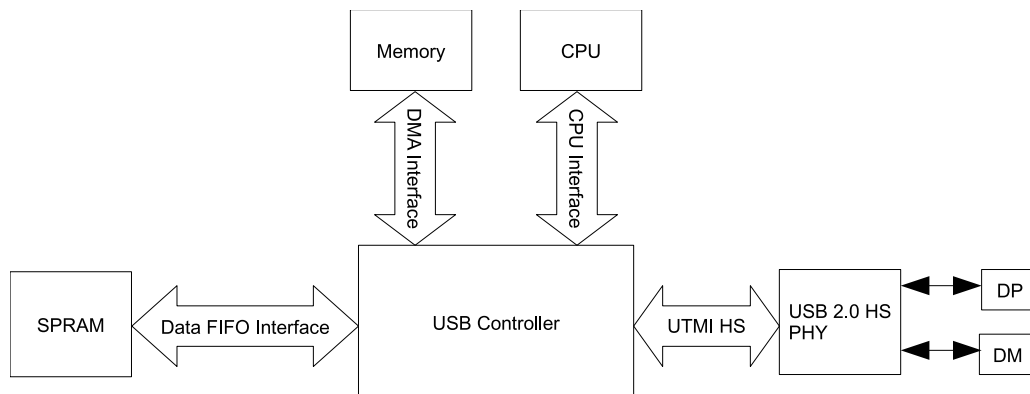

Figure 44.4-1. OTG\_HS System Architecture

OTG\_HS uses the same controller core as OTG\_FS, i.e., USB Controller Core. The controller core has the following interfaces, see Figure 44.4-1:

- **CPU Interface**

Provides the CPU with read/write access to the controller core's various registers and FIFOs. This interface is internally implemented as an AHB slave interface. The way to access the FIFOs through the CPU interface is called Slave mode.

- **DMA Interface**

Provides the controller core's internal DMA with read/write access to system memory, e.g., fetching and writing data payloads in DMA mode. This interface is internally implemented as an AHB master interface.

- **USB 2.0 Interface (USB 2.0 HS PHY)**

This interface is used to connect the controller core to a USB 2.0 UTMI serial transceiver. With this serial transceiver, OTG\_HS is able to support High-Speed data rate and Full-Speed data rate.

- **Data FIFO Interface**

The multiple FIFOs used by the controller core are not actually located within the controller core itself, but on the Single-Port RAM (SPRAM). FIFOs are dynamically sized, thus are allocated at run-time in the SPRAM. When the CPU, DMA, or the controller core attempts to read/write to FIFOs, those accesses are routed through the data FIFO RAM interface.

### 44.4.2 Memory Layout

Figure 44.4-2 illustrates the memory layout of the registers which are used to configure and control the USB Controller Core.

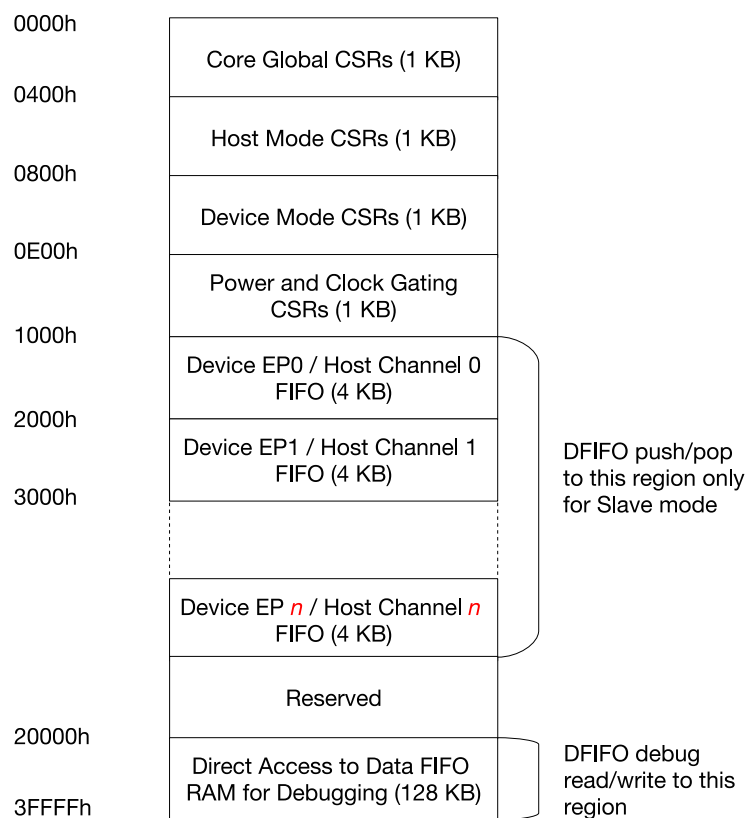

Figure 44.4-2. OTG\_HS Register Layout

#### 44.4.2.1 Control & Status Registers (CSRs)

- **Core Global CSRs**

These registers are responsible for the configuration/control/status of the global features of OTG\_HS, i.e., features which are common to both Host and Device modes. These features include OTG control and system-level interrupts. Software can access these registers whilst in Host or Device modes.

- **Host Mode CSRs**

These registers are responsible for the configuration/control/status in Host mode, thus should only be accessed in Host mode. Each channel has its own set of registers within the Host mode CSRs.

- **Device Mode CSRs**

These registers are responsible for the configuration/control/status in Device mode, thus should only be accessed in Device mode. Each endpoint has its own set of registers within the Device mode CSRs.

- **Power and Clock Gating Register**

A single register controls power-down and gates various clocks.

#### 44.4.2.2 FIFO Access

The OTG\_HS makes use of multiple FIFOs to buffer the data payloads to be transmitted or to buffer the received data payloads. The number and type of FIFOs are dependent on Host or Device mode, and the number of channels or endpoints used, see Section 44.4.3. There are two ways to access the FIFOs: DMA mode and Slave mode. In Slave mode, the CPU will need to access these FIFOs by reading and writing to either the DFIFO push/pop regions or the DFIFO read/write debug region. FIFO access is governed by the

following rules:

- Read access to any address in any one of the 4 KB push/pop regions will result in a pop from the shared RX FIFO.
- Write access to a particular 4 KB push/pop region will result in a push to the corresponding endpoint or channel's TX FIFO given that the endpoint is an IN endpoint, or the channel is an OUT channel.
  - In Device mode, data is pushed to the corresponding IN endpoint's dedicated TX FIFO.
  - In Host mode, data is pushed to the non-periodic TX FIFO or the periodic TX FIFO depending on whether the channel is a non-periodic channel, or a periodic channel.
- Access to the 128 KB read/write region will result in direct read/write instead of a push/pop. This is generally used for debugging purposes only.

Note that pushing and popping data to and from the FIFOs by the CPU is only required in Slave mode. In DMA mode, the internal DMA will handle all pushing/popping of data to and from the TX and RX FIFOs.

### 44.4.3 FIFO and Queue Organization

The FIFOs in OTG\_HS are primarily used to hold data packet payloads, i.e., the data field of USB Data packets. TX FIFOs are used to store data payloads that will be transmitted by OUT transactions in Host mode or IN transactions in Device mode. RX FIFOs are used to store received data payloads of IN transactions in Host mode or OUT transactions in Device mode. In addition to storing data payloads, RX FIFOs also store a **status entry** for each data payload. Each status entry contains information about a data payload such as channel number, byte count, and validity status. In Slave mode, status entries are also used to indicate various channel events.

The portion of SPRAM that can be used for FIFO allocation has a depth of 1024 and a width of 35 bits (32 data bits plus 3 control bits). The multiple FIFOs used by each channel (in Host mode) or endpoint (in Device mode) are allocated into the SPRAM and can be dynamically sized.

#### 44.4.3.1 Host Mode FIFOs and Queues

The following FIFOs are used in Host mode, see Figure [44.4-3](#):

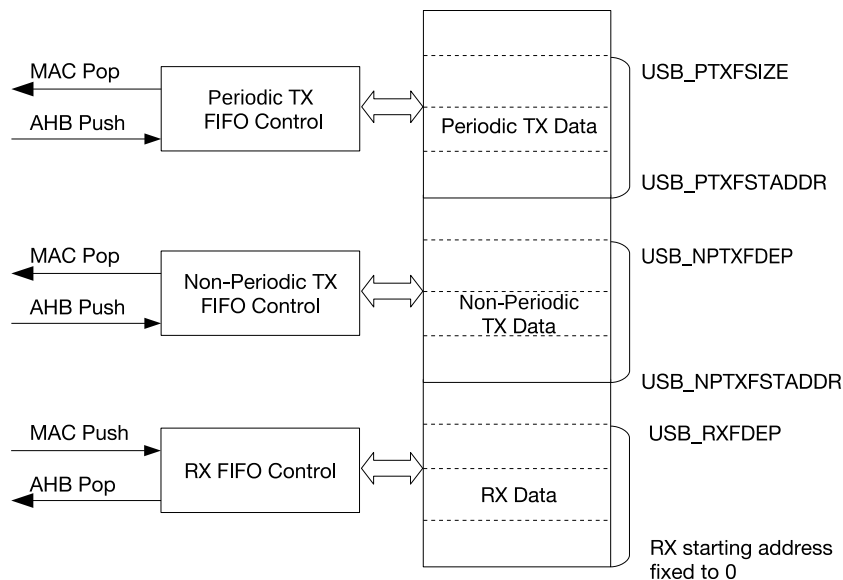

Figure 44.4-3. Host Mode FIFOs

- **Non-periodic TX FIFO:** Stores data payloads of bulk and control OUT transactions for all channels.
- **Periodic TX FIFO:** Stores data payloads of interrupt or isochronous OUT transactions for all channels.
- **RX FIFO:** Stores data payloads of all IN transactions, and status entries that are used to indicate size of data payloads and transaction/channel events such as transfer complete or channel halted.

In addition to FIFOs, Host mode also contains two request queues used to queue up the various transaction request from the multiple channels. Each entry in a request queue holds the IN/OUT channel number along with other information to perform the transaction, such as transaction type. Request queues are also used to queue other types of requests such as a channel halt request.

Unlike FIFOs, request queues are fixed in size and cannot be accessed directly by software. Rather, once a channel is enabled, requests will be automatically written to the request queue by the Host core. The order in which the requests are written into the queue determines the sequence of transactions on the USB.

Host mode contains the following request queues:

- **Non-periodic request queue:** Request queue for all non-periodic Bulk and Control channels. The queue has a depth of four entries.
- **Periodic request queue:** Request queue for all periodic Interrupt and Isochronous channels. The queue has a depth of four entries.

When scheduling transactions, hardware will execute all requests on the periodic request queue first before executing requests on the non-periodic request queue.

#### 44.4.3.2 Device Mode FIFOs

The following FIFOs are used in Device mode, see Figure 44.4-4:

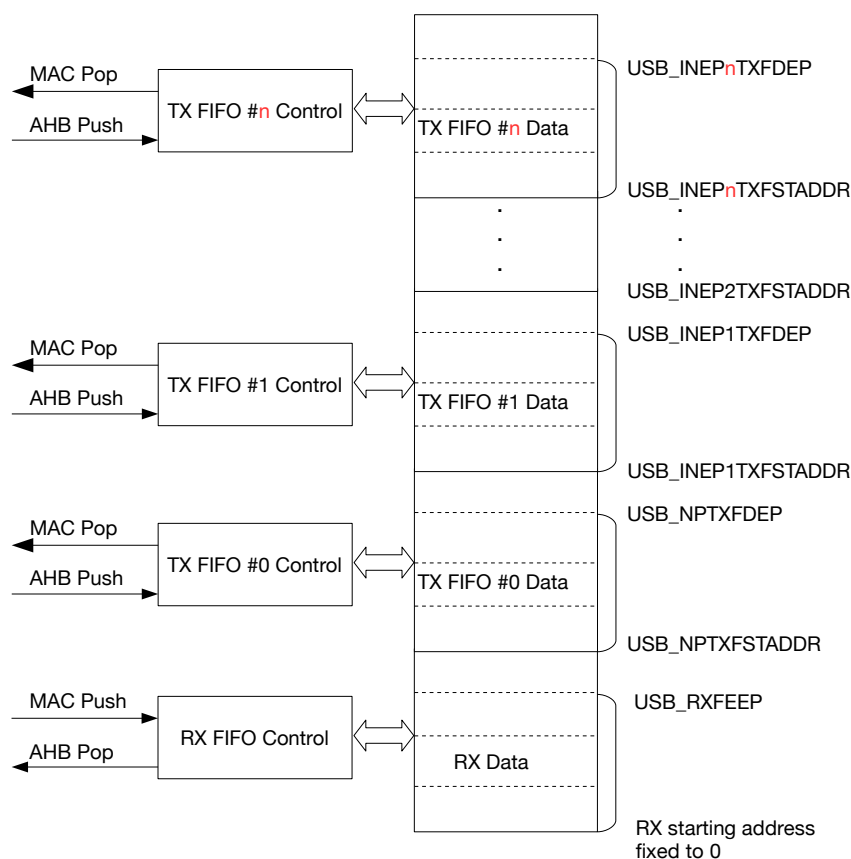

Figure 44.4-4. Device Mode FIFOs

- **RX FIFO:** Stores data payloads received in Data packet, and status entries used to indicate size of those data payloads.
- **Dedicated TX FIFO:** Each active IN endpoint will have a dedicated TX FIFO used to store all IN data payloads of that endpoint, regardless of the transaction type, both periodic and non-periodic IN transactions.

Due to the dedicated FIFOs, Device mode does not use any request queues. Instead, the order of IN transactions are determined by the Host.

#### 44.4.4 Interrupt Hierarchy

OTG\_HS provides a single interrupt line which can be routed via the interrupt matrix to one of the CPUs. The interrupt signal can be unmasked by setting USB\_GLBLINTRMSK. The OTG\_HS interrupt is an OR of all bits in the USB\_GINTSTS\_REG register, and the bits in USB\_GINTSTS\_REG can be unmasked by setting the corresponding bits in the USB\_GINTMSK\_REG register. USB\_GINTSTS\_REG contains system level interrupts, and also specific bits for Host or Device mode interrupts, and OTG specific interrupts. OTG\_HS interrupt sources are organized as Figure 44.4-5 shows.

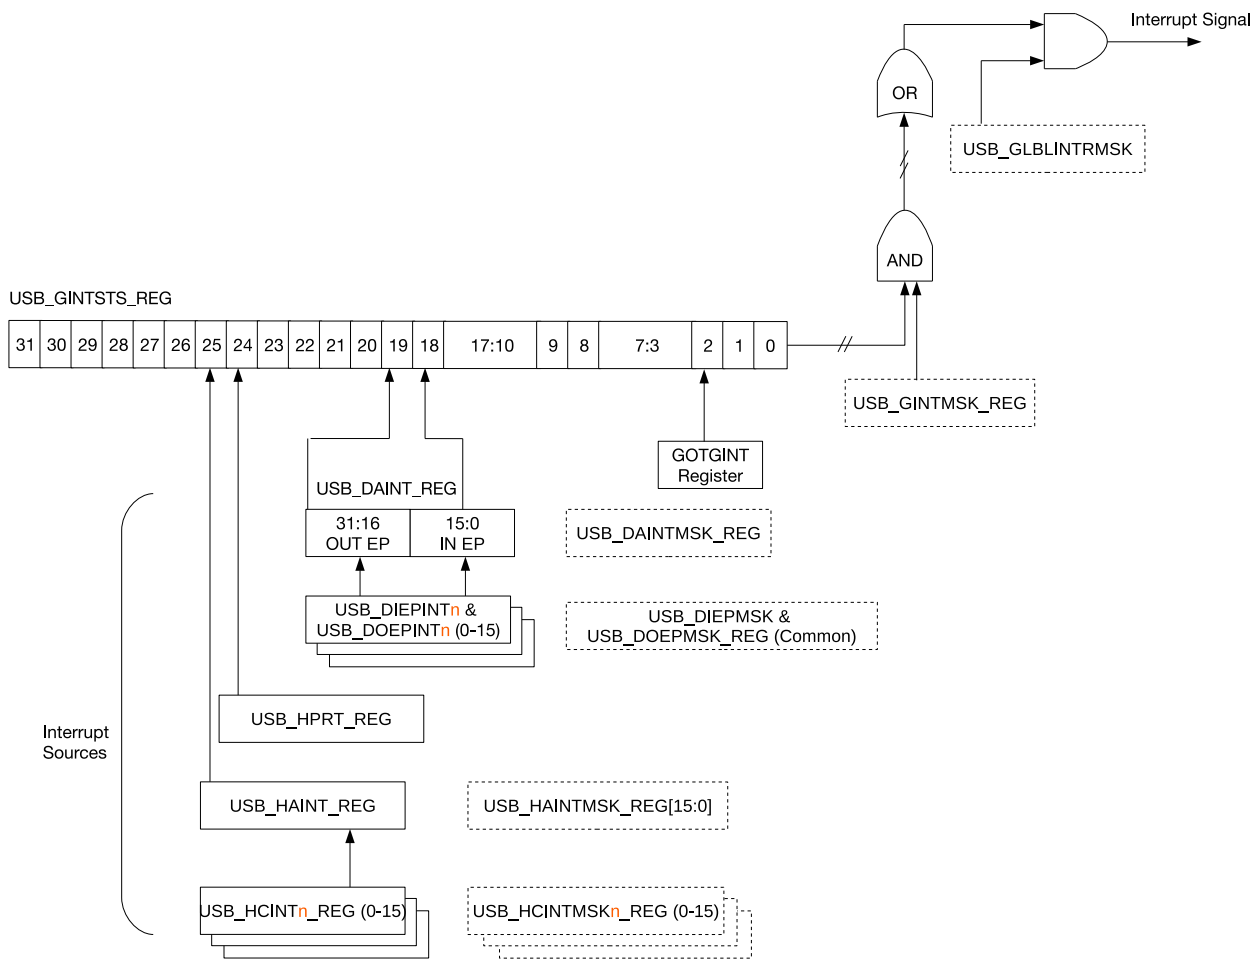

Figure 44.4-5. OTG\_HS Interrupt Hierarchy

The following bits of the USB\_GINTSTS\_REG register indicate an interrupt source lower in the hierarchy:

- **USB\_PRTINT** indicates that the Host port has a pending interrupt. The USB\_HPRT\_REG register indicates the interrupt source.
- **USB\_HCHINT** indicates that one or more Host channels have a pending interrupt. Read the USB\_HAINT\_REG register to determine which channel(s) have a pending interrupt, then read the pending channel's USB\_HCINT<sub>n</sub>\_REG register to determine the interrupt source.
- **USB\_OEPINT** indicates that one or more OUT endpoints have a pending interrupt. Read the USB\_DAJNT\_REG register to determine which OUT endpoint(s) have a pending interrupt, then read the USB\_DOEPINT<sub>n</sub>\_REG register to determine the interrupt source.
- **USB\_IEPINT** indicates that one or more IN endpoints have a pending interrupt. Read the USB\_DAJNT\_REG register to determine which IN endpoint(s) are pending, then read the pending IN endpoint's USB\_DIEPINT<sub>n</sub>\_REG register to determine the interrupt source.
- **USB\_OTGINT** indicates an On-The-Go event has triggered an interrupt. Read the USB\_GOTGINT\_REG register to determine which OTG event(s) triggered the interrupt.

## 44.4.5 DMA Modes and Slave Mode

USB OTG supports three ways to access memory: Slave mode, Buffer DMA mode, and Scatter/Gather DMA mode.

### 44.4.5.1 Slave Mode

In Slave mode, all data payloads must be pushed/popped to and from the FIFOs by the CPU.

- When transmitting a packet using IN endpoints or OUT channels, the data payload must be pushed into the corresponding endpoint or channel's TX FIFO.
- When receiving a packet, the packet's status entry must first be popped off the RX FIFO by reading USB\_GRXSTSP\_REG. The status entry should be used to determine the length of the packet's payload in bytes. The corresponding number of bytes must then be manually popped off the RX FIFO by reading from the RX FIFO's memory region.

### 44.4.5.2 Buffer DMA Mode

Buffer mode is similar to Slave mode but utilizes the internal DMA to push and pop data payloads to the FIFOs.

- When transmitting a packet using IN endpoints or OUT channels, the data payload's address in memory should be written to the USB\_HCDMA $n$ \_REG (in Host mode) or USB\_DIEPDMA $n$ \_REG (in Device mode) registers. When the endpoint or channel is enabled, the internal DMA will push the data payload from memory into the TX FIFO of the channel or endpoint.
- When receiving a packet using OUT endpoints or IN channels, the address of an empty buffer in memory should be written to the USB\_HCDMA $n$ \_REG (in Host mode) or USB\_DOEPDMA $n$ \_REG (in Device mode) registers. When the endpoint or channel is enabled, the internal DMA will pop the data payload from RX FIFO into the buffer.

### 44.4.5.3 Scatter/Gather DMA Mode

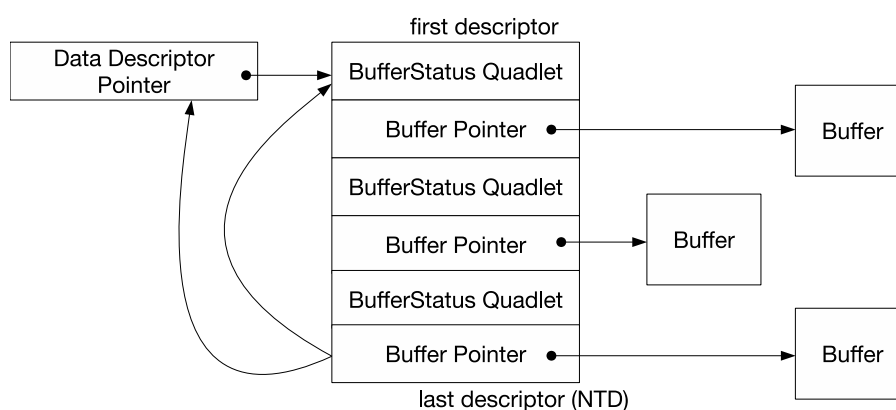

Figure 44.4-6. Scatter/Gather DMA Descriptor List

In Scatter/Gather DMA mode, buffers containing data payloads can be scattered throughout memory. Each endpoint or channel will have a contiguous DMA descriptor list, where each descriptor contains a 32-bit

pointer to the data payload or buffer and a 32-bit buffer descriptor (BufferStatus Quadlet). The data payloads and buffers can correspond to a single transaction (i.e., < 1 MPS bytes) or an entire transfer (> 1 MPS bytes). MPS: maximum packet size. The list is implemented as a ring buffer meaning that the DMA will return to the first entry when it encounters the last entry on the list.

- When transmitting a transfer/transaction using IN endpoints or OUT channels, the DMA will gather the data payloads from the multiple buffers and push them into a TX FIFO.
- When receiving a transfer/transaction using OUT endpoints or IN channels, the DMA will pop the received data payloads from the RX FIFO and scatter them to the multiple buffers pointed to by the DMA list entries.

## 44.4.6 Transaction and Transfer Level Operation

In either Host or Device mode, communication can operate either at the transaction level or the transfer level.

### 44.4.6.1 Transaction and Transfer Level Operation in DMA Mode

When operating at the transfer level in DMA Host mode, software is interrupted only when a channel has been halted. Channels are halted when their programmed transfer size has completed successfully, has received a STALL, or if there are excessive transaction errors, e.g., 3 consecutive transaction errors. In DMA Device mode, all errors are handled by the controller core itself.

When operating at the transaction level in DMA mode, the transfer size is set to the size of one data packet, either a maximum packet size or a short packet size.

### 44.4.6.2 Transaction and Transfer Level Operation in Slave Mode

When operating at the transaction level in Slave Mode, transfers are handled one transaction at a time. Each data payload should correspond to a single data packet, and software must determine whether a retry of the transaction is necessary based on the handshake response received on the USB, e.g., ACK or NAK.

The following table describes transaction level operation in Slave mode for both IN and OUT transactions.

Table 44.4-1. IN and OUT Transactions in Slave Mode

| Host Mode        | Device Mode |
|------------------|-------------|
| OUT Transactions |             |

| Host Mode   | Device Mode  |
|---|--|
| <ol style="list-style-type: none"> <li>1. Software specifies the size of the data packet and the number of data packets (1 data packet) in the USB_HCTSIZ<sub>n</sub>_REG register, enables the channel, then copies the packet's data payload into the TX FIFO.</li> <li>2. When the last DWORD of the data payload has been pushed, the controller core will automatically write a request into the appropriate request queue.</li> <li>3. If the transaction is successful, the USB_XFERCOMPL interrupt will be generated. If the transaction is unsuccessful, an error interrupt, e.g., USB_H_NACK<sub>n</sub> will occur.</li> </ol> | <ol style="list-style-type: none"> <li>1. Software specifies the expected size of the data packet (1 MPS) and the number of data packets (1 data packet) in the USB_DOEPSIZ<sub>n</sub>_REG register. Once the endpoint is enabled, it will wait for the host to transmit a packet to it.</li> <li>2. The received packet will be pushed into the RX FIFO along with a packet status entry.</li> <li>3. If the transaction is unsuccessful, e.g., due to a full RX FIFO, the endpoint will automatically NAK the incoming packet.</li> </ol> |
| IN Transactions   |  |
| <ol style="list-style-type: none"> <li>1. Software specifies the expected size of the data packet and the number of packets (1 data packet) in the USB_HCTSIZ<sub>n</sub>_REG register, then enables the channel.</li> <li>2. The controller core will automatically write a request into the appropriate request queue.</li> <li>3. If the transaction is successful, the received data along with a status entry should be written to the RX FIFO. If the transaction is unsuccessful, an error interrupt, e.g., USB_H_NACK<sub>n</sub> will occur.</li> </ol>  | <ol style="list-style-type: none"> <li>1. Software specifies the size of the data packet and the number of data packets (1 data packet) in the USB_DIEPTSIZ<sub>n</sub>_REG register. Once the endpoint is enabled, it will wait for the host to read the packet.</li> <li>2. When the packet has been transmitted, the USB_XFERCOMPL interrupt will be generated.</li> </ol>  |

When operating at the transfer level in Slave mode, one or more transaction-level operations can be pipelined thus being analogous to transfer level operation in DMA mode. Within pipelined transactions, multiple packets of the same transfer can be read/written from the FIFOs in single instance, thus preventing the need for interrupting the software on a per-packet basis.

Operating on a transfer level in Slave mode is similar to operating on the transaction-level, except the transfer size and packet count for each transfer in the USB\_HCTSIZ<sub>n</sub>\_REG or USB\_DOEPSIZ<sub>n</sub>\_REG register will need to be set to reflect the entire transfer. After the channel or endpoint is enabled, multiple data packets worth of payloads should be written to or read from the TX or RX FIFOs respectively (given that there is enough space or enough data).

### 44.4.7 OTG

Internal ID/VBUS is left floating in OTG\_HS, thus SRP/HNP is not supported. But OTG\_HS still supports Dual-Role-Devices (DRD), i.e, it can be used both as a host and a device. Software can force setting this

controller to work as host or device by configuring ForceDevMode or ForceHstMode in register USB\_GUSBCFG, regardless of the value of ID pin.

## 44.5 Registers

The catalog and comprehensive specifications of USB OTG registers are subject to a Non-Disclosure Agreement (NDA) as mandated by the IP provider. To obtain support information for a particular register, please contact Espressif Technical Support Team via [Technical Inquires](#).

## Chapter 45

# USB 2.0 Full-Speed OTG

## 45.1 Overview

The ESP32-P4 features a USB 2.0 Full-Speed On-The-Go peripheral (henceforth referred to as OTG\_FS) along with integrated transceivers. This OTG\_FS conforms to USB 2.0 specification, OTG Revision 1.3, and OTG Revision 2.0 specifications, OTG\_FS can operate as either a USB Host or Device and supports 12 Mbit/s full-speed (FS) and 1.5 Mbit/s low-speed (LS) data rates of the USB 2.0 specification. The Host Negotiation Protocol (HNP) and the Session Request Protocol (SRP) are also supported.

## 45.2 Glossary

The following abbreviations and terms are used in this chapter.

|  |  |
|--|--|
| <b>Host</b>                            | The host computer system where the USB Host Controller is installed. This includes the host hardware platform (CPU, bus, etc.) and the operating system in use.  |
| <b>Device</b>                          | A logical or physical entity that performs a function. The actual entity described depends on the context of the reference. At the lowest level, device may refer to a single hardware component, as in a memory device. At a higher level, it may refer to a collection of hardware components that perform a particular function, such as a USB interface device. At an even higher level, device may refer to the function performed by an entity attached to the USB; for example, a data/FAX modem device. When used as a non-specific reference, a USB device is either a hub or a function. |
| <b>Full-speed</b>                      | USB operation at 12 Mbit/s.  |
| <b>Low-speed</b>                       | USB operation at 1.5 Mbit/s.   |
| <b>Host Negotiation Protocol (HNP)</b> | Allows the host function to be transferred between two directly connected OTG devices and eliminates the need for a user to switch the cable connections in order to allow a change in control of communications between the devices.  |
| <b>Session Request Protocol (SRP)</b>  | Allows a B-device to request the A-device to turn on the power supply to the USB interface (VBUS) and start a session.   |
| <b>Endpoint</b>                        | A uniquely addressable portion of a USB device that is the source or sink of information in a communication flow between the host and device.  |
| <b>Scatter/Gather DMA mode</b>         | Accesses discontinuous memory areas via DMA.   |

|                          |  |
|--------------------------|--|
| <b>Buffer DMA mode</b>   | Accesses contiguous memory areas via DMA.                                |
| <b>Slave mode</b>        | Accesses memory area through the CPU.                                    |
| <b>RX FIFO</b>           | Stores the received data.  |
| <b>TX FIFO</b>           | Stores the data to be transmitted.                                       |
| <b>Periodic FIFO</b>     | Stores Isochronous transfer data and Interrupt transfer data to be sent. |
| <b>Non-periodic FIFO</b> | Stores Control transfer data and Bulk transfer data to be sent.          |

## 45.3 Features

### 45.3.1 General Features

- USB 2.0 specification, OTG Revision 1.3 and OTG Revision 2.0 specifications
- USB 2.0 full-speed and low-speed data rates
- HNP and SRP as A-device or B-device
- Dynamic FIFO (DFIFO) sizing, maximum to 1 KB
- Multiple modes of memory access
  - Scatter/Gather DMA mode
  - Buffer DMA mode
  - Slave mode
- Two integrated transceivers

### 45.3.2 Device Mode Features

- Endpoint 0 always present, bi-directional, consisting of EPO IN and EPO OUT
- Six additional endpoints 1~6, configurable as IN or OUT
- Maximum of five IN endpoints concurrently active at any time, including EPO IN
- All OUT endpoints share a single RX FIFO
- Each IN endpoint has a dedicated TX FIFO

### 45.3.3 Host Mode Features

- Eight host channels
- RX FIFO: shared by all periodic and non-periodic transactions
- Two TX FIFO:
  - One shared by all non-periodic transactions
  - One shared by all periodic transactions
- All of the above FIFOs share a 1 KB RAM.
- The size of each FIFO is configurable, with a maximum of 1 KB.

## 45.4 Functional Description

### 45.4.1 Controller Core and Interfaces

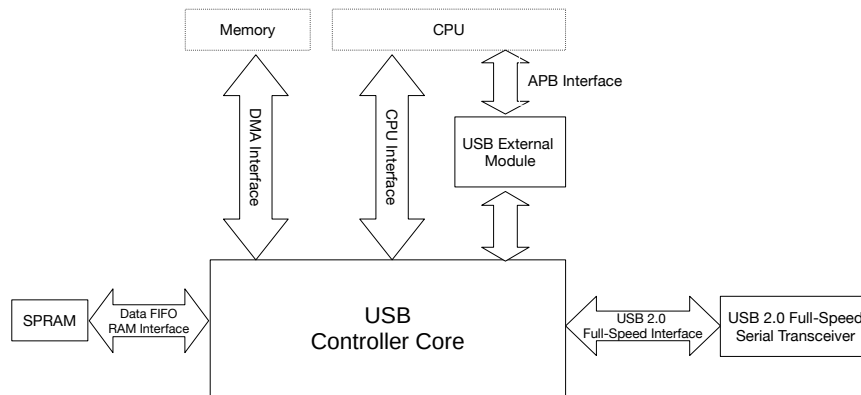

Figure 45.4-1. OTG\_FS System Architecture

The core part of the OTG\_FS peripheral is the USB Controller Core. The controller core has the following interfaces, see Figure 45.4-1:

- **CPU Interface**

Provides the CPU with read/write access to the controller core's various registers and FIFOs. This interface is internally implemented as an AHB slave interface. The way to access the FIFOs through the CPU interface is called Slave mode.

- **APB Interface**

Allows the CPU to control the USB controller core via the USB external controller.

- **DMA Interface**

Provides the controller core's internal DMA with read/write access to system memory, e.g., fetching and writing data payloads in DMA mode. This interface is internally implemented as an AHB master interface.

- **USB 2.0 Full-Speed Interface**

ESP32-P4 has two full-speed transceivers. This interface is used to connect the controller core to one of USB 2.0 full-speed serial transceivers. Aside from USB OTG, ESP32-P4 also includes a USB Serial/JTAG controller, see Chapter 46 [USB Serial/JTAG Controller \(USB\\_SERIAL\\_JTAG\)](#). These two USB controllers can utilize the integrated internal transceivers by time-division multiplexing. In the following sections, GPIO24 and GPIO25 are referred to as FS\_PHY1, while GPIO26 and GPIO27 as FS\_PHY2.

By default FS\_PHY1 connects to USB Serial/JTAG controller and FS\_PHY2 to OTG\_FS. The connection is configurable via eFuse settings:

- 0: FS\_PHY1 is connected to USB Serial/JTAG controller, while FS\_PHY2 to OTG\_FS.
- 1: FS\_PHY2 is connected to USB Serial/JTAG controller, while FS\_PHY1 to OTG\_FS.

- **USB External Controller**

The USB External Controller is primarily used to control the routing of the USB 2.0 full-speed serial interface to the internal registers, thus allowing the CPU to perform query operations, etc. The External Controller can also enable a power saving mode by gating the controller core's clock, i.e., AHB clock, or

powering down the connected SPRAM clock. Note that this power saving mode is different from the power savings via SRP.

- **Data FIFO RAM Interface**

The multiple FIFOs used by the controller core are not actually located within the controller core itself, but on the Single-Port RAM (SPRAM). FIFOs are dynamically sized, thus are allocated at run-time in the SPRAM. When the CPU, DMA, or the controller core attempts to read/write to FIFOs, those accesses are routed through the data FIFO RAM interface.

## 45.4.2 Memory Layout

Figure 45.4-2 illustrates the memory layout of the registers which are used to configure and control the USB Controller Core. Note that USB External Controller uses a separate set of registers called wrap registers.

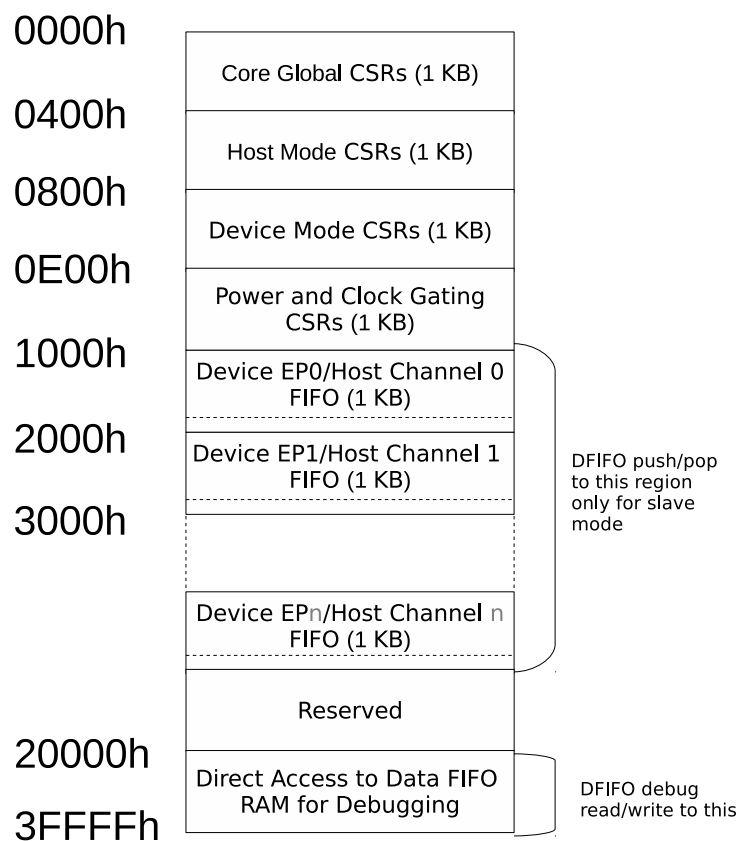

Figure 45.4-2. OTG\_FS Register Layout

### 45.4.2.1 Control & Status Registers (CSRs)

- **Core Global CSRs**

These registers are responsible for the configuration/control/status of the global features of OTG\_FS, i.e., features which are common to both Host and Device modes. These features include:

- OTG control (HNP, SRP, and A/B-device detection);
- USB configuration (Host or Device mode selection and PHY selection);
- and system-level interrupts.

Software can access these registers whilst in Host or Device modes.

- **Host Mode CSRs**

These registers are responsible for the configuration/control/status in Host mode, thus should only be accessed in Host mode. Each channel has its own set of registers within the Host mode CSRs.

- **Device Mode CSRs**

These registers are responsible for the configuration/control/status in Device mode, thus should only be accessed in Device mode. Each endpoint has its own set of registers within the Device mode CSRs.

- **Power and Clock Gating Register**

A single register controls power-down and gates various clocks.

#### 45.4.2.2 FIFO Access

The OTG\_FS makes use of multiple FIFOs to buffer the data payloads to be transmitted or to buffer the received data payloads. The number and type of FIFOs are dependent on Host or Device mode, and the number of channels or endpoints used, see Section 45.4.3. There are two ways to access the FIFOs: DMA mode and Slave mode. In Slave mode, the CPU accesses these FIFOs by reading and writing to either the DFIFO push/pop regions or the DFIFO read/write debug region. FIFO access is governed by the following rules:

- Read access to any address in any one of the 1 KB push/pop regions will result in a pop from the shared RX FIFO.
- Write access to a particular 1 KB push/pop region will result in a push to the corresponding endpoint or channel's TX FIFO given that the endpoint is an IN endpoint, or the channel is an OUT channel.
  - In Device mode, data is pushed to the corresponding IN endpoint's dedicated TX FIFO.
  - In Host mode, data is pushed to the non-periodic TX FIFO or the periodic TX FIFO depending on whether the channel is a non-periodic channel, or a periodic channel.
- Access to the 128 KB read/write region will result in direct read/write instead of a push/pop. This is generally used for debugging purposes only.

Note that pushing and popping data to and from the FIFOs by the CPU is only required in Slave mode. In DMA mode, the internal DMA will handle all pushing/popping of data to and from the TX and RX FIFOs.

#### 45.4.3 FIFO and Queue Organization

The FIFOs in OTG\_FS are primarily used to hold data packet payloads, i.e., the data field of USB Data packets. TX FIFOs are used to store data payloads that will be transmitted by OUT transactions in Host mode or IN transactions in Device mode. RX FIFOs are used to store received data payloads of IN transactions in Host mode or OUT transactions in Device mode. In addition to storing data payloads, RX FIFOs also store a **status entry** for each data payload. Each status entry contains information about a data payload such as channel number, byte count, and validity status. In Slave mode, status entries are also used to indicate various channel events.

The portion of SPRAM that can be used for FIFO allocation has a depth of 256 and a width of 35 bits (32 data bits plus 3 control bits). The multiple FIFOs used by each channel in Host mode or endpoint in Device mode are allocated into the SPRAM and can be dynamically sized.

### 45.4.3.1 Host Mode FIFOs and Queues

The following FIFOs are used in Host mode, see Figure 45.4-3:

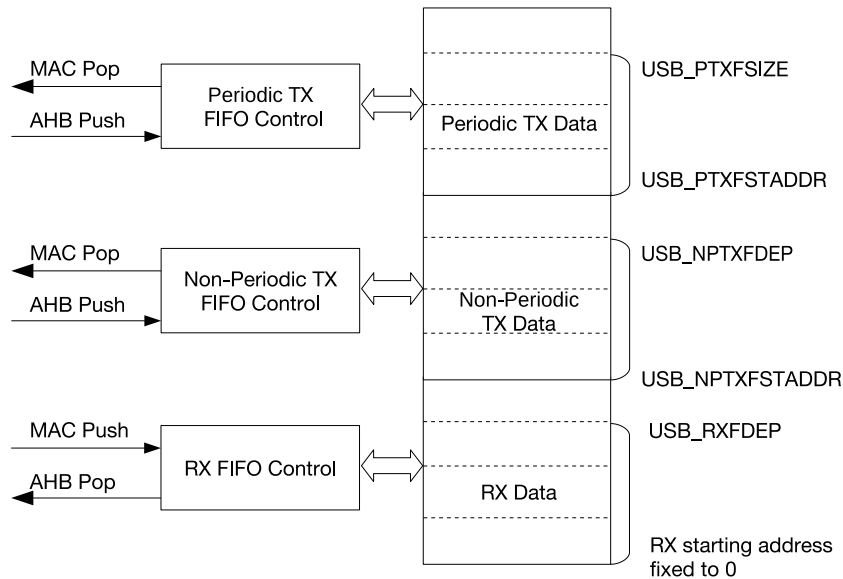

Figure 45.4-3. Host Mode FIFOs

- **Non-periodic TX FIFO:** Stores data payloads of Bulk and Control OUT transactions for all channels.
- **Periodic TX FIFO:** Stores data payloads of Interrupt or Isochronous OUT transactions for all channels.
- **RX FIFO:** Stores data payloads of all IN transactions, and status entries that are used to indicate size of data payloads and transaction/channel events such as transfer complete or channel halted.

In addition to FIFOs, Host mode also contains two request queues used to queue up the various transaction request from the multiple channels. Each entry in a request queue holds the IN/OUT channel number along with other information to perform the transaction, such as transaction type. Request queues are also used to queue other types of requests such as a channel halt request.

Unlike FIFOs, request queues are fixed in size and cannot be accessed directly by software. Rather, once a channel is enabled, requests will be automatically written to the request queue by the Host core. The order in which the requests are written into the queue determines the sequence of transactions on the USB.

Host mode contains the following request queues:

- **Non-periodic request queue:** Request queue for all non-periodic Bulk and Control channels. The queue has a depth of four entries.
- **Periodic request queue:** Request queue for all periodic Interrupt and Isochronous channels. The queue has a depth of eight entries.

When scheduling transactions, hardware will execute all requests on the periodic request queue first before executing requests on the non-periodic request queue.

### 45.4.3.2 Device Mode FIFOs

The following FIFOs are used in Device mode, see Figure 45.4-4:

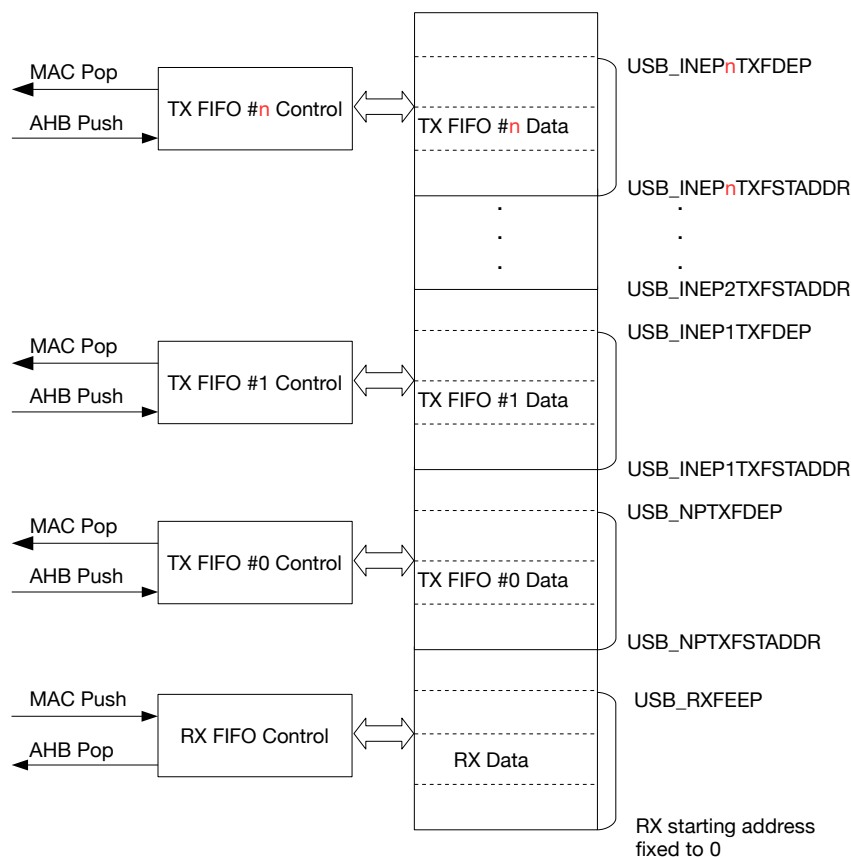

Figure 45.4-4. Device Mode FIFOs

- **RX FIFO:** Stores data payloads received in Data packet, and status entries used to indicate size of those data payloads.
- **Dedicated TX FIFO:** Each active IN endpoint will have a dedicated TX FIFO used to store all IN data payloads of that endpoint, regardless of the transaction type, both periodic and non-periodic IN transactions.

Due to the dedicated FIFOs, Device mode does not use any request queues. Instead, the order of IN transactions are determined by the Host.

#### 45.4.4 Interrupt Hierarchy

OTG\_FS provides a single interrupt line which can be routed via the interrupt matrix to one of the CPUs. The interrupt signal can be unmasked by setting USB\_GLBLINTRMSK. The OTG\_FS interrupt is an OR of all bits in the USB\_GINTSTS\_REG register, and the bits in USB\_GINTSTS\_REG can be unmasked by setting the corresponding bits in the USB\_GINTMSK\_REG register. USB\_GINTSTS\_REG contains system level interrupts, and also specific bits for Host or Device mode interrupts, and OTG specific interrupts. OTG\_FS interrupt sources are organized as Figure 45.4-5 shows.

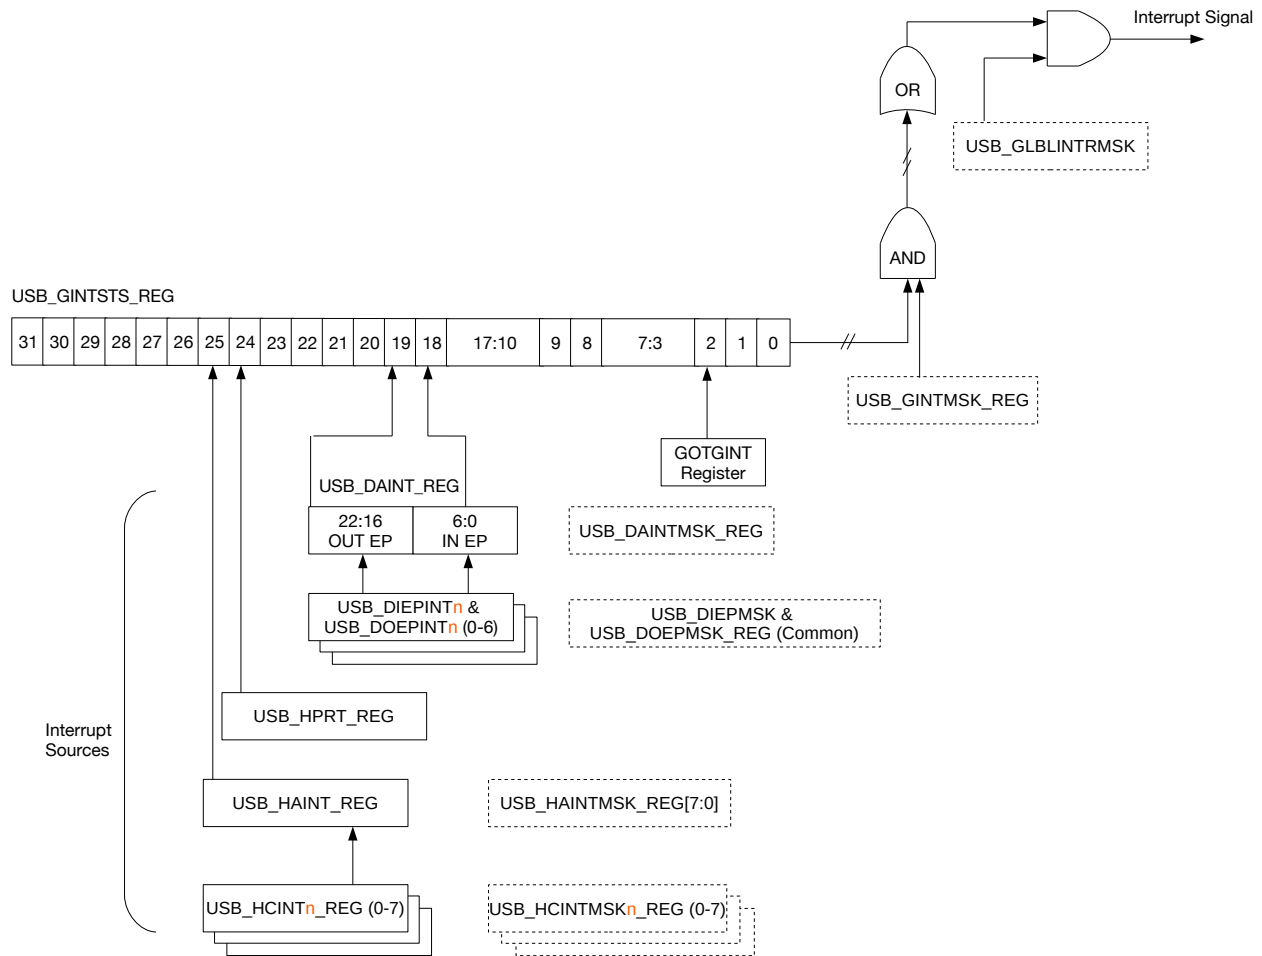

Figure 45.4-5. OTG\_FS Interrupt Hierarchy

The following bits of the **USB\_GINTSTS\_REG** register indicate an interrupt source lower in the hierarchy:

- **USB\_PRTINT** indicates that the Host port has a pending interrupt. The **USB\_HPRT\_REG** register indicates the interrupt source.
- **USB\_HCHINT** indicates that one or more Host channels have a pending interrupt. Read the **USB\_HAINT\_REG** register to determine which channel(s) have a pending interrupt, then read the pending channel's **USB\_HCINT<sub>n</sub>\_REG** register to determine the interrupt source.
- **USB\_OEPINT** indicates that one or more OUT endpoints have a pending interrupt. Read the **USB\_DAINTEG** register to determine which OUT endpoint(s) have a pending interrupt, then read the **USB\_DOEPINT<sub>n</sub>\_REG** register to determine the interrupt source.
- **USB\_IEPINT** indicates that one or more IN endpoints have a pending interrupt. Read the **USB\_DAINTEG** register to determine which IN endpoint(s) are pending, then read the pending IN endpoint's **USB\_DIEPINT<sub>n</sub>\_REG** register to determine the interrupt source.
- **USB\_OTGINT** indicates an On-The-Go event has triggered an interrupt. Read the **USB\_GOTGINT\_REG** register to determine which OTG event(s) triggered the interrupt.

## 45.4.5 Slave Mode and DMA Modes

OTG\_FS supports three ways to access memory: Slave mode, Buffer DMA mode, and Scatter/Gather DMA mode.

### 45.4.5.1 Slave Mode

In Slave mode, all data payloads must be pushed/popped to and from the FIFOs by the CPU.

- When transmitting a packet using IN endpoints or OUT channels, the data payload must be pushed into the corresponding endpoint or channel's TX FIFO.
- When receiving a packet, the packet's status entry must first be popped off the RX FIFO by reading USB\_GRXSTSP\_REG. The status entry should be used to determine the length of the packet's payload (in bytes). The corresponding number of bytes must then be manually popped off the RX FIFO by CPU reading from the RX FIFO's memory region.

### 45.4.5.2 Buffer DMA Mode

Buffer DMA mode is similar to Slave mode but utilizes the internal DMA to push and pop data payloads to the FIFOs.

- When transmitting a packet using IN endpoints or OUT channels, the data payload's address in memory should be written to USB\_HCDMA $n$ \_REG in Host mode or USB\_DIEPDMA $n$ \_REG in Device mode. When the endpoint or channel is enabled, the internal DMA will push the data payload from memory into the TX FIFO of the channel or endpoint.
- When receiving a packet using OUT endpoints or IN channels, the address of an empty buffer in memory should be written to USB\_HCDMA $n$ \_REG in Host mode or USB\_DOEPDMA $n$ \_REG in Device mode. When the endpoint or channel is enabled, the internal DMA will pop the data payload from RX FIFO into the buffer.

### 45.4.5.3 Scatter/Gather DMA Mode

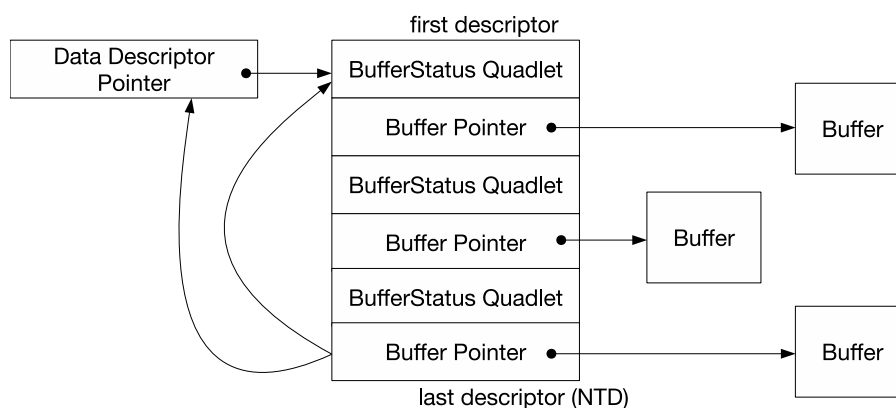

Figure 45.4-6. Scatter/Gather DMA Descriptor List

In Scatter/Gather DMA mode, buffers containing data payloads can be scattered throughout memory. Each endpoint or channel will have a contiguous DMA descriptor list, where each descriptor contains a 32-bit

pointer to the data payload or buffer and a 32-bit buffer descriptor (BufferStatus Quadlet). The data payloads and buffers can correspond to a single transaction (i.e., < 1 MPS bytes) or an entire transfer (> 1 MPS bytes). MPS: maximum packet size. The list is implemented as a ring buffer meaning that the DMA will return to the first entry when it encounters the last entry on the list.

- When transmitting a transfer/transaction using IN endpoints or OUT channels, the DMA will gather the data payloads from the multiple buffers and push them into a TX FIFO.
- When receiving a transfer/transaction using OUT endpoints or IN channels, the DMA will pop the received data payloads from the RX FIFO and scatter them to the multiple buffers pointed to by the DMA list entries.

## 45.4.6 Transaction and Transfer Level Operation

In either Host or Device mode, communication can operate either at the transaction level or the transfer level.

### 45.4.6.1 Transaction and Transfer Level Operation in DMA Mode

When operating at the transaction level in DMA mode, the transfer size is set to the size of one data packet, either a maximum packet size or a short packet size.

When operating at the transfer level in DMA Host mode, software is interrupted only when a channel has been halted. Channels are halted when their programmed transfer size has completed successfully, has received a STALL, or if there are excessive transaction errors, e.g., 3 consecutive transaction errors. In DMA Device mode, all errors are handled by the controller core itself.

### 45.4.6.2 Transaction and Transfer Level Operation in Slave Mode

When operating at the transaction level in Slave Mode, transfers are handled one transaction at a time. Each data payload should correspond to a single data packet, and software must determine whether a retry of the transaction is necessary based on the handshake response received on the USB, e.g., ACK or NAK.

The following table describes transaction level operation in Slave mode for both IN and OUT transactions.

Table 45.4-1. IN and OUT Transactions in Slave Mode

| Host Mode        | Device Mode |
|------------------|-------------|
| OUT Transactions |             |

| Host Mode  | Device Mode   |
|--|---|
| <ol style="list-style-type: none"> <li>1. Software specifies the size of the data packet and the number of data packets (1 data packet) in the USB_HCTSIZ<sub>n</sub>_REG register, enables the channel, then copies the packet's data payload into the TX FIFO.</li> <li>2. When the last DWORD of the data payload has been pushed, the controller core will automatically write a request into the appropriate request queue.</li> <li>3. If the transaction is successful, the USB_XFERCOMPL interrupt will be generated. If the transaction is unsuccessful, an error interrupt, e.g. USB_H_NACK<sub>n</sub> will occur.</li> </ol> | <ol style="list-style-type: none"> <li>1. Software specifies the expected size of the data packet (1 MPS) and the number of data packets (1 data packet) in the USB_DOEPSIZ<sub>n</sub>_REG. Once the endpoint is enabled, it will wait for the host to transmit a packet to it.</li> <li>2. The received packet will be pushed into the RX FIFO along with a packet status entry.</li> <li>3. If the transaction is unsuccessful, e.g., due to a full RX FIFO, the endpoint will automatically NAK the incoming packet.</li> </ol> |
| IN Transactions  |   |
| <ol style="list-style-type: none"> <li>1. Software specifies the expected size of the data packet and the number of packets (1 data packet) in the USB_HCTSIZ<sub>n</sub>_REG register, then enables the channel.</li> <li>2. The controller core will automatically write a request into the appropriate request queue.</li> <li>3. If the transaction is successful, the received data along with a status entry should be written to the RX FIFO. If the transaction is unsuccessful, an error interrupt, e.g., USB_H_NACK<sub>n</sub> will occur.</li> </ol>   | <ol style="list-style-type: none"> <li>1. Software specifies the size of the data packet and the number of data packets (1 data packet) in the USB_DIEPTSIZ<sub>n</sub>_REG register. Once the endpoint is enabled, it will wait for the host to read the packet.</li> <li>2. When the packet has been transmitted, the USB_XFERCOMPL interrupt will be generated.</li> </ol>   |

When operating at the transfer level in Slave mode, one or more transaction-level operations can be pipelined thus being analogous to transfer level operation in DMA mode. Within pipelined transactions, multiple packets of the same transfer can be read/written from the FIFOs in single instance, thus preventing the need for interrupting the software on a per-packet basis.

Operating on a transfer level in Slave mode is similar to operating on the transaction-level, except the transfer size and packet count for each transfer in the USB\_HCTSIZ<sub>n</sub>\_REG or USB\_DOEPSIZ<sub>n</sub>\_REG register will need to be set to reflect the entire transfer. After the channel or endpoint is enabled, multiple data packets worth of payloads should be written to or read from the TX or RX FIFOs respectively (given that there is enough space or enough data).

## 45.5 OTG

USB OTG allows OTG devices to act in the USB Host role or the USB Device role. Thus, OTG devices will typically have a Mini-AB or Micro-AB receptacle so that it can receive an A-plug or B-plug. OTG devices will

become either an A-device or a B-device depending on whether an A-plug or a B-plug is connected.

- A-device defaults to the Host role (A-Host) whilst B-device defaults to the Device role (B-Peripheral).
- A-device and B-device may exchange roles by using the Host Negotiation Protocol (HNP), thus becoming A-peripheral and B-Host.
- A-device can turn off Vbus to save power. B-device can then wake up the A-device by requesting it to turn on Vbus and start a new session. This mechanism is called session request protocol (SRP).
- A-device always powers Vbus even if it is an A-peripheral.

OTG devices are able to determine whether they are connected to an A plug or a B plug using the ID pin of the plugs. The ID pin in A-plugs are pulled to ground whilst B-plugs have the ID pin left floating.

### 45.5.1 OTG Interface

The OTG\_FS supports both the Session Request Protocol (SRP) and Host Negotiation Protocol (HNP) of the OTG Revision 1.3 specification. The OTG\_FS controller core interfaces with the internal transceiver using the UTMI+ OTG interface. The UTMI+ OTG interface allows the controller core to manipulate the transceiver for OTG purposes, e.g., enabling/disabling pull-ups and pull-downs in HNP, and also allows the transceiver to indicate OTG related events. If an external transceiver is used instead, the UTMI+ OTG interface signals will be routed to the ESP32-P4's GPIOs instead through GPIO Matrix. Please refer to Chapter [8 GPIO Matrix and IO MUX](#). The UTMI+ OTG interface signals are described in Table 45.5-1.

**Table 45.5-1. UTMI+ OTG Interface**

| Signal Name          | I/O | Description  |
|----------------------|-----|--|
| usb_otg_iddig_in     | I   | Mini A/B Plug Indicator. Indicates whether the connected plug is mini-A or mini-B. Valid only when usb_otg_idpullup is sampled asserted.<br>0: Mini-A connected<br>1: Mini-B connected   |
| usb_otg_avalid_in    | I   | A-Peripheral Session Valid. Indicates if the voltage Vbus is at a valid level for an A-peripheral session. The comparator thresholds are:<br>0: Vbus < 0.8 V<br>1: Vbus = 0.2 V to 2.0 V |
| usb_otg_bvalid_in    | I   | B-Peripheral Session Valid. Indicates if the voltage Vbus is at a valid level for a B-peripheral session. The comparator thresholds are:<br>0: Vbus < 0.8 V<br>1: Vbus = 0.8 V to 4 V    |
| usb_otg_vbusvalid_in | I   | Vbus Valid. Indicates if the voltage Vbus is valid for A/B-device/peripheral operation. The comparator thresholds are:<br>0: Vbus < 4.4 V<br>1: Vbus > 4.75 V                            |
| usb_srp_sessend_in   | I   | B-device Session End. Indicates if the voltage Vbus is below the B-device Session End threshold. The comparator thresholds are:<br>0: Vbus > 0.8 V<br>1: Vbus < 0.2 V                    |

| Signal Name         | I/O | Description  |
|---------------------|-----|--|
| usb_otg_idpullup    | O   | Analog ID input Sample Enable. Enables sampling the analog ID line.<br>0: ID pin sampling disabled<br>1: ID pin sampling enabled   |
| usb_otg_dppulldown  | O   | D+ Pull-down Resistor Enable. Enables the 15 k $\Omega$ pull-down resistor on the D+ line.   |
| usb_otg_dmpulldown  | O   | D- Pull-down Resistor Enable. Enables the 15 k $\Omega$ pull-down resistor on the D- line.   |
| usb_otg_drvvbus     | O   | Drive Vbus. Enables driving Vbus to 5 V.<br>0: Do not drive Vbus<br>1: Drive Vbus  |
| usb_srp_chrgvbus    | O   | Vbus Input Charge Enable. Directs the PHY to charge Vbus.<br>0: Do not charge Vbus through a resistor<br>1: Charge Vbus through a resistor (must be active for at least 30 ms)               |
| usb_srp_dischrgvbus | O   | Vbus Input Discharge Enable. Directs the PHY to discharge Vbus.<br>0: Do not discharge Vbus through a resistor.<br>1: Discharge Vbus through a resistor (must be active for at least 50 ms). |

## 45.5.2 ID Pin Detection

Bit USB\_CONIDSTS in register USB\_GOTGCTL\_REG indicates whether the OTG controller is an A-device (1'b0) or a B-device (1'b1). The USB\_CONIDSTSCHNG interrupt will trigger whenever there is a change to USB\_CONIDSTS, i.e., when a plug is connected or disconnected.

## 45.5.3 Session Request Protocol (SRP)

### 45.5.3.1 A-Device SRP

Figure 45.5-1 illustrates the flow of SRP when the OTG\_FS is acting as an A-device, i.e., default host and the device that powers Vbus.

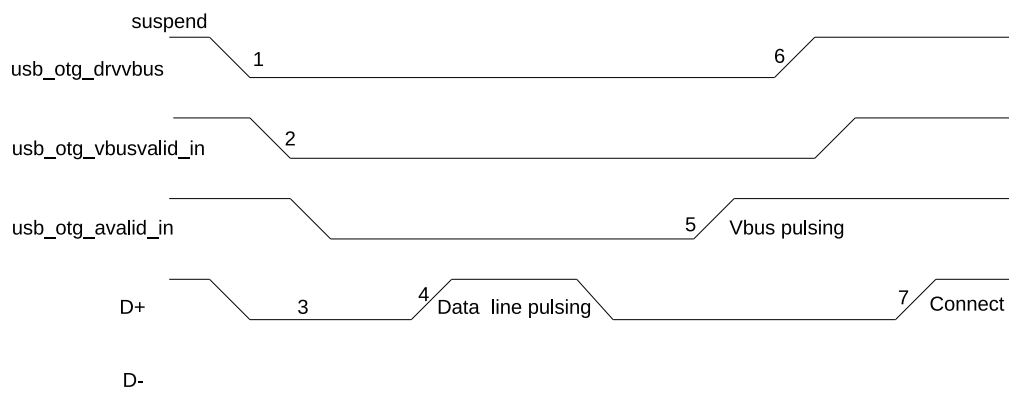

Figure 45.5-1. A-Device SRP

1. To save power, the application suspends and turns off port power when the bus is idle by writing to the Port Suspend (USB\_PRTSUSP to 1'b0) and Port Power (USB\_P RTPWR to 1'b0) bits in the Host Port Control and Status register.

2. PHY indicates port power off by deasserting the `usb_otg_vbusvalid_in` signal.
3. The A-device must detect SEO for at least 2 ms to start SRP when Vbus power is off.
4. To initiate SRP, the B-device turns on its data line pull-up resistor for 5 to 10 ms. The OTG\_FS core detects data-line pulsing.
5. The device drives Vbus above the A-device session valid (2.0 V minimum) for Vbus pulsing. The OTG\_FS core interrupts the application on detecting SRP. The Session Request Detected bit (`USB_SESSREQINT`) is set in Global Interrupt Status register.
6. The application must service the Session Request Detected interrupt and turn on the Port Power bit by writing the Port Power bit in the Host Port Control and Status register. The PHY indicates port power-on by asserting `usb_otg_vbusvalid_in` signal.
7. When the USB is powered, the B-Device connects, completing the SRP process.

### 45.5.3.2 B-Device SRP

Figure 45.5-2 illustrates the flow of SRP when the OTG\_FS is acting as a B-device, i.e., does not power Vbus.

Figure 45.5-2. B-Device SRP

1. To save power, the host (A-device) suspends and turns off port power when the bus is idle. PHY indicates port power off by deasserting the `usb_otg_vbusvalid_in` signal. The OTG\_FS core sets the Early Suspend bit (`USB_ERLYSUSP`) in the Core Interrupt register after detecting 3 ms of bus idleness. Following this, the OTG\_FS core sets the USB Suspend bit (`USB_USBSUSP`) in the Core Interrupt register. PHY indicates the end of the B-device session by deasserting the `usb_otg_bvalid_in` signal.
2. The OTG\_FS core asserts the `usb_otg_dischrgvbus` signal to indicate to the PHY to speed up Vbus discharge.
3. PHY indicates the session's end by asserting the `usb_otg_sessend_in` signal. This is the initial condition

for SRP. The OTG\_FS core requires 2 ms of SEO before initiating SRP. For a USB 2.0 full-speed serial transceiver, the application must wait until Vbus discharges to 0.2 V after USB\_BSESVDL is deasserted.

4. The application waits for 1.5 seconds (TB\_SEO\_SRP time) before initiating SRP by writing the Session Request bit (USB\_SESREQ) in the OTG Control and Status register. The OTG\_FS core performs data-line pulsing followed by Vbus pulsing.
5. The host (A-device) detects SRP from either the data-line or Vbus pulsing, and turns on Vbus. The PHY indicates Vbus power-on by asserting `usb_otg_vbusvalid_in`.
6. The OTG\_FS core performs Vbus pulsing by asserting `usb_srp_chrgvbus`. The host (A-device) starts a new session by turning on Vbus, indicating SRP success. The OTG\_FS core interrupts the application by setting the Session Request Success Status Change bit (USB\_SESREQSC) in the OTG Interrupt Status register. The application reads the Session Request Success bit in the OTG Control and Status register.
7. When the USB is powered, the OTG\_FS core connects, completing the SRP process.

## 45.5.4 Host Negotiation Protocol (HNP)

### 45.5.4.1 A-Device HNP

Figure 45.5-3 illustrates the flow of HNP when the OTG\_FS is acting as an A-device.

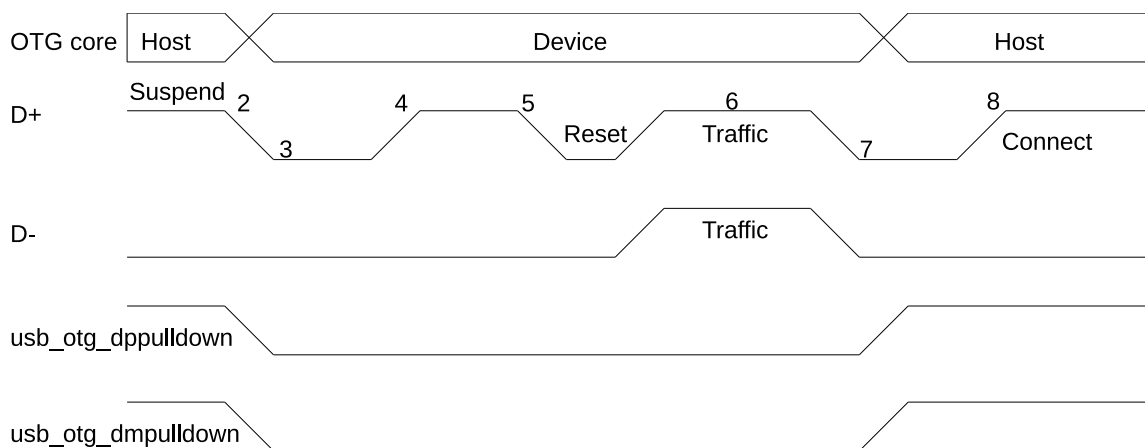

Figure 45.5-3. A-Device HNP

1. The OTG\_FS core sends the B-device a SetFeature `b_hnp_enable` descriptor to enable HNP support. The B-device's ACK response indicates that the B-device supports HNP. The application must set Host Set HNP Enable bit (USB\_HSTSETHNPEN) in the OTG Control and Status register to indicate to the OTG\_FS core that the B-device supports HNP.
2. When it has finished using the bus, the application suspends by writing the Port Suspend bit (USB\_PRTSUSP) in the Host Port Control and Status register.
3. When the B-device observes a USB suspend, it disconnects, indicating the initial condition for HNP. The B-device initiates HNP only when it must switch to the host role; otherwise, the bus continues to be suspended. The OTG\_FS core sets the Host Negotiation Detected interrupt (USB\_HSTNEGDET) in the OTG Interrupt Status register, indicating the start of HNP. The OTG\_FS core deasserts the `usb_otg_dppulldown` and `usb_otg_dmpulldown` signals to indicate a device role. The PHY enables the D+ pull-up resistor, thus indicating a connection for the B-device. The application must read the Current

Mode bit (USB\_CURMOD\_INT) in the OTG Control and Status register to determine Device mode operation.

4. The B-device detects the connection, issues a USB reset, and enumerates the OTG\_FS core for data traffic.
5. The B-device continues the host role, initiating traffic, and suspends the bus when done. The OTG\_FS core sets the Early Suspend bit (USB\_ERLYSUSP) in the Core Interrupt register after detecting 3 ms of bus idleness. Following this, the OTG\_FS core sets the USB Suspend bit (USB\_USBSUSP) in the Core Interrupt register.
6. In Negotiated mode, the OTG\_FS core detects the suspend, disconnects, and switches back to the host role. The OTG\_FS core asserts the usb\_otg\_dppulldown and usb\_otg\_dmpulldown signals to indicate its assumption of the host role.
7. The OTG\_FS core sets the Connector ID Status Change bit (USB\_CONIDSTS) in the OTG Interrupt Status register. The application must read the connector ID status in the OTG Control and Status register to determine the OTG\_FS core's operation as an A-device. This indicates the completion of HNP to the application. The application must read the Current Mode bit (USB\_CURMOD\_INT) in the OTG Control and Status register to determine Host mode operation.
8. The B-device connects, completing the HNP process.

#### 45.5.4.2 B-Device HNP

Figure 45.5-4 illustrates the flow of HNP when the OTG\_FS is acting as a B-device.

Figure 45.5-4. B-Device HNP

1. The A-device sends the SetFeature b\_hnp\_enable descriptor to enable HNP support. The OTG\_FS core's ACK response indicates that it supports HNP. The application must set the Device HNP Enable bit (USB\_DEVHNPEN) in the OTG Control and Status register to indicate HNP support. The application sets the HNP Request bit (USB\_DEVHNPEN) in the OTG Control and Status register to indicate to the OTG\_FS core to initiate HNP.
2. When A-device has finished using the bus, it suspends the bus.
  - (a) The OTG\_FS core sets the Early Suspend bit (USB\_ERLYSUSP) in the Core Interrupt register after 3 ms of bus idleness. Following this, the OTG\_FS core sets the USB Suspend bit (USB\_USBSUSP) in

- the Core Interrupt register. The OTG\_FS core disconnects and the A-device detects SEO on the bus, indicating HNP.
- (b) The OTG\_FS core asserts the `usb_otg_dppulldown` and `usb_otg_dmpulldown` signals to indicate its assumption of the host role.
  - (c) The A-device responds by activating its D+ pull-up resistor within 3 ms of detecting SEO. The OTG\_FS core detects this as a connect.
  - (d) The OTG\_FS core sets the Host Negotiation Success Status Change interrupt in the OTG Interrupt Status register (`USB_CONIDSTS`), indicating the HNP status. The application must read the Host Negotiation Success bit (`USB_HSTNEGSCS`) in the OTG Control and Status register to determine host negotiation success. The application must read the Current Mode bit (`USB_CURMOD_INT`) in the Core Interrupt register to determine Host mode operation.
3. Program the `USB_PRT_PWR` bit to 1'b1. This drives Vbus on the USB.
  4. Wait for the `USB_PRTCONNDT` interrupt. This indicates that a device is connected to the port.
  5. The application sets the reset bit (`USB_PRT_RST`) and the OTG\_FS core issues a USB reset and enumerates the A-device for data traffic.
  6. Wait for the `USB_PRTENCHNG` interrupt.
  7. The OTG\_FS core continues the host role of initiating traffic, and when done, suspends the bus by writing the Port Suspend bit (`USB_PRT_SUSP`) in the Host Port Control and Status register.
  8. In Negotiated mode, when the A-device detects a suspend, it disconnects and switches back to the host role. The OTG\_FS core deasserts the `usb_otg_dppulldown` and `usb_otg_dmpulldown` signals to indicate the assumption of the device role.
  9. The application must read the Current Mode bit (`USB_CURMOD_INT`) in the Core Interrupt register to determine the Host mode operation.
  10. The OTG\_FS core connects, completing the HNP process.

## 45.6 Registers

The catalog and comprehensive specifications of USB OTG registers are subject to a Non-Disclosure Agreement (NDA) as mandated by the IP provider. To obtain support information for a particular register, please contact Espressif Technical Support Team via [Technical Inquires](#).

## Chapter 46

### USB Serial/JTAG Controller (USB\_SERIAL\_JTAG)

ESP32-P4 contains a USB Serial/JTAG Controller. This unit can be used to program the SoC's flash, read program output, as well as attach a debugger to the running program. All of these are possible for any computer with a USB host (hereafter referred to as 'host') without any active external components.

#### 46.1 Overview

While programming and debugging an ESP32-P4 project using the UART and JTAG functionality is certainly possible, it has a few downsides. First of all, both UART and JTAG take up IO pins and as such, fewer pins are left usable for controlling external signals in software. Additionally, an external chip or adapter is needed for both UART and JTAG to interface with a host computer, which means it will be necessary to integrate these two functionalities in the form of external chips or debugging adapters.

In order to alleviate these issues, ESP32-P4 provides a USB Serial/JTAG Controller, which integrates the functionality of both a USB-to-serial converter as well as a USB-to-JTAG adapter. As this device directly interfaces with an external USB host using only the two data lines required by USB 2.0, only two pins are required to be dedicated to this functionality for debugging ESP32-P4.

#### 46.2 Features

The USB Serial/JTAG controller has the following features:

- USB Full-speed device; Hardwired for CDC-ACM (Communication Device Class - Abstract Control Model) and JTAG adapter functionality
- CDC-ACM:
  - Integrates CDC-ACM adherent serial port emulation (plug-and-play on most modern OSes)
  - Supports host controllable chip reset and entry into download mode
- JTAG adapter functionality:
  - Allows fast communication with CPU debugging core using a compact representation of JTAG instructions
- A control endpoint, a dummy interrupt endpoint, two bulk input endpoints, and two bulk output endpoints; Up to 64-byte data payload size
- Internal PHY: very few or no external components needed to connect to a host computer

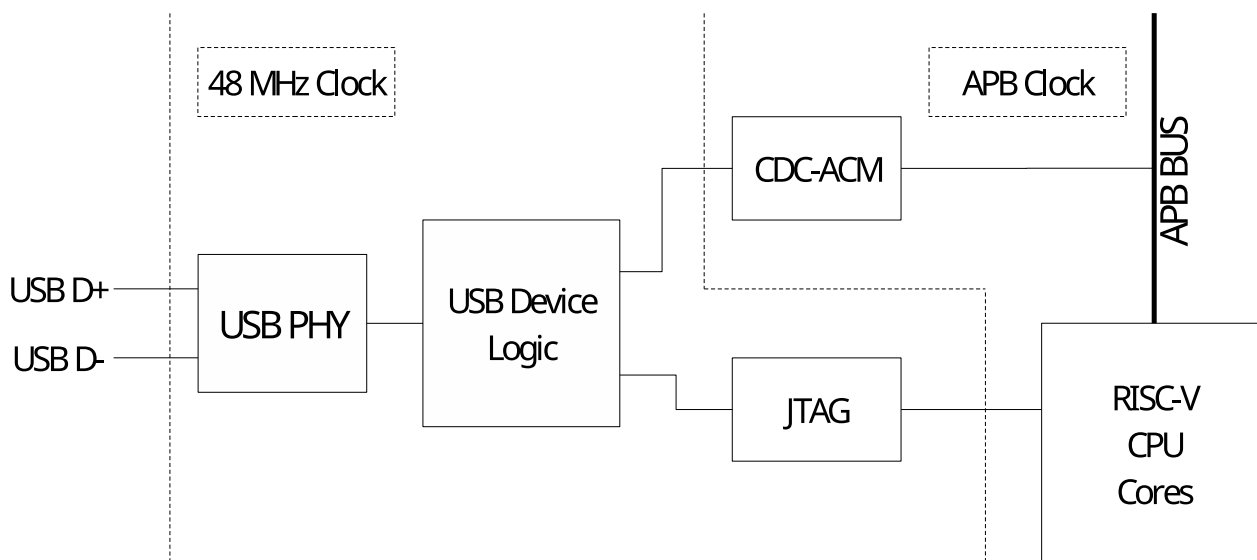

Figure 46.2-1. USB Serial/JTAG High Level Diagram

As shown in Figure 46.2-1, the USB Serial/JTAG controller consists of a USB PHY, a USB device interface, a JTAG command processor, a response capture unit, and the CDC-ACM registers. The PHY and device interface are clocked from a 48 MHz clock derived from the baseband PLL (BBPLL); the software-accessible side of the CDC-ACM block is clocked from APB\_CLK. The JTAG command processor is connected to the JTAG debugging unit of the main processor; the CDC-ACM registers are connected to the APB bus and as such can be read from and written to by software running on the main CPU.

Note that while the USB Serial/JTAG device supports USB 2.0 standard, it only supports Full-speed (12 Mbps) mode but not other modes that the USB 2.0 standard introduced, e.g., the High-speed (480 Mbps) mode.

Figure 46.2-2 shows the internal details of the USB Serial/JTAG controller on the USB side. The USB Serial/JTAG controller consists of a USB 2.0 Full-speed device. It contains a control endpoint, a dummy interrupt endpoint, two bulk input endpoints, and two bulk output endpoints. Together, these form a USB composite device, which consists of a CDC-ACM USB class device as well as a vendor-specific device implementing the JTAG interface. On the SoC side, the JTAG interface is directly connected to the RISC-V CPU's debugging interface, allowing debugging of programs running on that core. Meanwhile, the CDC-ACM device is exposed as a set of registers, allowing a program on the CPU to read and write from it. Additionally, the ROM startup code of the SoC contains code that allows the user to reprogram attached flash memory using this interface.

**Note:**

To get specific information about what endpoint numbers are used for what functionality, please parse the relevant USB descriptors as returned by the device. This guarantees compatibility with other devices with the same functionality but a different implementation.

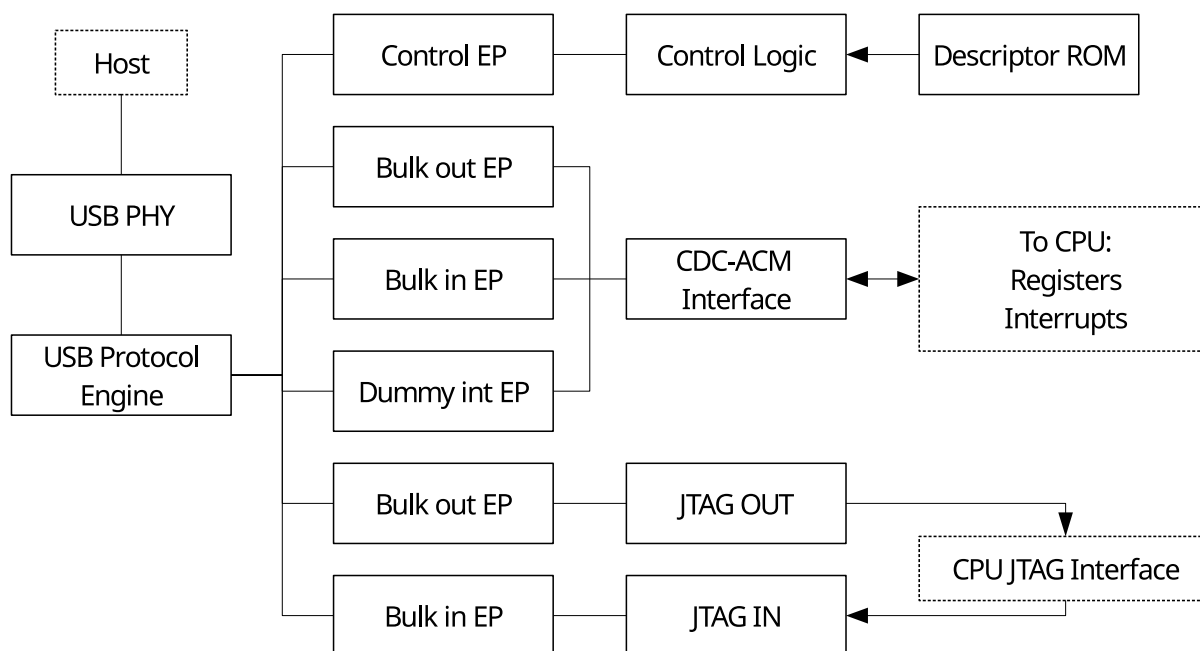

Figure 46.2-2. USB Serial/JTAG Block Diagram

## 46.3 Functional Description

The USB Serial/JTAG controller interfaces with a USB host processor on one side, and with the CPU debugging hardware as well as the software that communicates through the CDC-ACM port on the other side.

### 46.3.1 CDC-ACM USB Interface Functional Description

The CDC-ACM interface adheres to the standard USB CDC-ACM class for serial port emulation. It contains a dummy interrupt endpoint (which will never send any events, as they are not implemented nor needed) and a Bulk IN as well as a Bulk OUT endpoint for the host's received and sent serial data respectively. These endpoints can handle 64-bytes packet at a time, allowing high throughput. As CDC-ACM is a standard USB device class, a host generally can function without any special installation procedures. That is to say, when the USB debugging device is properly connected to a host, the operating system should show a new serial port moments later.

The CDC-ACM interface accepts the following standard CDC-ACM control requests:

Table 46.3-1. Standard CDC-ACM Control Requests

| Command                | Action  |
|------------------------|---|
| SEND_BREAK             | Accepted but ignored (dummy)  |
| SET_LINE_CODING        | Accepted, value sent is readable in software  |
| GET_LINE_CODING        | By default, returns 9600 baud, no parity, 8 data bits, 1 stop bit (Can be changed through software) |
| SET_CONTROL_LINE_STATE | Set the state of the RTS/DTR lines. See Table <a href="#">46.3-2</a>                                |

Aside from general-purpose communication, the CDC-ACM interface can also be used to reset ESP32-P4 and optionally make it enter download mode to flash new firmware. This can be realized by setting the RTS and DTR lines on the virtual serial port.

**Table 46.3-2. CDC-ACM Settings with RTS and DTR**

| RTS | DTR | Action                   |
|-----|-----|--------------------------|
| 0   | 0   | Clear download mode flag |
| 0   | 1   | Set download mode flag   |
| 1   | 0   | Reset ESP32-P4           |
| 1   | 1   | No action                |

Note that if the download mode flag is set when ESP32-P4 is reset, ESP32-P4 will reboot into download mode. When this flag is cleared and the chip is reset, ESP32-P4 will boot from flash. For specific sequences, please refer to Section 46.4. All these functions can also be disabled by programming various eFuses. Please refer to Chapter 7 *eFuse Controller* for more details.

### 46.3.2 CDC-ACM Firmware Interface Functional Description

The CPU can interact with the USB Serial/JTAG controller as the module is connected to the internal APB bus of ESP32-P4. This is mainly used to read and write data from and to the virtual serial port on the attached host.

USB CDC-ACM serial data is sent to and received from the host in packets of 0 to 64 bytes in size. When enough CDC-ACM data has accumulated in the host, the host sends a packet to the CDC-ACM receive endpoint, and the USB Serial/JTAG controller accepts this packet if it has a free buffer. Conversely, the host checks periodically if the USB Serial/JTAG controller has a packet ready to be sent to the host, and if so, receives this packet.

Firmware can get notified of new data from the host in one of the following two ways. First of all, the [USB\\_SERIAL\\_JTAG\\_SERIAL\\_OUT\\_EP\\_DATA\\_AVAIL](#) bit will remain set as long as there still is unread host data in the buffer. Secondly, the availability of data will trigger the [USB\\_SERIAL\\_JTAG\\_SERIAL\\_OUT\\_RECV\\_PKT\\_INT](#) interrupt. When data is available, it can be read by firmware through repeatedly reading bytes from [USB\\_SERIAL\\_JTAG\\_EP1\\_REG](#). The amount of bytes to read can be determined by checking the [USB\\_SERIAL\\_JTAG\\_SERIAL\\_OUT\\_EP\\_DATA\\_AVAIL](#) bit after reading each byte to see if there is more data to read. After all data is read, the USB device is automatically readied to receive a new data packet from the host.

When the firmware has data to send, it can put the data in the send buffer and trigger a flush to allow the host to receive the data in a USB packet. In order to do so, there needs to be space available in the send buffer. Firmware can check this by reading [USB\\_REG\\_SERIAL\\_IN\\_EP\\_DATA\\_FREE](#). A 1 in this register field indicates there is still free room in the buffer, and firmware can fill the buffer by writing bytes to the [USB\\_SERIAL\\_JTAG\\_EP1\\_REG](#) register. Writing the buffer does not immediately trigger sending data to the host until the buffer is flushed. After the flush, the entire buffer will be ready to be received by the USB host at once. A flush can be triggered in two ways: 1) after the 64th byte is written to the buffer, the USB hardware will automatically flush the buffer to the host; or 2) firmware can trigger a flush by writing 1 to [USB\\_REG\\_SERIAL\\_WR\\_DONE](#).

Regardless of how a flush is triggered, the send buffer will be unavailable for firmware to write into until it has

been fully read by the host. As soon as the send buffer has been fully read, the [USB\\_SERIAL\\_JTAG\\_SERIAL\\_IN\\_EMPTY\\_INT](#) interrupt will be triggered, indicating that the send buffer can receive another 64 bytes.

It is possible to handle some out-of-band serial requests in software, specifically, the host setting DTR and RTS and changing the line state. If the CDC-ACM interface receives a [SET\\_LINE\\_CODING](#) request, the peripheral can be configured to trigger a [USB\\_SERIAL\\_JTAG\\_SET\\_LINE\\_CODE\\_INT](#) interrupt, at which point the line coding can be read from the [USB\\_SERIAL\\_JTAG\\_SET\\_LINE\\_CODE\\_WO\\_REG](#) register. Similarly, [SET\\_CONTROL\\_LINE\\_STATE](#) requests will trigger [USB\\_SERIAL\\_JTAG\\_RTS\\_CHG\\_INT](#) and [USB\\_SERIAL\\_JTAG\\_DTR\\_CHG\\_INT](#) interrupts if they change the state of these lines. Software can then read the specific state through the [USB\\_SERIAL\\_JTAG\\_RTS](#) and [USB\\_SERIAL\\_JTAG\\_DTR](#) bits. Note that as described earlier, certain RTS/DTR sequences lead to hardware reset of ESP32-P4. Software can disable hardware recognition of these DTR/RTS sequences by setting the [USB\\_SERIAL\\_JTAG\\_USB\\_UART\\_CHIP\\_RST\\_DIS](#) bit, allowing software to interpret these signals freely.

Finally, the host can read the current line state using [GET\\_LINE\\_CODING](#). This event sends back the data in the [USB\\_SERIAL\\_JTAG\\_GET\\_LINE\\_CODE\\_WO\\_REG](#) register and triggers a [USB\\_SERIAL\\_JTAG\\_GET\\_LINE\\_CODE\\_INT](#) interrupt.

### 46.3.3 USB-to-JTAG Interface: JTAG Command Processor

The USB-to-JTAG interface uses a vendor-specific class for its implementation. It consists of two endpoints, one to receive commands and another to send responses. Additionally, some less time-sensitive commands can be given as control requests.

Commands from the host to the JTAG interface are interpreted by the JTAG command processor. Internally, the JTAG command processor implements a full four-wire JTAG bus, consisting of the TCK, TMS and TDI output lines to the RISC-V CPU, as well as the TDO line signalling back from the CPU to the JTAG response capture unit. These signals adhere to the IEEE 1149.1 JTAG standards. Additionally, there is an SRST line to reset ESP32-P4.

Optionally, software can set [USB\\_SERIAL\\_JTAG\\_USB\\_JTAG\\_BRIDGE\\_EN](#) in order to redirect these signals to the GPIO matrix instead, where they can be routed to IO pads on ESP32-P4. This also allows external devices to be debugged via the USB Serial/JTAG peripheral.

The JTAG command processor parses each received nibble (4-bit value) as a command. As USB data is received in 8-bit bytes, this means each byte contains two commands. The USB command processor will execute high-nibble first and low-nibble second. The commands are used to control the TCK, TMS, TDI, and SRST lines of the internal JTAG bus, as well as to signal the JTAG response capture unit the state of the TDO line (which is driven by the CPU debugging logic) that needs to be captured.

In the internal JTAG bus, TCK, TMS, TDI, and TDO are connected directly to the JTAG debugging logic of the RISC-V CPU. SRST is connected to the reset logic of the digital circuitry in ESP32-P4 and a high level on this line will cause a digital system reset. Note that the USB Serial/JTAG controller itself is not affected by SRST.

A nibble can contain the following commands:

**Table 46.3-3. Commands of a Nibble**

| bit       | 3 | 2   | 1   | 0    |
|-----------|---|-----|-----|------|
| CMD_CLK   | 0 | cap | tms | tdi  |
| CMD_RST   | 1 | 0   | 0   | srst |
| CMD_FLUSH | 1 | 0   | 1   | 0    |
| CMD_RSV   | 1 | 0   | 1   | 1    |
| CMD_REP   | 1 | 1   | R1  | R0   |

- CMD\_CLK will set the TDI and TMS as the indicated values and emit one clock pulse on TCK. If the CAP bit is 1, it will instruct the JTAG response capture unit to capture the state of the TDO line. This instruction forms the basis of JTAG communication.
- CMD\_RST will set the state of the SRST line as the indicated value. This can be used to reset ESP32-P4.
- CMD\_FLUSH will instruct the JTAG response capture unit to flush the buffer of all bits it collected so the host is able to read them. Note that in some cases, a JTAG transaction will end in an odd number of commands and as such an odd number of nibbles. In this case, it is allowed to repeat the CMD\_FLUSH command to get an even number of nibbles fitting an integer number of bytes.
- CMD\_RSV is reserved in the current implementation. This command will be ignored when received by ESP32-P4.
- CMD\_REP repeats the last (non-CMD\_REP) command for a certain number of times. The purpose is to compress command streams which repeat the CMD\_CLK instruction for multiple times. A command such as CMD\_CLK can be followed by multiple CMD\_REP commands. The number of repetitions done by one CMD\_REP can be expressed as  $repetition\_count = (R1 \times 2 + R0) \times (4^{cmd\_rep\_count})$ , where *cmd\_rep\_count* indicates the number of the CMD\_REP instruction that went directly before it. Note that the CMD\_REP command is only intended to repeat a CMD\_CLK command. Specifically, using it on a CMD\_FLUSH command may lead to an unresponsive USB device, and a USB reset will be required to recover it.

#### 46.3.4 USB-to-JTAG Interface: CMD\_REP Usage Example

Here is a list of commands as an illustration of the usage of CMD\_REP. Note that each command is a nibble, and in this example, the bitwise command stream would be 0x0D 0x5E 0xCF.

1. 0x0 (CMD\_CLK: cap=0, tdi=0, tms=0)
2. 0xD (CMD\_REP: R1=0, R0=1)
3. 0x5 (CMD\_CLK: cap=1, tdi=0, tms=1)
4. 0xE (CMD\_REP: R1=1, R0=0)
5. 0xC (CMD\_REP: R1=0, R0=0)
6. 0xF (CMD\_REP: R1=1, R0=1)

The following shows what happens at every step:

1. TCK is clocked with the TDI and TMS lines set to 0. No data is captured.
2. TCK is clocked another  $(0 \times 2 + 1) \times (4^0) = 1$  time with the same settings as step 1.

3. TCK is clocked with the TDI line set to 0 and TMS set to 1. Data on the TDO line is captured.
4. TCK is clocked another  $(1 \times 2 + 0) \times (4^0) = 2$  times with the same settings as step 3.
5. Nothing happens:  $(0 \times 2 + 0) \times (4^1) = 0$ . Note that this increases cmd\_rep\_count in the next step.
6. TCK is clocked another  $(1 \times 2 + 1) \times (4^2) = 48$  times with the same settings as step 3.

In other words, this example stream has the same net effect as that of executing command 1 twice, then repeating command 3 for 51 times.

### 46.3.5 USB-to-JTAG Interface: Response Capture Unit

The response capture unit reads the TDO line of the internal JTAG bus and captures its value when the command parser executes a CMD\_CLK with cap=1. It puts this bit into an internal shift register, and writes a byte into the USB buffer when 8 bits have been collected. Of these 8 bits, the least significant one is the one that is read from TDO the earliest.

As soon as either 64 bytes (512 bits) have been collected or a CMD\_FLUSH command is executed, the response capture unit will make the buffer available for the host to receive. Note that the interface to the USB logic is double-buffered. Therefore, as long as the USB throughput is sufficient, the response capture unit can always receive more data. That is to say, while one of the buffers is waiting to be sent to the host, the other can receive more data. When the host has received data from its buffer and the response capture unit flushes its buffer, the two buffers exchange position.

This also means that a command stream can cause at most 128 bytes of capture data generated (less if there are flush commands in the stream) without the host acting to receive the generated data. If more data is generated anyway, the command stream will pause and the device will not accept more commands until the generated capture data is read out.

Note that in general, the logic of the response capture unit tries not to send zero-byte responses. For instance, sending a series of CMD\_FLUSH commands will not cause a series of 0-byte USB responses to be sent. However, in the current implementation, some zero-0 responses may be generated in extraordinary circumstances. It is recommended to ignore these responses.

### 46.3.6 USB-to-JTAG Interface: Control Transfer Requests

Aside from the command processor and the response capture unit, the USB-to-JTAG interface also understands some control requests, as documented in the table below:

**Table 46.3-4. USB-to-JTAG Control Requests**

| bmRequestType | bRequest             | wValue    | wIndex    | wLength | Data            |
|---------------|----------------------|-----------|-----------|---------|-----------------|
| 01000000b     | 0 (VEND_JTAG_SETDIV) | [divider] | interface | 0       | None            |
| 01000000b     | 1 (VEND_JTAG_SETIO)  | [iobits]  | interface | 0       | None            |
| 11000000b     | 2 (VEND_JTAG_GETTDO) | 0         | interface | 1       | [iostate]       |
| 10000000b     | 6 (GET_DESCRIPTOR)   | 0x2000    | 0         | 256     | [jtag cap desc] |

- VEND\_JTAG\_SETDIV sets the divider used. This directly affects the duration of a TCK clock pulse. The TCK clock pulses are derived from a base clock of 48 MHz, which is divided down using an internal

divider. This control request allows the host to set this divider. Note that on startup, the divider is set to 2, which means the TCK clock rate will generally be 24 MHz.

- `VEND_JTAG_SETIO` can bypass the JTAG command processor to set the internal TDI, TDO, TMS, and SRST lines to given values. These values are encoded in the `wValue` field in the format of 11'b0, `srst`, `trst`, `tck`, `tms`, `tdi`.
- `VEND_JTAG_GETTDO` can bypass the JTAG response capture unit to read the internal TDO signal directly. This request returns one byte of data, of which the least significant bit represents the status of the TDO line.
- `GET_DESCRIPTOR` is a standard USB request. However, it can also be used with a vendor-specific `wValue` of 0x2000 to get the JTAG capabilities descriptor. This returns a certain amount of bytes representing the following fixed structure, which describes the capabilities of the USB-to-JTAG adapter (as shown in Table 46.3-5). This structure allows host software to automatically support future revisions of the hardware without the need for an update.

The JTAG capability descriptors of ESP32-P4 are as follows. Note that all 16-bit values are little-endian.

**Table 46.3-5. JTAG Capability Descriptors**

| Byte  | Value | Description   |
|-------|-------|---|
| 0     | 1     | JTAG protocol capability structure version  |
| 1     | 10    | Total length of JTAG protocol capabilities  |
| 2     | 1     | Type of this struct: 1 for speed capability struct  |
| 3     | 8     | Length of this speed capabilities struct  |
| 4 ~ 5 | 4800  | JTAG base clock speed in 10 kHz increments. Note that the maximum TCK speed is half of this value |
| 6 ~ 7 | 1     | Minimum divider value settable by the <code>VEND_JTAG_SETDIV</code> request                       |
| 8 ~ 9 | 255   | Maximum divider value settable by the <code>VEND_JTAG_SETDIV</code> request                       |

## 46.4 Recommended Operation

Little setup is needed for using the USB Serial/JTAG device. The USB-to-JTAG hardware itself does not need any setup aside from the standard USB initialization that the host operating system already does. Apart from that, the CDC-ACM emulation on the host side is also plug-and-play.

On the firmware side, very little initialization is needed either. The USB hardware is self-initialized and after boot-up, if a host is connected and listening on the CDC-ACM interface, data can be exchanged as described above without any specific setup except for the situation when the firmware optionally sets up an interrupt service handler.

One thing to note is that there may be situations where either the host is not attached or the CDC-ACM virtual port is not opened. In such cases, the packets that are flushed to the host will never be picked up and the send buffer will never be empty. It is important to detect these situations and implement timeout, as this is the only way to reliably detect whether the port on the host side is closed or not.

Another thing to note is that the USB device is dependent on the BBPLL for the 48 MHz USB PHY clock. If this PLL is disabled, the USB communication will cease to function.

One scenario where this happens is Deep-sleep. The USB Serial/JTAG controller (as well as the attached RISC-V CPU) will be entirely powered down in Deep-sleep mode. If a device needs to be debugged in this mode, it may be preferable to use an external JTAG debugger and a serial interface instead.

The CDC-ACM interface can also be used to reset the SoC and take it into or out of download mode. Generating the correct sequence of handshake signals can be a bit complicated, since most operating systems only allow setting or resetting DTR and RTS separately, but not in tandem. Additionally, some drivers (e.g., the standard CDC-ACM driver on Windows) do not set DTR until RTS is set and the user needs to explicitly set RTS in order to 'propagate' the DTR value. The recommended procedures are introduced below.

To reset the SoC into download mode:

**Table 46.4-1. Reset SoC into Download Mode**

| Action    | Internal state | Note                       |
|-----------|----------------|----------------------------|
| Clear DTR | RTS=?, DTR=0   | Initialize to known values |
| Clear RTS | RTS=0, DTR=0   | -                          |
| Set DTR   | RTS=0, DTR=1   | Set download mode flag     |
| Clear RTS | RTS=0, DTR=1   | Propagate DTR              |
| Set RTS   | RTS=1, DTR=1   | -                          |
| Clear DTR | RTS=1, DTR=0   | Reset SoC                  |
| Set RTS   | RTS=1, DTR=0   | Propagate DTR              |
| Clear RTS | RTS=0, DTR=0   | Clear download flag        |

To reset the SoC into booting from flash:

**Table 46.4-2. Reset SoC into Booting from flash**

| Action    | Internal state | Note                |
|-----------|----------------|---------------------|
| Clear DTR | RTS=?, DTR=0   | -                   |
| Clear RTS | RTS=0, DTR=0   | Clear download flag |
| Set RTS   | RTS=1, DTR=0   | Reset SoC           |
| Clear RTS | RTS=0, DTR=0   | Exit reset          |

## 46.5 Interrupts

ESP32-P4's USB Serial/JTAG Controller can generate the USB\_SERIAL\_JTAG\_INTR interrupt signal that will be sent to the [Interrupt Matrix](#). There are several internal interrupt sources from the USB Serial/JTAG Controller that can generate this interrupt signal.

- USB\_SERIAL\_JTAG\_JTAG\_IN\_FLUSH\_INT: triggered when flush cmd is received for the JTAG bulk out endpoint.
- USB\_SERIAL\_JTAG\_SOF\_INT: triggered when SOF frame is received.
- USB\_SERIAL\_JTAG\_SERIAL\_OUT\_RECV\_PKT\_INT: triggered when Serial Port OUT Endpoint receives one packet.

- USB\_SERIAL\_JTAG\_SERIAL\_IN\_EMPTY\_INT: triggered when Serial Port IN Endpoint is empty.
- USB\_SERIAL\_JTAG\_PID\_ERR\_INT: triggered when PID error is detected.
- USB\_SERIAL\_JTAG\_CRC5\_ERR\_INT: triggered when CRC5 error is detected.
- USB\_SERIAL\_JTAG\_CRC16\_ERR\_INT: triggered when CRC16 error is detected.
- USB\_SERIAL\_JTAG\_STUFF\_ERR\_INT: triggered when a bit stuffing error is detected.
- USB\_SERIAL\_JTAG\_IN\_TOKEN\_REC\_IN\_EP1\_INT: triggered when IN token for IN endpoint 1 is received.
- USB\_SERIAL\_JTAG\_USB\_BUS\_RESET\_INT: triggered when USB bus reset is detected.
- USB\_SERIAL\_JTAG\_OUT\_EP1\_ZERO\_PAYLOAD\_INT: triggered when OUT endpoint 1 receives packet with zero payload.
- USB\_SERIAL\_JTAG\_OUT\_EP2\_ZERO\_PAYLOAD\_INT: triggered when OUT endpoint 2 receives packet with zero payload.
- USB\_SERIAL\_JTAG\_RTS\_CHG\_INT: triggered when level of RTS from USB serial channel is changed.
- USB\_SERIAL\_JTAG\_DTR\_CHG\_INT: triggered when level of DTR from USB serial channel is changed.
- USB\_SERIAL\_JTAG\_GET\_LINE\_CODE\_INT: triggered when level of GET LINE CODING request is received.
- USB\_SERIAL\_JTAG\_SET\_LINE\_CODE\_INT: triggered when level of SET LINE CODING request is received.

## 46.6 Register Summary

The addresses in this section are relative to USB Serial/JTAG controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section [Access Types for Registers](#).

| Name   | Description   | Address | Access   |
|--|---|---------|----------|
| <b>Configuration Registers</b>                       |   |         |          |
| <a href="#">USB_SERIAL_JTAG_EP1_REG</a>              | FIFO access for the CDC-ACM data IN and OUT endpoints     | 0x0000  | R/W      |
| <a href="#">USB_SERIAL_JTAG_EP1_CONF_REG</a>         | Configuration and control registers for the CDC-ACM FIFOs | 0x0004  | varies   |
| <a href="#">USB_SERIAL_JTAG_CONFO_REG</a>            | PHY hardware configuration                                | 0x0018  | R/W      |
| <a href="#">USB_SERIAL_JTAG_TEST_REG</a>             | Registers used for debugging the PHY                      | 0x001C  | varies   |
| <a href="#">USB_SERIAL_JTAG_MISC_CONF_REG</a>        | Clock enable control                                      | 0x0044  | R/W      |
| <a href="#">USB_SERIAL_JTAG_MEM_CONF_REG</a>         | Memory power control                                      | 0x0048  | R/W      |
| <a href="#">USB_SERIAL_JTAG_CHIP_RST_REG</a>         | CDC-ACM chip reset control                                | 0x004C  | varies   |
| <a href="#">USB_SERIAL_JTAG_GET_LINE_CODE_W0_REG</a> | W0 of GET_LINE_CODING command                             | 0x0058  | R/W      |
| <a href="#">USB_SERIAL_JTAG_GET_LINE_CODE_W1_REG</a> | W1 of GET_LINE_CODING command                             | 0x005C  | R/W      |
| <a href="#">USB_SERIAL_JTAG_CONFIG_UPDATE_REG</a>    | Configuration registers' value update                     | 0x0060  | WT       |
| <a href="#">USB_SERIAL_JTAG_SER_AFIFO_CONFIG_REG</a> | Serial AFIFO configure register                           | 0x0064  | varies   |
| <b>Interrupt Registers</b>                           |   |         |          |
| <a href="#">USB_SERIAL_JTAG_INT_RAW_REG</a>          | Interrupt raw status register                             | 0x0008  | R/WTC/SS |
| <a href="#">USB_SERIAL_JTAG_INT_ST_REG</a>           | Interrupt status register                                 | 0x000C  | RO       |
| <a href="#">USB_SERIAL_JTAG_INT_ENA_REG</a>          | Interrupt enable status register                          | 0x0010  | R/W      |
| <a href="#">USB_SERIAL_JTAG_INT_CLR_REG</a>          | Interrupt clear status register                           | 0x0014  | WT       |
| <b>Status Registers</b>                              |   |         |          |
| <a href="#">USB_SERIAL_JTAG_JFIFO_ST_REG</a>         | JTAG FIFO status and control registers                    | 0x0020  | varies   |
| <a href="#">USB_SERIAL_JTAG_FRAM_NUM_REG</a>         | Last received SOF frame index register                    | 0x0024  | RO       |
| <a href="#">USB_SERIAL_JTAG_IN_EPO_ST_REG</a>        | Control IN endpoint status information                    | 0x0028  | RO       |
| <a href="#">USB_SERIAL_JTAG_IN_EP1_ST_REG</a>        | CDC-ACM IN endpoint status information                    | 0x002C  | RO       |
| <a href="#">USB_SERIAL_JTAG_IN_EP2_ST_REG</a>        | CDC-ACM interrupt IN endpoint status information          | 0x0030  | RO       |
| <a href="#">USB_SERIAL_JTAG_IN_EP3_ST_REG</a>        | JTAG IN endpoint status information                       | 0x0034  | RO       |
| <a href="#">USB_SERIAL_JTAG_OUT_EPO_ST_REG</a>       | Control OUT endpoint status information                   | 0x0038  | RO       |
| <a href="#">USB_SERIAL_JTAG_OUT_EP1_ST_REG</a>       | CDC-ACM OUT endpoint status information                   | 0x003C  | RO       |
| <a href="#">USB_SERIAL_JTAG_OUT_EP2_ST_REG</a>       | JTAG OUT endpoint status information                      | 0x0040  | RO       |

| Name   | Description                   | Address | Access |
|--|-------------------------------|---------|--------|
| <a href="#">USB_SERIAL_JTAG_SET_LINE_CODE_W0_REG</a> | W0 of SET_LINE_CODING command | 0x0050  | RO     |

## 46.7 Registers

The addresses in this section are relative to USB Serial/JTAG controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

Register 46.1. USB\_SERIAL\_JTAG\_EP1\_REG (0x0000)

**USB\_SERIAL\_JTAG\_RDWR\_BYTE** A write to this register pushes the written data into the CDC TX FIFO; a read from this register pops a byte from the CDC RX FIFO and returns it.  
When [USB\\_SERIAL\\_JTAG\\_SERIAL\\_IN\\_EMPTY\\_INT](#) is set, users can write data (up to 64 bytes) into CDC-ACM TX FIFO through this register.  
When [USB\\_SERIAL\\_JTAG\\_SERIAL\\_OUT\\_RECV\\_PKT\\_INT](#) is set, users can check how many data is received through [USB\\_SERIAL\\_JTAG\\_OUT\\_EP1\\_WR\\_ADDR](#), then read data from CDC-ACM RX FIFO through this register.  
(R/W)

Register 46.2. USB\_SERIAL\_JTAG\_EP1\_CONF\_REG (0x0004)

**USB\_SERIAL\_JTAG\_WR\_DONE** Configures whether to represent writing byte data to CDC-ACM TX FIFO is done.

0: No effect

1: Represents writing byte data to CDC-ACM TX FIFO is done

This bit then stays 0 until data in CDC-ACM TX FIFO is read by the USB Host.

(WT)

**USB\_SERIAL\_JTAG\_SERIAL\_IN\_EP\_DATA\_FREE** Represents whether CDC-ACM TX FIFO has space available.

0: CDC-ACM TX FIFO is full and no data should be written into it

1: CDC-ACM TX FIFO is not full and data can be written into it

After writing [USB\\_SERIAL\\_JTAG\\_WR\\_DONE](#), this bit will be 0 until data in CDC-ACM TX FIFO is read by USB Host.

(RO)

**USB\_SERIAL\_JTAG\_SERIAL\_OUT\_EP\_DATA\_AVAIL** Represents whether there is data in CDC-ACM RX FIFO.

0: There is no data in CDC-ACM RX FIFO

1: There is data in CDC-ACM RX FIFO

(RO)

**Register 46.3. USB\_SERIAL\_JTAG\_CONFO\_REG (0x0018)**

|            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |    |    |    |    |    |    |   |   |   |   |   |   |   |   |   |   |   |       |

**USB\_SERIAL\_JTAG\_PHY\_SEL** Configures whether to select internal or external PHY.

0: Internal PHY

1: External PHY

(R/W)

**USB\_SERIAL\_JTAG\_EXCHG\_PINS\_OVERRIDE** Configures whether to enable software control USB

D+ D- exchange.

0: Disable

1: Enable

(R/W)

**USB\_SERIAL\_JTAG\_EXCHG\_PINS** Configures whether to enable USB D+ D- exchange.

0: Disable

1: Enable

(R/W)

**USB\_SERIAL\_JTAG\_VREFH** Configures single-end input high threshold.

0: 1.76 V

1: 1.84 V

2: 1.92 V

3: 2.00 V

(R/W)

**USB\_SERIAL\_JTAG\_VREFL** Configures single-end input low threshold.

0: 0.80 V

1: 0.88 V

2: 0.96 V

3: 1.04 V

(R/W)

**USB\_SERIAL\_JTAG\_VREF\_OVERRIDE** Configures whether to enable software control input threshold.

0: Disable

1: Enable

(R/W)

**Continued on the next page...**

**Register 46.3. USB\_SERIAL\_JTAG\_CONFO\_REG (0x0018)**

Continued from the previous page...

**USB\_SERIAL\_JTAG\_PAD\_PULL\_OVERRIDE** Configures whether to enable software to control USB D+ D- pullup and pulldown.

0: Disable

1: Enable

(R/W)

**USB\_SERIAL\_JTAG\_DP\_PULLUP** Configures whether to enable USB D+ pull up when [USB\\_SERIAL\\_JTAG\\_PAD\\_PULL\\_OVERRIDE](#) is 1.

0: Disable

1: Enable

(R/W)

**USB\_SERIAL\_JTAG\_DP\_PULLDOWN** Configures whether to enable USB D+ pull down when [USB\\_SERIAL\\_JTAG\\_PAD\\_PULL\\_OVERRIDE](#) is 1.

0: Disable

1: Enable

(R/W)

**USB\_SERIAL\_JTAG\_DM\_PULLDOWN** Configures whether to enable USB D- pull down when [USB\\_SERIAL\\_JTAG\\_PAD\\_PULL\\_OVERRIDE](#) is 1.

0: Disable

1: Enable

(R/W)

**USB\_SERIAL\_JTAG\_PULLUP\_VALUE** Configures the pull up value when [USB\\_SERIAL\\_JTAG\\_PAD\\_PULL\\_OVERRIDE](#) is 1.

0: 2.2 K

1: 1.1 K

(R/W)

**USB\_SERIAL\_JTAG\_USB\_PAD\_ENABLE** Configures whether to enable USB pad function.

0: Disable

1: Enable

(R/W)

**USB\_SERIAL\_JTAG\_USB\_JTAG\_BRIDGE\_EN** Configures whether to disconnect USB\_JTAG and internal JTAG.

0: USB\_JTAG is connected to the internal JTAG port of CPU

1: USB\_JTAG and the internal JTAG are disconnected, MTMS, MTDI, and MTCK are output through GPIO Matrix, and MTDO is input through GPIO Matrix

(R/W)

#### Register 46.4. USB\_SERIAL\_JTAG\_TEST\_REG (0x001C)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |       |                            |   |   |   |                            |  |  |  |                             |  |  |  |                            |  |  |  |                            |  |  |  |                             |  |  |  |  |  |  |  |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-------|----------------------------|---|---|---|----------------------------|--|--|--|-----------------------------|--|--|--|----------------------------|--|--|--|----------------------------|--|--|--|-----------------------------|--|--|--|--|--|--|--|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 7 | 6 | 5 | 4     | 3                          | 2 | 1 | 0 |                            |  |  |  |                             |  |  |  |                            |  |  |  |                            |  |  |  |                             |  |  |  |  |  |  |  |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | Reset |                            |   |   |   |                            |  |  |  |                             |  |  |  |                            |  |  |  |                            |  |  |  |                             |  |  |  |  |  |  |  |
|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |       | USB_SERIAL_JTAG_TEST_RX_DM |   |   |   | USB_SERIAL_JTAG_TEST_RX_DP |  |  |  | USB_SERIAL_JTAG_TEST_RX_RCV |  |  |  | USB_SERIAL_JTAG_TEST_TX_DM |  |  |  | USB_SERIAL_JTAG_TEST_TX_DP |  |  |  | USB_SERIAL_JTAG_TEST_USB_OE |  |  |  |  |  |  |  |

**USB\_SERIAL\_JTAG\_TEST\_ENABLE** Configures whether to enable the test mode of the USB pad.

0: Resume normal operation

1: Enable the test mode of the USB pad

Enabling the test mode of the USB pad allows the USB pad to be controlled/read using the other bits in this register.

(R/W)

**USB\_SERIAL\_JTAG\_TEST\_USB\_OE** Configures whether to enable USB pad output.

0: Set D+ and D- to high impedance

1: Output the values set in `USB_SERIAL_JTAG_TEST_TX_DP` and `USB_SERIAL_JTAG_TEST_TX_DM` on the D+ and D- pins

(R/W)

USB\_SERIAL\_JTAG\_TEST\_TX\_DP Configures value of USB D+ in test mode when  
USB\_SERIAL\_JTAG\_TEST\_USB\_OE is 1. (R/W)

**USB\_SERIAL\_JTAG\_TEST\_TX\_DM** Configures value of USB D- in test mode when [USB\\_SERIAL\\_JTAG\\_TEST\\_USB\\_OE](#) is 1. (R/W)

**USB\_SERIAL\_JTAG\_TEST\_RX\_RCV** Represents the current logical level of the voltage difference between USB D- and USB D+ pads in test mode.

0: USB D- voltage is higher than USB D+

1: USB D+ voltage is higher than USB D-

(RO)

**USB\_SERIAL\_JTAG\_TEST\_RX\_DP** Represents the logical level of the USB D+ pad in test mode.

(RO)

**USB SERIAL JTAG TEST RX DM** Represents the logical level of the USB D- pad in test mode.

(RO)

Register 46.5. USB\_SERIAL\_JTAG\_MISC\_CONF\_REG (0x0044)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                        |   |   |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|------------------------|---|---|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | USB_SERIAL_JTAG_CLK_EN |   |   |   |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 1                      | 0 |   |   |       |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0                      | 0 | 0 | 0 | Reset |

**USB\_SERIAL\_JTAG\_CLK\_EN** Configures whether to force clock on for register.

0: Support clock only when application writes registers

1: Force clock on for register

(R/W)

Register 46.6. USB\_SERIAL\_JTAG\_MEM\_CONF\_REG (0x0048)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                                |   |                            |  |

**USB\_SERIAL\_JTAG\_USB\_MEM\_PD** Configures whether to power down USB memory.

0: No effect

1: Power down

(R/W)

**USB\_SERIAL\_JTAG\_USB\_MEM\_CLK\_EN** Configures whether to force clock on for USB memory.

0: No effect

1: Force

(R/W)

**Register 46.9. USB\_SERIAL\_JTAG\_GET\_LINE\_CODE\_W1\_REG (0x005C)**

|            |   |   |   |   |   |   |   |                                  |   |  |  |  |  |  |  |                                  |  |  |  |  |  |  |   |                                |  |  |  |  |  |   |  |   |  |  |  |  |       |  |  |   |  |  |  |  |  |  |  |   |

**USB\_SERIAL\_JTAG\_SERIAL\_IN\_AFIFO\_RESET\_WR** Configures whether to reset CDC\_ACM IN async FIFO write clock domain.

0: No effect

1: Reset

(R/W)

**USB\_SERIAL\_JTAG\_SERIAL\_IN\_AFIFO\_RESET\_RD** Configures whether to reset CDC\_ACM IN async FIFO read clock domain.

0: No effect

1: Reset

(R/W)

**USB\_SERIAL\_JTAG\_SERIAL\_OUT\_AFIFO\_RESET\_WR** Configures whether to reset CDC\_ACM OUT async FIFO write clock domain.

0: No effect

1: Reset

(R/W)

**USB\_SERIAL\_JTAG\_SERIAL\_OUT\_AFIFO\_RESET\_RD** Configures whether to reset CDC\_ACM OUT async FIFO read clock domain.

0: No effect

1: Reset

(R/W)

**USB\_SERIAL\_JTAG\_SERIAL\_OUT\_AFIFO\_EMPTY** Represents CDC\_ACM OUT async FIFO empty signal in read clock domain. (RO)

**USB\_SERIAL\_JTAG\_SERIAL\_IN\_AFIFO\_WFULL** Represents CDC\_ACM IN async FIFO full signal in write clock domain. (RO)

 |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  | |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |  |  |  |  |  |  |  | |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Reset

**USB\_SERIAL\_JTAG\_OUT\_EP2\_STATE** Represents state of OUT Endpoint 2. (RO)

**USB\_SERIAL\_JTAG\_OUT\_EP2\_WR\_ADDR** Represents write data address of OUT endpoint 2.

When **USB\_SERIAL\_JTAG\_SERIAL\_OUT\_RECV\_PKT\_INT** is detected there are  
(**USB\_SERIAL\_JTAG\_OUT\_EP2\_WR\_ADDR** – 2) bytes data in OUT endpoint 2.  
(RO)

**USB\_SERIAL\_JTAG\_OUT\_EP2\_RD\_ADDR** Represents read data address of OUT endpoint 2. (RO)

Register 46.25. USB\_SERIAL\_JTAG\_SET\_LINE\_CODE\_W0\_REG (0x0050)

**USB\_SERIAL\_JTAG\_DW\_DTE\_RATE** Represents the value of dwDTERate set by host through SET\_LINE\_CODING command. (RO)

Register 46.26. USB\_SERIAL\_JTAG\_SET\_LINE\_CODE\_W1\_REG (0x0054)

**USB\_SERIAL\_JTAG\_BCHAR\_FORMAT** Represents the value of bCharFormat set by host through SET\_LINE\_CODING command. (RO)

**USB\_SERIAL\_JTAG\_BPARITY\_TYPE** Represents the value of bParityTpye set by host through SET\_LINE\_CODING command. (RO)

**USB\_SERIAL\_JTAG\_BDATA\_BITS** Represents the value of bDataBits set by host through SET\_LINE\_CODING command. (RO)

Register 46.27. USB\_SERIAL\_JTAG\_BUS\_RESET\_ST\_REG (0x0068)

**USB\_SERIAL\_JTAG\_USB\_BUS\_RESET\_ST** Represents whether USB bus reset is released.

- 0: USB Serial/JTAG is in USB bus reset status
- 1: USB bus reset is released

(RO)

Register 46.28. USB\_SERIAL\_JTAG\_DATE\_REG (0x0088)

**USB\_SERIAL\_JTAG\_DATE** Version control register. (R/W)

## Chapter 47

# Ethernet Media Access Controller (EMAC)

## 47.1 Overview

By using the external Ethernet PHY (physical layer), ESP32-P4 can send and receive data via Ethernet MAC (Media Access Controller) according to the IEEE 802.3 standard, as Figure 47.1-1 shows. Ethernet is currently the most commonly used network protocol that controls how data is transmitted over local- and wide-area networks, abbreviated as LAN and WAN, respectively.

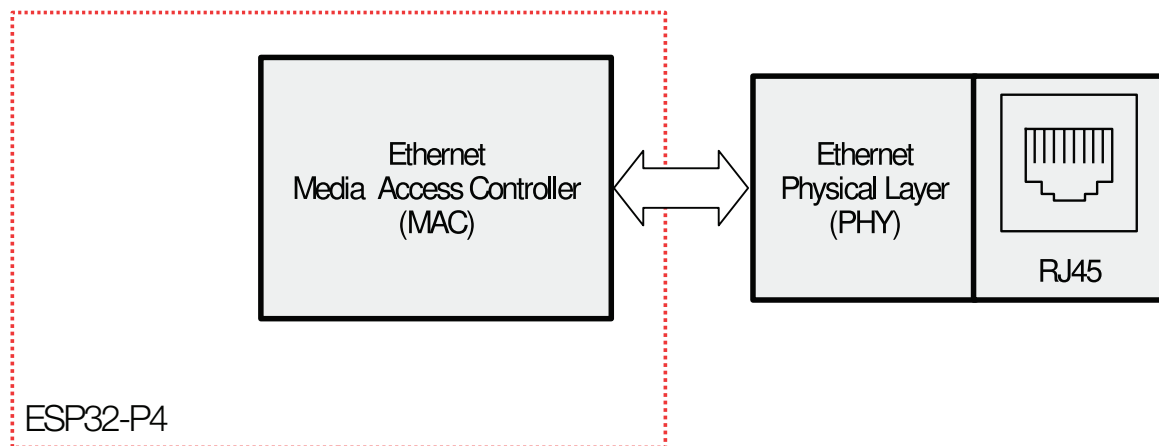

Figure 47.1-1. Ethernet MAC Functionality Overview

ESP32-P4 Ethernet MAC complies with the following standards:

- IEEE 802.3-2002 for Ethernet MAC
- IEEE 1588-2008 standard for precise networked clock synchronization
- IEEE 802.3 standard Media Independent Interface (MII) and Reduced Media Independent Interface (RMII)
- IEEE 802.3az-2010 for Energy Efficient Ethernet
- IEEE 802.1Q for VLAN frame format

## 47.2 Features

- Data rates of 10/100 Mbit/s through an external PHY interface
- Communication with an external Fast Ethernet PHY through IEEE 802.3-compliant MII and RMII interfaces
- Full-duplex and half-duplex modes

- Carrier Sense Multiple Access or Collision Detection (CSMA/CD) protocol in half-duplex mode
- IEEE 802.3x flow control in full-duplex mode
- Optional forwarding of received pause control frame to the user application in full-duplex mode
- Back-pressure flow control in half-duplex mode
- Automatic transmission of zero-quanta pause frame on deassertion of flow control input in full-duplex mode
- Preamble and start-of-frame data (SFD) insertion in Transmit, and deletion in Receive paths
- Automatic CRC and padding (all 0) generation controllable on a per-frame basis
- Options for automatic padding generation for data below the minimum frame length
- Programmable frame length supporting jumbo frames of up to 16 KB
- Programmable inter-frame gap (IFG) from 40 to 96 bit times in steps of 8)
- Supports a variety of flexible address filtering modes:
  - Up to eight 48-bit perfect address filters with masks for each byte
  - Up to eight 48-bit source address (SA) address comparison check with masks for each byte
  - Option to pass all multicast addressed frames
  - Promiscuous mode support to pass all frames without any filtering for network monitoring
  - Passes all incoming packets (as per filter) with a status report
- Separate 32-bit status returned for transmission and reception packets
- Supports IEEE 802.1Q VLAN tag detection for reception frames
- Separate transmission, reception, and control interfaces for the application
- Management Data Input/Output (MDIO) interface for PHY device configuration and management
- Supports checksum off-load for received IPv4 and TCP packets encapsulated by the Ethernet frame
- Supports checking IPv4 header checksum and TCP, UDP, or ICMP checksum encapsulated in IPv4 or IPv6 datagrams
- Supports 64-bit timestamp on each transmit and receive frame (see IEEE 1588-2008)
- Supports Energy Efficient Ethernet (see IEEE 802.3az-2010)
- CRC replacement, SA insertion or replacement, and VLAN insertion, replacement or deletion in transmit frames
- Two FIFOs: 256-byte TX FIFO and 256-byte RX FIFO
- Receive status vectors inserted into RX FIFO after the EOF (end of frame) transfer, which enables multiple-frame storage in RX FIFO without requiring another FIFO to store those frames' receive status
- Option to forward good runt frames
- Supports statistics by generating pulses for frames dropped or corrupted due to overflow in RX FIFO
- Automatic re-transmission of collision frames (subject to certain conditions, see Section [47.4.1.1](#))

- Discarding frames in cases of late collisions, excessive collisions, excessive deferrals, and underflow conditions
- Software control to flush TX FIFO

## 47.3 Ethernet MAC Architecture

Figure 47.3-1 shows the block diagram of the Ethernet MAC.

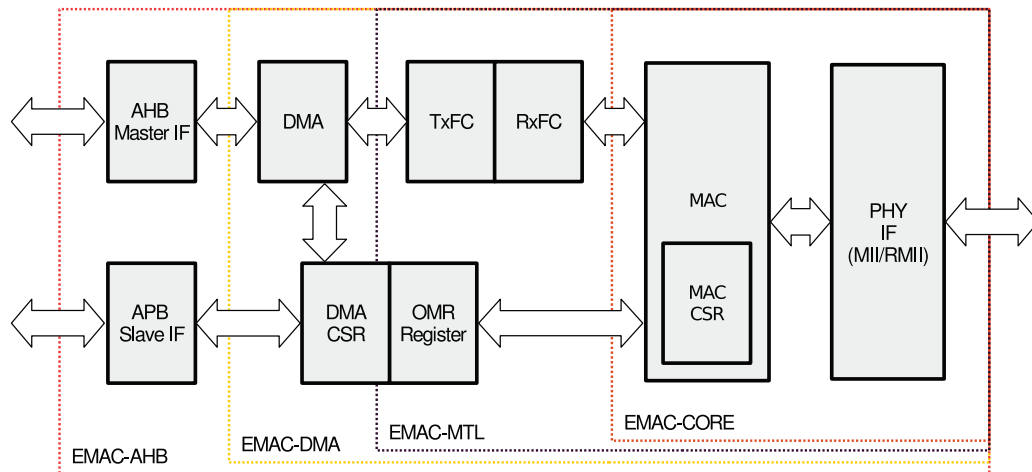

Figure 47.3-1. Ethernet MAC Block Diagram

Ethernet MAC consists of three layers: EMAC\_CORE (MAC Core Layer), EMAC\_MTL (MAC Transition Layer), and EMAC\_DMA (Direct Memory Access). Each of these three layers has two directions: TX and RX. They are connected to the system through the Advanced High Performance Bus (AHB) and the Advanced Peripheral Bus (APB) on the chip. Off the chip, they communicate with the external PHY through the MII and RMII interfaces to establish an Ethernet connection.

## 47.4 Functional Description

### 47.4.1 EMAC\_CORE

The MAC supports two interfaces (see Section 47.4.4) towards the PHY chip. The PHY interface can be selected only once after the chip reset. The MAC core communicates with the application side (DMA side) using the MAC Transmit Interface (MTI), MAC Receive Interface (MRI), and the MAC Control Interface (MCI).

#### 47.4.1.1 Transmission

Transmission is initiated when the MTL application pushes in data with the SOF signal (start of frame) asserted. When the SOF signal is detected, the MAC accepts the data and begins transmitting to the RMII or MII. The time required to transmit the frame data to the RMII or MII after the application initiates transmission is variable, depending on delay factors like IFG delay, time to transmit preamble or SFD (Start Frame Delimiter), and any back-off delays for half-duplex mode. Until then, the MAC does not accept the data received from MTL by deasserting the ready signal.

After the EOF (end of frame) is transmitted to the MAC, the MAC completes normal transmission and then gives the Transmit Status to the MTL. If a normal collision (in half-duplex mode) occurs during transmission, the MAC core makes valid the Transmit Status to the MTL. It will then accept and drop all further data until the next SOF is received. The MTL block should retransmit the same frame from SOF on observing a retry request (in the Status) from the MAC.

The MAC issues an underflow status if the MTL is not able to provide the data continuously during the transmission. During the normal transmission of a frame from the MTL, if the MAC receives an SOF without getting an EOF for the previous frame, then the SOF is ignored and the new frame is considered as a continuation of the previous frame.

### Transmit Flow Control

In full-duplex mode, when the Transmit Flow Control Enable bit ([TFCE](#)) is set to 1, the MAC generates pause frames and transmits them as necessary, with the calculated CRC appended.

Pause frame generation can be initiated in two ways. When the application sets the Flow Control Busy bit ([FCBBA](#)) to 1, or when the RX FIFO is full, a pause frame is transmitted.

- If the application has requested flow control by setting the [FCBBA](#) bit to 1, the MAC will generate and transmit a single pause frame. The value of the pause time in the generated frame is the pause time value programmed in the [PAUSE\\_TIME](#) field. If the application wants to extend or end the pause prior to the time specified in the previously transmitted pause frame, it must request another pause frame transmission after programming the pause time field [PAUSE\\_TIME](#) with an appropriate value.
- If the application has requested flow control when the RX FIFO is full, the MAC will generate and transmit a pause frame. The value of the pause time in the generated frame is the pause time value programmed in the [PAUSE\\_TIME](#) field. If the RX FIFO remains full at a configurable number of slot times ([PLT](#)) before the pause time runs out, a second pause frame will be transmitted. The process will be repeated as long as the RX FIFO remains full. If the FIFO is no longer full prior to the sampling time, the MAC will send a pause frame with zero pause time to indicate to the remote end that the RX buffer is ready to receive new data frames.

### Retransmission During Collision

In half-duplex mode, a collision may occur on the MAC line interface when frames are transmitted to the MAC. The MAC may indicate a retry attempt by giving the status even before the EOF is transferred. Then the MAC will enable the retransmission by popping out the frame again from the FIFO. After more than 96 bytes are popped towards the MAC core, the FIFO controller frees the space in the FIFO, and makes it available to the DMA to push in more data. This means that the retransmission is not possible after this threshold is crossed or when the MAC core indicates a late-collision event.

The MAC transmitter may abort the transmission of a frame because of collision, TX FIFO underflow, loss of carrier, jabber timeout, no carrier, excessive deferral, or late collision. When frame transmission is aborted because of collision, the MAC requests retransmission of the frame.

### Transmit Status Word

At the end of the Ethernet frame transfer, the MAC outputs the transmit status to the application. The detailed description of the Transmit Status is the same as for [TDES0](#).

### 47.4.1.2 Reception

A receive operation is initiated when the MAC detects an SFD on the RMII or MII. The MAC strips the preamble and SFD before proceeding to process the frame. The header fields are checked for filtering and the FCS (Frame Check Sequence) field used to verify the CRC for the frame. The received frame is stored in a shallow buffer until the address filtering is performed. The frame is dropped in the MAC if it fails the address filtering.

The frames received by the MAC are pushed into the RX FIFO. Once the RX FIFO crosses the configured Receive threshold ([RX\\_THRESH\\_CTRL](#)), its status is indicated to the DMA, so that the DMA can initiate a pre-configured burst transfers towards the AHB interface.

In the default cut-through mode, when the FIFO receives 64 bytes or a full packet of data, it pops out the data and indicates the availability to the DMA. Once the DMA initiates the transfer to the AHB interface, the data transmission continues from the FIFO until a complete packet has been transferred. Upon the completion of the EOF frame transfer, the status word will be popped out and transmitted to the DMA controller.

#### Receive Protocol

The receive module strips the preamble and SFD of the received frame. Once the SFD is detected, the MAC begins sending the Ethernet frame data to the RX FIFO, starting from the first byte following the SFD (destination address). If the IEEE 1588 timestamp feature is enabled, the snapshot of system time will be captured whenever an SFD of any frame is detected on MII, and sent to the application unless the MAC filters out and drops the frame.

If the Length/Type field of the receiving frame is less than 0x600 and if the MAC is programmed for the automatic CRC/paddingstripping option, the MAC sends the frame data up to the count specified in the Length/Type field to the RX FIFO, and then starts dropping bytes (including the FCS field). If the Length/Type field is greater than or equal to 0x600, the MAC will send all received Ethernet frame data to the RX FIFO, regardless of the value on the programmed automatic CRC stripping option. By default, the MAC is programmed for the watchdog timer to be enabled, that is frames above 2048 bytes (including DA, SA, LT, data, padding, and FCS) are cut off. This feature can be disabled by programming the Watchdog Disable bit [EMACWATCHDOG](#). However, even if the watchdog timer is disabled, frames longer than 16 KB will still be cut off and the watchdog timeout status will be indicated.

#### Receive Frame Controller

If the [RECEIVE\\_ALL](#) bit in the MAC Frame Filter Register is reset, the MAC performs frame filtering based on the destination and source addresses. The application still needs to perform another level of filtering if it decides not to receive any bad frames like runt, CRC error frames, etc. On detecting a filter failure, the frame is dropped and not transmitted to the application. When the filter parameters change dynamically, if a DA and SA filter failure occurs, the reset of the frame is dropped and the Receive Status word (with zero frame length, CRC Error, and Runt Error bits set) is updated immediately indicating the filter failure.

#### Receive Flow Control

The MAC detects the receiving pause frame and pauses the frame transmission for the delay specified within the received pause frame (in full-duplex mode only). The Pause Frame Detection Function can be enabled or disabled with the [RFCE](#) bit. Once the receive flow control is enabled, the MAC starts monitoring the received frame destination address for any match with the multicast address of the control frame (0x0180 C200 0001).

If a match is detected (i.e., the destination address of the received frame matches the destination address of the reserved control frame), the MAC decides whether to transmit the received control frame to the application, according to the [PCF](#) field.

The MAC also decodes the type, the opcode, and the pause timer field of the receiving control Frame. If the byte count of the status indicates 64 bytes, and if there is no CRC error, the MAC transmitter will pause the transmission of any data frame for the duration of the decoded pause time value multiplied by the slot time (64 byte times for 10/100 Mbit/s mode). Meanwhile, if another pause frame is detected with a zero pause time, the MAC will reset the pause time and give another pause request.

If the received control frame matches neither the type field (0x8808), the opcode (0x00001), nor the byte length (64 bytes), or if there is a CRC error, the MAC will not generate a pause.

In the case of a pause frame with a multicast destination address, the MAC filters the frame according to the address match.

For a pause frame with a unicast destination address, the filtering depends on whether the DA matched the contents of the MAC Address Register 0 and the [UPFD](#) (detecting a pause frame even with a unicast destination address) is set. The [PCF](#) register controls the filtering for control frames in addition to the address filter.

### Receive Operation Multiframe Handling

Since the status is available immediately following the data, the MAC is capable of storing any number of frames into the FIFO, as long as it is not full.

### Error Handling

If the RX FIFO is full before it receives the EOF data from the MAC, an overflow will be declared and the whole frame will be dropped. The status bit [RDESO](#)[11] will reflect the fact that this frame is a partial frame due to overflow. The RX FIFO can perform the filtering of error frames and runt frames, if this function is enabled via [FLUSH\\_TX\\_FIFO](#) and [FWD\\_UNDER\\_GF](#).

In cut-through mode, if a frame's status and length are available when reading an SOF from the RX FIFO, the whole error frame can be dropped. The DMA can flush the error frame being read from the FIFO by clearing [FWD\\_ERR\\_FRAME](#) to 0. The DMA then stops transferring data to the application, internally reads out the rest of the frame, and drops it. The MTL will then start the transfer of the next frame, if it is available. If FIFO is available, the transmission of the next frame will be initiated.

### Receive Status Word

At the end of the Ethernet frame transfer, the MAC outputs the receive status to the application via [EMAC\\_DMA](#). The detailed description of the receive status is the same for bit[31:0] in [RDESO](#).

## 47.4.2 EMAC\_MTL (MAC Transaction Layer)

The MAC Transaction Layer provides FIFO memory to buffer and regulate the frames between the application system memory and the MAC. It also enables the data to be transmitted between the application clock domain and the MAC clock domains. The MTL layer has two data paths, namely the Transmit path and the Receive path. The data path for both directions is 32-bit wide and operates with a simple FIFO protocol.

### 47.4.3 EMAC\_DMA

EMAC has its own DMA module, with independent Transmit and Receive engines and a CSR (Control and Status Registers) space. The Transmit engine transfers data from the system memory to the device port (MTL), while the Receive engine transmits data from the device port to the system memory. The controller uses descriptors to efficiently move data from source to destination with minimal Host CPU intervention. The DMA is designed for packet-oriented data transfer such as frames in Ethernet. The controller can be programmed to interrupt the Host CPU for normal situations, such as the completion of frame transmission or reception, or error conditions.

#### 47.4.3.1 Transmit Descriptors

Figure 47.4-1 shows the structure of the transmit descriptor linked list. Table 47.4-1 through Table 47.4-4 show the descriptions of each transmit descriptor.

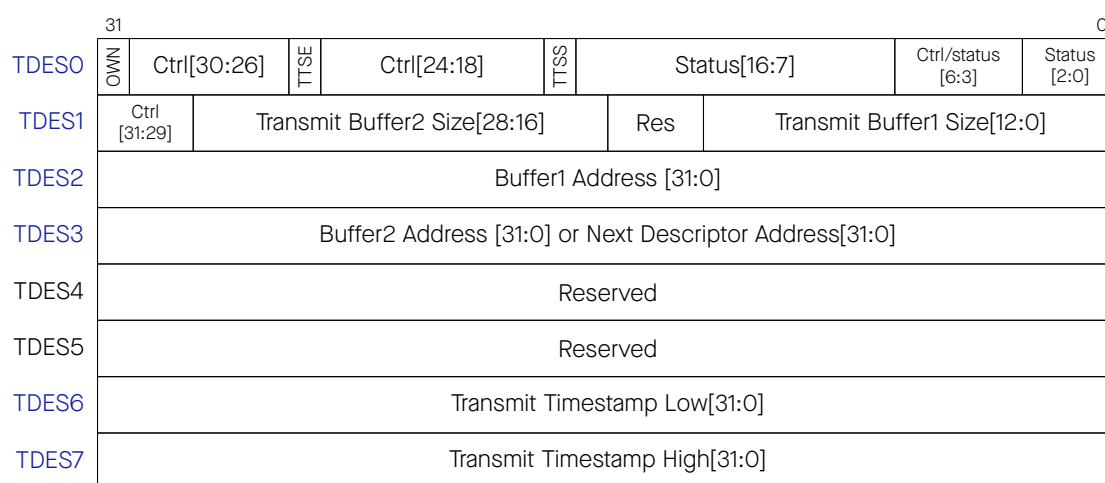

Figure 47.4-1. Transmit Descriptor Linked List

Table 47.4-1. Transmit Descriptor 0 (TDES0)

| Bits | Name                        | Description  |
|------|-----------------------------|--|
| [31] | OWN: Own Bit                | When set, this bit indicates that the descriptor is owned by the DMA. When reset, it indicates that the descriptor is owned by the Host. The DMA clears this bit, either when it completes the frame transmission or when the buffers allocated to the descriptor are empty. The ownership bit of the First Descriptor of the frame should be set after all subsequent descriptors belonging to the same frame have been set. This avoids a possible race condition between fetching a descriptor and the driver setting an ownership bit. |
| [30] | IC: Interrupt on Completion | When set, this bit sets the Transmit Interrupt <a href="#">TRANS_INT</a> after the present frame has been transmitted. This bit is valid only when the last segment bit <a href="#">TDES0[29]</a> is set.  |
| [29] | LS: Last Segment            | When set, this bit indicates that the buffer contains the last segment of the frame, and the TBS1 or TBS2 field in TDES1 should have a non-zero value.   |

| Bits    | Name                             | Description  |
|---------|----------------------------------|--|
| [28]    | FS: First Segment                | When set, this bit indicates that the buffer contains the first segment of a frame.  |
| [27]    | DC: Disable CRC                  | When this bit is set, the MAC does not append a cyclic redundancy check (CRC) to the end of the transmitted frame. This is valid only when the first segment (TDES0[28]) is set.   |
| [26]    | DP: Disable Padding              | When this bit is set, the MAC does not automatically add padding to a frame shorter than 64 bytes. When this bit is reset, the DMA automatically adds padding and CRC to a frame shorter than 64 bytes, and the CRC field is added despite the state of the DC (TDES0[27]) bit. This is valid only when the first segment (TDES0[28]) is set.  |
| [25]    | TTSE: Transmit Time Stamp Enable | When this bit is set, the MAC enables IEEE1588 hardware timestamping for the transmit frame.   |
| [24]    | CRCR: CRC Replacement Control    | When set, the MAC replaces the last four bytes of the transmitted packet with recalculated CRC bytes. The Host should ensure that the CRC bytes are present in the frame being transmitted from the Transmit Buffer. This bit is valid when the First Segment control bit (TDES0[28]) is set. In addition, CRC replacement is done only when Bit TDES0[27] is set to 1.  |
| [23:22] | CIC: Checksum Insertion Control  | <p>These bits control the checksum calculation and insertion. Bit encodings are shown below:</p> <ul style="list-style-type: none"> <li>• 00: Checksum insertion is disabled.</li> <li>• 01: Only IP header checksum calculation and insertion are enabled.</li> <li>• 10: IP header checksum and payload checksum calculation and insertion are enabled, but pseudo-header checksum is not calculated in hardware.</li> <li>• 11: IP Header checksum and payload checksum calculation and insertion are enabled, and pseudo-header checksum is calculated in hardware.</li> </ul> <p>This field is valid when the First Segment control bit (TDES0[28]) is set.</p> |
| [21]    | TER: Transmit End of Ring        | When set, this bit indicates that the descriptor list reached its final descriptor. The DMA returns to the base address of the list, creating a Descriptor Ring.   |
| [20]    | TCH: Second Address Chained      | When set, this bit indicates that the second address in the descriptor is the Next Descriptor address, rather than the second buffer address. When TDES0[20] is set, TBS2 (TDES1[28:16]) is a “don’t care” value. TDES0[21] takes precedence over TDES0[20]. This bit must be set to 1.  |

| Bits    | Name                            | Description  |
|---------|---------------------------------|--|
| [19:18] | VLIC: VLAN Insertion Control    | <p>When set, these bits request the MAC to perform VLAN tagging or untagging before transmitting the frames. If the frame is modified for VLAN tags, the MAC automatically recalculates and replaces the CRC bytes. The following list describes the values of these bits:</p> <ul style="list-style-type: none"> <li>• 00: Do not add a VLAN tag.</li> <li>• 01: Remove the VLAN tag from the frames before transmission. This option should be used only with the VLAN frames.</li> <li>• 10: Insert a VLAN tag with the tag value programmed in VLAN Tag Inclusion or Replacement Register.</li> <li>• 11: Replace the VLAN tag in frames with the Tag value programmed in VLAN Tag Inclusion or Replacement Register. This option should be used only with the VLAN frames.</li> </ul> |
| [17]    | TTSS: Transmit Timestamp Status | <p>This bit is used as a status bit to indicate that a timestamp was captured for the described transmit frame. When this bit is set, <a href="#">TDES6</a> and <a href="#">TDES7</a> have a timestamp value captured for the transmit frame. This bit is valid only when the descriptor's LS (<a href="#">TDES0[29]</a>) is set.</p>  |
| [16]    | IHE: IP Header Error            | <p>When set, this bit indicates that the MAC transmitter detected an error in the IP datagram header. The transmitter checks the header length in the IPv4 packet against the number of header bytes received from the application, and indicates an error status if there is a mismatch. For IPv6 frames, a header error is reported if the main header length is not 40 bytes. Furthermore, the Ethernet Length/Type field value for an IPv4 or IPv6 frame must match the IP header version received with the packet. For IPv4 frames, an error status is also indicated if the Header Length field has a value less than 0x5.</p>   |
| [15]    | ES: Error Summary               | <p>Indicates the logical OR of the following bits:</p> <ul style="list-style-type: none"> <li>• <a href="#">TDES0[16]</a>: IP Header Error</li> <li>• <a href="#">TDES0[14]</a>: Jabber Timeout</li> <li>• <a href="#">TDES0[13]</a>: Frame Flush</li> <li>• <a href="#">TDES0[12]</a>: IP Payload Error</li> <li>• <a href="#">TDES0[11]</a>: Loss of Carrier</li> <li>• <a href="#">TDES0[10]</a>: No Carrier</li> <li>• <a href="#">TDES0[9]</a>: Late Collision</li> <li>• <a href="#">TDES0[8]</a>: Excessive Collision</li> <li>• <a href="#">TDES0[2]</a>: Excessive Deferral</li> <li>• <a href="#">TDES0[1]</a>: Underflow Error</li> </ul>   |
| [14]    | JT: Jabber Timeout              | <p>When set, this bit indicates the MAC transmitter has experienced a jabber timeout. This bit is only set when the EMACJABBER bit (disable jabber) of <a href="#">EMACCONFIG_REG</a> is not set.</p>  |
| [13]    | FF: Frame Flushed               | <p>When set, this bit indicates that the DMA or MTL flushed the frame because of a software Flush command given by the CPU.</p>  |

| Bits  | Name                    | Description  |
|-------|-------------------------|--|
| [12]  | IPE: IP Payload Error   | When set, this bit indicates that the MAC transmitter detected an error in the TCP, UDP, or ICMP IP datagram payload. The transmitter checks the payload length received in the IPv4 or IPv6 header against the actual number of TCP, UDP, or ICMP packet bytes received from the application, and issues an error status in case of a mismatch.   |
| [11]  | LOC: Loss of Carrier    | When set, this bit indicates that a Loss of Carrier occurred during frame transmission (that is, the MII_CRS signal was inactive for one or more transmit clock periods during frame transmission). This is valid only for the frames transmitted without collision and when the MAC operates in the half-duplex mode.   |
| [10]  | NC: No Carrier          | When set, this bit indicates that the carrier sense signal from the PHY was not asserted during transmission.  |
| [9]   | LC: Late Collision      | When set, this bit indicates that frame transmission was aborted because of a collision occurring after the collision window (in MII mode, 64 byte times including Preamble, and 512 byte times including Preamble and Carrier Extension). This bit is not valid if the Underflow Error bit is set.  |
| [8]   | EC: Excessive Collision | When set, this bit indicates that the transmission was aborted after 16 successive collisions while attempting to transmit the current frame. If the EMACRETRY bit of <a href="#">EMACCONFIG_REG</a> is set, this bit is set after the first collision, and the transmission of the frame is aborted.  |
| [7]   | VF: VLAN Frame          | When set, this bit indicates that the transmitted frame was a VLAN-type frame.   |
| [6:3] | Ctrl/status             | These status bits indicate the number of collisions occurring before the frame was transmitted. This count is not valid when the Excessive Collisions bit ( <a href="#">TDES0[8]</a> ) is set. The CPU updates this status field only in the half-duplex mode.   |
| [2]   | ED: Excessive Deferral  | When set, this bit indicates that the transmission has ended because of excessive deferral of over 24,288 bit times (if Jumbo Frame is enabled) if the EMACDEFERRAL bit (deferral check) of <a href="#">EMACCONFIG_REG</a> is set high.  |
| [1]   | UF: Underflow Error     | When set, this bit indicates that the MAC aborted the frame because the data arrived late from the Host memory. Underflow Error indicates that the DMA encountered an empty transmit buffer while transmitting the frame. The transmission process enters the Suspended state and sets both Transmit Underflow Register (Status Register <a href="#">TRANS_UNDFLOW</a> ) and Transmit Interrupt Register (Status Register <a href="#">TRANS_INT</a> ). |
| [0]   | DB: Deferred Bit        | When set, this bit indicates that the MAC defers before transmission because of the presence of a carrier. This bit is valid only in the half-duplex mode.   |

**Table 47.4-2. Transmit Descriptor 1 (TDES1)**

| Bits    | Name                         | Description   |
|---------|------------------------------|---|
| [31:29] | SAIC: SA Insertion Control   | <p>These bits request the MAC to add or replace the Source Address field in the Ethernet frame with the value given in <a href="#">EMACADDROHIGH_REG</a>, <a href="#">EMACADDROLOW_REG</a>, <a href="#">EMACADDRHIGH_REG</a>, and <a href="#">EMACADDRLOW_REG</a>. If the Source Address field is modified in a frame, the MAC automatically recalculates and replaces the CRC bytes. The Bit[31] specifies the MAC Address Register value (1 or 0) that is used for Source Address insertion or replacement. The following list describes the values of Bits[30:29]:</p> <ul style="list-style-type: none"> <li>• 00: Do not include the source address.</li> <li>• 01: Include or insert the source address. For reliable transmission, the application must provide frames without source addresses.</li> <li>• 10: Replace the source address. For reliable transmission, the application must provide frames with source addresses.</li> <li>• 11: Reserved.</li> </ul> <p>These bits are valid when the First Segment control bit (<a href="#">TDES0[28]</a>) is set.</p> |
| [28:16] | TBS2: Transmit Buffer2 Size  | These bits specify the transmit Buffer 2 size in bytes. This field is not valid if <a href="#">TDES0[20]</a> is set.  |
| [15:13] | Reserved                     | Reserved  |
| [12:0]  | TBS1: Transmit Buffer 1 Size | These bits indicate the data buffer byte size in bytes. If this field is 0, the DMA ignores this buffer and uses Buffer 2 or the next descriptor, depending on the value of TCH ( <a href="#">TDES0[20]</a> ).  |

**Table 47.4-3. Transmit Descriptor 2 (TDES2)**

| Bits   | Name                     | Description   |
|--------|--------------------------|---|
| [31:0] | Buffer 1 Address Pointer | These bits indicate the physical address of Buffer 1. |

**Table 47.4-4. Transmit Descriptor 3 (TDES3)**

| Bits   | Name  | Description  |
|--------|---|--|
| [31:0] | Buffer2 Address Pointer (Next Descriptor Address) | These bits specify the physical address of Buffer 2 when a descriptor ring structure is used. If the Second Address Chained ( <a href="#">TDES0[20]</a> ) bit is set, this address specifies the physical memory where the Next Descriptor is present. |

Table 47.4-5. Transmit Descriptor 6 (TDES6)

| Bits   | Name                                | Description  |
|--------|-------------------------------------|--|
| [31:0] | TTSL: Transmit Frame Time Stamp Low | This field is updated by DMA with the least significant 32 bits of the timestamp captured for the corresponding transmit frame. This field has the timestamp only if the Last Segment (TDES0[29]) bit in the descriptor is set, and the Timestamp Status (TDES0[17]) bit is set. |

Table 47.4-6. Transmit Descriptor 7 (TDES7)

| Bits   | Name                                 | Description  |
|--------|--------------------------------------|--|
| [31:0] | TTSH: Transmit Frame Time Stamp High | This field is updated by DMA with the most significant 32 bits of the timestamp captured for the corresponding receive frame. This field has the timestamp only if the Last Segment (TDES0[29]) bit in the descriptor is set, and the Timestamp Status (TDES0[17]) bit is set. |

47.4.3.2 Receive Descriptors

Figure 47.4-2 shows the structure of the receive descriptor linked list. Table 47.4-7 through Table 47.4-11 show the descriptions of each receive descriptor.

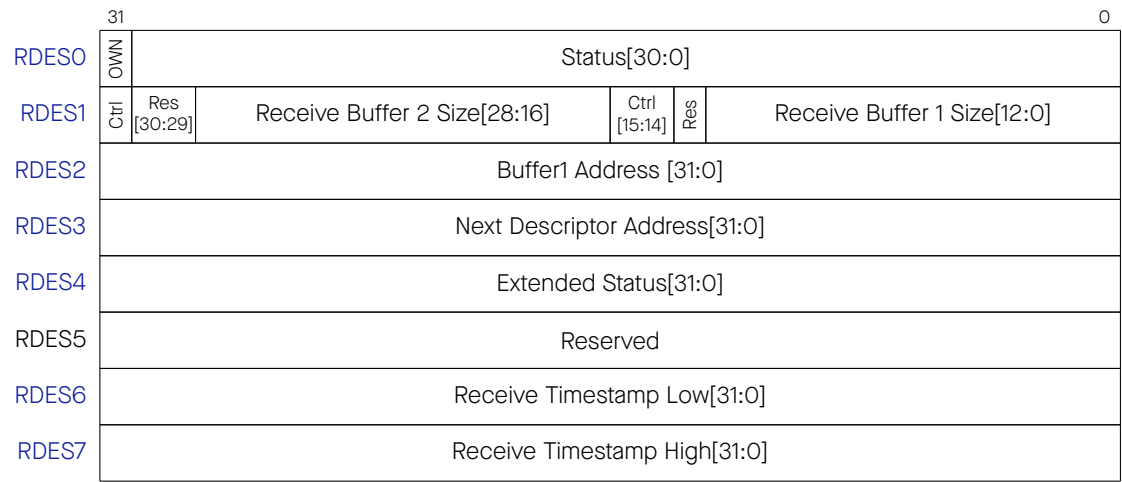

Figure 47.4-2. Receive Descriptor Linked List

Table 47.4-7. Receive Descriptor 0 (RDES0)

| Bits | Name         | Description  |
|------|--------------|--|
| [31] | OWN: Own Bit | When set, this bit indicates that the descriptor is owned by the DMA. When reset, it indicates that the descriptor is owned by the Host. The DMA clears this bit either when it completes the frame reception or when the buffers that are associated with this descriptor are full. |

| Bits    | Name                                 | Description  |
|---------|--------------------------------------|--|
| [30]    | AFM: Destination Address Filter Fail | When set, this bit indicates a frame that failed in the DA Filter in the MAC.  |
| [29:16] | FL: Frame Length                     | These bits indicate the byte length of the received frame that was transmitted to Host memory. This field is valid when Last Descriptor ( <a href="#">RDESO[8]</a> ) is set and either the Descriptor Error ( <a href="#">RDESO[14]</a> ) or Overflow Error bit <a href="#">RDESO[11]</a> are reset. The frame length also includes the two bytes appended to the Ethernet frame when IP checksum calculation (Type 1) is enabled and the received frame is not a MAC control frame.   |
| [15]    | ES: Error Summary                    | Indicates the logical OR of the following bits: <ul style="list-style-type: none"> <li>• <a href="#">RDESO[1]</a>: CRC Error</li> <li>• <a href="#">RDESO[3]</a>: Receive Error</li> <li>• <a href="#">RDESO[4]</a>: Watchdog Timeout</li> <li>• <a href="#">RDESO[6]</a>: Late Collision</li> <li>• <a href="#">RDESO[7]</a>: Giant Frame</li> <li>• <a href="#">RDES4[4:3]</a>: IP Header or Payload Error</li> <li>• <a href="#">RDESO[11]</a>: Overflow Error</li> <li>• <a href="#">RDESO[14]</a>: Descriptor Error</li> </ul> This field is valid only when <a href="#">RDESO[8]</a> is set. |
| [14]    | DE: Descriptor Error                 | When set, this bit indicates a frame truncation caused by a frame that does not fit within the current descriptor buffers, and that the DMA does not own the Next Descriptor. The frame is truncated. This field is valid only when This field is valid only when <a href="#">RDESO[8]</a> is set.   |
| [13]    | SAF: Source Address Filter Fail      | When set, this bit indicates that the SA field of frame failed the SA Filter in the MAC.   |
| [12]    | LE: Length Error                     | When set, this bit indicates that the actual length of the frame received and that the Length/Type field does not match. This bit is valid only when the Frame Type ( <a href="#">RDESO[5]</a> ) bit is reset.   |
| [11]    | OE: Overflow Error                   | When set, this bit indicates that the received frame was damaged because of buffer overflow in MTL.  |
| [10]    | VLAN: VLAN Tag                       | When set, this bit indicates that the frame pointed to by this descriptor is a VLAN frame tagged by the MAC. The VLAN tagging depends on checking the VLAN fields of the received frame based on the VLAN Tag Register) configuration.   |
| [9]     | FS: First Descriptor                 | When set, this bit indicates that this descriptor contains the first buffer of the frame. If the size of the first buffer is 0, the second buffer contains the beginning of the frame. If the size of the second buffer is also 0, the next Descriptor contains the beginning of the frame.  |
| [8]     | LS: Last Descriptor                  | When set, this bit indicates that the buffers pointed to by this descriptor are the last buffers of the frame.   |

| Bits | Name                                      | Description  |
|------|---|--|
| [7]  | IP Checksum Error (Type1), or Giant Frame | <p>When the Advanced Timestamp feature is present, and when this bit set, it indicates that a snapshot of the Timestamp is written in descriptor word 6 (<a href="#">RDES6</a>) and 7 (<a href="#">RDES7</a>). This is valid only when the Last Descriptor bit (<a href="#">RDES0[8]</a>) is set.</p> <p>When IP Checksum Engine (Type 1) is selected, this bit, if set, indicates one of the following:</p> <ul style="list-style-type: none"> <li>• The 16-bit IPv4 header checksum calculated by the core did not match the received checksum bytes.</li> <li>• The header checksum checking is bypassed for non-IPv4 frames.</li> </ul> <p>Otherwise, this bit, when set, indicates the Giant Frame Status. When normal frame processing is enabled, Giant frames are larger than 1,518 bytes (or 1,522 bytes for VLAN or 2,000 bytes when <a href="#">ASS2KP</a> is set). When Jumbo Frame processing is enabled, Giant frames are larger than 9,018 bytes (or 9,022 bytes for VLAN).</p> |
| [6]  | LC: Late Collision                        | When set, this bit indicates that a late collision has occurred while receiving the frame in the half-duplex mode.   |
| [5]  | FT: Frame Type                            | When set, this bit indicates that the Receive Frame is an Ethernet-type frame (the LT field is greater than, or equal to, 1,536 bytes). When reset, it indicates that the received frame is an IEEE 802.3 frame. This bit is not valid for Runt frames which are less than 14 bytes.   |
| [4]  | RWT: Receive Watchdog Timeout             | When set, this bit indicates that the Receive Watchdog Timer has expired while receiving the current frame and the current frame is truncated after the Watchdog Timeout.  |
| [3]  | RE: Receive Error                         | When set, this bit indicates that the MII_RXER signal is asserted while MII_RXDV is asserted during frame reception.   |
| [2]  | DE: Dribble Bit Error                     | When set, this bit indicates that the received frame has a non-integer multiple of bytes (odd nibbles). This bit is valid only in the MII Mode.  |
| [1]  | CE: CRC Error                             | When set, this bit indicates that a Cyclic Redundancy Check (CRC) Error occurred on the received frame. This field is valid only when the Last Descriptor ( <a href="#">RDES0[8]</a> ) is set.   |

| Bits | Name   | Description   |
|------|--|---|
| [0]  | Extended Status Available/<br>RX MAC Address | <p>When the IP Checksum Offload (Type 2) is present, this bit, when set, indicates that the extended status is available in descriptor word 4 (<a href="#">RDES4</a>). This is valid only when the Last Descriptor bit (<a href="#">RDES0[8]</a>) is set. This bit is invalid when Bit 30 is set.</p> <p>When IP Checksum Offload (Type 2) is present, this bit is set even when the IP Checksum Offload engine bypasses the processing of the received frame. The bypassing may be because of a non-IP frame or an IP frame with a non-TCP/UDP/ICMP payload.</p> <p>When the IPC Full Offload is not selected, this bit indicates an RX MAC Address status. When set, this bit indicates that the RX MAC Address registers value (1 to 15) matched the frame's DA field. When reset, this bit indicates that the RX MAC Address Register 0 value matched the DA field.</p> |

**Table 47.4-8. Receive Descriptor 1 (RDES1)**

| Bits    | Name                        | Description   |
|---------|-----------------------------|---|
| [31]    | Ctrl                        | When set, this bit prevents setting the Status Register's RI bit ( <a href="#">RECV_INT</a> ) for the received frame that ends in the buffer indicated by this descriptor. This, in turn, disables the assertion of the interrupt to Host because of the RI for that frame.   |
| [30:29] | Reserved                    | Reserved.   |
| [28:16] | RBS2: Receive Buffer 2 Size | These bits indicate the size of Buffer 2 in bytes. The buffer size must be a multiple of 4, even if the value of <a href="#">RDES3</a> (Buffer 2 address pointer) is not aligned to bus width. In the case where the buffer size is not a multiple of 4, the resulting behavior is undefined. This field is not valid if <a href="#">RDES1[14]</a> is set.  |
| [15]    | RER: Receive End of Ring    | When set, this bit indicates that the descriptor list reached its final descriptor. The DMA returns to the base address of the list, creating a Descriptor Ring.  |
| [14]    | RCH: Second Address Chained | When set, this bit indicates that the second address in the descriptor is the Next Descriptor address rather than the second buffer address. When this bit is set, RBS2 ( <a href="#">RDES1[28:16]</a> ) is a "don't care" value. <a href="#">RDES1[15]</a> takes precedence over <a href="#">RDES1[14]</a> .   |
| [13]    | Reserved                    | Reserved.   |
| [12:0]  | RBS1: Receive Buffer 1 Size | These bits indicate the size of Buffer 1 in bytes. The buffer size must be a multiple of 4, even if the value of <a href="#">RDES2</a> (buffer1 address pointer) is not aligned to bus width. When the buffer size is not a multiple of 4, the resulting behavior is undefined. If this field is 0, the DMA ignores this buffer and uses Buffer 2 or the next descriptor depending on the value of RCH (Bit[14]). |

**Table 47.4-9. Receive Descriptor 2 (RDES2)**

| Bits   | Name                     | Description   |
|--------|--------------------------|---|
| [31:0] | Buffer 1 Address Pointer | These bits indicate the physical address of Buffer 1. |

**Table 47.4-10. Receive Descriptor 3 (RDES3)**

| Bits   | Name  | Description  |
|--------|---|--|
| [31:0] | Buffer 2 Address Pointer<br>(Next Descriptor Address) | These bits indicate the physical address of Buffer 2 when descriptor chaining is used. If the Second Address Chained ( <a href="#">RDES1[14]</a> ) bit is set, then this address contains the pointer to the physical memory where the Next Descriptor is present. |

**Table 47.4-11. Receive Descriptor 4 (RDES4)**

| Bits    | Name              | Description   |
|---------|-------------------|---|
| [31:28] | Reserved          | Reserved.   |
| [27:26] | Reserved          | Reserved.   |
| [25]    | Reserved          | Reserved.   |
| [24]    | Reserved          | Reserved.   |
| [23:21] | Reserved          | Reserved.   |
| [20:18] | Reserved          | Reserved.   |
| [17]    | Reserved          | Reserved.   |
| [16]    | Reserved          | Reserved.   |
| [15]    | Reserved          | Reserved.   |
| [14]    | Timestamp Dropped | When set, this bit indicates that the timestamp was captured for the receive frame but got dropped in the MTL RX FIFO because of overflow.  |
| [13]    | PTP Version       | When set, this bit indicates that the received PTP message is having the IEEE 1588 version 2 format. When reset, it has the version 1 format.   |
| [12]    | PTP Frame Type    | When set, this bit indicates that the PTP message over Ethernet is sent directly over Ethernet. When this bit is not set and the MT (message type) is not 0, it indicates that the PTP message over UDP-IPv4 or UDP-IPv6 is received. |

| Bits   | Name                 | Description   |
|--------|----------------------|---|
| [11:8] | Message Type         | <p>These bits are encoded to give the type of the message received.</p> <ul style="list-style-type: none"> <li>• 0000: Reserved</li> <li>• 0001: SYNC (all clock types)</li> <li>• 0010: Follow_Up (all clock types)</li> <li>• 0011: Delay_Req (all clock types)</li> <li>• 0100: Delay_Resp (all clock types)</li> <li>• 0101: Pdelay_Req (in peer-to-peer transparent clock)</li> <li>• 0110: Pdelay_Resp (in peer-to-peer transparent clock)</li> <li>• 0111: Pdelay_Resp_Follow_Up (in peer-to-peer transparent clock)</li> <li>• 1000: Announce</li> <li>• 1001: Management</li> <li>• 1010: Signaling</li> <li>• 1011-1110: Reserved</li> <li>• 1111: PTP packet with Reserved message type</li> </ul> |
| [7]    | IPv6 Packet Received | When set, this bit indicates that the received packet is an IPv6 packet. This bit is updated only when Bit[10] (IPC) of MAC Configuration Register ( <a href="#">EMACRXIPCOFFLOAD</a> ) is set.   |
| [6]    | IPv4 Packet Received | When set, this bit indicates that the received packet is an IPv4 packet. This bit is updated only when Bit[10] (IPC) of MAC Configuration Register ( <a href="#">EMACRXIPCOFFLOAD</a> ) is set.   |
| [5]    | IP Checksum Bypassed | When set, this bit indicates that the checksum offload engine is bypassed.  |
| [4]    | IP Payload Error     | When set, this bit indicates that the 16-bit IP payload checksum (that is, the TCP, UDP, or ICMP checksum) that the MAC core calculated does not match the corresponding checksum field in the received segment. It is also set when the TCP, UDP, or ICMP segment length does not match the payload length value in the IP Header field. This bit is valid when either Bit[7] or Bit[6] is set.  |
| [3]    | IP Header Error      | When set, this bit indicates that either the 16-bit IPv4 header checksum calculated by the MAC core does not match the received checksum bytes, or the IP datagram version is not consistent with the Ethernet Type value. This bit is valid when either Bit[7] or Bit[6] is set.   |

| Bits  | Name            | Description   |
|-------|-----------------|---|
| [2:0] | IP Payload Type | <p>These bits indicate the type of payload encapsulated in the IP datagram processed by the Receive Checksum Offload Engine (COE). The COE also sets these bits to 00 if it does not process the IP datagram's payload due to an IP header error or fragmented IP.</p> <ul style="list-style-type: none"> <li>• 000: Unknown or did not process IP payload</li> <li>• 001: UDP</li> <li>• 010: TCP</li> <li>• 011: ICMP</li> <li>• 1xx: Reserved</li> </ul> <p>This bit is valid when either Bit[7] or Bit[6] is set.</p> |

**Table 47.4-12. Receive Descriptor 6 (RDES6)**

| Bits   | Name                               | Description   |
|--------|------------------------------------|---|
| [31:0] | RTSH: Receive Frame Time Stamp Low | <p>This field is updated by DMA with the least significant 32 bits of the timestamp captured for the corresponding receive frame. This field is updated by DMA only for the last descriptor of the receive frame which is indicated by the Last Descriptor status bit (<a href="#">RDES0[8]</a>).</p> |

**Table 47.4-13. Receive Descriptor 7 (RDES7)**

| Bits   | Name                               | Description  |
|--------|------------------------------------|--|
| [31:0] | RTSH: Receive Frame Timestamp High | <p>This field is updated by DMA with the most significant 32 bits of the timestamp captured for the corresponding receive frame. This field is updated by DMA only for the last descriptor of the receive frame which is indicated by the Last Descriptor status bit (<a href="#">RDES0[8]</a>).</p> |

## 47.4.4 PHY Interface

The MAC and the external PHY communicate through two interfaces:

- Media Independent Interface (MII)
- Reduced Media Independent Interface (RMII)

### 47.4.4.1 Media Independent Interface: MII

The Media Independent Interface (MII) defines the interconnection between MAC sublayers and PHYs at 10 Mbit/s and 100 Mbit/s.

#### MII Signals to PHY

The MII interface signals are shown in Figure [47.4-3](#).

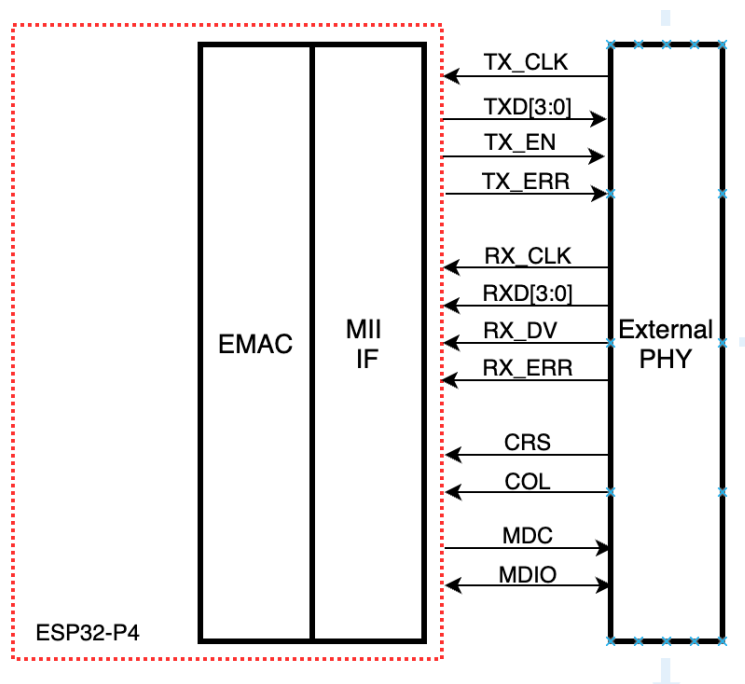

Figure 47.4-3. MII Interface

The MII interface signals are described below:

- **MII\_TX\_CLK**: TX clock signal. This signal provides the reference timing for TX data transmission. It has two frequencies: 2.5 MHz at 10 Mbit/s, and 25 MHz at 100 Mbit/s.
- **MII\_TXD[3:0]**: A bundle of four transmit data signals driven by the MAC sublayer, and qualified (valid data) on the assertion of the MII\_TX\_EN signal. MII\_TXD[0] is the lowest significant bit and MII\_TXD[3] is the highest significant bit. When the MII\_TX\_EN signal is deasserted, the transmit data have no effect on the PHY.
- **MII\_TX\_EN**: Transmission enable signal. This signal indicates that the MAC is presenting nibbles (4 bits) on the MII for transmission. It must be asserted synchronously (MII\_TX\_CLK) with the first nibble of the preamble and must remain asserted while all nibbles to be transmitted are presented to the MII.
- **MII\_TX\_ERR**: Transmit error signal. The signal must be asserted for one or more clock periods (MII\_TX\_CLK) to indicate to the PHY layer that an error was detected somewhere in the frame.
- **MII\_RX\_CLK**: RX clock signal. This signal provides the reference timing for RX data transmission. It has two frequencies: 2.5 MHz at 10 Mbit/s, and 25 MHz at 100 Mbit/s.
- **MII\_RXD[3:0]**: A bundle of four receive data signals driven by the MAC sublayer, and qualified (valid data) on the assertion of the MII\_RX\_DV signal. MII\_RXD[0] is the lowest significant bit and MII\_RXD[3] is the highest significant bit. When MII\_RX\_DV is deasserted and MII\_RX\_ERR is asserted, a specific MII\_RXD[3:0] value is used to transfer specific information from the PHY.
- **MII\_RX\_DV**: Receive data valid signal. This signal indicates that the PHY is presenting recovered and decoded nibbles on the MII for reception. It must be asserted synchronously (MII\_RX\_CLK) with the first recovered nibble of the frame and must remain asserted through the final recovered nibble. It must be deasserted prior to the first clock cycle that follows the final nibble. In order to receive the frame correctly, the MII\_RX\_DV signal must encompass the frame, starting no later than the SFD field.

- MII\_CRS: Carrier sense signal. When the transmit or receive medium is non-idle, the signal is asserted by the PHY. When the transmit or receive medium is idle, the signal is deasserted by the PHY. The PHY must ensure that the MII\_CRS signal remains asserted throughout the duration of a collision condition. This signal does not need to be synchronized with the TX and RX clocks. In full duplex mode the state of this signal is don't care for the MAC sublayer.
- MII\_COL: Collision detection signal. This signal must be asserted by the PHY upon detection of a collision on the medium and must remain asserted while the collision condition persists. This signal is not required to transition synchronously with respect to the TX and RX clocks. In full duplex mode, the state of this signal is don't care for the MAC sublayer.
- MII\_RX\_ERR: Receive error signal. The signal must be asserted for one or more clock periods (MII\_RX\_CLK) to indicate to the MAC sublayer that an error was detected somewhere in the frame.
- MDIO and MDC: Management data input/output and management data clock signal. The two signals constitute a serial bus defined for the Ethernet family of IEEE 802.3 standards, used to transfer control and data information to the PHY, see section [Station Management Agent \(SMA\) Interface](#).

### MII Clock

In MII mode, there are clock signals in two directions between MII and the PHY, namely `clk_tx` and `clk_rx`. `clk_tx` is used to synchronize the TX data, and `clk_rx` is used to synchronize the RX data. Both clocks are provided by the PHY.

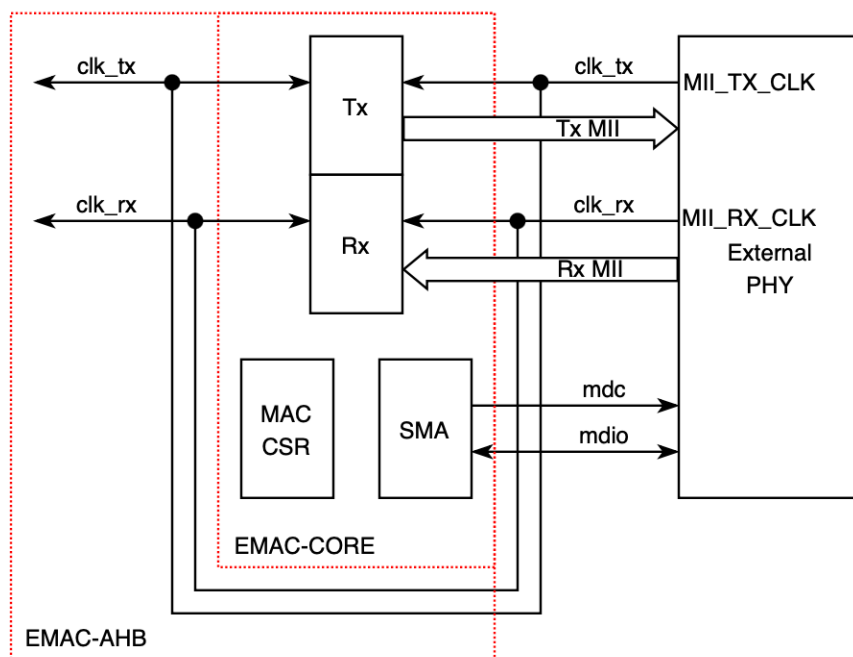

Figure 47.4-4. MII Clock

#### 47.4.4.2 Reduced Media Independent Interface: RMII

RMII interface signals are shown in Figure 47.4-5.

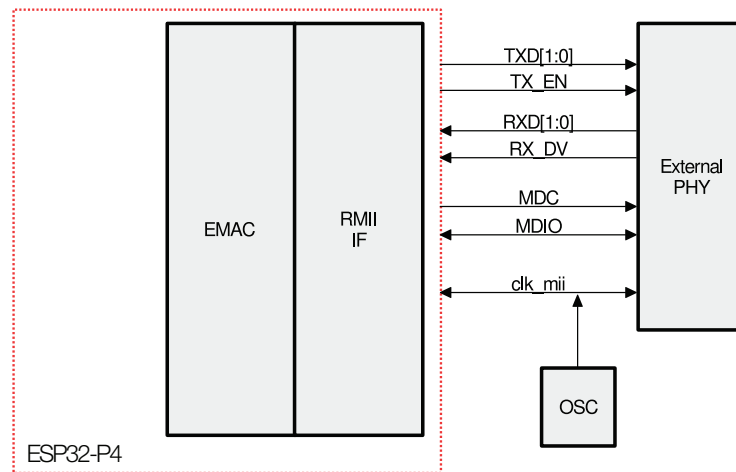

Figure 47.4-5. RMII Interface

### RMII Signals

The Reduced Media Independent Interface (RMII) specification reduces the number of pins between the microcontroller's Ethernet MAC and the external PHY at 10 Mbit/s or 100 Mbit/s. According to the IEEE 802.3u standard, an MII contains 16 pins for data and control. The RMII specification reduces the pin count to 7.

RMII has the following features:

- Supports an operating rate of 10 Mbit/s or 100 Mbit/s
- The clock reference must be 50 MHz.
- The same clock reference must be sourced externally both to the MAC and the external Ethernet PHY.
- Provides independent 2-bit wide TX and RX data paths.

### RMII Clock

The 50 MHz RMII reference clock can be:

- Generated internally by ESP32-P4 and looped back via GPIOs. For GPIO configurations, please refer to [Chapter 8 GPIO Matrix and IO MUX](#).
- Provided by the external crystal and obtained at GPIOs.

The RMII clock is shown in [Figure 47.4-6](#).

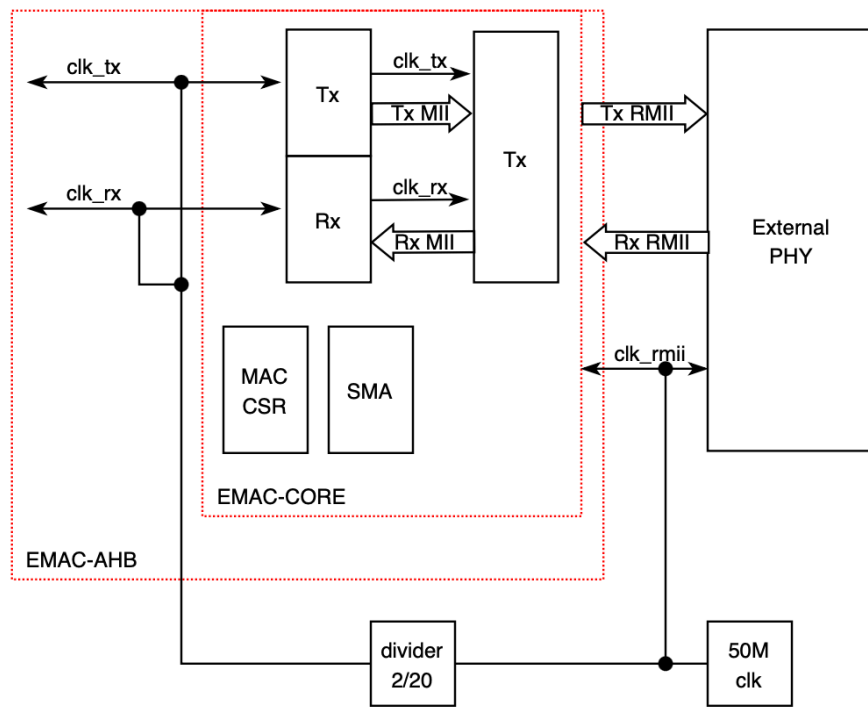

Figure 47.4-6. RMII Clock

#### 47.4.4.3 Station Management Agent (SMA) Interface

As Figure 47.4-3 and Figure 47.4-5 show, the MAC uses MDC and MDIO signals to transfer control and data information to the PHY. The MDC clock signal is generated from the application clock by a clock divider at the maximum frequency of 2.5 MHz. The MDIO data signal transfers to and fro PHY synchronously with the MDC clock signal. Meanwhile, the PHY transmits register data.

- Read a PHY register:
  - Read [MIIBUSY](#) until the MII is in an idle state.
  - Configure [MIIDEV](#) to specify the PHY device to access.
  - Configure [MIIREG](#) to specify the address of the PHY register to access.
  - Configure [MIICSRCLK](#) to set the APB clock frequency.
  - Set [MIIWRITE](#) to 0 for read access.
  - Read [MIIBUSY](#) until the MII is in an idle state.
  - Read [EMACMIIDATA\\_REG](#) to retrieve the value of the PHY register.
- Write a PHY register:
  - Read [MIIBUSY](#) until the MII is in an idle state.
  - Configure [EMACMIIDATA\\_REG](#) to set the value to be written to the PHY register.
  - Configure [MIIDEV](#) to specify the PHY device to access.
  - Configure [MIIREG](#) to specify the address of the PHY register to access.
  - Configure [MIICSRCLK](#) to set the APB clock frequency.

- Set [MIWRITE](#) to 1 for write access.
- Read [MIIBUSY](#) until the MII is in an idle state, which indicates the completion of the write operation.

## 47.4.5 MAC Address Filtering

Address filtering checks the destination and source addresses on all received frames and reports the address filtering status accordingly. Address checking is based on different parameters (Frame filter register) chosen by the application. The filtered frame can also be identified: multicast or broadcast frame. Address filtering uses the station's physical (MAC) address for address checking.

### 47.4.5.1 Unicast Destination Address Filtering

The MAC supports up to 9 MAC addresses for unicast perfect filtering. MAC compares all 48 bits of the received unicast address with the programmed MAC address for any match. By default, [EMACADDR0](#) is always enabled, and the other addresses ([EMACADDR0](#) ~ [EMACADDR8](#)) are selected with an individual enable bit. Each byte of these other addresses ([EMACADDR0](#) ~ [EMACADDR8](#)) can be masked during comparison with the corresponding received DA byte by setting the corresponding Mask Byte Control bit in the register. This helps group address filtering for the DA.

### 47.4.5.2 Multicast Destination Address Filtering

The MAC can be programmed to pass all multicast frames by setting the Pass All Multicast ([PAM](#)) bit in the Frame Filter Register to 1. If the [PAM](#) bit is reset, the MAC the filtering for multicast addresses.

In perfect filtering mode, the multicast address is compared with the programmed MAC Destination Address Registers ([EMACADDR0](#) ~ [EMACADDR8](#)). Group address filtering is also supported.

### 47.4.5.3 Broadcast Address Filter

The MAC does not filter any broadcast frames in the default mode. However, if the MAC is programmed to reject all broadcast frames by setting the Disable Broadcast Frames ([DBF](#)) bit in the Frame Filter Register to 1, all broadcast frames will be dropped.

### 47.4.5.4 Unicast Source Address Filter

The MAC can also perform perfect filtering based on the source address field of the received frames. By default, the Address Filtering Module (AFM) compares the Source Address (SA) field with the values programmed in the SA register. The MAC address registers [1:3] can be configured to contain SA instead of DA for comparison, by setting bit[30] in the corresponding register. Group filtering with SA is also supported. The frames that fail the SA filter are dropped by the MAC if the Source Address Filter Enable ([SAFE](#)) bit in the Frame filter register is set. Otherwise, the result of the SA filter is given as a status bit in the Receive Status word (see Table 47.4-7).

When the [SAFE](#) bit is set to 1, the result of the SA filtering and DA filtering is AND'ed to decide whether the frame needs to be forwarded. This means that either of the filter failure results will drop the frame. Both filters have to pass the frame for the frame to be forwarded to the application.

#### 47.4.5.5 Inverse Filtering Operation

For both destination and source address filtering, there is an option to invert the filter-match result at the final output. These are controlled by the **DAIF** and **SAIF** bits in the Frame filter register, respectively. The **DAIF** bit is applicable for both Unicast and Multicast DA frames. When the **DAIF** bit is set, the result of the unicast/multicast destination address filter is inverted. Similarly, when the **SAIF** bit is set, the result of the unicast SA filter is inverted.

The following two tables summarize the destination address and source address filtering based on the type of the frames received.

**Table 47.4-14. Destination Address Filtering**

| Frame Type | PM | PF | DAIF | PAM | DB | DA Filter Operation   |
|------------|----|----|------|-----|----|---|
| Broadcast  | 1  | X  | X    | X   | X  | Pass  |
|            | 0  | X  | X    | X   | 0  | Pass  |
|            | 0  | X  | X    | X   | 1  | Fail  |
| Unicast    | 1  | X  | X    | X   | X  | Pass all frames   |
|            | 0  | X  | 0    | X   | X  | Pass on perfect/group filter match  |
|            | 0  | X  | 1    | X   | X  | Fail on perfect/group filter match  |
|            | 0  | 1  | 0    | X   | X  | Pass on perfect/group filter match  |
|            | 0  | 1  | 1    | X   | X  | Fail on perfect/group filter match  |
| Multicast  | 1  | X  | X    | X   | X  | Pass all frames   |
|            | X  | X  | X    | 1   | X  | Pass all frames   |
|            | 0  | X  | 0    | 0   | X  | Pass on perfect/group filter match and drop pause control frames if PCF = 0x. |
|            | 0  | 1  | 0    | 0   | X  | Pass on perfect/group filter match and drop pause control frames if PCF = 0x. |
|            | 0  | X  | 1    | 0   | X  | Fail on perfect/group filter match and drop pause control frames if PCF = 0x. |
|            | 0  | 1  | 1    | 0   | X  | Fail on perfect/group filter match and drop pause control frames if PCF = 0x. |

The filtering parameters in the MAC Frame Filter Register described in Table 47.4-14 are as follows.

| Parameter name                              | Parameter setting |
|---|-------------------|
| PM: Pass All Multicast                      | 1: Set            |
| PF: Perfect Filter                          | 0: Cleared        |
| DAIF: Destination Address Inverse Filtering | X: Don't care     |
| PAM: Pass All Multicast                     |                   |
| DB: Disable Broadcast Frames                |                   |

**Table 47.4-15. Source Address Filtering**

| Frame Type | PM | SAIF | SAF | Source Address Filter Operation                                     |
|------------|----|------|-----|---|
| Unicast    | 1  | X    | X   | Pass all frames   |
|            | 0  | 0    | 0   | Pass on perfect/group filter match but do not drop frames that fail |
|            | 0  | 0    | 0   | Fail on perfect/group filter match but do not drop frames that fail |
|            | 0  | 0    | 0   | Pass on perfect/group filter match and drop frames that fail        |
|            | 0  | 0    | 0   | Fail on perfect/group filter match and drop frames that fail        |

The filtering parameters in the MAC Frame Filter Register described in Table 47.4-15 are as follows.

| Parameter name                         | Parameter setting |
|--|-------------------|
| PM: Pass All Multicast                 | 1: Set            |
| SAF: Source Address Filtering          | 0: Cleared        |
| SAIF: Source Address Inverse Filtering | X: Don't care     |

## 47.4.6 Energy Efficient Ethernet (EEE)

Energy Efficient Ethernet (EEE) is an optional operating mode that enables the MAC sublayer along with a series of physical layers to operate in the Low Power Idle (LPI) mode. The EEE mode supports 100 Mbps MAC operations compliant with the IEEE 802.3az-2010 standard. The EEE is supported only in the full-duplex mode when MAC uses MII.

The LPI mode allows power saving by switching off parts of the communication device functionality when there is no data to be transmitted and received. The system on both sides of the link can disable some functionalities and save power during the period of low-link utilization. The MAC controls whether the system should enter or exit the LPI mode and communicate this to the PHY.

### 47.4.6.1 Transmission

To enter the LPI mode, the software must set the [LPIEN](#) bit to indicate to the MAC to stop transmission and initiate the LPI protocol. The MAC completes the transmission in progress, generates its transmission status, and then starts transmitting the LPI pattern instead of the IDLE pattern during the Interframe gap (IFG). The MAC then updates [TLPIEN](#) and generates an interrupt.

To exit the LPI mode, the software must clear the [LPIEN](#) bit to indicate to the MAC. The MAC stops transmitting the LPI pattern, and starts transmitting the IDLE pattern. When the [LPI\\_TW\\_TIMER](#) expires, the MAC updates [TLPIEX](#) and generates an interrupt.

### 47.4.6.2 Reception

When the PHY receives the signals from the link partner to enter into the LPI state, the PHY starts transmitting the LPI pattern. The MAC updates [RLPIEN](#) and generates an interrupt.

When the PHY receives signals from the link partner to exit the LPI state, the PHY stops transmitting the LPI pattern. The MAC updates [RLPIEX](#) and generates an interrupt.

## 47.4.7 Source Address, VLAN, and CRC Control

### 47.4.7.1 Source Address Control

The software can enable source address insertion or replacement for all or some frames:

- Enable source address insertion or replacement for all frames by configuring [SAIRC](#).
- Enable source address insertion or replacement for the current frame by configuring [TDES1\[31:29\]](#) of the frame. When [TDES1\[31\]](#) is set, [MAC\\_ADDRESS1\\_HI](#) and [EMACADDR1LOW\\_REG](#) are used for insertion and replacement. When [TDES1\[31\]](#) is cleared, [MAC\\_ADDRESS0\\_HI](#) and [EMACADDR0LOW\\_REG](#) are used for insertion and replacement. When [ADDRESS\\_ENABLE1](#) is not set, [MAC\\_ADDRESS0\\_HI](#) and [EMACADDR0LOW\\_REG](#) are used for insertion and replacement irrespective of [TDES1\[31\]](#).

### 47.4.7.2 VLAN Control

The software can enable VLAN insertion, replacement, or deletion for all or some frames:

- Enable VLAN insertion, replacement, or deletion for all frames by configuring [VLC](#).
- Enable VLAN insertion, replacement, or deletion for the current frame by configuring [TDES0\[19:18\]](#) of the frame.

### 47.4.7.3 CRC Control

CRC replacement is a feature that the software can use to indicate the MAC to replace the FCS field of the frame being transmitted with the calculated CRC. This feature can be enabled for the current frame by configuring [TDES0\[24\]](#).

CRC replacement is valid only when MAC does not append CRC ([TDES0\[27\]](#) is set), i.e., when FCS is provided by software in frames transmitted. If source address or VLAN control is enabled, the MAC will replace or append FCS fields with CRC when [TDES0\[27\]](#) is set or cleared respectively.

## 47.4.8 Time Stamp

The IEEE 1588-2008 standard defines the Precision Time Protocol (PTP) that allows precise clock synchronization in measurement and control systems implemented with technologies such as local computing, network communication and distributed objects. It supports system-wide synchronization accuracy in the sub-microsecond range with a minimum network and local clock computing resources.

### 47.4.8.1 Transmit Path

The MAC captures a timestamp when the start-of-frame data (SFD) is sent on the MII interface. The frames for which timestamps are captured can be controlled on a per-frame basis. In other words, each transmit frame can be marked to indicate whether a timestamp should be captured for that frame. The MAC does not process the transmitted to identify PTP frames. Rather, it captures the timestamp or not according to the configurations of [TDES0\[25\]](#) by software. The MAC returns the timestamp to the software inside the corresponding transmit descriptor, thus connecting the timestamp automatically to the specific PTP frame. The 64-bit timestamp information is written to the [TDES6](#) and [TDES7](#) fields.

### 47.4.8.2 Receive Path

The MAC processes the received frames to identify valid PTP frames. The snapshot of the time to be sent to the application can be controlled by software via [EMACTSTPCTRL\\_REG](#).

The MAC returns the timestamp to the software inside the corresponding receive descriptor. The extended status (including the timestamp status and IPC status) is written to [RDES4](#), and the timestamp snapshot is written to [RDES6](#) and [RDES7](#).

### 47.4.9 Remote Wakeup

The MAC supports remote wakeup. When the receiver receives a remote wakeup frame or a magic packet, an interrupt will be triggered, and the PMU will be notified to wake up the SoC system.

The software can control whether to use remote wakeup frames to trigger interrupts by configuring [RWKPKTEN](#), whether to use magic packets to trigger interrupts by configuring [MGKPKTEN](#), and whether the MAC drops all received frames in power-down mode by configuring [PWRDWN](#).

### 47.4.10 Good Transmitted and Received Frames

A frame that has been successfully transmitted is considered a “good frame”. In other words, a transmitted frame is considered to be “good”, if the frame transmission is not aborted due to the following errors:

- Jabber timeout ([TDES0\[14\]](#))
- No carrier or loss of carrier ([TDES0\[11:10\]](#))
- Late collision ([TDES0\[9\]](#))
- Frame underflow ([TDES0\[1\]](#))
- Excessive deferral ([TDES0\[2\]](#))
- Excessive collision ([TDES0\[8\]](#))

A received frame is considered to be “good” if the following errors do not occur:

- CRC error ([RDES0\[1\]](#))
- Runt frames (frames shorter than 64 bytes)
- Alignment error (in 10/100 Mbps modes only) ([RDES0\[2\]](#))
- Length error (non-type frames only) ([RDES0\[12\]](#))
- Frame size over the maximum size (for non-type frames over the maximum frame size only) ([RDES0\[7\]](#))
- MII\_RXER input error ([RDES0\[3\]](#))

The maximum frame size depends on the frame type:

- The maximum size of untagged frames = 1518 bytes
- The maximum size of VLAN frames = 1522 bytes

## 47.5 Programming Procedures

### 47.5.1 MAC System Layer Configuration

1. Configure the IO interfaces. For detailed configurations about the MII and the RMII interface, see Chapter [8 GPIO Matrix and IO MUX](#).

2. Configure the EMAC system clock by setting [HP\\_SYS\\_CLKRST\\_EMAC\\_SYS\\_CLK\\_EN](#) to 1.
3. Configure the PHY interface clock:
  - RMII interface: select the RMII interface by configuring [HP\\_SYS\\_PHY\\_INTF\\_SEL](#) to 4.
    - Select RMII reference clock source:
      - \* Reference clock sourced from the external crystal:
        - Configure [HP\\_SYS\\_CLKRST\\_PAD\\_EMAC\\_REF\\_CLK\\_EN](#) to disable [PAD\\_EMAC\\_REF\\_CLK](#) outputted to GPIO.
        - Configure [HP\\_SYS\\_CLKRST\\_REF\\_50M\\_CLK\\_EN](#) to disable [PLL\\_F50M\\_CLK](#).
      - \* Reference clock sourced from ESP32-P4:
        - Configure [HP\\_SYS\\_CLKRST\\_PAD\\_EMAC\\_REF\\_CLK\\_EN](#) to enable [PAD\\_EMAC\\_REF\\_CLK](#) outputted to GPIO.
        - Configure [HP\\_SYS\\_CLKRST\\_REF\\_50M\\_CLK\\_DIV\\_NUM](#) to specify the clock divisor for [PLL\\_F50M\\_CLK](#).
        - Configure [HP\\_SYS\\_CLKRST\\_REF\\_50M\\_CLK\\_EN](#) to enable [PLL\\_F50M\\_CLK](#).
    - Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_RMII\\_CLK\\_SRC\\_SEL](#) to specify the clock source of [EMAC\\_RMII\\_CLK](#) as [PAD\\_EMAC\\_TXRX\\_CLK](#);
    - Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_RX\\_CLK\\_SRC\\_SEL](#) to specify the clock source of [EMAC\\_RX\\_CLK](#) as [PAD\\_EMAC\\_TXRX\\_CLK](#);
    - Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_RX\\_CLK\\_DIV\\_NUM](#) to specify the clock divisor for [EMAC\\_RX\\_CLK](#) according to the EMAC line speed (10 Mbit/s or 100 Mbit/s);
    - Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_TX\\_CLK\\_SRC\\_SEL](#) to specify the clock source of [EMAC\\_TX\\_CLK](#) as [PAD\\_EMAC\\_TXRX\\_CLK](#);
    - Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_TX\\_CLK\\_DIV\\_NUM](#) to specify the clock divisor for [EMAC\\_TX\\_CLK](#) according to the EMAC line speed (10 Mbit/s or 100 Mbit/s);
    - Configure [LP\\_AONCLKRST\\_HP\\_PAD\\_EMAC\\_TXRX\\_CLK\\_EN](#) to enable the clock from IO pin [PAD\\_EMAC\\_TXRX\\_CLK](#);
    - Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_RMII\\_CLK\\_EN](#) to enable [EMAC\\_RMII\\_CLK](#);
    - Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_RX\\_CLK\\_EN](#) to enable [EMAC\\_RX\\_CLK](#);
    - Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_TX\\_CLK\\_EN](#) to enable [EMAC\\_TX\\_CLK](#);
  - MII interface: select the MII interface by configuring [HP\\_SYS\\_PHY\\_INTF\\_SEL](#) to 0.
    - Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_RX\\_CLK\\_SRC\\_SEL](#) to specify [EMAC\\_RX\\_CLK](#) as [PAD\\_EMAC\\_RX\\_CLK](#);
    - Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_RX\\_CLK\\_DIV\\_NUM](#) to specify the clock divisor for [EMAC\\_RX\\_CLK](#) according to the EMAC line speed (10 Mbit/s or 100 Mbit/s);
    - Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_TX\\_CLK\\_SRC\\_SEL](#) to specify [EMAC\\_TX\\_CLK](#) as [PAD\\_EMAC\\_TX\\_CLK](#);

- Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_TX\\_CLK\\_DIV\\_NUM](#) to specify the clock divisor for EMAC\_TX\_CLK according to the EMAC line speed (10 Mbit/s or 100 Mbit/s);
- Configure [LP\\_AONCLKRST\\_HP\\_PAD\\_EMAC\\_RX\\_CLK\\_EN](#) to enable the clock from IO pin PAD\_EMAC\_RX\_CLK;
- Configure [LP\\_AONCLKRST\\_HP\\_PAD\\_EMAC\\_TX\\_CLK\\_EN](#) to enable the clock from IO pin PAD\_EMAC\_TX\_CLK;
- Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_RX\\_CLK\\_EN](#) to enable EMAC\_RX\_CLK;
- Configure [HP\\_SYS\\_CLKRST\\_EMAC\\_TX\\_CLK\\_EN](#) to enable EMAC\_TX\_CLK;

## 47.5.2 EMAC Initial Configuration

Initialize EMAC\_DMA:

- Reset EMAC by setting [SW\\_RST](#) to 1.
- Wait for the completion of reset until reading 0 from [SW\\_RST](#), which indicates that the reset is done.
- Read [AHB\\_ST](#); a value of 0 indicates that all AHB bus transactions have been completed.
- Configure the AHB bus mode for EMAC\_DMA via [DMABUSMODE\\_REG](#).
- Prepare the linked list and configure the linked list base address via [DMARXBASEADDR\\_REG](#) and [DMATXBASEADDR\\_REG](#).
- Configure the operating mode for EMAC\_DMA and EMAC\_MTL via [DMAOPERATION\\_MODE\\_REG](#).
- Configure whether to enable DMA interrupts via [DMAIN\\_EN\\_REG](#).

Initialize EMAC\_CORE:

- Read [EMACMIADDR\\_REG](#) and [EMACMIIDATA\\_REG](#) for the PHY's connection status, operating frequency, and operating mode.
- Configure [EMACADDROHIGH\\_REG](#) and [EMACADDROLOW\\_REG](#) to specify the MAC address.
- Configure [EMACFF\\_REG](#) to select the packet filtering mode.
- Configure [EMACFC\\_REG](#) for flow control.
- Configure whether to mask MAC interrupts via [EMACINTMASK\\_REG](#).
- Configure the MAC's operating mode for transmission and reception via [EMACCONFIG\\_REG](#).

## 47.5.3 Starting Transmission

- Start EMAC\_DMA transmission by setting [START\\_STOP\\_TRANSMISSION\\_COMMAND](#) to 1.
- Start EMAC\_CORE transmission by setting [EMACTX](#) to 1.
- Detect the TRANS\_INT interrupt if enabled, and wait for the frame transmission to complete.

## 47.5.4 Starting Reception

- Start EMAC\_DMA reception by setting [START\\_STOP\\_RX](#) to 1.

- Start EMAC\_CORE reception by setting [EMACRX](#) to 1.
- Detect the RECV\_INT interrupt if enabled, and wait for the frame reception to complete.

### 47.5.5 TX Entering and Exiting the LPI State

- Configure the LPI timer counter via [EMACLPITIMERSCONTROL\\_REG](#)
- Make the transmitter to enter the LPI state via [EMACLPI\\_CSR\\_REG](#)
- Detect the LPI\_INT interrupt, and wait for [TLPIEN](#) to be set, which indicates that the transmitter has entered the LPI state
- Bring the transmitter out of the LPI state by clearing [LPIEN](#)
- Detect the LPI\_INT interrupt, and wait for [TLPIEX](#) to be set, which indicates that the transmitter has exited the LPI state

### 47.5.6 RX Entering and Exiting the LPI State

- Detect the LPI\_INT interrupt, and wait for [RLPIEN](#) to be set, which indicates that the receiver has entered the LPI state
- Detect the LPI\_INT interrupt, and wait for [RLPIEX](#) to be set, which indicates that the receiver has exited the LPI state

## 47.6 Interrupts

ESP32-P4's EMAC can generate the following interrupt signals that will be sent to the [Interrupt Matrix](#).

- ETH\_MAC\_INTR
- PMT\_INTR
- LPT\_INTR

There are several internal interrupt sources from EMAC that can generate the above interrupt signals.

The following interrupt sources can generate the ETH\_MAC\_INTR interrupt signal:

- [ABN\\_INT\\_SUMM](#): Triggered when [DMAIN\\_AISE](#) is 1 and the following interrupts are triggered.
  - [TRANS\\_PROC\\_STOP](#): Triggered when [DMAIN\\_TSE](#) is 1 and the transmit process stops.
  - [TRANS\\_JABBER\\_TO](#): Triggered when [DMAIN\\_TJTE](#) is 1 and the frame size exceeds 2048 bytes (10240 bytes if the jumbo frame is enabled).
  - [RECV\\_OVERFLOW](#): Triggered when [DMAIN\\_OIE](#) is 1 and the receive buffer overflows during frame reception.
  - [TRANS\\_UNDFLOW](#): Triggered when [DMAIN\\_UIE](#) is 1 and the transmit buffer underflows during frame transmission.
  - [RECV\\_BUF\\_UNAVAIL](#): Triggered when [DMAIN\\_RBUE](#) is 1, the Host owns the Next Descriptor in the Receive List and the DMA cannot acquire it.
  - [RECV\\_PROC\\_STOP](#): Triggered when [DMAIN\\_RSE](#) is 1 and the receive process stops.

- [RECV\\_WDT\\_TO](#): Triggered when [DMAIN\\_RWTE](#) is 1 and the Receive Watchdog Timer has expired while receiving the current frame.
- [EARLY\\_TRANS\\_INT](#): Triggered when [DMAIN\\_ETIE](#) is 1 and the frame has been completely transmitted to MTL TX FIFO.
- [FATAL\\_BUS\\_ERR\\_INT](#): Triggered when [DMAIN\\_FBEE](#) is 1 and a bus error described in [ERROR\\_BITS](#) occurs.
- [NORM\\_INT\\_SUMM](#): Triggered when [DMAIN\\_NISE](#) is 1 and the following interrupts are triggered.
  - [TRANS\\_INT](#): Triggered when [DMAIN\\_TIE](#) is 1 and the transmission completes.
  - [TRANS\\_BUF\\_UNAVAIL](#): Triggered when [DMAIN\\_TBUE](#) is 1, the Host owns the Next Descriptor in the Transmit List and the DMA cannot acquire it.
  - [RECV\\_INT](#): Triggered when [DMAIN\\_RIE](#) is 1 and the frame has been received.
  - [EARLY\\_RECV\\_INT](#): Triggered when [DMAIN\\_ERIE](#) is 1 and the DMA has received the first buffer of the data packet.

[EMAC\\_PMT\\_INT](#): Triggered when [PMTINTMASK](#) is 0, and a magic packet or a remote wakeup frame has been received in power-down mode.

[TS\\_TRI\\_INT](#): Triggered when [TSINTMASK](#) is 0 and any of the following conditions is true:

- The system time value equals or exceeds the value specified in the Target Time registers
- There is an overflow in the System Time Seconds Register

[EMAC\\_LPI\\_INT](#): Triggered when [LPIINTMASK](#) is 0 and any of the following conditions is true:

- The MAC Transmitter enters the LPI state
- The MAC Transmitter exits the LPI state
- The MAC Receiver enters the LPI state
- The MAC Receiver exits the LPI state

The following interrupt sources can generate the [PMT\\_INTR](#) interrupt signal:

- [RWKPRCVD](#): Triggered when a remote wakeup frame is received.
- [MGKPRCVD](#): Triggered when a magic packet is received.

The following interrupt source can generate the [LPI\\_INTR](#) interrupt signal:

- [RLPIEX](#): Triggered when the MAC receiver has stopped receiving the LPI pattern on PHY and has exited the LPI state.

## 47.7 Register Summary

The addresses in this section are relative to EMAC base address provided in Table 6.3-2 in Chapter 6 [System and Memory](#).

The abbreviations given in Column **Access** are explained in Section [Access Types for Registers](#).

| Name   | Description                                       | Address | Access  |
|--|---|---------|---------|
| <b>DMA configuration and control registers</b> |   |         |         |
| <a href="#">DMABUSMODE_REG</a>                 | Bus mode register                                 | 0x1000  | R/WS/SC |
| <a href="#">DMATXPOLLDEMAND_REG</a>            | Transmit poll demand register                     | 0x1004  | RO/WT   |
| <a href="#">DMARXPOLLDEMAND_REG</a>            | Receive poll demand register                      | 0x1008  | RO/WT   |
| <a href="#">DMARXBASEADDR_REG</a>              | Base address of the first receive descriptor      | 0x100C  | R/W     |
| <a href="#">DMATXBASEADDR_REG</a>              | Base address of the first transmit descriptor     | 0x1010  | R/W     |
| <a href="#">DMASTATUS_REG</a>                  | Base address of interrupt, error and other events | 0x1014  | R/SS/WC |
| <a href="#">DMAOPERATION_MODE_REG</a>          | Operation mode and command register               | 0x1018  | R/SS/WC |

## 47.8 Registers

The addresses in this section are relative to EMAC base address provided in Table 6.3-2 in Chapter 6 [System and Memory](#).

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

**Register 471. DMABUSMODE\_REG (0x1000)**

|                       |    |    |    |            |    |    |    |                     |      |    |     |               |    |   |      |            |   |       |   |             |  |  |  |           |  |  |  |                |  |  |  |               |  |  |  |               |  |  |  |             |  |  |  |

**DMAREBUILDINCRBURST** Configures whether to rebuild INCRx burst.

0: Not rebuild

1: If the AHB master gets an EBT (retry, split, or losing bus grant), the AHB master interface rebuilds the pending beats of any burst transfer initiated with INCRx using INCRx and SINGLE.

(R/W)

**DMATransmitPriority** Configures whether the transmit DMA has higher priority than the receive DMA during arbitration.

0: Lower priority

1: Higher priority

(R/W)

**DMAMixedBurst** Configures whether to use mixed burst.

0: Not use

1: If the FIXED\_BURST bit is 1, the AHB Master interface starts all bursts of length more than 16 with INCR (undefined burst) whereas it reverts to fixed burst transfers (INCRx and SINGLE) for burst length of 16 and less.

(R/W)

**DMAAddralibea** Configures whether bursts are aligned to address.

0: Not aligned to address

1: If the FIXED\_BURST bit is 1, the AHB interface generates all bursts aligned to the start address LS bits. If the FIXED\_BURST bit is 0, the first burst (accessing the data buffer's start address) is not aligned, but subsequent bursts are aligned to the address.

(R/W)

Continued on the next page...

**Register 471. DMABUSMODE\_REG (0x1000)**

Continued from the previous page...

**PBLX8\_MODE** Configures whether to multiply the PBL (programmable burst length) value by 8.

0: Disable

1: The programmed PBL value (PROG\_BURST\_LEN and RX\_DMA\_PBL) is multiplied by 8. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value.

(R/W)

**USE\_SEP\_PBL** Configures whether to use separate PBL.

0: PROG\_BURST\_LEN is applicable only for TX DMA, and RX DMA uses RX\_DMA\_PBL.

1: PROG\_BURST\_LEN is applicable for both TX and RX DMA.

(R/W)

**RX\_DMA\_PBL** Configure the maximum number of beats to be transferred in one RX DMA transaction, namely the maximum value that is used in a single block Read or Write.

Value range: 1, 2, 4, 8, 16 and 32. Any other value results in undefined behavior.

Valid only when USE\_SEP\_PBL is set.

(R/W)

**FIXED\_BURST** Configures whether the AHB Master interface performs fixed burst transfers.

0: The AHB interface uses SINGLE and INCR burst transfer operations.

1: The AHB interface uses only SINGLE, INCR4, INCR8, or INCR16 during start of the normal burst transfers.

(R/W)

**PRI\_RATIO** Configures the priority ratio in the weighted round-robin arbitration between the RX DMA and TX DMA.

0: 1:1

1: 2:0

2: 3:1

3: 4:1

Valid only when DMA\_ARB\_SCH is 0. (R/W)

**PROG\_BURST\_LEN** Configures the maximum number of beats to be transferred in one DMA transaction.

If the number of beats to be transferred is more than 32, then perform the following steps:

1. Set the PBLx8 mode with PBLX8\_MODE

2. Set the PBL with PROG\_BURST\_LEN

(R/W)

**ALT\_DESC\_SIZE** Configures whether to increase the descriptor size to 32 bytes.

0: Keep 16 bytes

1: Increase to 32 bytes

(R/W)

**DESC\_SKIP\_LEN** Configures the number of Word, Dword, or Lword (depending on the 32-bit, 64-bit, or 128-bit bus) to skip between two unchained descriptors.

The address skipping starts from the end of the current descriptor to the start of next descriptor.

When this field is 0, the descriptor table is taken as contiguous by the DMA in Ring mode. (R/W)

Continued on the next page...

Register 47.1. DMABUSMODE\_REG (0x1000)

Continued from the previous page...

- DMA\_ARB\_SCH** Configures the arbitration scheme between the transmit and receive paths.  
0: Weighted round-robin with RX:TX or TX:RX. In this case, the priority between the paths is according to the priority specified in PRI\_RATIO.  
1: Fixed priority (The transmit path has priority over receive path).  
(R/W)
- SW\_RST** Configures whether the MAC DMA Controller resets the logic and all internal registers of the MAC.  
0: Release from reset  
1: Reset  
This bit is cleared automatically after the reset operation has completed in all of the ETH\_MAC clock domains.  
(R/WS/SC)

Register 47.2. DMATXPOLLDemand\_REG (0x1004)

- TRANS\_POLL\_DEMAND** Configures whether to enable the TX DMA to check if the DMA owns the current descriptor.  
Any value: Enable  
When this field is written, the DMA reads the current descriptor pointed to by [DMATXCUR-RDESC\\_REG](#). If that descriptor is not available (owned by the Host), the transmission returns to the Suspend state and the Bit 2 (TU) of Register 5 (Status Register) is asserted. If the descriptor is available, the transmission resumes. (RO/WT)

**Register 47.3. DMARXPOLLDEMAND\_REG (0x1008)**

**RCV\_POLL\_DEMAND** Configures whether to enable the RX DMA to check if the DMA owns the current descriptor.

Any value: Enable

When this field is written, the DMA reads the current descriptor pointed to by [DMARXCUR-RDESC\\_REG](#). If that descriptor is not available (owned by the Host), the reception returns to the Suspended state and the Bit 7 (RU) of Register 5 (Status Register) is not asserted. If the descriptor is available, the RX DMA returns to the active state.(RO/WT)

**Register 47.4. DMARXBASEADDR\_REG (0x100C)**

**START\_RECV\_LIST** Configures the base address of the first descriptor in the receive descriptor linked list.

The LSB bits (1:0) are ignored (32-bit wide bus) and internally taken as all-zero by the DMA. Therefore, these LSB bits are read-only (RO). (R/W)

**Register 47.5. DMATXBASEADDR\_REG (0x1010)**

**START\_TRANS\_LIST** Configures the base address of the first descriptor in the Transmit Descriptor list. The LSB bits (1:0) are ignored (32-bit wide bus) and are internally taken as all-zero by the DMA. Therefore, these LSB bits are read-only (RO). (R/W)

**Register 47.6. DMASTATUS\_REG (0x1014)**

|            |    |              |    |            |    |              |  |            |    |            |    |                  |   |                 |    |               |    |              |    |                |    |                   |   |            |   |                 |   |             |   |                |   |                  |   |               |   |              |   |                 |   |                   |   |                 |   |           |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

Reset

**EMAC\_LPI\_INT** The raw interrupt status of EMAC\_LPI\_INT. (RO)

**TS\_TRI\_INT** The raw interrupt status of TS\_TRI\_INT. (RO)

**EMAC\_PMT\_INT** The raw interrupt status of EMAC\_PMT\_INT. (RO)

**ERROR\_BITS** Represents the type of error that caused a Bus Error, for example, error response on the AHB interface.

0: Error during RX DMA Write Data Transfer

1: Error during TX DMA Read Data Transfer

2: Error during RX DMA Descriptor Write Access

3: Error during TX DMA Descriptor Write Access

4: Error during RX DMA Descriptor Read Access

5: Error during TX DMA Descriptor Read Access

Valid only when Bit 13 (FBI) is 1. This field does not generate an interrupt. (RO)

**TRANS\_PROC\_STATE** Represents the Transmit DMA FSM state.

0: Stopped; Reset or Stop Transmit Command issued

1: Running; Fetching Transmit Transfer Descriptor

2: Running; Waiting for status

3: Running; Reading Data from Host memory buffer and queuing it to transmit buffer (TX FIFO)

4: TIME\_STAMP write state

5: Reserved for future use

6: Suspended; Transmit Descriptor Unavailable or Transmit Buffer Underflow

7: Running; Closing Transmit Descriptor

This field does not generate an interrupt. (RO)

**Register 47.6. DMASTATUS\_REG (0x1014)**

Continued from the previous page...

**NORM\_INT\_SUMM** Represents the logical OR of the following when the corresponding interrupt bits are enabled in Interrupt Enable Register.

Bit[0]: Transmit Interrupt

Bit[2]: Transmit Buffer Unavailable

Bit[6]: Receive Interrupt

Bit[14]: Early Receive Interrupt

Only unmasked interrupts affect this bit.

This is a sticky bit and must be cleared (by writing 1 to this bit) each time a corresponding bit, which causes this set to be set, is cleared. (R/SS/WC)

**ABN\_INT\_SUMM** Represents the logical OR of the following when the corresponding interrupt bits are enabled in Interrupt Enable Register.

Bit[1]: Transmit Process Stopped

Bit[3]: Transmit Jabber Timeout

Bit[4]: Receive FIFO Overflow

Bit[5]: Transmit Underflow

Bit[7]: Receive Buffer Unavailable

Bit[8]: Receive Process Stopped

Bit[9]: Receive Watchdog Timeout

Bit[10]: Early Transmit Interrupt

Bit[13]: Fatal Bus Error

Only unmasked interrupts affect this bit.

This is a sticky bit and must be cleared each time a corresponding bit, which causes this bit to be set, is cleared. (R/SS/WC)

**EARLY\_RECV\_INT** The raw interrupt status of EARLY\_RECV\_INT. (R/SS/WC)

**FATAL\_BUS\_ERR\_INT** The raw interrupt status of FATAL\_BUS\_ERR\_INT. (R/SS/WC)

**EARLY\_TRANS\_INT** The raw interrupt status of EARLY\_TRANS\_INT. (R/SS/WC)

**RCV\_WDT\_TO** Represents whether the Receive Watchdog Timer expired while receiving the current frame and the current frame is truncated after the watchdog timeout.

0: Not expired

1: Expired

(R/SS/WC)

**RCV\_PROC\_STOP** Represents whether the Receive Process enters the Stopped state.

0: Not stopped

1: Stopped

(R/SS/WC)

**Register 47.6. DMASTATUS\_REG (0x1014)**

Continued from the previous page...

**RECV\_BUF\_UNAVAIL** Represents whether the Receive Buffer is available.

0: Available

1: Unavailable

This bit is set only when the previous Receive Descriptor is owned by the DMA.

When set, the Host owns the Next Descriptor in the Receive List and the DMA cannot acquire it. The Receive Process is suspended.

To resume processing Receive descriptors, the Host should change the ownership of the descriptor and issue a Receive Poll Demand command. If no Receive Poll Demand is issued, the Receive Process resumes when the next recognized incoming frame is received. (R/SS/WC)

**RECV\_INT** The raw interrupt status of RECV\_INT. (R/SS/WC)

**TRANS\_UNDFLOW** Represents whether the Transmit Buffer had an Underflow during frame transmission.

0: No underflow

1: Underflow

When this bit is 1, transmission is suspended and an Underflow Error TDES0[1] is set. (R/SS/WC)

**RECV\_OVFLOW** Represents whether the Receive Buffer had an Overflow during frame reception.

0: No overflow

1: Overflow

If the partial frame is transferred to the application, the overflow status is set in RDES0[11]. (R/SS/WC)

**TRANS\_JABBER\_TO** Represents whether the Transmit Jabber Timer expired, which happens when the frame size exceeds 2,048 (10,240 bytes when the Jumbo frame is enabled).

0: Not expired

1: Expired

When the Jabber Timeout occurs, the transmission process is aborted and placed in the Stopped state. This causes the Transmit Jabber Timeout TDES0[14] flag to assert. (R/SS/WC)

**TRANS\_BUF\_UNAVAIL** Represents whether the Transmit Buffer is available.

0: Available

1: Unavailable

When this bit is 1, the Host owns the Next Descriptor in the Transmit List and the DMA cannot acquire it. Transmission is suspended. Bits[22:20] explain the Transmit Process state transitions.

To resume processing Transmit descriptors, the Host should change the ownership of the descriptor by setting TDES0[31] and then issue a Transmit Poll Demand command. (R/SS/WC)

**TRANS\_PROC\_STOP** Represents whether the transmission is stopped.

0: Not stopped

1: Stopped

(R/SS/WC)

**TRANS\_INT** The raw interrupt status of TRANS\_INT. (R/SS/WC)

**Register 47.7. DMAOPERATION\_MODE\_REG (0x1018)**

|            |   |   |   |   |                                       |    |    |    |    |                                     |   |    |    |    |                             |    |    |   |    |   |    |    |   |   |            |   |   |   |   |   |   |   |       |  |

**DIS\_DROP\_TCPIP\_ERR\_FRAM** Configures whether to disable dropping of TCP/IP checksum error frames.

0: Enable

1: Disable

When FWD\_ERR\_FRAME is 0, this bit is ignored and all error frames are dropped. (R/W)

**DIS\_FLUSH\_RECV\_FRAMES** Configures whether to disable flushing of received frames because of the unavailability of receive descriptors or buffers.

0: Enable

1: Disable

(R/W)

**FLUSH\_TX\_FIFO** Configures whether to flush TX FIFO to default values.

0: Not flush

1: Flush

(R/WS/SC)

**TX\_THRESH\_CTRL** Configures the threshold of TX FIFO. Transmission starts when the frame size within the TX FIFO is larger than the threshold. In addition, full frames with a length less than the threshold are also transmitted.

0: 64

1: 128

2: 192

3: 256

4: 40

5: 32

6: 24

7: 16

Transmission starts when the frame size within the TX FIFO is larger than the threshold. In addition, full frames with a length less than the threshold are also transmitted.

(R/W)

Continued on the next page...

**Register 47.7. DMAOPERATION\_MODE\_REG (0x1018)**

Continued from the previous page...

**START\_STOP\_TRANSMISSION\_COMMAND** Configures whether to start or stop the transmission.

0: Stop

1: Start

(R/W)

**FWD\_ERR\_FRAME** Configures whether RX FIFO forward frames with error status (CRC error, collision error, giant frame, watchdog timeout, or overflow)

0: Drop

1: Forward

(R/W)

**FWD\_UNDER\_GF** Configures whether the RX FIFO forward undersized (frames with no Error and length less than 64 bytes) good frames including PAD and CRC.

0: Drop

1: Forward

(R/W)

**DROP\_GFRM** Configures whether to the ETH\_MAC drops the received giant frames in the RX FIFO.

0: Not drop

1: Drop

(R/W)

**RX\_THRESH\_CTRL** Configures the threshold of the RX FIFO.

0: 64

1: 32

2: 96

3: 128

Transfer (request) to DMA starts when the frame size within the RX FIFO is larger than the threshold. (R/W)

**OPT\_SECOND\_FRAME** Configures whether the DMA processes the second frame of the Transmit data even before the status for the first frame is obtained.

0: Not process

1: Process

(R/W)

**START\_STOP\_RX** Configures whether to start or stop RX DMA reception.

0: Stop reception after the transfer of the current frame

1: Start reception

(R/W)

**Register 47.8. DMAIN\_EN\_REG (0x101C)**

| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    | DMAIN_NISE<br>DMAIN_AISE<br>DMAIN_ERIE<br>DMAIN_FBEE<br>(reserved)<br>DMAIN_ETIE<br>DMAIN_RWTE<br>DMAIN_RSE<br>DMAIN_RBUE<br>DMAIN_RIE<br>DMAIN_UIE<br>DMAIN_OIE<br>DMAIN_TJTE<br>DMAIN_TBUE<br>DMAIN_TSE<br>DMAIN_TIE |    |    |    |    |    |    |   |   |   |       |   |   |   |   |   |   |  |

**Overflow\_BFOC** Represents the status of the overflow frame counter.

0: No overflow.

1: The overflow frame counter (Overflow\_FC) overflows, that is, the RX FIFO overflows with the overflow frame counter at maximum value. In such a scenario, the overflow frame counter is reset to all-zeros.

(R/SS/RC)

**Overflow\_FC** Represents the number of frames missed by the application.

This counter is incremented each time the MTL FIFO overflows. (R/SS/RC)

**Overflow\_BMFC** Represents the status of the missed frame counter.

0: No overflow.

1: The missed frame counter (Missed\_FC) overflows, that is, the Host Receive Buffer being unavailable with the missed frame counter at maximum value. In such a scenario, the Missed frame counter is reset to all-zeros.

(R/SS/RC)

**Missed\_FC** Represents the number of frames missed by the controller because of the Host Receive Buffer being unavailable.

This counter is incremented each time the DMA discards an incoming frame. (R/SS/RC)

**Register 47.10. DMARINTWDTIMER\_REG (0x1024)**

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |   |   |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |

**SAIRC** Configures the source address insertion or replacement for all transmitted frames.

Bit 30 specifies which MAC Address register (0 or 1) is used for source address insertion or replacement based on the values of Bits [29:28].

Bits [29:28]:

0, 1: The input mti\_sa\_ctrl\_i and ati\_sa\_ctrl\_i control the SA field generation

2: Insert the content of the MAC Address register (0 or 1) in the SA field of all transmitted frames

3: Replace the the content of MAC Address register (0 or 1) in the SA field of all transmitted frames

Bit 30:

0: Use MAC Address 0 register

1: Use MAC Address 1 register

(R/W)

**ASS2KP** Configures whether the MAC considers received frames of more than 2000 bytes as normal packets or giant frames.

0: Giant frames. In this case, if Bit[20] (JE) is 0, the MAC considers all received frames of size more than 1,518 bytes (1,522 bytes for tagged) as Giant frames.

1: Normal packets.

(R/W)

**EMACCRC\_STRIP** Configures whether to strip and drop the last 4 bytes (FCS) of all frames of Ether type (Length/Type field greater than or equal to 1,536) before forwarding the frame to the application.

0: Not strip and drop

1: Strip and drop

(R/W)

**EMACWATCHDOG** Configures whether to disable the watchdog timer.

0: Enable. In this case, the MAC does not allow a receive frame with more than 2,048 bytes (10,240 if JE is set high) or the value programmed in Watchdog Timeout Register. The MAC cuts off any bytes received after the watchdog limit number of bytes.

1: Disable. In this case, the MAC can receive frames of up to 16,384 bytes.

(R/W)

**EMACJABBER** Configures whether to disable the jabber timer on the transmitter.

0: Enable. In this case, the MAC cuts off the transmitter if the application sends out more than 2,048 bytes of data (10,240 if JE is set high) during transmission.

1: Disable. In this case, the MAC can transfer frames of up to 16,384 bytes.

(R/W)

Continued on the next page...

**Register 47:16. EMACCONFIG\_REG (0x0000)**

Continued from the previous page...

**EMACJUMBOFRAME** Configures whether the MAC allows Jumbo frames of 9,018 bytes (9,022 bytes for VLAN tagged frames) without reporting a giant frame error in the receive frame status.

0: Not allow

1: Allow

(R/W)

**EMACINTERFRAMEGAP** Configures the minimum interframe gap (IFG) between frames during transmission.

0: 96 bit times

1: 88 bit times

2: 80 bit times

3: 72 bit times

4: 64 bit times

5: 56 bit times

6: 48 bit times

7: 40 bit times

In the half-duplex mode, the minimum IFG can be configured only for 64 bit times (IFG = 100).

(R/W)

**EMACDISABLECRS** Configures whether to disable Carrier Sense during transmission.

0: The MAC transmitter generates Loss of Carrier or No Carrier errors because of Carrier Sense and can even abort the transmissions.

1: The MAC transmitter ignores the MII CRS signal during frame transmission in the half-duplex mode. This request results in no errors generated because of Loss of Carrier or No Carrier during such transmission.

(R/W)

**EMACMII** Configures the Ethernet line speed.

0: For 1000 Mbps operations

1: For 10 or 100 Mbps operations

In 10 or 100 Mbps operations, the exact line speed is determined by both this bit and the FES (EMACFESPEED) bit. (R/W)

**EMACFESPEED** Configures the speed in the MII and RMII interface.

0: 10 Mbps

1: 100 Mbps

(R/W)

**EMACRXOWN** Configures whether to disable receive own.

0: The MAC receives all packets that are given by the PHY while transmitting.

1: the MAC disables the reception of frames when TX\_EN triggers an interrupt in the half-duplex mode.

This bit is not applicable if the MAC is operating in the full-duplex mode. (R/W)

Continued on the next page...

**Register 47:16. EMACCONFIG\_REG (0x0000)**

Continued from the previous page...

**EMACLOOPBACK** Configures whether to enable the loopback mode.

0: Disable.

1: Enable. In this case, the MII Receive clock input (CLK\_RX) is required for the loopback to work properly, because the Transmit clock is not looped-back internally.

(R/W)

**EMACDUPLEX** Configures whether to enable full-duplex mode, so that the MAC can transmit and receive simultaneously.

0: Disable

1: Enable

This bit is RO with a default value of 1 in the full-duplex-only configuration. (R/W)

**EMACRXIPCOFFLOAD** Configures whether to enable the checksum offload function

0: Disable

1: Enable

When the checksum offload function is enabled, the MAC calculates the 16-bit one's complement of the one's complement sum of all received Ethernet frame payloads. It also checks whether the IPv4 Header checksum (assumed to be bytes 25/26 or 29/30 (VLAN-tagged) of the received Ethernet frame) is correct for the received frame and gives the status in the receive status word. The MAC also appends the 16-bit checksum calculated for the IP header datagram payload (bytes after the IPv4 header) and appends it to the Ethernet frame transferred to the application (when Type 2 COE is deselected). (R/W)

**EMACRETRY** Configures whether to disable retry, so that the MAC attempts only one transmission, and when a collision occurs on the MII interface the MAC ignores the current frame transmission and reports a Frame Abort with excessive collision error in the transmit frame status.

0: Enable

1: Disable

Valid only in the half-duplex mode. (R/W)

**EMACPADCRCSTRIP** Configures whether to enable automatic Pad or CRC stripping.

0: Disable. In this case, the MAC passes all incoming frames, without modifying them, to the Host.

1: Enable. In this case, the MAC strips the Pad or FCS field on the incoming frames only if the value of the length field is less than 1,536 bytes. All received frames with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field.

(R/W)

Continued on the next page...

**Register 47:16. EMACCONFIG\_REG (0x0000)**

Continued from the previous page...

**EMACBACKOFFLIMIT** Configures the back-off limit determining the random integer number (r) of slot time delays (4,096 bit times for 1000 Mbps and 512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision.

00:  $k = \min(n, 10)$

01:  $k = \min(n, 8)$

10:  $k = \min(n, 4)$

11:  $k = \min(n, 1)$

where  $n$  = retransmission attempt.

The random integer  $r$  takes the value in the range  $0 \leq r < k$ th power of 2

Valid only in the half-duplex mode. (R/W)

**EMACDEFERRALCHECK** Configures whether to enable the deferral check function.

0: Disable

1: Enable

(R/W)

**EMACTX** Configures whether to enable the transmit state machine of the MAC.

0: Disabled after the completion of the transmission of the current frame, and does not transmit any further frames

1: Enabled for transmission on the MII

(R/W)

**EMACRX** Configures whether to enable the receiver state machine of the MAC. 0: Disabled after the completion of the reception of the current frame, and does not receive any further frames from the MII

1: Enabled for receiving frames from the MII

(R/W)

**PLTF** Configures the number of preamble bytes that are added to the beginning of every Transmit frame.

0: 7 bytes of preamble

1: 5 byte of preamble

2: 3 bytes of preamble

3: Reserved

The preamble reduction occurs only when the MAC is operating in the full-duplex mode. (R/W)

### Register 47.17. EMACFF\_REG (0x0004)

[illegible]

**RECEIVE\_ALL** Configures whether to pass all received modules.

0: The MAC Receiver module passes only those frames to the Application that pass the SA or DA address filter.

1: The MAC Receiver module passes all received frames, irrespective of whether they pass the address filter or not, to the Application. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bits in the Receive Status Word.

(R/W)

**VTFE** Configures whether to enable the VLAN Tag filter.

0: Disable. In this case, the MAC forwards all frames irrespective of the match status of the VLAN Tag.

1: Enable. In this case, the MAC drops VLAN-tagged frames that do not match the VLAN Tag comparison.

(R/W)

**SAFE** Configures whether to enable the source address filter.

0: Disable. In this case, the MAC forwards the received frame to the application with an updated SAF bit of the RX Status depending on the SA address comparison.

1: Enable. In this case, the MAC compares the SA field of the received frames with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the frame.

(R/W)

**SAIF** Configures whether to enable SA inverse filtering.

0: Disable. In this case, frames whose SA does not match the SA registers are marked as failing the SA Address filter.

1: Enable. In this case, the Address Check block operates in inverse filtering mode for the SA address comparison. The frames whose SA matches the SA registers are marked as failing the SA Address filter.

(R/W)

Continued on the next page...

**Register 4717. EMACFF\_REG (0x0004)**

Continued from the previous page...

**PCF** Configures the forwarding of all control frames (including unicast and multicast PAUSE frames).

0: The MAC filters all control frames.

1: The MAC forwards all control frames except PAUSE control frames to application even if they fail the Address filter.

2: The MAC forwards all control frames to application even if they fail the Address Filter.

3: The MAC forwards control frames that pass the Address Filter.

The following conditions should be true for the PAUSE control frames processing:

Condition 1: The MAC is in the full-duplex mode and flow control is enabled by setting Bit 2 (RFE) of Register 6 (Flow Control Register) to 1.

Condition 2: The destination address (DA) of the received frame matches the special multicast address or EMACADDRO when Bit 3 (UP) of the Register 6 (Flow Control Register) is set.

Condition 3: The Type field of the received frame is 0x8808 and the OP CODE field is 0x0001.

(R/W)

**DBF** Configures whether to disable broadcast frames.

0: Enable. The AFM (Address Filtering Module) module passes all received broadcast frames.

1: Disable. The AFM module filters all incoming broadcast frames. In addition, it overrides all other filter settings.

(R/W)

**PAM** Configures whether to pass all multicast frames.

0: Filtering of multicast frame depends on HMC bit

1: All received frames with a multicast destination address (first bit in the destination address field is '1') are passed

(R/W)

**DAIF** Configures whether to enable DA inverse filtering for both unicast and multicast frames.

0: Disable

1: Enable

(R/W)

**PMODE** Configures whether to enable the promiscuous mode.

0: Disable.

1: Enabled. In this case, the Address Filter module passes all incoming frames regardless of its destination or source address. The SA or DA Filter Fails status bits of the Receive Status Word are always cleared when PR (PRI\_RATIO) is set.

(R/W)

**Register 47.18. EMACMIADDR\_REG (0x0010)**

|                                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |        |  |  |  |        |  |  |  |           |  |  |  |         |  |         |  |   |  |       |  |   |  |  |  |   |  |  |  |   |  |   |  |

**MIIDEV** Configures which of the 32 possible PHY devices are being accessed. (R/W)

**MIIREG** Configures the desired address register in the selected PHY device. (R/W)

**MIICSRCLK** Configures the CSR clock frequency.

0: APB clock frequency is 80 MHz, and MDC clock frequency is APB\_CLK/42

3: APB clock frequency is 40 MHz, and MDC clock frequency is APB\_CLK/26

Other values are reserved

(R/W)

**MIIWRITE** Configures the direction of the operation that uses [MII\\_DATA](#).

0: Read operation

1: Write operation

(R/W)

**MIIBUSY** Configures the state of the MII.

0: Idle

1: Busy

This bit is used in combination with [MIIREG](#) and [MII\\_DATA](#).

This bit should read logic 0 (default) before writing to [MIIREG](#) and [MII\\_DATA](#).

To read or write to [MIIREG](#) and [MII\\_DATA](#), software (the user) should set this field to 1.

[MII\\_DATA](#) should be kept valid (data remains unchanged) when it is accessed until this field is cleared by hardware (the MAC).

Note that ESP32-P4 MAC does not receive ACK from PHY during a read or write access to [MIIREG](#) and [MII\\_DATA](#). (R/WS/SC)

**Register 47.19. EMACMIIDATA\_REG (0x0014)**

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |          |    |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |   |

**MII\_DATA** Configures the 16-bit data value read from the PHY after a Management Read operation or the 16-bit data value to be written to the PHY before a Management Write operation.(R/W)

**Register 47.20. EMACFC\_REG (0x0018)**

|            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |            |   |   |   |   |   |   |   |      |   |            |   |     |      |      |      |       |   |       |
|------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|------------|---|---|---|---|---|---|---|------|---|------------|---|-----|------|------|------|-------|---|-------|
| PAUSE_TIME |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | (reserved) |   |   |   |   |   |   |   | DZPQ |   | (reserved) |   | PLT | UPFD | RFCE | TFCE | FCBBA |   |       |
| 31         |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 16         |   |   |   |   |   |   |   |      | 8 | 7          | 6 | 5   | 4    | 3    | 2    | 1     | 0 |       |
| 0x00000    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0    | 0 | 0          | 0 | 0x0 | 0    | 0    | 0    | 0     | 0 | Reset |

**PAUSE\_TIME** Configures the value to be used in the Pause Time field in the transmit control frame. If the Pause Time bits is configured to be double-synchronized to the (G)MII clock domain, then consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain. (R/W)

**DZPQ** Configures whether to disable the automatic generation of the Zero-Quanta Pause Control frames.  
 0: Enable  
 1: Disable  
 (R/W)

**PLT** Configures the threshold of the PAUSE timer at which the PAUSE Frame is automatically retransmitted.  
 0: The threshold is Pause time minus 4 slot times (PT - 4 slot times).  
 1: The threshold is Pause time minus 28 slot times (PT - 28 slot times).  
 2: The threshold is Pause time minus 144 slot times (PT - 144 slot times).  
 3: The threshold is Pause time minus 256 slot times (PT - 256 slot times).  
 The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot-times), and PLT = 01, then a second PAUSE frame is automatically transmitted 228 (256 - 28) slot times after the first PAUSE frame is transmitted.  
 (R/W)

**UPFD** Configures whether to enable unicast pause frame detection.  
 0: Disable. The MAC only detects Pause frames with a unique multicast address.  
 1: Enable. The MAC can also detect Pause frames with unicast address of the station. This unicast address should be as specified in the EMACADDRO High Register and EMACADDRO Low Register.  
 (R/W)

**RFCE** Configures whether to enable the decode function of the Pause time.  
 0: Disable  
 1: Enable. The MAC decodes the received Pause frame and disables its transmitter for a specified (Pause) time  
 (R/W)

**TFCE** Configures whether to enable transmit flow control in full-duplex mode, and whether to enable the back-pressure feature in half-duplex mode.  
 0: Disable  
 1: Enable  
 (R/W)

Continued on the next page...

**Register 47.20. EMACFC\_REG (0x0018)**

Continued from the previous page...

**FCBBA** Configures whether to enable a Pause Control frame in the full-duplex mode, and whether to activate the back-pressure function in the half-duplex mode if the TFCE bit is set.

0: Disable

1: Enable

In the full-duplex mode, this bit should be read as 0 before writing to the Flow Control register. To initiate a Pause control frame, the Application must set this bit to 1. During a transfer of the Control Frame, this bit continues to be set to signify that a frame transmission is in progress. After the completion of Pause control frame transmission, the MAC resets this bit to 0. The Flow Control register should not be written to until this bit is cleared. (R/WS/SC)

In the half-duplex mode, when this bit is set (and TFCE is set), then backpressure is asserted by the MAC. During backpressure, when the MAC receives a new frame, the transmitter starts sending a JAM pattern resulting in a collision. When the MAC is configured for the full-duplex mode, the BPA is automatically disabled. (R/W)

### Register 47.21. EMACVLANTAG\_REG (0x001C)

|                               |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                     |   |   |        |    |    |   |  |  |  |  |  |  |  |  |  |  |  |       |  |  |
|-------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|---------------------|---|---|--------|----|----|---|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|
| (reserved)                    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | ESVL<br>VTIM<br>ETV |   |   | VL     |    |    |   |  |  |  |  |  |  |  |  |  |  |  |       |  |  |
| 31                            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 19                  |   |   | 18     | 17 | 16 | 0 |  |  |  |  |  |  |  |  |  |  |  |       |  |  |
| 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0                   | 0 | 0 | 0x0000 |    |    |   |  |  |  |  |  |  |  |  |  |  |  | Reset |  |  |

**ESVL** Configures whether to enable S-VLAN.

0: Disable.

1: Enable. The MAC transmitter and receiver also consider the S-VLAN (Type = 0x88A8) frames as valid VLAN tagged frames.

(R/W)

**VTIM** Configures whether to enable VLAN Tag inverse match.

0: Disable. The frames with matched VLAN Tag are marked as matched.

1: Enable. The frames that do not have matching VLAN Tag are marked as matched.

(R/W)

**ETV** Configures whether to enable 12-bit VLAN Tag comparison.

0: Disable. All 16 bits of the 15th and 16th bytes of the received VLAN frame are used for comparison and VLAN hash filtering.

1: Enable. A 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits [11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged frame.

(R/W)

**VL** Configures the 802.1Q VLAN tag to identify the VLAN frames and is compared to the 15th and 16th bytes of the frames being received for VLAN frames.

When the ETV bit is set, only the VID (Bits[11:0]) is used for comparison.

If VL (VL[11:0] if ETV is set) is all zeros, the MAC does not check the fifteenth and 16th bytes for VLAN tag comparison, and declares all frames with a Type field value of 0x8100 or 0x88a8 as VLAN frames.(R/W)

**Register 47.22. EMACDEBUG\_REG (0x0024)**

**MTLTSFFS** Represents whether MTL TX Status FIFO is full and can accept any more frames for transmission.

0: Not Full

1: Full

(RO)

**MTLTFNES** Represents whether MTL TX FIFO is not empty and some data is left for transmission.

0: Empty

1: Not empty

(RO)

**MTLTFWCS** Represents whether MTL TX FIFO Write Controller is active and transferring data to the TX FIFO.

0: Inactive

1: Active

(RO)

**MTLTFRCS** Represents the state of the TX FIFO Read Controller.

0: IDLE state

1: READ state (transferring data to MAC transmitter)

2: Waiting for TXStatus from MAC transmitter

3: Writing the received TXStatus or flushing the TX FIFO

(RO)

**MACTP** Represents whether the MAC transmitter is in the PAUSE condition (in the full-duplex only mode) and hence does not schedule any frame for transmission.

0: Not in pause

1: In pause

(RO)

**MACTFCS** Represents the state of the MAC Transmit Frame Controller module.

0: IDLE state

1: Waiting for Status of the previous frame or IFG or backoff period to be over

2: Generating and transmitting a PAUSE control frame (in the full-duplex mode)

3: Transferring input frame for transmission

(RO)

**MACTPES** Represents the status of the MAC MII transmit protocol engine.

0: IDLE state

1: Actively transmitting data

(RO)

Continued on the next page...

**Register 47.22. EMACDEBUG\_REG (0x0024)**

Continued from the previous page...

**MTLRFFLS** Represents the status of the fill-level of the RX FIFO.

- 0: RX FIFO Empty
  - 1: RX FIFO fill level is below the flow-control deactivate threshold
  - 2: RX FIFO fill level is above the flow-control activate threshold
  - 3: RX FIFO Full
- (RO)

**MTLRFRCs** Represents the state of the RX FIFO read Controller.

- 0: IDLE state
  - 1: Reading frame data
  - 2: Reserved
  - 3: Flushing the frame data and status
- (RO)

**MTLRFWCAS** Represents the state of the MTL RX FIFO Write Controller.

- 0: Inactive
  - 1: Active and is transferring a received frame to the FIFO.
- (RO)

**MACRFFCS** Represents the state of the small FIFO Read (bit 1) and Write (bit 0) controllers of the MAC Receive Frame Controller Module.

- 0: Inactive
  - 1: Active
- (RO)

**MACRPES** Represents the state of the MAC GMII or MII receive protocol engine.

- 0: IDLE
  - 1: Actively receiving data
- (RO)

**Register 47.23. PMT\_RWUFR\_REG (0x0028)**

**WKUPPKTFILTER** When RWKPTR is 0 ~ 3, configures the masking of filter 0 ~ 3 wakeup frame.

Bit[30:0] corresponds to offset+j (j = 0 ~ 30).

Bit[31] has to be 0. 0: Unmask

1: Mask

When RWKPTR is 4, bit[3]/bit[11]/bit[19]/bit[27] configure the target address type, and bit[0]/bit[8]/bit[16]/bit[24] configure whether to enable filter 0 ~ 3.

0: Unicast/Disable

1: Multicast/Enable

When RWKPTR is 5, configures the offset of the filter 0 ~ 3 masked byte.

Bit[7:0] configures the offset of filter 0 masked byte, and [31:24] configures the offset of filter 3 masked byte.

When RWKPTR is 6 ~ 7, configures the 16-bit CRC value of filter 0 ~ 3 masked byte starting from offset based on the formula:

$$G(x) = x^{16} + x^{15} + x^2 + 1$$

Bit[7:0] configures the CRC value of filter 0 or filter 2 masked byte when RWKPTR is 6 or 7 respectively, and bit[31:16] configures the CRC value of filter 1 or filter 3 masked byte when RWKPTR is 6 or 7 respectively.

(R/W)

**RWKFILTRST** Configures whether to reset the RWKPTR register.

0: Release from reset

1: Reset

(R/WS/SC)

**RWKPTR** Configures the purpose of the PMT\_RWUFR register. For details, see the description of PMT\_RWUFR. (RO)

**GLBLUCAST** Configures whether to enable the unicast frame of target address filter as the wakeup frame.

0: Disable

1: Enable

(R/W)

**RWKPRCVD** Represents whether a remote wakeup frame event has been received.

0: Not received

1: Received

(R/SS/RC)

**MGKPRCVD** Represents whether a magic frame event has been received.

0: Not received

1: Received

(R/SS/RC)

**RWKPKTEN** Configures whether to enable power management events using remote wakeup frames.

0: Disable

1: Enable

(R/W)

**MGKPKTEN** Configures whether to enable power management events using magic frames.

0: Disable

1: Enable

(R/W)

**PWRDWN** Configures whether the EMAC receiver drops all received frames until it receives the expected magic frame or remote wakeup frame.

Valid only when MGKPKTEN, GLBLUCAST or RWKPKTEN is 1. (R/WS/SC)

**Register 47.25. EMACLPI\_CSR\_REG (0x0030)**

Reset

**LPITXA** Configures the behavior of the MAC when it is entering or coming out of the LPI mode on the transmit side.

0: This bit directly controls behavior of the MAC when it is entering or coming out of the LPI mode.

1: This bit controls behavior of the MAC when it is entering or coming out of the LPI mode in combination with LPIEN. When LPIEN is also 1, the MAC enters the LPI mode only after all outstanding frames (in the core) and pending frames (in the application interface) have been transmitted. The MAC comes out of the LPI mode when the application sends any frame for transmission

(R/W)

**PLS** Configures the link status of the PHY.

0: Link up

1: Link down

(R/W)

**LPIEN** Configures whether the EMAC transmitter enters the LPI state.

0: Exit

1: Enter

This bit is cleared when the LPITXA bit is set and the MAC exits the LPI state because of the arrival of a new packet for transmission.

(R/W/SC)

**RLPIST** Represents the receive LPI state.

0: Inactive

1: The EMAC is receiving the LPI pattern

(RO)

**TLPIST** Represents the transmit LPI state.

0: Inactive

1: The EMAC is transmitting the LPI pattern

(RO)

**RLPIEX** Represents the receive LPI exit state.

0: Inactive

1: The EMAC Receiver has stopped receiving the LPI pattern, exited the LPI state, and resumed the normal reception

(R/SS/RC)

Continued on the next page...

Register 47.25. EMACLPI\_CSR\_REG (0x0030)

Continued from the previous page...

- RLPIEN** Represents the receive LPI entry state.  
0: Inactive  
1: The EMAC Receiver has received an LPI pattern and entered the LPI state (R/SS/RC)
- TLPIEX** Represents the transmit LPI exit state.  
0: Inactive  
1: The EMAC transmitter has exited the LPI state after the user has cleared the LPIEN bit and the LPI\_TW\_TIMER has expired (R/SS/RC)
- TLPIEN** Represents the transmit LPI entry state.  
0: Inactive  
1: The EMAC Transmitter has entered the LPI state because of the setting of the LPIEN bit (R/SS/RC)

- LPI\_LS\_TIMER** Configures the minimum time for which the link status from the PHY should be up.  
Measurement unit: millisecond.  
The default value is 1000 (1 second) as defined in the IEEE standard.  
(R/W)
- LPI\_TW\_TIMER** Configures the minimum time for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission.  
Measurement unit: millisecond.  
The TLPIEX status bit is set after the expiry of this timer.  
(R/W)

Reset

**ADDRESS\_ENABLE0** This bit is always set to 1. (RO)

**MAC\_ADDRESS0\_HI** Configures the upper 16 bits of the first 6-byte MAC address [47:32].

The MAC uses this field for filtering the received frames and inserting the MAC address in the Transmit Flow Control (PAUSE) Frames. (R/W)

**Register 47.30. EMACADDR0LOW\_REG (0x0044)**

|            |   |

**ADDRESS\_ENABLE1** Configures whether to enable perfect filtering using the second MAC address.

0: Disable

1: Enable

(R/W)

**SOURCE\_ADDRESS** Configures whether to which fields of the received frame EMACADDR1 [47:0] compares.

0: The DA fields

1: The SA fields

(R/W)

**MASK\_BYTE\_CONTROL** Configures whether to mask MAC address byte bytes when comparing the received DA or SA with the contents of EMACADDR1.

0: Unmask

1: Mask

The correspondence between the mask control bits and the bytes:

Bit[29]: EMACADDR1HIGH\_REG[15:8]

Bit[28]: EMACADDR1HIGH\_REG[7:0]

Bit[27]: EMACADDR1LOW\_REG[31:24]

Bit[24]: EMACADDR1LOW\_REG[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.(R/W)

**MAC\_ADDRESS1\_HI** Configures the upper 16 bits of the second 6-byte MAC address [47:32]. (R/W)

**Register 47.32. EMACADDR1LOW\_REG (0x004C)**

|            |   |
|------------|---|
| 31         | 0 |
| 0xFFFFFFFF |   |
| Reset      |   |

**EMACADDR1LOW\_REG** Configures the lower 32 bits of the second 6-byte MAC address.

The content of this field is undefined until loaded by the Application after the initialization process. (R/W)

**Register 47.33. EMACADDR2HIGH\_REG (0x0050)**

|                                    |    |                    |    |            |    |                 |       |
|------------------------------------|----|--------------------|----|------------|----|-----------------|-------|
| ADDRESS_ENABLE2<br>SOURCE_ADDRESS2 |    | MASK_BYTE_CONTROL2 |    | (reserved) |    | MAC_ADDRESS2_HI |       |
|                                    |    |                    |    |            |    |                 |       |
| 31                                 | 30 | 29                 | 24 | 23         | 16 | 15              | 0     |
| 0                                  | 0  | 0x00               |    | 0          | 0  | 0               | 0     |
| 0x0FFF                             |    |                    |    |            |    |                 | Reset |

**ADDRESS\_ENABLE2** Configures whether to enable perfect filtering using the third MAC address.

0: Disable

1: Enable

(R/W)

**SOURCE\_ADDRESS2** Configures whether to which fields of the received frame EMACADDR2 [47:0] compares.

0: The DA fields

1: The SA fields

(R/W)

**MASK\_BYTE\_CONTROL2** Configures whether to mask MAC address byte bytes when comparing the received DA or SA with the contents of EMACADDR2.

0: Unmask

1: Mask

The correspondence between the mask control bits and the bytes:

Bit[29]: EMACADDR2HIGH\_REG[15:8]

Bit[28]: EMACADDR2HIGH\_REG[7:0]

Bit[27]: EMACADDR2LOW\_REG[31:24]

Bit[24]: EMACADDR2LOW\_REG[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.(R/W)

**MAC\_ADDRESS2\_HI** Configures the upper 16 bits of the third 6-byte MAC address [47:32]. (R/W)

**Register 47.34. EMACADDR2LOW\_REG (0x0054)**

|            |   |
|------------|---|
| 31         | 0 |
| 0xFFFFFFFF |   |
| Reset      |   |

**EMACADDR2LOW\_REG** Configures the lower 32 bits of the third 6-byte MAC address.

The content of this field is undefined until loaded by the Application after the initialization process. (R/W)

**Register 47.35. EMACADDR3HIGH\_REG (0x0058)**

|                 |    |                 |    |                    |    |            |   |                 |   |        |       |
|-----------------|----|-----------------|----|--------------------|----|------------|---|-----------------|---|--------|-------|
| ADDRESS_ENABLE3 |    | SOURCE_ADDRESS3 |    | MASK_BYTE_CONTROL3 |    | (reserved) |   | MAC_ADDRESS3_HI |   |        |       |
| 31              | 30 | 29              | 24 | 23                 | 16 | 15         | 0 |                 |   |        |       |
| 0               | 0  | 0x00            |    | 0                  | 0  | 0          | 0 | 0               | 0 | 0x0FFF | Reset |

**ADDRESS\_ENABLE3** Configures whether to enable perfect filtering using the fourth MAC address.

0: Disable

1: Enable

(R/W)

**SOURCE\_ADDRESS3** Configures whether to which fields of the received frame EMACADDR3 [47:0] compares.

0: The DA fields

1: The SA fields

(R/W)

**MASK\_BYTE\_CONTROL3** Configures whether to mask MAC address byte bytes when comparing the received DA or SA with the contents of EMACADDR3.

0: Unmask

1: Mask

The correspondence between the mask control bits and the bytes:

Bit[29]: EMACADDR3HIGH\_REG[15:8]

Bit[28]: EMACADDR3HIGH\_REG[7:0]

Bit[27]: EMACADDR3LOW\_REG[31:24]

Bit[24]: EMACADDR3LOW\_REG[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address. (R/W)

**MAC\_ADDRESS3\_HI** Configures the upper 16 bits of the fourth 6-byte MAC address [47:32]. (R/W)

**Register 47.36. EMACADDR3LOW\_REG (0x005C)**

|            |   |
|------------|---|
| 31         | 0 |
| 0xFFFFFFFF |   |
| Reset      |   |

**EMACADDR3LOW\_REG** Configures the lower 32 bits of the fourth 6-byte MAC address.

The content of this field is undefined until loaded by the Application after the initialization process. (R/W)

**Register 47.37. EMACADDR4HIGH\_REG (0x0060)**

|                                    |    |                    |    |            |    |                 |       |
|------------------------------------|----|--------------------|----|------------|----|-----------------|-------|
| ADDRESS_ENABLE4<br>SOURCE_ADDRESS4 |    | MASK_BYTE_CONTROL4 |    | (reserved) |    | MAC_ADDRESS4_HI |       |
|                                    |    |                    |    |            |    |                 |       |
| 31                                 | 30 | 29                 | 24 | 23         | 16 | 15              | 0     |
| 0                                  | 0  | 0x00               |    | 0          | 0  | 0               | 0     |
| 0x0FFF                             |    |                    |    |            |    |                 | Reset |

**ADDRESS\_ENABLE4** Configures whether to enable perfect filtering using the fifth MAC address.

0: Disable

1: Enable

(R/W)

**SOURCE\_ADDRESS4** Configures whether to which fields of the received frame EMACADDR4 [47:0] compares.

0: The DA fields

1: The SA fields

(R/W)

**MASK\_BYTE\_CONTROL4** Configures whether to mask MAC address byte bytes when comparing the received DA or SA with the contents of EMACADDR4.

0: Unmask

1: Mask

The correspondence between the mask control bits and the bytes:

Bit[29]: EMACADDR4HIGH\_REG[15:8]

Bit[28]: EMACADDR4HIGH\_REG[7:0]

Bit[27]: EMACADDR4LOW\_REG[31:24]

Bit[24]: EMACADDR4LOW\_REG[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.(R/W)

**MAC\_ADDRESS4\_HI** Configures the upper 16 bits of the fifth 6-byte MAC address [47:32]. (R/W)

**Register 47.38. EMACADDR4LOW\_REG (0x0064)**

|            |   |
|------------|---|
| 31         | 0 |
| 0xFFFFFFFF |   |
| Reset      |   |

**EMACADDR4LOW\_REG** Configures the lower 32 bits of the fifth 6-byte MAC address.

The content of this field is undefined until loaded by the Application after the initialization process. (R/W)

**Register 47.39. EMACADDR5HIGH\_REG (0x0068)**

|                                    |    |                    |    |            |    |                 |   |   |   |        |       |
|------------------------------------|----|--------------------|----|------------|----|-----------------|---|---|---|--------|-------|
| ADDRESS_ENABLE5<br>SOURCE_ADDRESS5 |    | MASK_BYTE_CONTROL5 |    | (reserved) |    | MAC_ADDRESS5_HI |   |   |   |        |       |
|                                    |    |                    |    |            |    |                 |   |   |   |        |       |
| 31                                 | 30 | 29                 | 24 | 23         | 16 | 15              | 0 |   |   |        |       |
| 0                                  | 0  | 0x00               |    | 0          | 0  | 0               | 0 | 0 | 0 | 0x0FFF | Reset |

**ADDRESS\_ENABLE5** Configures whether to enable perfect filtering using the sixth MAC address.

0: Disable

1: Enable

(R/W)

**SOURCE\_ADDRESS5** Configures whether to which fields of the received frame EMACADDR5 [47:0] compares.

0: The DA fields

1: The SA fields

(R/W)

**MASK\_BYTE\_CONTROL5** Configures whether to mask MAC address byte bytes when comparing the received DA or SA with the contents of EMACADDR5.

0: Unmask

1: Mask

The correspondence between the mask control bits and the bytes:

Bit[29]: EMACADDR5HIGH\_REG[15:8]

Bit[28]: EMACADDR5HIGH\_REG[7:0]

Bit[27]: EMACADDR5LOW\_REG[31:24]

Bit[24]: EMACADDR5LOW\_REG[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.(R/W)

**MAC\_ADDRESS5\_HI** Configures the upper 16 bits of the sixth 6-byte MAC address [47:32]. (R/W)

**Register 47.40. EMACADDR5LOW\_REG (0x006C)**

|            |   |
|------------|---|
| 31         | 0 |
| 0xFFFFFFFF |   |
| Reset      |   |

**EMACADDR5LOW\_REG** Configures the lower 32 bits of the sixth 6-byte MAC address.

The content of this field is undefined until loaded by the Application after the initialization process. (R/W)

**Register 47.41. EMACADDR6HIGH\_REG (0x0070)**

|                                    |    |                    |    |            |    |                 |       |
|------------------------------------|----|--------------------|----|------------|----|-----------------|-------|
| ADDRESS_ENABLE6<br>SOURCE_ADDRESS6 |    | MASK_BYTE_CONTROL6 |    | (reserved) |    | MAC_ADDRESS6_HI |       |
|                                    |    |                    |    |            |    |                 |       |
| 31                                 | 30 | 29                 | 24 | 23         | 16 | 15              | 0     |
| 0                                  | 0  | 0x00               |    | 0          | 0  | 0               | 0     |
| 0x0FFF                             |    |                    |    |            |    |                 | Reset |

**ADDRESS\_ENABLE6** Configures whether to enable perfect filtering using the seventh MAC address.

0: Disable

1: Enable

(R/W)

**SOURCE\_ADDRESS6** Configures whether to which fields of the received frame EMACADDR 6[47:0] compares.

0: The DA fields

1: The SA fields

(R/W)

**MASK\_BYTE\_CONTROL6** Configures whether to mask MAC address byte bytes when comparing the received DA or SA with the contents of EMACADDR6.

0: Unmask

1: Mask

The correspondence between the mask control bits and the bytes:

Bit[29]: EMACADDR6HIGH\_REG[15:8]

Bit[28]: EMACADDR6HIGH\_REG[7:0]

Bit[27]: EMACADDR6LOW\_REG[31:24]

Bit[24]: EMACADDR6LOW\_REG[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address. (R/W)

**MAC\_ADDRESS6\_HI** Configures the upper 16 bits of the seventh 6-byte MAC address [47:32]. (R/W)

**Register 47.42. EMACADDR6LOW\_REG (0x0074)**

|            |   |
|------------|---|
| 31         | 0 |
| 0xFFFFFFFF |   |
| Reset      |   |

**EMACADDR6LOW\_REG** Configures the lower 32 bits of the seventh 6-byte MAC address.  
 The content of this field is undefined until loaded by the Application after the initialization process. (R/W)

**Register 47.43. EMACADDR7HIGH\_REG (0x0078)**

|                                    |    |                    |    |            |    |    |   |   |   |   |   |                 |  |   |  |  |  |  |       |
|------------------------------------|----|--------------------|----|------------|----|----|---|---|---|---|---|-----------------|--|---|--|--|--|--|-------|

**ADDRESS\_ENABLE7** Configures whether to enable perfect filtering using the eighth MAC address.  
 0: Disable  
 1: Enable  
 (R/W)

**SOURCE\_ADDRESS7** Configures whether to which fields of the received frame EMACADDR7 [47:0] compares.  
 0: The DA fields  
 1: The SA fields  
 (R/W)

**MASK\_BYTE\_CONTROL7** Configures whether to mask MAC address byte bytes when comparing the received DA or SA with the contents of EMACADDR7.

0: Unmask  
 1: Mask

The correspondence between the mask control bits and the bytes:

Bit[29]: EMACADDR7HIGH\_REG[15:8]

Bit[28]: EMACADDR7HIGH\_REG[7:0]

Bit[27]: EMACADDR7LOW\_REG[31:24]

Bit[24]: EMACADDR7LOW\_REG[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address. (R/W)

**MAC\_ADDRESS7\_HI** Configures the upper 16 bits of the eighth 6-byte MAC address [47:32]. (R/W)

**Register 47.44. EMACADDR7LOW\_REG (0x007C)**

|            |   |
|------------|---|
| 31         | 0 |
| 0x0FFFFFFF |   |
| Reset      |   |

**EMACADDR7LOW\_REG** Configures the lower 32 bits of the eighth 6-byte MAC address.

The content of this field is undefined until loaded by the Application after the initialization process. (R/W)

**Register 47.45. EMACADDR8HIGH\_REG (0x0080)**

|                                    |    |                    |    |            |    |                 |       |
|------------------------------------|----|--------------------|----|------------|----|-----------------|-------|
| ADDRESS_ENABLE8<br>SOURCE_ADDRESS8 |    | MASK_BYTE_CONTROL8 |    | (reserved) |    | MAC_ADDRESS8_HI |       |
|                                    |    |                    |    |            |    |                 |       |
| 31                                 | 30 | 29                 | 24 | 23         | 16 | 15              | 0     |
| 0                                  | 0  | 0x00               |    | 0          | 0  | 0               | 0     |
| 0x0FFF                             |    |                    |    |            |    |                 | Reset |

**ADDRESS\_ENABLE8** Configures whether to enable perfect filtering using the ninth MAC address.

0: Disable

1: Enable

(R/W)

**SOURCE\_ADDRESS8** Configures whether to which fields of the received frame EMACADDR8 [47:0] compares.

0: The DA fields

1: The SA fields

(R/W)

**MASK\_BYTE\_CONTROL8** Configures whether to mask MAC address byte bytes when comparing the received DA or SA with the contents of EMACADDR8.

0: Unmask

1: Mask

The correspondence between the mask control bits and the bytes:

Bit[29]: EMACADDR8HIGH\_REG[15:8]

Bit[28]: EMACADDR8HIGH\_REG[7:0]

Bit[27]: EMACADDR8LOW\_REG[31:24]

Bit[24]: EMACADDR8LOW\_REG[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address. (R/W)

**MAC\_ADDRESS8\_HI** Configures the upper 16 bits of the ninth 6-byte MAC address [47:32]. (R/W)

**Register 47.46. EMACADDR8LOW\_REG (0x0084)**

|            |   |
|------------|---|
| 31         | 0 |
| 0x0FFFFFFF |   |
| Reset      |   |

**EMACADDR8LOW\_REG** Configures the lower 32 bits of the ninth 6-byte MAC address.

The content of this field is undefined until loaded by the Application after the initialization process. (R/W)

**Register 47.47. EMACSTATUS\_REG (0x00D8)**

**JABBER\_TIMEOUT** Represents whether a receive jabber error occurs.

0: Not occur

1: Occur

(RO)

**LINK\_MODE** Represents the current mode of operation of the link.

0: Half-duplex

1: Full-duplex

(RO)

**PWDOGEN** Configures whether the watchdog timeout is programmable.

0: Not programmable. The watchdog timeout for a received frame is controlled by the setting of EMACCONFIG\_REG[23] (WD) and EMACCONFIG\_REG[20] (JE).

1: Programmable via the WDOGTO field if EMACCONFIG\_REG[23] (WD) is 0.

(R/W)

**WDOGTO** Configures the watchdog timeout for a received frame when PWDOGEN is 1 and EMACCONFIG\_REG[23] (WD) is 0.

If the length of a received frame exceeds the value of this field, such frame is terminated and declared as an error frame. (R/W)

| 31         |   |   |   |   |   |   |   |   |   |   |   | 20   | 19 | 18  | 17  | 16  | 15 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0     |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0    | 0  | 0   | 0   | 0   |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |

**CSVL** Configures which type is inserted or replaced in the 13th and 14th bytes of transmitted frames.

0: C-VLAN type (0x8100)

1: S-VLAN type (0x88A8)

(R/W)

**VLP** Configures what controls VLAN deletion, insertion, or replacement.

0: The control input signal

1: VLC

(R/W)

**VLC** Configures the VLAN tag in transmit frames.

0: No VLAN tag deletion, insertion, or replacement.

1: VLAN tag deletion. The MAC removes the VLAN type (bytes 13 and 14) and VLAN tag (bytes 15 and 16) of all transmitted frames with VLAN tags.

2: VLAN tag insertion. The MAC inserts VLT in bytes 15 and 16 of the frame after inserting the Type value (0x8100/0x88a8) in bytes 13 and 14. This operation is performed on all transmitted frames, irrespective of whether they already have a VLAN tag.

3: VLAN tag replacement. The MAC replaces VLT in bytes 15 and 16 of all VLAN-type transmitted frames (Bytes 13 and 14 are 0x8100/0x88a8).

(R/W)

**VLT** Configures the value of the VLAN tag to be inserted or replaced.

The value must only be changed when the transmit lines are inactive or during the initialization phase. (R/W)

|  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |

**TSENMACADDR** Configures whether to enable the DA MAC address (that matches any MAC Address register) for PTP frame filtering when PTP is directly sent over Ethernet.

0: Disable

1: Enable

(R/W)

**SNAPTYPSEL** Configures the set of PTP packet types for which snapshot needs to be taken, in combination with TSMSTRENA and TSEVNTENA.

SNAPTYPSEL, TSMSTRENA, TSEVNTENA:

00x0: SYNC, Follow\_Up, Delay\_Req, Delay\_Resp

0001: SYNC

0011: Delay\_Req

01x0: SYNC, Follow\_Up, Delay\_Req, Delay\_Resp, Pdelay\_Req, Pdelay\_Resp, Pdelay\_Resp\_Follow\_Up

0101: SYNC, Pdelay\_Req, Pdelay\_Resp

0111: Delay\_Req, Pdelay\_Req, Pdelay\_Resp

10xx: SYNC, Delay\_Req

11xx: Pdelay\_Req, Pdelay\_Resp

(R/W)

**TSMSTRENA** Configures whether to enable snapshot only for messages relevant to the master node.

0: Disable. The snapshot is taken for the messages relevant to the slave node

1: Enable

(R/W)

**TSEVNTENA** Configures whether to enable timestamp snapshot only for event messages (SYNC, Delay\_Req, Pdelay\_Req, Pdelay\_Resp).

0: Disable. The snapshot is taken for all messages except Announce, Management, and Signaling

1: Enable

(R/W)

**TSIPV4ENA** Configures whether to enable the processing of PTP frames sent over IPv4-UDP.

0: Disable. The MAC ignores the PTP transported over UDP-IPv4 packets

1: Enable. The MAC receiver processes the PTP packets encapsulated in UDP over IPv4 packets

(R/W)

Continued on the next page...

**Register 47.50. EMACTSTPCTRL\_REG (0x0700)**

Continued from the previous page...

**TSIPV6ENA** Configures whether to enable the processing of PTP frames sent over IPv6-UDP.

0: Disable. The MAC ignores the PTP transported over UDP-IPv6 packets

1: Enable. The MAC receiver processes the PTP packets encapsulated in UDP over IPv6 packets

(R/W)

**TSIPENA** Configures whether to enable the processing of PTP sent over Ethernet frames.

0: Disable. the MAC ignores the PTP over Ethernet packets

1: Enable. The MAC receiver processes the PTP packets encapsulated directly in the Ethernet frames

(R/W)

**TSVER2ENA** Configures whether to enable PTP packet processing for version 2 format.

0: Disable. The PTP packets are processed using the version 1 format

1: Enable. The PTP packets are processed using the 1588 version 2 format

(R/W)

**TSCTRLSSR** Configures the timeout digital or binary rollover.

0: The Timestamp Low register rolls over after the value of the sub-second register 0x7FFF\_FFFF. The sub-second increment has to be programmed correctly depending on the PTP reference clock frequency and the value of this bit.

1: The Timestamp Low register rolls over after 0x3B9A\_C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds.

(R/W)

**TSENALL** Configures whether to enable timestamp for all frames received by the MAC.

0: Disable

1: Enable

(R/W)

**TSADDREG** Configures whether to update the content of the EMACTSTPADDEND\_REG register in the PTP block for fine correction.

0: Not update

1: Update

This bit should be zero before setting it. (R/WS/SC)

Continued on the next page...

**Register 47.50. EMACTSTPCTRL\_REG (0x0700)**

Continued from the previous page...

**TSTRIG** Configures whether to enable the timestamp interrupt trigger.

0: Disable

1: Enable. The timestamp interrupt is generated when the System Time becomes greater than the value written in the Target Time register

(R/WS/SC)

**TSUPDT** Configures whether to update (add or subtract) the system time with the value specified in EMAC2NDUPT\_REG and EMACNSUPT\_REG.

0: Not update

1: Update

This bit should be read as zero before updating it.

EMACSYSTIMHIGHWORD2ND\_REG is not updated. (R/WS/SC)

**TSINIT** Configures whether to initialize (overwrite) the system time with the value specified in EMAC2NDUPT\_REG and EMACNSUPT\_REG.

0: Not initialize

1: Initialize

This bit should be read as zero before updating it.

EMACSYSTIMHIGHWORD2ND\_REG will be initialized. (R/WS/SC)

**TSCFUPDT** Configures the method used to update the system time.

0: Coarse method

1: Find update method

(R/W)

**TSENA** Configures whether to add the timestamp for the transmit and receive frames.

0: Not add the timestamp, and receive frames and the Timestamp Generator is also suspended

1: Add the timestamp

You need to initialize the Timestamp (system time) after setting this bit to 1.

On the receive side, the MAC processes the 1588 frames only if this bit is set. (R/W)

**Register 47.51. EMACSUB2NDINCR\_REG (0x0704)**

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |   |   |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|---|---|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|
| (reserved)  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | SSINC |   |   |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |
| 31  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 8     | 7 | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |
| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0x00  |   |   |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |  |

**SSINC** Configures the value accumulated every clock cycle (PTP clock) with the contents of the sub-second register.

For example, when PTP clock is 50 MHz (the period is 20 ns), you should program 20 (0x14) when the System Time-Nanoseconds register has an accuracy of 1 ns (EMACTSTPCTRL\_REG[9], i.e., the TSCTRLSSR bit is set). When TSCTRLSSR is cleared, the Nanoseconds register has a resolution of 0.465 ns. In this case, you should program a value of 43 (0x2B) that is derived by  $20 \text{ ns} / 0.465$ . (R/W)

**Register 47.52. EMACSYSTIM2ND\_REG (0x0708)**

**TSTRGTERR** Represents whether the target time, being programmed in EMACTGTIME2ND\_REG and EMACTGTIMENS\_REG, is already elapsed.

0: Not elapsed

1: Elapsed

(R/SS/RC)

**TSTARGET** Represents whether the system time is greater or equal to the value specified in EMACTGTIME2ND\_REG and EMACTGTIMENS\_REG.

0: Less than the value

1: Greater or equal to the value

(R/SS/RC)

**TSSOVF** Represents whether the second value of the timestamp has overflowed beyond 0xFFFF\_FFFF.

0: No overflow

1: Overflow

(R/SS/RC)

## Chapter 48

# Two-Wire Automotive Interface (TWAI)

The Two-wire Automotive Interface (TWAI®) is a multi-master, multi-cast communication protocol with functions such as error detection and signaling and inbuilt message priorities and arbitration. The TWAI protocol is suited for automotive and industrial applications (see Section 48.2 for more details).

ESP32-P4 contains three TWAI controllers, TWAI 0, TWAI 1, and TWAI 2. Each controller can individually be connected to a TWAI bus via an external transceiver. The TWAI controllers have many advanced features, and can be utilized in a wide range of use cases, such as automotive products, industrial automation controls, building automation, etc.

## 48.1 Features

Each TWAI controller on ESP32-P4 supports the following features:

- Compatibility with ISO 11898-1 protocol (CAN Specification 2.0)
- Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID)
- Bit rates from 1 Kbit/s to 1 Mbit/s
- Multiple modes of operation:
  - Normal
  - Listen-only (no influence on bus)
  - Self-test (no acknowledgment required during data transmission)
- 64-byte Receive FIFO
- Special transmissions:
  - Single-shot transmissions (does not automatically re-transmit upon error)
  - Self-reception (the TWAI controller transmits and receives messages simultaneously)
- Acceptance Filter (supports Single and Dual-filter modes)
- Error detection and handling:
  - Error counters
  - Configurable error warning limit
  - Error code capture
  - Arbitration lost capture
  - Automatic transceiver standby

## 48.2 Protocol Overview

### 48.2.1 TWAI Properties

The TWAI protocol connects two or more nodes in a bus network, and allows nodes to exchange messages with deterministic delay. A TWAI bus has the following properties:

**Single Channel and Non-Return-to-Zero:** The bus has only one transmission line for single-channel communication, which is half-duplex. Synchronization is also implemented in this channel, so extra channels (e.g., clock or enable) are not required. The bit stream of a TWAI message is encoded using the Non-Return-to-Zero (NRZ) method.

**Bit Values:** The single channel can either be in a dominant or recessive state, representing a logical 0 and a logical 1 respectively. A node transmitting data in a dominant state always overrides the other node transmitting data in a recessive state. The physical implementation on the bus is left to the application level to decide (e.g., differential pair or a single wire).

**Bit Stuffing:** Certain fields of TWAI messages are bit-stuffed. A transmitter that transmits five consecutive bits of the same value (e.g., dominant value or recessive value) should automatically insert a complementary bit. Likewise, a receiver that receives five consecutive bits of the same value should treat the next bit as a stuffed bit. Bit stuffing is applied to the following fields: SOF, arbitration field, control field, data field, and CRC sequence (see Section [48.2.2](#) for more details).

**Multi-Cast:** All nodes receive the same bits as they are connected to the same bus. Data is consistent across all nodes unless there is a bus error (see Section [48.2.3](#) for more details).

**Multi-Master:** Any node can initiate a transmission. If a transmission is already ongoing, a node will wait until the current transmission is over before initiating a new transmission.

**Message Priority and Arbitration:** If two or more nodes simultaneously initiate a transmission, the TWAI protocol ensures that one node will win arbitration of the bus. The arbitration field of the message transmitted by each node is used to determine which node will win the arbitration.

**Error Detection and Signaling:** Each node actively monitors the bus for errors, and signals the detected errors by transmitting an error frame.

**Fault Confinement:** Each node maintains a set of error counters that are incremented/decremented according to a set of rules. When the error counters surpass a certain threshold, the node will automatically eliminate itself from the network by switching itself off.

**Configurable Bit Rate:** The bit rate for a single TWAI bus is configurable. However, all nodes on the same bus must operate at the same bit rate.

**Transmitters and Receivers:** At any point in time, a TWAI node can either be a transmitter or a receiver.

- A node generating a message is a transmitter. The node remains a transmitter until the bus is idle or until the node loses arbitration. Please note that there could be multiple nodes that act as transmitters during arbitration.
- All nodes that are not transmitters can work as receivers.

## 48.2.2 TWAI Messages

TWAI nodes use messages to transmit data, and signal errors to other nodes when detecting errors on the bus. Messages are split into various frame types, and different frame types have different frame formats.

The TWAI protocol has the following frame types:

- Data frame
- Remote frame
- Error frame
- Overload frame
- Interframe space

The TWAI protocol supports the following frame formats:

- Standard Frame Format (SFF) that uses a 11-bit identifier
- Extended Frame Format (EFF) that uses a 29-bit identifier

### 48.2.2.1 Data Frames and Remote Frames

Data frames are used by nodes to send data to other nodes, and can have a payload of 0 to 8 data bytes. Remote frames are used for nodes to request a data frame with the same identifier from other nodes, and thus they do not contain any data bytes. However, data frames and remote frames share many fields. Figure 48.2-1 illustrates the fields and sub-fields of different frames and formats.

#### Arbitration Field

When two or more nodes transmit data or remote frames simultaneously, the arbitration field is used to determine which node will win arbitration of the bus. In the arbitration field, if a node transmits a recessive bit while detecting a dominant bit, it indicates that another node has overridden its recessive bit. Therefore, the node transmitting the recessive bit has lost arbitration of the bus and should immediately switch to be a receiver.

The arbitration field primarily consists of a frame identifier that is transmitted from the most significant bit first. Given that a dominant bit represents a logical 0, and a recessive bit represents a logical 1:

- A frame with the smallest ID value always wins arbitration.
- Given the same ID and format, data frames always prevail over remote frames due to their **RTR** bits being dominant.
- Given the same first 11 bits of ID, a Standard Format Data Frame always prevails over an Extended Format Data Frame due to its **SRR** bits being recessive.

#### Control Field

The control field primarily consists of the Data Length Code (DLC) which indicates the number of payload data bytes for a data frame, or the number of requested data bytes for a remote frame. The DLC is transmitted from the most significant bit first.

#### Data Field

The data field contains the actual payload data bytes of a data frame. Remote frames do not contain any data field.

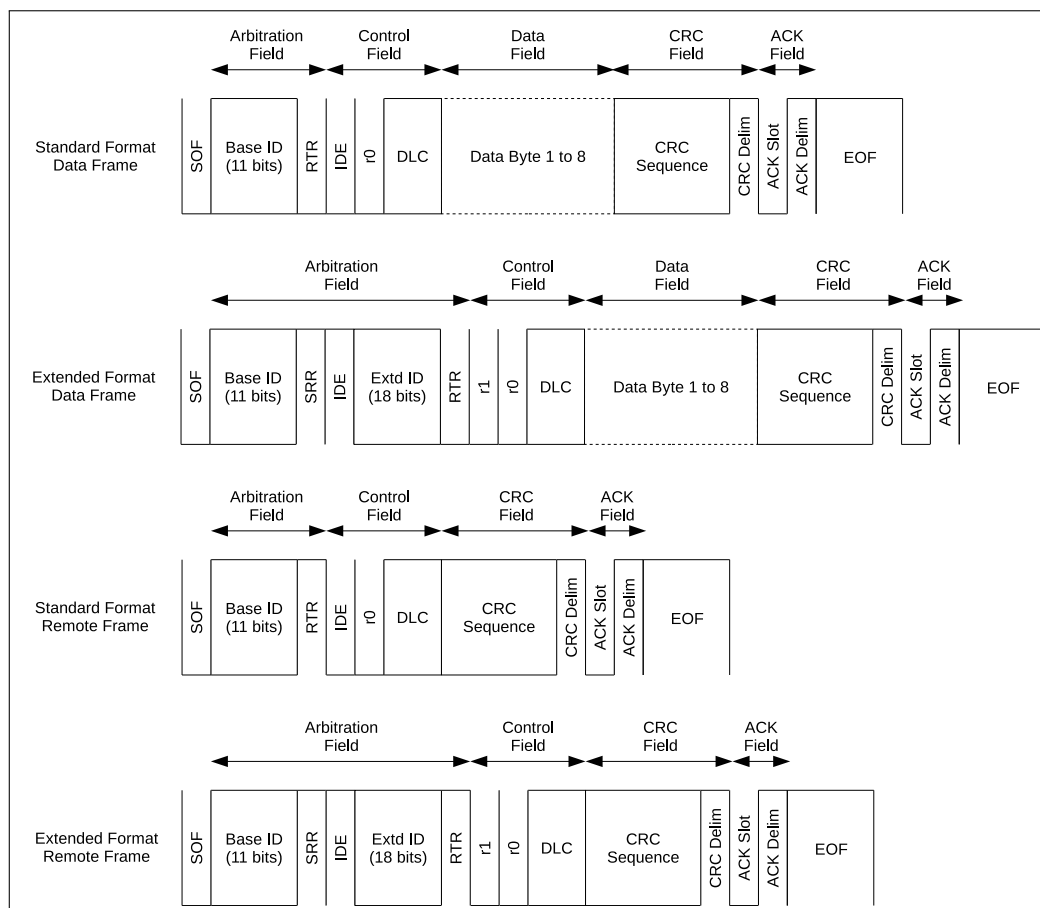

Figure 48.2-1. Bit Fields in Data Frames and Remote Frames

**CRC Field**

The CRC field primarily consists of a CRC sequence. The CRC sequence is a 15-bit cyclic redundancy code calculated from the de-stuffed contents (everything from the SOF to the end of the data field) of a data or remote frame.

**ACK Field**

The ACK field primarily consists of an ACK Slot and an ACK Delim. The ACK field indicates that the receiver has received an effective message from the transmitter.

Table 48.2-1. Data Frames and Remote Frames in SFF and EFF

| Data/Remote Frames | Description   |
|--------------------|---|
| SOF                | The SOF (Start of Frame) is a single dominant bit used to synchronize nodes on the bus.   |
| Base ID            | The Base ID (ID.28 to ID.18) is the 11-bit identifier for SFF, or the first 11 bits of the 29-bit identifier for EFF.   |
| RTR                | The RTR (Remote Transmission Request) bit indicates whether the message is a data frame (dominant) or a remote frame (recessive). This means that a remote frame will always lose arbitration to a data frame if they have the same ID. |

Cont'd on next page

Table 48.2-1 – cont'd from previous page

| Data/Remote Frames | Description  |
|--------------------|--|
| SRR                | The SRR (Substitute Remote Request) bit is transmitted in EFF to substitute for the RTR bit at the same position in SFF.   |
| IDE                | The IDE (Identifier Extension) bit indicates whether the message is SFF (dominant) or EFF (recessive). This means that a SFF frame will always win arbitration over an EFF frame if they have the same Base ID.  |
| Extd ID            | The Extended ID (ID.17 to ID.0) is the remaining 18 bits of the 29-bit identifier for EFF.   |
| r1                 | The r1 bit (reserved bit 1) is always dominant.  |
| r0                 | The r0 bit (reserved bit 0) is always dominant.  |
| DLC                | The DLC (Data Length Code) is 4-bit long and should contain any value from 0 to 8. Data frames use the DLC to indicate the number of data bytes in the data frame. Remote frames used the DLC to indicate the number of data bytes to request from another node.   |
| Data Bytes         | The data payload of data frames. The number of bytes should match the value of DLC. Data byte 0 is transmitted first, and each data byte is transmitted from the most significant bit first.   |
| CRC Sequence       | The CRC sequence is a 15-bit cyclic redundancy code.   |
| CRC Delim          | The CRC Delim (CRC Delimiter) is a single recessive bit that follows the CRC sequence.   |
| ACK Slot           | The ACK Slot (Acknowledgment Slot) is intended for receiver nodes to indicate that the data or remote frame was received without any issue. The transmitter node will send a recessive bit in the ACK Slot and receiver nodes should override the ACK Slot with a dominant bit if the frame was received without errors. |
| ACK Delim          | The ACK Delim (Acknowledgment Delimiter) is a single recessive bit.  |
| EOF                | The EOF (End of Frame) marks the end of a data or remote frame, and consists of seven recessive bits.  |

### 48.2.2.2 Error and Overload Frames

#### Error Frames

Error frames are transmitted when a node detects a bus error. Error frames notably include an Error Flag which is made up of six consecutive bits of the same value, thus violating the bit-stuffing rule. Therefore, when a particular node detects a bus error and transmits an error frame, all other nodes will then detect a stuff error and transmit their own error frames in response. This has the effect of propagating the detection of a bus error across all nodes on the bus.

When a node detects a bus error, it will transmit an error frame starting from the next bit. However, when a node detects a CRC error, the error frame will start at the bit following the ACK Delim (see Section 48.2.3 for more details). The following Figure 48.2-2 shows different fields of an error frame:

Figure 48.2-2. Fields of an Error Frame

Table 48.2-2. Error Frame

| Error Frame              | Description   |
|--------------------------|---|
| Error Flag               | The Error Flag has two forms, the <a href="#">Active Error Flag</a> consisting of six dominant bits and the <a href="#">Passive Error Flag</a> consisting of six recessive bits (unless overridden by dominant bits of other nodes). Active Error Flags are sent by error active nodes, whilst Passive Error Flags are sent by error passive nodes. |
| Error Flag Superposition | The Error Flag Superposition field meant to allow for other nodes on the bus to transmit their respective Active Error Flags. The superposition field can range from 0 to 6 bits, and ends when the first recessive bit is detected (i.e., the first it of the Delimiter).  |
| Error Delimeter          | The Delimiter field marks the end of the error/overload frame, and consists of eight recessive bits.  |

Overload Frames

An overload frame has the same bit fields as an error frame containing an Active Error Flag. The key difference is in the cases that can trigger the transmission of an overload frame. Figure 48.2-3 below shows the bit fields of an overload frame.

Figure 48.2-3. Fields of an Overload Frame

Table 48.2-3. Overload Frame

| Overload Flag               | Description  |
|-----------------------------|--|
| Overload Flag               | Consists of six dominant bits. Same as an Active Error Flag.   |
| Overload Flag Superposition | Allows for the superposition of Overload Flags from other nodes, similar to an Error Flag Superposition. |
| Overload Delimeter          | Consists of eight recessive bits. Same as an Error Delimeter.  |

Overload frames will be transmitted in the following cases:

- 1. A receiver requires a delay of the next data or remote frame.
- 2. A dominant bit is detected at the first and second bit of [intermission](#).

3. A dominant bit is detected at the eighth (last) bit of an Error Delimiter. Note that in this case, TEC and REC will not be incremented (see Section 48.2.3 for more details).

Transmitting an overload frame due to one of the above cases must also satisfy the following rules:

- The start of an overload frame due to case 1 is only allowed to be started at the first bit time of an expected intermission. In this case, a maximum of two overload frames may be generated.
- The start of an overload frame due to case 2 and 3 is only allowed to be started one bit after detecting the dominant bit.

### 48.2.2.3 Interframe Space

The Interframe Space acts as a separator between frames. Before sending, data frames and remote frames must be separated from preceding frames by an Interframe Space, regardless of the preceding frame's type (data frame, remote frame, error frame, or overload frame). However, error frames and overload frames do not need to be separated from preceding frames.

Figure 48.2-4 shows the fields within an Interframe Space:

Figure 48.2-4. The Fields within an Interframe Space (\*Error Passive)

Table 48.2-4. Interframe Space

| Interframe Space     | Description   |
|----------------------|---|
| Intermission         | The Intermission consists of three recessive bits.  |
| Suspend Transmission | An Error Passive node that has just transmitted a message must include a Suspend Transmission field. This field consists of eight recessive bits. Error Active nodes should not include this field.       |
| Bus Idle             | The Bus Idle field is of arbitrary length. Bus Idle ends when an SOF is transmitted. If a node has a pending transmission, the SOF should be transmitted at the first bit following Suspend Transmission. |

## 48.2.3 TWAI Errors

### 48.2.3.1 Error Types

Bus Errors in TWAI are categorized into the following types:

#### Bit Error

A Bit Error occurs when a node transmits a bit value (i.e., dominant or recessive) but detects an opposite bit (e.g., a dominant bit is transmitted but a recessive is detected). However, if the transmitted bit is recessive and is located in the Arbitration Field, ACK Slot, or Passive Error Flag, then detecting a dominant bit will not be considered as a Bit Error.

#### Stuff Error

A stuff error occurs when six consecutive bits of the same value are detected (which violates the bit-stuffing encoding rules).

#### CRC Error

The receiver will calculate the CRC value based on the valid bits of received data frames and remote frames (before bit stuffing). A CRC Error occurs when the CRC calculated by the receiver does not match the CRC sequence in the received data frames and remote frames.

#### Format Error

A Format Error occurs when a format-fixed bit field of a message contains an illegal bit. For example, the r1 and r0 fields must be dominant.

#### ACK Error

An ACK Error occurs when a transmitter does not detect a dominant bit at the ACK Slot.

### 48.2.3.2 Error States

TWAI nodes implement fault confinement by maintaining two error counters in each node, where the counter values determine the error state. The two error counters are known as the Transmit Error Counter (TEC) and Receive Error Counter (REC). TWAI has the following error states:

#### Error Active

An Error Active node is able to participate in bus communication and transmit an Active Error Flag when it detects an error.

#### Error Passive

An Error Passive node is able to participate in bus communication and transmit a Passive Error Flag when it detects an error. Error Passive nodes that have transmitted data or remote frames must also include the Suspend Transmission field in the subsequent Interframe Space.

#### Bus Off

A Bus Off node is not permitted to influence the bus in any way (i.e., is not allowed to transmit data).

### 48.2.3.3 Error State Transition

1. A node becomes Error Passive when its TEC and/or REC is greater than or equal to 128. Though the node becomes Error Passive, it still sends an Active Error Flag. Note that once the REC has reached 128, any further increases to its value are invalid until the REC returns to a value less than 128.
2. A node becomes Bus Off when its TEC is greater than or equal to 256.
3. An Error Passive node becomes Error Active when both the TEC and REC are less than or equal to 127.
4. A Bus Off node can become Error Active (with both its TEC and REC reset to 0) after it monitors 128 occurrences of 11 consecutive recessive bits on the bus.

### 48.2.3.4 Error Counter Rules

The TEC and REC are incremented/decremented according to the following rules. **Note that more than one rule can apply to a given message transfer.**

**TEC increment/decrement rules:**

1. When a transmitter sends an Error Flag, the TEC is increased by 8. However, the following scenarios are exempt from this rule:
  - A transmitter is Error Passive and no dominant bit is detected when an Acknowledgment Error is detected and the Passive Error Flag is sent. In this case, the TEC should not be increased.
  - A transmitter transmits an Error Flag due to a Stuff Error during Arbitration. If the stuffed bit should have been recessive but was monitored as dominant, then the TEC should not be increased.
2. If a transmitter detects a Bit Error while sending an Active Error Flag or Overload Flag, the TEC is increased by 8.
3. A node can tolerate up to 7 consecutive dominant bits after sending an Active/Passive Error Flag, or Overload Flag. After detecting the 14th consecutive dominant bit when sending an Active Error Flag or Overload Flag, or the 8th consecutive dominant bit following a Passive Error Flag, a transmitter will increase its TEC by 8 and a receiver will increase its REC by 8. Every additional 8 consecutive dominant bits will also increase the TEC for transmitters or REC for receivers by 8 as well.
4. When a transmitter has transmitted a message, which means getting ACK and no errors until the EOF is completed, the TEC is decremented by 1, unless the TEC is already at 0.

**REC increment/decrement rules:**

1. When a receiver detects a dominant bit as the first bit after sending an Error Flag, the REC is increased by 8.
2. When a receiver detects an error, the REC is increased by 1, except when the detected error was a Bit Error during the transmission of an Active Error Flag or an Overload Flag.
3. If a receiver detects a Bit Error while sending an Active Error Flag or Overload Flag, the REC is increased by 8.
4. When a receiver successfully receives a message, which means getting no errors before ACK Slot and successfully sending ACK, the REC is decremented accordingly.
  - If the REC is between 1 and 127, it will be decremented by 1.
  - If the REC is greater than 127, it will be set to 127.
  - If the REC is 0, it will remain 0.

## 48.2.4 TWAI Bit Timing

### 48.2.4.1 Nominal Bit

The TWAI protocol allows a TWAI bus to operate at a particular bit rate. However, all nodes within a TWAI bus must operate at the same bit rate.

- **The Nominal Bit Rate** is defined as the number of bits transmitted per second.
- **The Nominal Bit Time** is defined as  $1/\text{Nominal Bit Rate}$ .

A single Nominal Bit Time is divided into multiple segments, and each segment is made up of multiple Time Quanta. A **Time Quantum** is a minimum unit of time, and is implemented as some form of prescaled clock signal in each node. Figure 48.2-5 illustrates the segments within a single Nominal Bit Time.

TWAI controllers will operate in time steps of one Time Quanta where the state of the TWAI bus is analyzed. If the bus states in two consecutive Time Quanta are different (i.e., recessive to dominant or vice versa), an edge is generated. The intersection of PBS1 and PBS2 is considered the Sample Point and the sampled bus value is considered the value of that bit.

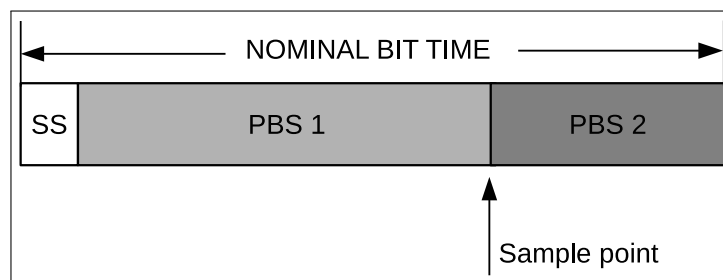

Figure 48.2-5. Layout of a Bit

Table 48.2-5. Segments of a Nominal Bit Time

| Segment | Description   |
|---------|---|
| SS      | The SS (Synchronization Segment) is 1 Time Quantum long. If all nodes are perfectly synchronized, the edge of a bit will lie in the SS.   |
| PBS1    | PBS1 (Phase Buffer Segment 1) can be 1 to 16 Time Quanta long. PBS1 is meant to compensate for the physical delay times within the network. PBS1 can also be lengthened for synchronization purposes. |
| PBS2    | PBS2 (Phase Buffer Segment 2) can be 1 to 8 Time Quanta long. PBS2 is meant to compensate for the information processing time of nodes. PBS2 can also be shortened for synchronization purposes.      |

#### 48.2.4.2 Hard Synchronization and Resynchronization

Due to clock skew and jitter, the bit timing of nodes on the same bus may become out of phase. Therefore, a bit edge may come before or after the SS. To ensure that the internal bit timing clocks of each node are kept in phase, TWAI has various methods of synchronization. The **Phase Error “e”** is measured in the number of Time Quanta and relative to the SS.

- A positive Phase Error ( $e > 0$ ) is when the edge lies after the SS and before the Sample Point (i.e., the edge is late).
- A negative Phase Error ( $e < 0$ ) is when the edge lies after the Sample Point of the previous bit and before SS (i.e., the edge is early).

To correct Phase Errors, there are two forms of synchronization, known as **Hard Synchronization** and **Resynchronization**. **Hard Synchronization** and **Resynchronization** obey the following rules:

- Only one synchronization may occur in a single bit time.
- Synchronizations only occur on recessive to dominant edges.

##### Hard Synchronization

Hard Synchronization occurs on the recessive to dominant (i.e., the first SOF bit after Bus Idle) edges when the bus is idle. All nodes will restart their internal bit timings so that the recessive to dominant edge lies within the SS of the restarted bit timing.

## Resynchronization

Resynchronization occurs on recessive to dominant edges when the bus is not idle. If the edge has a positive Phase Error ( $e > 0$ ), PBS1 is lengthened by a certain number of Time Quanta. If the edge has a negative Phase Error ( $e < 0$ ), PBS2 will be shortened by a certain number of Time Quanta.

The number of Time Quanta to lengthen or shorten depends on the magnitude of the Phase Error, and is also limited by the Synchronization Jump Width (SJW) value which is programmable.

- When the magnitude of the Phase Error (**e**) is less than or equal to the SJW, PBS1/PBS2 are lengthened/shortened by the **e** number of Time Quanta. This has the same effect as Hard Synchronization.
- When the magnitude of the Phase Error is greater than the SJW, PBS1/PBS2 are lengthened/shortened by the SJW number of Time Quanta. This means it may take multiple bits of synchronization before the Phase Error is entirely corrected.

## 48.3 Architectural Overview

The major functional blocks of the TWAI controller are shown in Figure 48.3-1.

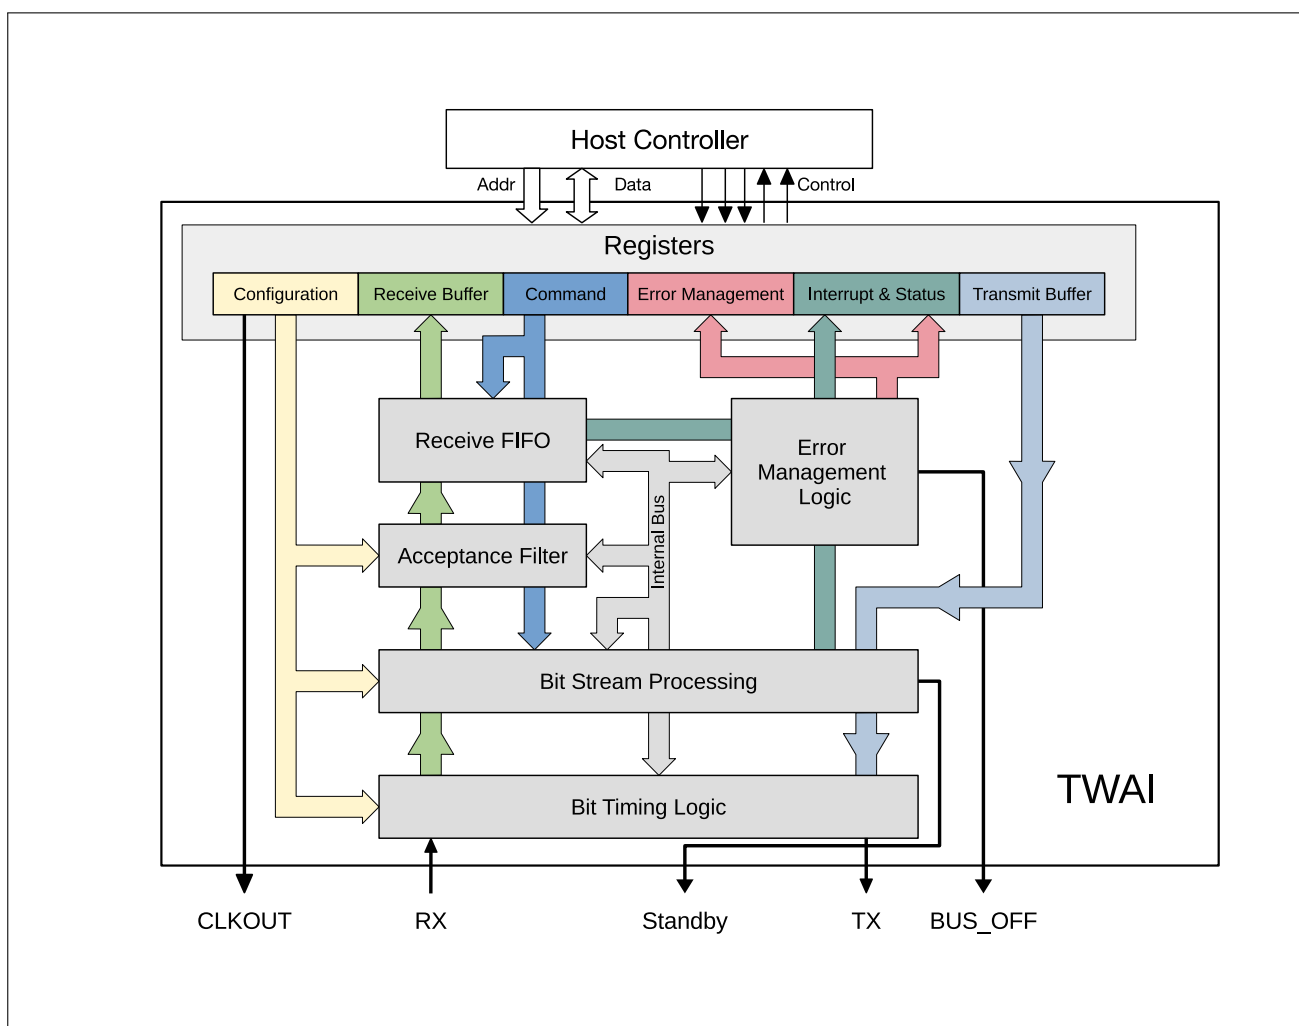

Figure 48.3-1. TWAI Overview Diagram

### 48.3.1 Bit Timing Logic

The Bit Timing Logic (BTL) module transmits and receives messages at the configured bit rate. The BTL module also handles bit timing synchronization so that communication remains stable. A single bit rate consists of multiple programmable segments that allows users to set the number of time quanta to adjust propagation delay and controller processing time, etc.

### 48.3.2 Bit Stream Processor

The Bit Stream Processing (BSP) module handles the frame processing of data from the Transmit Buffer (e.g., bit stuffing and additional CRC fields) and generates a bit stream for the Bit Timing Logic (BTL) module. At the same time, the BSP module is also responsible for processing the received bit stream (e.g., de-stuffing and verifying CRC) from the BTL module and placing the message into the Receive FIFO. The BSP will also detect errors on the TWAI bus and report them to the Error Management Logic (EML).

### 48.3.3 Acceptance Filter

The Acceptance Filter is a programmable message filtering unit that allows the TWAI controller to accept or reject a received message based on the message's ID field. Only accepted messages will be stored in the Receive FIFO. The Acceptance Filter can be configured to Single-filter mode or Dual-filter mode through registers.

### 48.3.4 Receive FIFO

The Receive FIFO is a 64-byte buffer (inside the TWAI controller) that stores received messages accepted by the Acceptance Filter. Messages in the Receive FIFO can vary in size (between 3 to 13 bytes). When the Receive FIFO is full (or does not have enough space to store the currently received message in its entirety), the Overrun Interrupt will be triggered, and any subsequently received messages will be lost until adequate space is cleared in the Receive FIFO. The first message in the Receive FIFO will be mapped to the 13-byte Receive Buffer until that message is cleared (using the Release Receive Buffer command bit). After being cleared, the Receive Buffer will map to the next message in the Receive FIFO, and the space occupied by the previous message in the Receive FIFO can be used to receive new messages.

### 48.3.5 Error Management Logic

The Error Management Logic (EML) module updates the TEC and REC, records error information like error types and positions, and updates the error state of the TWAI controller to ensure that the BSP module generates the correct Error Flags. Furthermore, this module also records the bit position when the TWAI controller loses arbitration.

### 48.3.6 Registers Block

The ESP32-P4 CPU accesses peripherals using 32-bit aligned words. However, the majority of registers in the TWAI controller only contain useful data at the least significant byte (bits [7:0]). Therefore, in these registers, bits [31:8] are ignored on writes, and return 0 on reads.

#### Configuration Registers

The configuration registers store various configuration items for the TWAI controller such as bit rates, Operation mode, Acceptance Filter, etc. Configuration registers can only be modified whilst the TWAI controller is in Reset mode (See Section [48.4.1](#)).

### Command Registers

The command register is used by the CPU to drive the TWAI controller to initiate certain actions such as transmitting a message or clearing the Receive Buffer. The command register can only be modified when the TWAI controller is in Operation mode (see Section [48.4.1](#)).

### Interrupt & Status Registers

The interrupt register indicates what events have occurred in the TWAI controller (each event is represented by a separate bit). The status register indicates the current status of the TWAI controller.

### Error Management Registers

The error management registers include error counters and capture registers. The error counter registers represent TEC and REC values. The capture registers will record information about instances where the TWAI controller detects a bus error, or when it loses arbitration.

### Transmit Buffer Registers

The transmit buffer is a 13-byte buffer used to store a TWAI message to be transmitted.

### Receive Buffer Registers

The Receive Buffer is a 13-byte buffer which stores a single message. The Receive Buffer acts as a window of Receive FIFO, whose first message will be mapped into the Receive Buffer.

Note that the Transmit Buffer registers, Receive Buffer registers, and the Acceptance Filter registers share the same address range (offset 0x0040 to 0x0070). Their access is governed by the following rules:

- When the TWAI controller is in Reset mode, all reads and writes to the address range maps to the Acceptance Filter registers.
- When the TWAI controller is in Operation mode:
  - All reads to the address range maps to the Receive Buffer registers.
  - All writes to the address range maps to the Transmit Buffer registers.

## 48.4 Functional Description

### 48.4.1 Modes

The ESP32-P4 TWAI controller has two working modes: Reset mode and Operation mode. Reset mode and Operation mode are entered by setting or clearing the [TWAI\\_RESET\\_MODE](#) bit.

#### 48.4.1.1 Reset Mode

Entering Reset mode is required in order to modify the various configuration registers of the TWAI controller. When entering Reset mode, the TWAI controller is essentially disconnected from the TWAI bus. When in Reset mode, the TWAI controller will not be able to transmit any messages (including error signals). Any transmission in progress is immediately terminated. Likewise, the TWAI controller will not be able to receive any messages either.

### 48.4.1.2 Operation Mode

In Operation mode, the TWAI controller connects to the bus and write-protects all configuration registers to ensure consistency during operation. When in Operation mode, the TWAI controller can transmit and receive messages (including error signaling) depending on which operation sub-mode the TWAI controller was configured with. The TWAI controller supports the following operation sub-modes:

- **Normal mode:** The TWAI controller can transmit and receive messages including error signals (such as Error and Overload Frames).
- **Self-test mode:** Self-test mode is similar to Normal mode, but the TWAI controller will consider the transmission of a data or remote frame successful and do not generate an ACK error even if it was not acknowledged. This mode is commonly used during the self-test of a TWAI controller.
- **Listen-only mode:** The TWAI controller will be able to receive messages, but will remain completely passive on the TWAI bus. Thus, the TWAI controller will not be able to transmit any messages, acknowledgments, or error signals. The error counters will remain frozen. This mode is useful for TWAI bus monitoring.

Note that when exiting Reset mode (i.e., entering Operation mode), the TWAI controller must wait for 11 consecutive recessive bits to occur before fully connecting to the TWAI bus (i.e., being able to transmit or receive).

### 48.4.2 Bit Timing

The operating bit rate of the TWAI controller must be configured whilst the TWAI controller is in Reset mode. The bit rate is configured using [TWAI\\_BUS\\_TIMING\\_0\\_REG](#) and [TWAI\\_BUS\\_TIMING\\_1\\_REG](#).

The following Table 48.4-1 illustrates the bit fields of [TWAI\\_BUS\\_TIMING\\_0\\_REG](#). The frequency of the TWAI core clock has multiple clock sources that can be configured by the user as needed. See Chapter 9 [Reset and Clock](#) for detailed configuration instructions.

Table 48.4-1. Bit Information of [TWAI\\_BUS\\_TIMING\\_0\\_REG](#) (0x18)

| Bit 31-16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | ..... | Bit 1 | Bit 0 |
|-----------|--------|--------|--------|--------|-------|-------|-------|
| Reserved  | SJW.1  | SJW.0  | BRP.13 | BRP.12 | ..... | BRP.1 | BRP.0 |

#### Notes:

- BRP: The TWAI Time Quanta clock is derived from the XTAL clock (the default is 40 MHz and is configured). The Baud Rate Prescaler (BRP) field is used to define the prescaler according to the equation below, where  $t_{Tq}$  is the Time Quanta clock cycle and  $t_{CLK}$  is TWAI core clock cycle:  

$$t_{Tq} = 2 \times t_{CLK} \times (BRP + 1)$$
- SJW ( $t_{SJW}$ ): Synchronization Jump Width (SJW)  $t_{SJW}$  is configured in SJW[1:0] where  $t_{SJW} = (SJW[1:0] + 1)$ .

The following Table 48.4-2 illustrates the bit fields of [TWAI\\_BUS\\_TIMING\\_1\\_REG](#).

Table 48.4-2. Bit Information of `TWAI_BUS_TIMING_1_REG` (0x1c)

| Bit 31-8 | Bit 7 | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |
|----------|-------|--------|--------|--------|--------|--------|--------|--------|
| Reserved | SAM   | PBS2.2 | PBS2.1 | PBS2.0 | PBS1.3 | PBS1.2 | PBS1.1 | PBS1.0 |

**Notes:**

- PBS1: The number of Time Quanta in Phase Buffer Segment 1 is defined based on PBS1 + 1.
- PBS2: The number of Time Quanta in Phase Buffer Segment 2 is defined based on PBS2 + 1.
- SAM: Enables triple sampling if set to 1. This is useful for low/medium speed buses to filter spikes on the bus line.

## 48.4.3 Transmit and Receive Buffers

### 48.4.3.1 Overview of Buffers

Table 48.4-3. Buffer Layout for Standard Frame Format and Extended Frame Format

| Standard Frame Format (SFF) |                         | Extended Frame Format (EFF) |                         |
|-----------------------------|-------------------------|-----------------------------|-------------------------|
| Offset Address              | Content                 | Offset Address              | Content                 |
| 0x40                        | TX/RX frame information | 0x40                        | TX/RX frame information |
| 0x44                        | TX/RX identifier 1      | 0x44                        | TX/RX identifier 1      |

| 0x70                        | reserved                | 0x70                        | TX/RX data byte 8       |

Table 48.4-3 illustrates the layout of the Transmit Buffer and Receive Buffer registers. Both the Transmit and Receive Buffer registers share the same address space and are only accessible when the TWAI controller is in Operation mode. The CPU accesses Transmit Buffer registers for write operations, and Receive Buffer registers for read operations. Both buffers share the exact same register layout and fields to store a message (received or to be transmitted). The Transmit Buffer registers are used to configure a TWAI message to be transmitted. The CPU would write to the Transmit Buffer registers specifying the message's frame type, frame format, frame ID, and frame data (payload). Once the Transmit Buffer is configured, the CPU would then initiate the transmission by setting the `TWAI_TX_REQUEST` bit in `TWAI_CMD_REG`.

- For a self-reception request, set the `TWAI_SELF_RX_REQUEST` bit instead.
- For a single-shot transmission, set both the `TWAI_TX_REQUEST` and the `TWAI_ABORT_TX` simultaneously.

The Receive Buffer registers map the first message in the Receive FIFO. The CPU would read the Receive Buffer registers to obtain the first message's frame type, frame format, frame ID, and frame data (payload). Once the message has been read from the Receive Buffer registers, the CPU can set the [TWAI\\_RELEASE\\_BUFFER](#) bit in [TWAI\\_CMD\\_REG](#) to clear the Receive Buffer registers. If there are still messages in the Receive FIFO, the Receive Buffer registers will map the first of the remaining messages again.

#### 48.4.3.2 Frame Information

The frame information is one byte long and specifies a message's frame type, frame format, and length of data. The frame information fields are shown in Table 48.4-4.

**Table 48.4-4. TX/RX Frame Information (SFF/EFF); TWAI Address 0x40**

| Bit 31-8 | Bit 7           | Bit 6            | Bit 5          | Bit 4          | Bit 3              | Bit 2              | Bit 1              | Bit 0              |
|----------|-----------------|------------------|----------------|----------------|--------------------|--------------------|--------------------|--------------------|
| Reserved | FF <sup>1</sup> | RTR <sup>2</sup> | X <sup>3</sup> | X <sup>3</sup> | DLC.3 <sup>4</sup> | DLC.2 <sup>4</sup> | DLC.1 <sup>4</sup> | DLC.0 <sup>4</sup> |

**Notes:**

1. FF: The Frame Format (FF) bit specifies whether the message is Extended Frame Format (EFF) or Standard Frame Format (SFF). The message is EFF when the FF bit is 1, and SFF when the FF bit is 0.
2. RTR: The Remote Transmission Request (RTR) bit specifies whether the message is a data frame or a remote frame. The message is a remote frame when the RTR bit is 1, and a data frame when the RTR bit is 0.
3. X: Don't care, can be any value.
4. DLC: The Data Length Code (DLC) field specifies the number of data bytes for a data frame, or the number of data bytes to request in a remote frame. TWAI data frames are limited to a maximum payload of 8 data bytes, and thus the DLC should range from 0 to 8.

#### 48.4.3.3 Frame Identifier

The Frame Identifier fields occupy two-byte (11-bit) long if the message is SFF, and four-byte (29-bit) long if the message is EFF.

The Frame Identifier fields for an SFF (11-bit) message are shown in Table 48.4-5 ~ 48.4-6.

**Table 48.4-5. TX/RX Identifier 1 (SFF); TWAI Address 0x44**

| Bit 31-8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|----------|-------|-------|-------|-------|-------|-------|-------|-------|
| Reserved | ID.10 | ID.9  | ID.8  | ID.7  | ID.6  | ID.5  | ID.4  | ID.3  |

**Table 48.4-6. TX/RX Identifier 2 (SFF); TWAI Address 0x48**

| Bit 31-8 | Bit 7 | Bit 6 | Bit 5 | Bit 4          | Bit 3          | Bit 2          | Bit 1          | Bit 0          |
|----------|-------|-------|-------|----------------|----------------|----------------|----------------|----------------|
| Reserved | ID.2  | ID.1  | ID.0  | X <sup>1</sup> | X <sup>2</sup> | X <sup>2</sup> | X <sup>2</sup> | X <sup>2</sup> |

**Notes:**

1. Don't care. Recommended to be compatible with receive buffer (i.e., set to RTR) in case of using the self-reception functionality (or together with self-test functionality).

2. Don't care. Recommended to be compatible with receive buffer (i.e., set to 0) in case of using the self-reception functionality (or together with self-test functionality).

The Frame Identifier fields for an EFF (29-bits) message is shown in Table 48.4-7 ~ 48.4-10.

**Table 48.4-7. TX/RX Identifier 1 (EFF); TWAI Address 0x44**

| Bit 31-8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|----------|-------|-------|-------|-------|-------|-------|-------|-------|
| Reserved | ID.28 | ID.27 | ID.26 | ID.25 | ID.24 | ID.23 | ID.22 | ID.21 |

**Table 48.4-8. TX/RX Identifier 2 (EFF); TWAI Address 0x48**

| Bit 31-8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|----------|-------|-------|-------|-------|-------|-------|-------|-------|
| Reserved | ID.20 | ID.19 | ID.18 | ID.17 | ID.16 | ID.15 | ID.14 | ID.13 |

**Table 48.4-9. TX/RX Identifier 3 (EFF); TWAI Address 0x4c**

| Bit 31-8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|----------|-------|-------|-------|-------|-------|-------|-------|-------|
| Reserved | ID.12 | ID.11 | ID.10 | ID.9  | ID.8  | ID.7  | ID.6  | ID.5  |

**Table 48.4-10. TX/RX Identifier 4 (EFF); TWAI Address 0x50**

| Bit 31-8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2          | Bit 1          | Bit 0          |
|----------|-------|-------|-------|-------|-------|----------------|----------------|----------------|
| Reserved | ID.4  | ID.3  | ID.2  | ID.1  | ID.0  | X <sup>1</sup> | X <sup>2</sup> | X <sup>2</sup> |

**Notes:**

1. Don't care. Recommended to be compatible with receive buffer (i.e., set to RTR ) in case of using the self-reception functionality (or together with self-test functionality).
2. Don't care. Recommended to be compatible with receive buffer (i.e., set to 0 ) in case of using the self-reception functionality (or together with self-test functionality).

#### 48.4.3.4 Frame Data

The Frame Data field contains the payloads of transmitted or received data frame, and can range from 0 to 8 bytes. The number of valid bytes should be equal to the DLC. However, if the DLC is larger than eight bytes, the number of valid bytes would still be limited to eight. Remote frames do not have data payloads, so their Frame Data fields will be unused.

For example, when transmitting a data frame with five bytes, the CPU should write five to the DLC field, and then write data to the corresponding register of the first to the fifth data field. Likewise, when the CPU receives a data frame with a DLC of five data bytes, only the first to the fifth data byte will contain valid payload data for the CPU to read.

### 48.4.4 Receive FIFO and Data Overruns

The Receive FIFO is a 64-byte internal buffer used to store received messages in First In First Out order. A single received message can occupy between 3 to 13 bytes of space in the Receive FIFO, and their

endianness is identical to the register layout of the Receive Buffer registers. The Receive Buffer registers are mapped to the bytes of the first message in the Receive FIFO.

When the TWAI controller receives the first message, the value of [TWAI\\_RX\\_MESSAGE\\_COUNTER](#) increases to 1, and the RXI interrupt is activated, automatically updating the first message into the buffer. Subsequently, with each new message received by the TWAI controller, the value of [TWAI\\_RX\\_MESSAGE\\_COUNTER](#) increments by 1, reaching a maximum of 64. When this limit is reached and there is sufficient space remaining in the Receive FIFO, the message will be written into the FIFO.

Once the software reads a message from the Receive Buffer, it can free up the space occupied by the message in the Receive FIFO by setting [TWAI\\_RELEASE\\_BUFFER](#) to 1. This will also decrement [TWAI\\_RX\\_MESSAGE\\_COUNTER](#) by 1. The Receive Buffer will then map to the next message in the Receive FIFO. The software should repeat the above operations until [TWAI\\_RX\\_MESSAGE\\_COUNTER](#) reaches 0. At this point, the RXI interrupt stops being triggered, the data in the receive buffer becomes invalid, and [TWAI\\_STATUS\\_RECEIVE\\_BUFFER](#) is set to 0.

A data overrun occurs when the TWAI controller receives a message, but the Receive FIFO lacks adequate free space to store the received message in its entirety (either due to the message contents being larger than the free space in the Receive FIFO, or the Receive FIFO being completely full).

When a data overrun occurs:

- The free space left in the Receive FIFO is filled with the partial contents of the overrun message. If the Receive FIFO is already full, then none of the overrun message's contents will be stored.
- When data in the Receive FIFO overruns for the first time, a Data Overrun Interrupt will be triggered.
- Each overrun message will still increment the [TWAI\\_RX\\_MESSAGE\\_COUNTER](#) up to a maximum of 64.
- The Receive FIFO will internally mark overrun messages as invalid. The [TWAI\\_STATUS\\_MISS](#) bit can be used to determine whether the message currently mapped to by the Receive Buffer is valid or overrun.

To clear an overrun Receive FIFO, the [TWAI\\_RELEASE\\_BUFFER](#) must be called repeatedly until [TWAI\\_RX\\_MESSAGE\\_COUNTER](#) is 0. This requires users to read all valid messages in the Receive FIFO and clear all overrun messages.

### 48.4.5 Acceptance Filter

The Acceptance Filter allows the TWAI controller to filter out received messages based on their ID (and optionally their first data byte and frame type). Only accepted messages are passed on to the Receive FIFO. The use of Acceptance Filters allows a more lightweight operation of the TWAI controller (e.g., less use of Receive FIFO, fewer Receive Interrupts) since the TWAI Controller only needs to handle a subset of messages.

The Acceptance Filter configuration registers can only be accessed whilst the TWAI controller is in Reset mode, since they share the same address spaces with the Transmit Buffer and Receive Buffer registers.

The configuration registers consist of a 32-bit Acceptance Code Value and a 32-bit Acceptance Mask Value. The Acceptance Code value specifies a bit pattern which each filtered bit of the message must match in order for the message to be accepted. The Acceptance Mask Value is able to mask out certain bits of the Code value (i.e., set as "Don't Care" bits). Each filtered bit of the message must either match the acceptance code or be masked in order for the message to be accepted, as demonstrated in Figure 48.4-1.

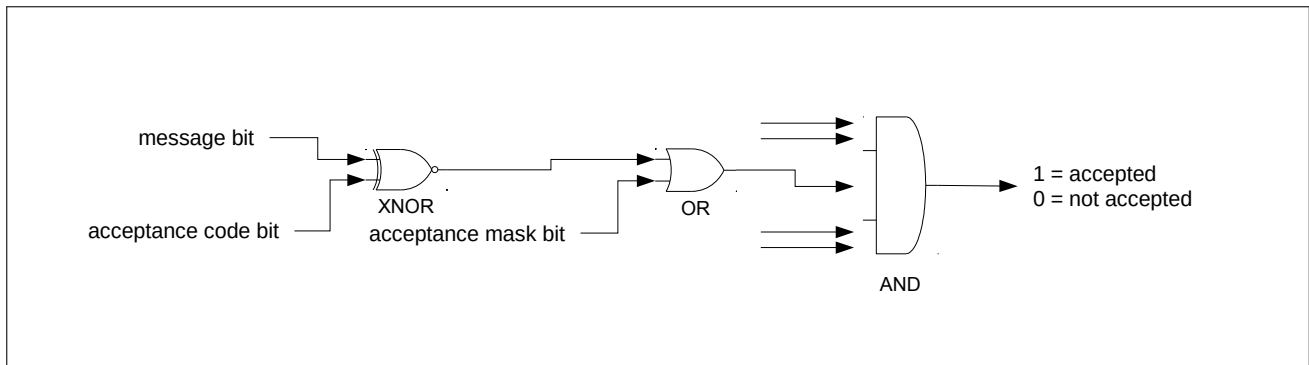

Figure 48.4-1. Acceptance Filter

The TWAI controller Acceptance Filter allows the 32-bit Acceptance Code and Mask Values to either define a single filter (i.e., Single-filter mode), or two filters (i.e., Dual-filter mode). How the Acceptance Filter interprets the 32-bit code and mask values is dependent on the filter mode and the format of received messages (i.e., SFF or EFF).

#### 48.4.5.1 Single-Filter Mode

Single Filter mode is enabled by setting the `TWAI_ACCEPTANCE_FILTER_MODE` bit to 1. This will cause the 32-bit code and mask values to define a single filter. The single filter can filter the following bits of data or remote frames:

- SFF
  - The entire 11-bit ID
  - RTR bit
  - Data byte 1 and Data byte 2
- EFF
  - The entire 29-bit ID
  - RTR bit

The following Figure 48.4-2 illustrates how the 32-bit code and mask values will be interpreted under Single-filter mode.

#### 48.4.5.2 Dual-Filter Mode

Dual-filter mode is enabled by clearing the `TWAI_ACCEPTANCE_FILTER_MODE` bit to 0. This will cause the 32-bit code and mask values to define a two separate filters referred to as filter 1 or filter 2. Under Dual-filter mode, a message will be accepted if it is accepted by one of the two filters.

The two filters can filter the following bits of data or remote frames:

- SFF
  - The entire 11-bit ID
  - RTR bit
  - Data byte 1 (for filter 1 only)

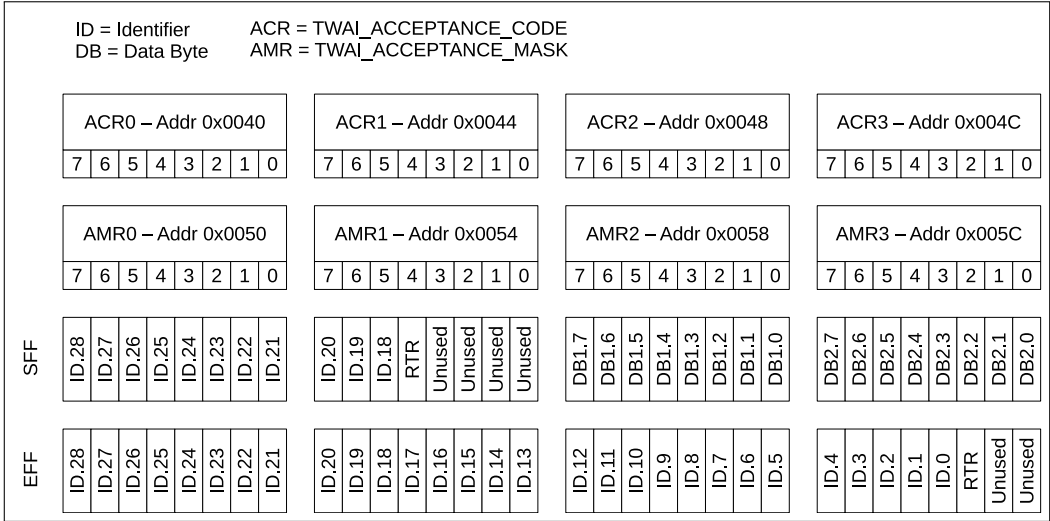

Figure 48.4-2. Single-Filter Mode

- EFF
  - The first 16 bits of the 29-bit ID

The following Figure 48.4-3 illustrates how the 32-bit code and mask values will be interpreted in Dual-filter mode.

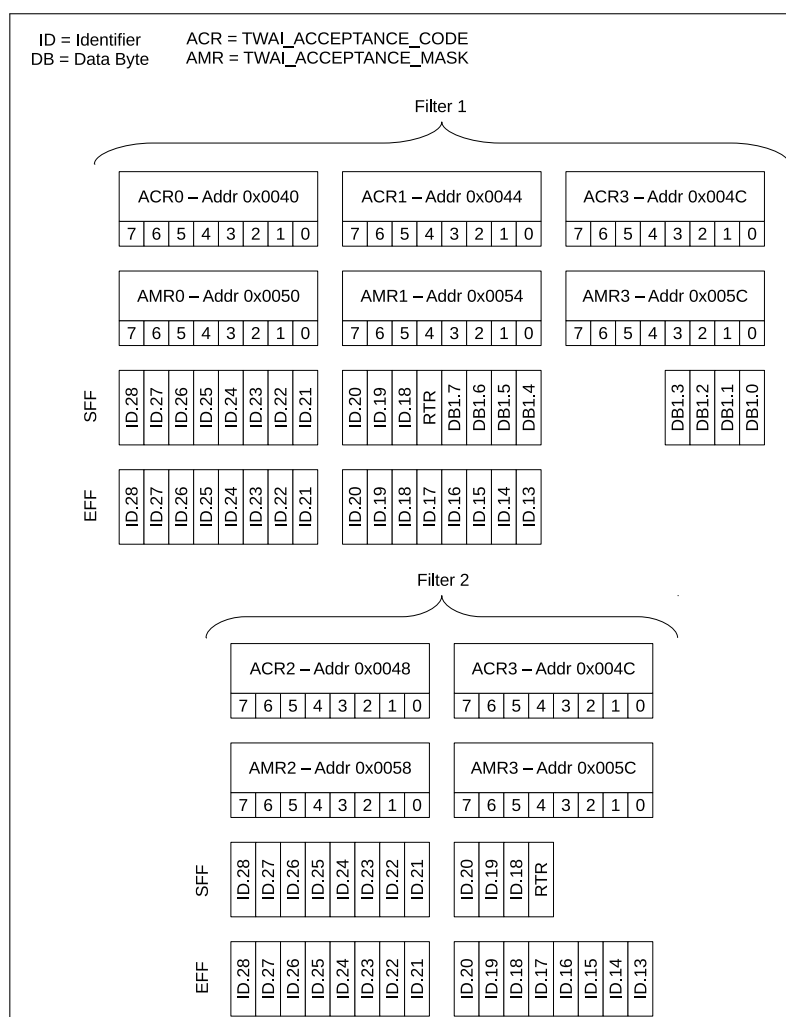

Figure 48.4-3. Dual-Filter Mode

## 48.4.6 Error Management

The TWAI protocol requires that each TWAI node maintains the Transmit Error Counter (TEC) and Receive Error Counter (REC). The value of both error counters determines the current error state of the TWAI controller (i.e., Error Active, Error Passive, Bus-Off). The TWAI controller stores the TEC and REC values in [TWAI\\_TX\\_ERR\\_CNT\\_REG](#) and [TWAI\\_RX\\_ERR\\_CNT\\_REG](#) respectively, and they can be read by the CPU anytime. In addition to the error states, the TWAI controller also offers an Error Warning Limit (EWL) feature that can warn users of the occurrence of severe bus errors before the TWAI controller enters the Error Passive state.

The current error state of the TWAI controller is indicated via a combination of the following values and status bits: TEC, REC, [TWAI\\_STATUS\\_ERR](#), and [TWAI\\_STATUS\\_NODE\\_BUS\\_OFF](#). Certain changes to these values and bits will also trigger interrupts, so that users are notified of error state transitions (see section 48.5). The following figure 48.4-4 shows the relation between the error states, values and bits, and error state related interrupts.

Figure 48.4-4. Error State Transition

#### 48.4.6.1 Error Warning Limit

The Error Warning Limit (EWL) is a configurable threshold value for the TEC and REC, which will trigger an interrupt when exceeded. The EWL is intended to serve as a warning about severe TWAI bus errors, and is triggered before the TWAI controller enters the Error Passive state. The EWL is configured in [TWAI\\_ERR\\_WARNING\\_LIMIT\\_REG](#) and can only be configured whilst the TWAI controller is in Reset mode. The [TWAI\\_ERR\\_WARNING\\_LIMIT\\_REG](#) has a default value of 96.

When the values of TEC and/or REC are larger than or equal to the EWL value, the [TWAI\\_STATUS\\_ERR](#) bit is immediately set to 1. Likewise, when the values of both the TEC and REC are smaller than the EWL value, the [TWAI\\_STATUS\\_ERR](#) bit is immediately reset to 0. The Error Warning Interrupt is triggered whenever the value of the [TWAI\\_STATUS\\_ERR](#) bit (or the [TWAI\\_STATUS\\_NODE\\_BUS\\_OFF](#)) changes.

#### 48.4.6.2 Error Passive

The TWAI controller is in the Error Passive state when the TEC or REC value exceeds 127. Likewise, when both the TEC and REC are less than or equal to 127, the TWAI controller enters the Error Active state. The Error Passive Interrupt is triggered whenever the TWAI controller transitions from the Error Active state to the Error Passive state or vice versa.

#### 48.4.6.3 Bus-Off and Bus-Off Recovery

The TWAI controller enters the Bus-Off state when the TEC value exceeds 255. On entering the Bus-Off state, the TWAI controller will automatically do the following:

- Set REC to 0
- Set TEC to 127
- Set the [TWAI\\_STATUS\\_NODE\\_BUS\\_OFF](#) bit to 1
- Enter Reset mode

The Error Warning Interrupt is triggered whenever the value of the [TWAI\\_STATUS\\_NODE\\_BUS\\_OFF](#) bit (or the [TWAI\\_STATUS\\_ERR](#) bit) changes.

To return to the Error Active state, the TWAI controller must undergo Bus-Off Recovery. Bus-Off Recovery requires the TWAI controller to observe 128 occurrences of 11 consecutive recessive bits on the bus. To initiate Bus-Off Recovery (after entering the Bus-Off state), the TWAI controller should enter Operation mode by setting the [TWAI\\_RESET\\_MODE](#) bit to 0. The TEC tracks the progress of Bus-Off Recovery by decrementing the TEC each time when the TWAI controller observes 11 consecutive recessive bits. When Bus-Off Recovery has completed (i.e., TEC has decremented from 127 to 0), the [TWAI\\_STATUS\\_NODE\\_BUS\\_OFF](#) bit will automatically be reset to 0, thus triggering the Error Warning Interrupt.

### 48.4.7 Error Code Capture

The Error Code Capture (ECC) feature allows the TWAI controller to record the error type and bit position of a TWAI bus error in the form of an error code. Upon detecting a TWAI bus error, the Bus Error Interrupt is triggered and the error code is recorded in [TWAI\\_ERR\\_CODE\\_CAP\\_REG](#). Subsequent bus errors will trigger the Bus Error Interrupt, but their error codes will not be recorded until the current error code is read from [TWAI\\_ERR\\_CODE\\_CAP\\_REG](#).

The following Table 48.4-11 shows the fields of the [TWAI\\_ERR\\_CODE\\_CAP\\_REG](#):

**Table 48.4-11. Bit Information of [TWAI\\_ERR\\_CODE\\_CAP\\_REG](#) (0x30)**

| Bit 31-8 | Bit 7               | Bit 6               | Bit 5            | Bit 4              | Bit 3              | Bit 2              | Bit 1              | Bit 0              |
|----------|---------------------|---------------------|------------------|--------------------|--------------------|--------------------|--------------------|--------------------|
| Reserved | ERRC.1 <sup>1</sup> | ERRC.0 <sup>1</sup> | DIR <sup>2</sup> | SEG.4 <sup>3</sup> | SEG.3 <sup>3</sup> | SEG.2 <sup>3</sup> | SEG.1 <sup>3</sup> | SEG.0 <sup>3</sup> |

**Notes:**

- **ERRC:** The Error Code (ERRC) indicates the type of bus error; 00 for bit error, 01 for format error, 10 for stuff error, and 11 for other types of error.
- **DIR:** The Direction (DIR) indicates whether the TWAI controller was transmitting or receiving when the bus error occurred; 0 for the transmitter, 1 for the receiver.
- **SEG:** The Error Segment (SEG) indicates the segment of the TWAI message at which the bus error occurred.

The following Table 48.4-12 shows how to interpret the SEG.0 to SEG.4 bits.

**Table 48.4-12. Bit Information of Bits SEG.4 - SEG.0**

| Bit SEG.4 | Bit SEG.3 | Bit SEG.2 | Bit SEG.1 | Bit SEG.0 | Description    |
|-----------|-----------|-----------|-----------|-----------|----------------|
| 0         | 0         | 0         | 1         | 1         | start of frame |
| 0         | 0         | 0         | 1         | 0         | ID.28 ~ ID.21  |
| 0         | 0         | 1         | 1         | 0         | ID.20 ~ ID.18  |
| 0         | 0         | 1         | 0         | 0         | bit SRTR       |
| 0         | 0         | 1         | 0         | 1         | bit IDE        |
| 0         | 0         | 1         | 1         | 1         | ID.17 ~ ID.13  |
| 0         | 1         | 1         | 1         | 1         | ID.12 ~ ID.5   |
| 0         | 1         | 1         | 1         | 0         | ID.4 ~ ID.0    |
| 0         | 1         | 1         | 0         | 0         | bit RTR        |
| 0         | 1         | 1         | 0         | 1         | reserved bit 1 |
| 0         | 1         | 0         | 0         | 1         | reserved bit 0 |

Cont'd on next page

| 1         | 0         | 1         | 1         | 1         | error delimiter        |
| 1         | 1         | 1         | 0         | 0         | overload flag          |

**Notes:**

- Bit SRTR: under Standard Frame Format.
- Bit IDE: Identifier Extension Bit, 0 for Standard Frame Format.

## 48.4.8 Arbitration Lost Capture

The Arbitration Lost Capture (ALC) feature allows the TWAI controller to record the bit position where it loses arbitration. When the TWAI controller loses arbitration, the bit position is recorded in [TWAI\\_ARB\\_LOST\\_CAP\\_REG](#) and the Arbitration Lost Interrupt is triggered.

Subsequent losses in arbitration will trigger the Arbitration Lost Interrupt, but will not be recorded in [TWAI\\_ARB\\_LOST\\_CAP\\_REG](#) until the current Arbitration Lost Capture is read from the [TWAI\\_ERR\\_CODE\\_CAP\\_REG](#).

Table 48.4-13 illustrates bits and fields of [TWAI\\_ERR\\_CODE\\_CAP\\_REG](#) whilst Figure 48.4-5 illustrates the bit positions of a TWAI message.

Figure 48.4-5. Positions of Arbitration Lost Bits

Table 48.4-13. Bit Information of [TWAI\\_ARB\\_LOST\\_CAP\\_REG](#) (0x2c)

| Bit 31-5 | Bit 4                | Bit 3                | Bit 2                | Bit 1                | Bit 0                |
|----------|----------------------|----------------------|----------------------|----------------------|----------------------|
| Reserved | BITNO.4 <sup>1</sup> | BITNO.3 <sup>1</sup> | BITNO.2 <sup>1</sup> | BITNO.1 <sup>1</sup> | BITNO.0 <sup>1</sup> |

**Notes:**

- BITNO: Bit Number (BITNO) indicates the nth bit of a TWAI message where arbitration was lost.

### 48.4.9 Transceiver Auto-Standby

It is common for TWAI transceivers to support a Standby mode to lower power consumption. TWAI transceivers will usually generate a standby signal that is asserted by the connected TWAI controller, thus allowing the controller to place the transceiver into standby when appropriate (e.g., when the bus will be idle for an extended period of time). Transceivers will exit Standby mode if the controller de-asserts the standby signal, or if the transceiver detects bus activity (also known as a wake-up feature).

ESP32-P4's TWAI controller supports both hardware control (i.e., automatic) and software control (i.e., manual) of the standby signal to control the switching of TWAI transceivers connected to the chip. When hardware controlled, the TWAI controller will automatically assert the standby signal when the bus remains idle for longer than a configurable amount of time. When software controlled, the standby signal can be manually asserted/de-asserted directly by the software.

- Hardware output:
  1. Set the [TWAI\\_HW\\_STANDBY\\_EN](#) field in the [TWAI\\_HW\\_CFG\\_REG](#) register to enable standby function for hardware.
  2. Configure the [TWAI\\_HW\\_STANDB\\_CNT\\_REG](#) register. This register indicates the time required before hardware triggers the standby signal after entering idle status, in which the value indicates the number of cycles of the TWAI controller operating clock (40 MHz by default).
- Software output:
  1. Set the [TWAI\\_SW\\_STANDBY\\_EN](#) field in the [TWAI\\_SW\\_STANDBY\\_CFG\\_REG](#) register to generate standby signals in the TWAI controller.

The standby signal generated using either of the above methods will be pulled down (cleared) when either of the following conditions is met:

1. The standby signal will be automatically cleared when the TWAI controller's receiver exits the idle status (such as when receiving a new message).
2. Users can also pull down the standby signal by setting the [TWAI\\_SW\\_STANDBY\\_CLR](#) field in the [TWAI\\_SW\\_STANDBY\\_CFG\\_REG](#) register.

## 48.5 Interrupts

ESP32-P4's TWAI can generate the following interrupt signal that will be sent to the [Interrupt Matrix](#).

- TWAI\_INT

There are several internal interrupt sources from the TWAI that can generate the above interrupt signal. The interrupt sources from the TWAI are listed with their trigger conditions and the resulted interrupt signal in Table 48.5-1.

**Table 48.5-1. TWAI's Internal Interrupt Sources**

| Internal Interrupt Source | Trigger Condition   | Interrupt Signal |
|---------------------------|---|------------------|
| TWAI_RECEIVE_INT (RXI)    | The Receive Interrupt (RXI) is asserted whenever the TWAI controller has received messages that are pending to be read from the Receive Buffer (i.e., when <a href="#">TWAI_RX_MESSAGE_COUNTER_REG</a> > 0). Pending received messages includes valid messages in the Receive FIFO and also overrun messages. The RXI will not be deasserted until all pending received messages are cleared using the <a href="#">TWAI_RELEASE_BUFFER</a> command bit.   | TWAI_INT         |
| TWAI_TRANSMIT_INT (TXI)   | The Transmit Interrupt (TXI) is triggered whenever Transmit Buffer becomes free, indicating another message can be loaded into the Transmit Buffer for transmission. The Transmit Buffer becomes free under the following scenarios: <ul style="list-style-type: none"> <li>• A message transmission has completed successfully, i.e., acknowledged without any errors. Any failed messages will automatically be resent.</li> <li>• A single shot transmission has completed (successfully or unsuccessfully, indicated by the <a href="#">TWAI_STATUS_TRANSMISSION_COMPLETE</a> bit).</li> <li>• A message transmission was aborted using the <a href="#">TWAI_ABORT_TX</a> command bit.</li> </ul> | TWAI_INT         |

Cont'd on next page

Table 48.5-1 – cont'd from previous page

| Internal Interrupt Source  | Trigger Condition   | Interrupt Signal |
|----------------------------|---|------------------|
| TWAI_ERR_WARNING_INT (EWI) | <p>The Error Warning Interrupt (EWI) is triggered whenever there is a change to the <a href="#">TWAI_STATUS_ERR</a> and <a href="#">TWAI_STATUS_NODE_BUS_OFF</a> bits of the <a href="#">TWAI_STATUS_REG</a> (i.e., transition from 0 to 1 or vice versa). Thus, an EWI could indicate one of the following events, depending on the values <a href="#">TWAI_STATUS_ERR</a> and <a href="#">TWAI_STATUS_NODE_BUS_OFF</a> at the moment when the EWI is triggered.</p> <ul style="list-style-type: none"> <li>• If <a href="#">TWAI_STATUS_ERR</a> = 0 and <a href="#">TWAI_STATUS_NODE_BUS_OFF</a> = 0: <ul style="list-style-type: none"> <li>– If the TWAI controller was in the Error Active state, it indicates both the TEC and REC have returned below the threshold value set by <a href="#">TWAI_ERR_WARNING_LIMIT_REG</a>.</li> <li>– If the TWAI controller was previously in the Bus Off Recovery state, it indicates that Bus Recovery has completed successfully.</li> </ul> </li> <li>• If <a href="#">TWAI_STATUS_ERR</a> = 1 and <a href="#">TWAI_STATUS_NODE_BUS_OFF</a> = 0: The TEC or REC error counters have exceeded the threshold value set by <a href="#">TWAI_ERR_WARNING_LIMIT_REG</a>.</li> <li>• If <a href="#">TWAI_STATUS_ERR</a> = 1 and <a href="#">TWAI_STATUS_NODE_BUS_OFF</a> = 1: The TWAI controller has entered the BUS_OFF state (due to the TEC &gt;= 256).</li> <li>• If <a href="#">TWAI_STATUS_ERR</a> = 0 and <a href="#">TWAI_STATUS_NODE_BUS_OFF</a> = 1: The TWAI controller's TEC has dropped below the threshold value set by <a href="#">TWAI_ERR_WARNING_LIMIT_REG</a> during BUS_OFF recovery.</li> </ul> | TWAI_INT         |

Cont'd on next page

Table 48.5-1 – cont'd from previous page

| Internal Interrupt Source       | Trigger Condition   | Interrupt Signal |
|---------------------------------|---|------------------|
| TWAI_DATA_OVERRUN_INT (DOI)     | The Data Overrun Interrupt (DOI) is triggered whenever the Receive FIFO has overrun. The DOI indicates that the Receive FIFO is full and should be cleared immediately to prevent any further overrun messages. The DOI is only triggered by the first message that causes the Receive FIFO to overrun (i.e., the transition from the Receive FIFO not being full to the Receive FIFO overflowing). Any subsequent overrun messages will not trigger the DOI again. The DOI could be triggered again when all received messages (valid or overrun) have been cleared. | TWAI_INT         |
| TWAI_TS_COUNTER_OVFL_INT        | The Timestamp Overflow Interrupt is triggered whenever the 32-bit counter of the TWAI controller timestamp has overflowed.  | TWAI_INT         |
| TWAI_ERR_PASSIVE_INT (EPI)      | The Error Passive Interrupt (EPI) is triggered whenever the TWAI controller switches from Error Active to Error Passive, or vice versa.   | TWAI_INT         |
| TWAI_ARBITRATION_LOST_INT (ALI) | The Arbitration Lost Interrupt (ALI) is triggered whenever the TWAI controller is attempting to transmit a message and loses arbitration. The bit position where the TWAI controller lost arbitration is automatically recorded in Arbitration Lost Capture register ( <a href="#">TWAI_ARB_LOST_CAP_REG</a> ). When the ALI occurs again, the Arbitration Lost Capture register will no longer record the new bit location until it is cleared (via CPU reading this register).  | TWAI_INT         |
| TWAI_BUS_ERR_INT (BEI)          | The Bus Error Interrupt (BEI) is triggered whenever the TWAI controller detects an error on the TWAI bus. When a bus error occurs, the Bus Error type and its bit position are automatically recorded in the Error Code Capture register ( <a href="#">TWAI_ERR_CODE_CAP_REG</a> ). When the BEI occurs again, the Error Code Capture register will no longer record new error information until it is cleared (via a read from the CPU).   | TWAI_INT         |
| TWAI_IDLE_INT (BISI)            | The Bus Idle Status Interrupt (BISI) is triggered when the number of clock cycles of the TWAI controller in the idle status exceeds the pre-configured value in the <a href="#">TWAI_IDLE_INTR_CNT_REG</a> register. Users can configure this interrupt to get the TWAI controller idle status and further decide whether to turn off the external TWAI receiver to reduce the overall power consumption (see Section <a href="#">48.4.9</a> ).   | TWAI_INT         |

The TWAI controller's interrupt signal to the interrupt matrix will be asserted whenever one or more interrupt bits are set in the [TWAI\\_INTERRUPT\\_REG](#), and de-asserted when all bits in [TWAI\\_INTERRUPT\\_REG](#) are cleared. The majority of interrupt bits in [TWAI\\_INTERRUPT\\_REG](#) are automatically cleared when the register is read, except for the Receive Interrupt which can only be cleared when all the messages are released by setting the [TWAI\\_RELEASE\\_BUFFER](#) bit.

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter [11 Interrupt Matrix](#) > Section [11.2 Interrupt Terminology in ESP32-P4](#).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section [48.6 Register Summary](#).

## 48.6 Register Summary

'|' here means a separate line to distinguish between TWAI working modes discussed in Section [48.4.1 Modes](#). The left describes the access in Operation mode. The right belongs to Reset mode and is marked in red. The addresses in this section are relative to Two-wire Automotive Interface base address provided in Table [6.3-2](#) in Chapter [6 System and Memory](#).

The abbreviations given in Column **Access** are explained in Section [Access Types for Registers](#).

| Name  | Description                       | Address | Access    |
|---|-----------------------------------|---------|-----------|
| <b>Configuration Registers</b>              |                                   |         |           |
| <a href="#">TWAI_MODE_REG</a>               | Mode Register                     | 0x0000  | R/W       |
| <a href="#">TWAI_CMD_REG</a>                | Command Register                  | 0x0004  | WO        |

## 48.7 Registers

'|' here means a separate line. The left describes the access in Operation mode. The right belongs to Reset mode with red color. The addresses in this section are relative to Two-wire Automotive Interface base address (each TWAI 0 and TWAI 1 has an individual base address) provided in Table 6.3-2 in Chapter 6 [System and Memory](#).

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

Register 48.1. TWAI\_MODE\_REG (0x0000)

|            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                             |  |  |  |   |   |   |   |       |
|------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-----------------------------|--|--|--|---|---|---|---|-------|
| (reserved) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | TWAI_ACCEPTANCE_FILTER_MODE |  |  |  |   |   |   |   |       |
|            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | TWAI_SELF_TEST_MODE         |  |  |  |   |   |   |   |       |
|            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | TWAI_LISTEN_ONLY_MODE       |  |  |  |   |   |   |   |       |
|            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | TWAI_RESET_MODE             |  |  |  |   |   |   |   |       |
| 31         |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 4                           |  |  |  | 3 | 2 | 1 | 0 |       |
| 0          |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0                           |  |  |  | 0 | 0 | 0 | 1 | Reset |

**TWAI\_RESET\_MODE** Configures the Operation mode of the TWAI Controller.

- 0: Operation mode
  - 1: Reset mode
- (R/W)

**TWAI\_LISTEN\_ONLY\_MODE** Configures whether to enter the Listen-only mode.

- 0: No effect
  - 1: Listen-only mode. In this mode, the nodes will only receive messages from the bus, without generating the acknowledge signal or updating the RX error counter.
- (R/W)

**TWAI\_SELF\_TEST\_MODE** Configures whether to enter the Self-test mode.

- 0: No effect
  - 1: Enter the Self-test mode. In this mode, the TX nodes can perform a successful transmission without receiving the acknowledge signal. This mode is often used to test a single node with the self-reception request command.
- (R/W)

**TWAI\_ACCEPTANCE\_FILTER\_MODE** Configures the filter mode.

- 0: Dual-filter mode
  - 1: Single-filter mode
- (R/W)

Register 48.2. TWAI\_CMD\_REG (0x0004)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |  |   |       |   |  |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|--|---|-------|---|--|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | TWAI_SELF_RX_REQUEST<br>TWAI_CLEAR_DATA_OVERRUN<br>TWAI_RELEASE_BUFFER<br>TWAI_ABORT_TX<br>TWAI_TX_REQUEST |   |       |   |  |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 5 | 4 | 3 | 2 | 1  | 0 | Reset |   |  |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0  | 0 | 0     | 0 |  |

**TWAI\_TX\_REQUEST** Configures whether to drive nodes to start transmission.

- 0: No effect
- 1: Drive nodes to start transmission

(WO)

**TWAI\_ABORT\_TX** Configures whether to cancel a pending transmission request.

- 0: No effect
- 1: Cancel a pending transmission request

(WO)

**TWAI\_RELEASE\_BUFFER** Configures whether to release the RX buffer.

- 0: No effect
- 1: Release the RX buffer

(WO)

**TWAI\_CLEAR\_DATA\_OVERRUN** Configures whether to clear the data overrun status bit.

- 0: No effect
- 1: Clear the data overrun status bit

(WO)

**TWAI\_SELF\_RX\_REQUEST** Configures whether to drive nodes to start transmitting messages while also receiving messages on the bus simultaneously.

- 0: No effect
- 1: Drive nodes to start transmitting messages while also receiving messages on the bus (set the value of [TWAI\\_TX\\_REQUEST](#) to 0, or only transmission is allowed)

(WO)

### Register 48.3. TWAI\_BUS\_TIMING\_0\_REG (0x0018)

**TWAI\_BAUD\_PRESC** Configures baud rate prescaler value, determining the frequency dividing ratio.

0: Low

1: High

(R/W)

**TWAI\_SYNC\_JUMP\_WIDTH** Configures Synchronization Jump Width (SJW), ranging from 1 ~ 4 Tq wide. (R/W)

#### Register 48.4. TWAI\_BUS\_TIMING\_1\_REG (0x001C)

Diagram illustrating the structure of the TWAI\_TSR register (32 bits):

- Bits 31 to 6: (reserved)
- Bits 5 to 3: TWAI\_TIME\_SEGMENT1
- Bits 2 to 0: TWAI\_TIME\_SAMPLING

**TWAI\_TIME\_SEGMENT1** Configures the width of PBS1. (R/W)

**TWAI\_TIME\_SEGMENT2** Configures the width of PBS2. (R/W)

**TWAI\_TIME\_SAMPLING** Configures the number of sample points.

0: The bus is sampled once

1: The bus is sampled three times

(R/W)

**Register 48.5. TWAI\_ERR\_WARNING\_LIMIT\_REG (0x0034)**

**TWAI\_ERR\_WARNING\_LIMIT** Configures error warning threshold. When any of the error counter values ([TWAI\\_RX\\_ERR\\_CNT](#) or [TWAI\\_TX\\_ERR\\_CNT](#)) exceeds the threshold, the TWAI controller enters an error state; when all the error counter values are below the threshold, the TWAI controller exits the error state. An error warning interrupt will be triggered if the TWAI controller enters or exits an error state. (R/W)

**Register 48.6. TWAI\_CLOCK\_DIVIDER\_REG (0x007C)**

**TWAI\_CD** Configures the divisor of the external CLKOUT pin. (R/W)

**TWAI\_CLOCK\_OFF** Configures whether or not to enable the external CLKOUT pin in Reset mode.

0: Enable the external CLKOUT pin

1: Disable the external CLKOUT pin

(R/W)

Register 48.7. TWAI\_SW\_STANDBY\_CFG\_REG (0x0080)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |       |

**TWAI\_SW\_STANDBY\_EN** Configures whether to set standby signals with software.

0: No effect

1: Set standby signals

(R/W)

**TWAI\_SW\_STANDBY\_CLR** Configures whether to clear standby signals with software.

0: No effect

1: Clear standby signals

(R/W)

**TWAI\_HW\_STANDBY\_EN** Configures whether to enable the automatic standby function for hardware.

0: No effect

1: Enable the automatic standby function for hardware

(R/W)

Register 48.9. TWAI\_HW\_STANDBY\_CNT\_REG (0x0088)

**TWAI\_STANDBY\_WAIT\_CNT** Configures the time required before hardware triggers the standby signal after entering idle status.  
Measurement unit: TWAI controller clock cycles.  
(R/W)

Register 48.10. TWAI\_IDLE\_INTR\_CNT\_REG (0x008C)

**TWAI\_IDLE\_INTR\_CNT** Configures the time required before hardware generates the bus idle status interrupt signal after entering idle status.  
Measurement unit: TWAI controller clock cycles.  
(R/W)

## Register 48.11. TWAI\_STATUS\_REG (0x0008)

**TWAI\_STATUS\_RECEIVE\_BUFFER** Represents whether or not the RX buffer is empty.

0: Empty

1: Not empty, with at least one received data packet.

(RO)

**TWAI\_STATUS\_OVERRUN** Represents whether or not the RX FIFO is full.

0: Not full

1: Full, and data overrun has occurred

(RO)

**TWAI\_STATUS\_TRANSMIT\_BUFFER** Represents whether or not the TX buffer is empty.

0: Not empty

1: Empty, and the CPU may write a message into it

(RO)

**TWAI\_STATUS\_TRANSMISSION\_COMPLETE** Represents whether or not the TWAI controller has sent an entire packet to the bus.

0: Not sent

1: Sent

(RO)

**TWAI\_STATUS\_RECEIVE** Represents whether or not the TWAI Controller is receiving a message from the bus.

0: Not receiving

1: Receiving

(RO)

**TWAI\_STATUS\_TRANSMIT** Represents whether or not the TWAI Controller is transmitting a message to the bus.

0: Not transmitting

1: Transmitting

(RO)

**TWAI\_STATUS\_ERR** Represents at least one of the RX/TX error counter has reached or exceeded the value set in register [TWAI\\_ERR\\_WARNING\\_LIMIT\\_REG](#). (RO)

Register 48.11. LP\_UART\_INT\_RAW\_REG (0x0004)

Continued from the previous page...

**TWAI\_STATUS\_NODE\_BUS\_OFF** Represents whether or not the TWAI Controller involves in bus activities in bus-off status.

0: Involved

1: No longer involved

(RO)

**TWAI\_STATUS\_MISS** Represents whether or not the data packet in the RX FIFO is complete.

0: The current packet is complete

1: The current packet is missing

(RO)

Register 48.12. TWAI\_ARB\_LOST\_CAP\_REG (0x002C)

**TWAI\_ARB\_LOST\_CAPTURE** Represents the bit position of lost arbitration. (RO)

### Register 48.13. TWAI\_ERR\_CODE\_CAP\_REG (0x0030)

|                                      |  |
|--------------------------------------|--|
| <b>TWAI_ERR_CAPTURE_CODE_SEGMENT</b> | Represents the location of errors, see Table 48.4-11 for details. (RO) |
|--------------------------------------|--|

**TWAI\_ERR\_CAPTURE\_CODE\_DIRECTION** Represents transmission direction of the node when an error occurs.

0: Error occurs when transmitting a message

1: Error occurs when receiving a message

(RO)

**TWAI\_ERR\_CAPTURE\_CODE\_TYPE** Represents error types.

0: Bit error

1: Form error

2: Stuff error

### 3: Others

(RO)

#### Register 48.14. TWAI\_RX\_ERR\_CNT\_REG (0x0038)

**TWAI\_RX\_ERR\_CNT** The RX error counter register, which reflects value changes in reception status.  
(R/W)

Register 48.15. TWAI\_TX\_ERR\_CNT\_REG (0x003C)

**TWAI\_TX\_ERR\_CNT** The TX error counter register, which reflects value changes in transmission status. (R/W)

Register 48.16. TWAI\_RX\_MESSAGE\_COUNTER\_REG (0x0074)

**TWAI\_RX\_MESSAGE\_COUNTER** Represents the number of messages available within the RX FIFO. (RO)

Register 48.17. TWAI\_INTERRUPT\_REG (0x000C)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | TWAI_IDLE_INT_ST<br>TWAI_BUS_ERR_INT_ST<br>TWAI_ARBITRATION_LOST_INT_ST<br>TWAI_ERR_PASSIVE_INT_ST<br>TWAI_TS_COUNTER_OVFL_INT_ST<br>TWAI_DATA_OVERRUN_INT_ST<br>TWAI_ERR_WARNING_INT_ST<br>TWAI_TRANSMIT_INT_ST<br>TWAI_RECEIVE_INT_ST |   |   |   |   |   |   |   |   |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 9 | 8   | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | Reset |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |   |   |   |   |   |   |   |   |   |       |

**TWAI\_RECEIVE\_INT\_ST** The masked interrupt status of [TWAI\\_RX\\_INT](#). (RO)

**TWAI\_TRANSMIT\_INT\_ST** The masked interrupt status of [TWAI\\_TX\\_INT](#). (RO)

**TWAI\_ERR\_WARNING\_INT\_ST** The masked interrupt status of [TWAI\\_ERR\\_WARN\\_INT](#). (RO)

**TWAI\_DATA\_OVERRUN\_INT\_ST** The masked interrupt status of [TWAI\\_OVERRUN\\_INT](#). (RO)

**TWAI\_TS\_COUNTER\_OVFL\_INT\_ST** The masked interrupt status of [TWAI\\_TS\\_COUNTER\\_OVFL\\_INT](#). (RO)

**TWAI\_ERR\_PASSIVE\_INT\_ST** The masked interrupt status of [TWAI\\_ERR\\_PASSIVE\\_INT](#). (RO)

**TWAI\_ARBITRATION\_LOST\_INT\_ST** The masked interrupt status of [TWAI\\_ARB\\_LOST\\_INT](#). (RO)

**TWAI\_BUS\_ERR\_INT\_ST** The masked interrupt status of [TWAI\\_BUS\\_ERR\\_INT](#). (RO)

**TWAI\_IDLE\_INT\_ST** The masked interrupt status of [TWAI\\_BUS\\_STATE\\_INT](#). (RO)

Register 48.18. TWAI\_INTERRUPT\_ENABLE\_REG (0x0010)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |  |  |   |   |   |   |   |   |   |   |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|--|--|---|---|---|---|---|---|---|---|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |  | TWAI_IDLE_INT_ENA<br>TWAI_BUS_ERR_INT_ENA<br>TWAI_ARBITRATION_LOST_INT_ENA<br>TWAI_ERR_PASSIVE_INT_ENA<br>TWAI_TS_COUNTER_OVFL_INT_ENA<br>TWAI_EXT_DATA_OVERRUN_INT_ENA<br>TWAI_EXT_ERR_TRANSMIT_INT_ENA<br>TWAI_EXT_RECEIVE_INT_ENA |   |   |   |   |   |   |   |   |   |       |

**TWAI\_EXT\_RECEIVE\_INT\_ENA** Write 1 to enable the [TWAI\\_RX\\_INT](#) interrupt. (R/W)

**TWAI\_EXT\_TRANSMIT\_INT\_ENA** Write 1 to enable the [TWAI\\_TX\\_INT](#) interrupt. (R/W)

**TWAI\_EXT\_ERR\_WARNING\_INT\_ENA** Write 1 to enable the [TWAI\\_ERR\\_WARN\\_INT](#) interrupt. (R/W)

**TWAI\_EXT\_DATA\_OVERRUN\_INT\_ENA** Write 1 to enable the [TWAI\\_OVERRUN\\_INT](#) interrupt. (R/W)

**TWAI\_TS\_COUNTER\_OVFL\_INT\_ENA** Write 1 to enable the [TWAI\\_TS\\_COUNTER\\_OVFL\\_INT](#) interrupt. (R/W)

**TWAI\_ERR\_PASSIVE\_INT\_ENA** Write 1 to enable the [TWAI\\_ERR\\_PASSIVE\\_INT](#) interrupt. (R/W)

**TWAI\_ARBITRATION\_LOST\_INT\_ENA** Write 1 to enable the [TWAI\\_ARB\\_LOST\\_INT](#) interrupt. (R/W)

**TWAI\_BUS\_ERR\_INT\_ENA** Write 1 to enable the [TWAI\\_BUS\\_ERR\\_INT](#) interrupt. (R/W)

**TWAI\_IDLE\_INT\_ENA** Write 1 to enable the [TWAI\\_BUS\\_STATE\\_INT](#) interrupt. (RO)

Register 48.19. TWAI\_DATA\_0\_REG (0x0040)

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |             |   |   |  |  |  |  |  |       |  |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------------|---|---|--|--|--|--|--|-------|--|
| (reserved)                                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | TWAI_DATA_0 |   |   |  |  |  |  |  |       |  |
| 31  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 8           | 7 | 0 |  |  |  |  |  |       |  |
| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0x0         |   |   |  |  |  |  |  | Reset |  |

**TWAI\_DATA\_0** In Operation mode, configures the 0th byte information of the data to be transmitted, or reads the 0th byte information of the data received. In Reset mode, configures the 1th byte of the filter code. (R/W)

**Register 48.20. TWAI\_DATA\_1\_REG (0x0044)**

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |             |   |   |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------------|---|---|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|
| (reserved)  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | TWAI_DATA_1 |   |   |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |
| 31  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 8           | 7 | 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |
| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0x0         |   |   |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |  |

**TWAI\_DATA\_1** In Operation mode, configures the 1st byte information of the data to be transmitted, or reads the 1st byte information of the data received. In Reset mode, configures the 2nd byte of the filter code. (R/W)

**Register 48.21. TWAI\_DATA\_2\_REG (0x0048)**

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |             |   |   |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------------|---|---|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|

**TWAI\_DATA\_12** In Operation mode, configures the 12th byte information of the data to be transmitted, or reads the 12th byte information of the data received. (R/W)  
 In Reset mode, reserved. (RO)

Register 48.32. TWAI\_TIMESTAMP\_DATA\_REG (0x0094)

**TWAI\_TIMESTAMP\_DATA** The timestamp of the TWAI frame indicated by the RX FIFO read pointer corresponds to the time when the current TWAI frame was received. Valid only when [TWAI\\_TS\\_ENABLE](#) is enabled. (RO)

Register 48.33. TWAI\_TIMESTAMP\_PRESCALER\_REG (0x0098)

**TWAI\_TS\_DIV\_NUM** Configures the clock divisor of the timestamp counter. (R/W)

Register 48.34. TWAI\_TIMESTAMP\_CFG\_REG (0x009C)

**TWAI\_TS\_ENABLE** Configures whether to enable the timestamp collection function.

- 0: Disable
- 1: Enable

(R/W)

## Chapter 49

# SD/MMC Host Controller (SDHOST)

## 49.1 Overview

The ESP32-P4 memory card interface controller provides a hardware interface between the Advanced Peripheral Bus (APB) and an external memory device. The memory card interface allows the ESP32-P4 to be connected to SDIO (secure digital I/O) memory cards, MMC (multimedia cards) and devices with a CE-ATA (Consumer Electronics Advanced Transport Architecture) interface. It supports two external cards (Card0 and Card1). All SD/MMC module interface signals only connect to GPIO pins via GPIO matrix.

## 49.2 Features

This module supports the following features:

- Two external cards
- SD memory Card specification V3.0 and V3.01, with a maximum transfer rate of DDR50
- MMC: V4.41, V4.5, and V4.51, with a maximum transfer rate of DDR50
- CE-ATA: V1.1
- 1-bit, 4-bit, and 8-bit modes

The SD/MMC controller topology is shown in Figure 49.2-1. The controller supports two peripherals, but they cannot function at the same time.

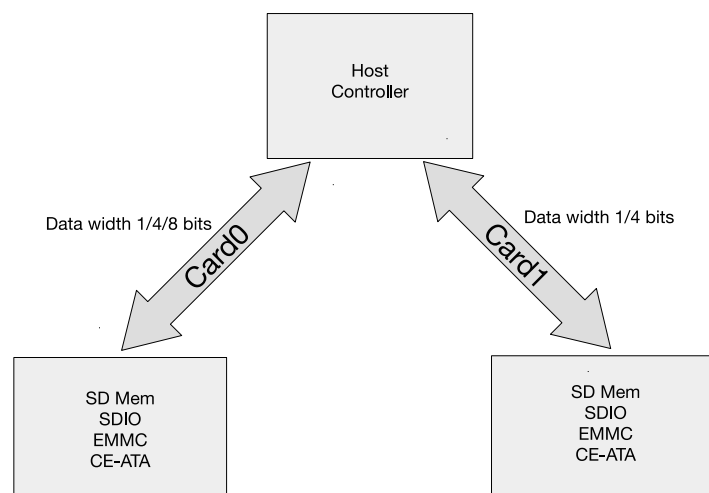

Figure 49.2-1. SD/MMC Controller Topology

## 49.3 SD/MMC External Interface Signals

The primary external interface signals, which enable the SD/MMC controller to communicate with an external device, are clock (sdhost\_cclk\_out\_1.eg:card1), command (sdhost\_ccmd\_out\_1), and data signals (sdhost\_cdata\_in\_1[7:0]/sdhost\_cdata\_out\_1[7:0]). Additional signals include the card interrupt, card detect, and write protect signals. The direction of each signal is shown in Figure 49.3-1. The direction and description of each pin are listed in Table 49.3-1.

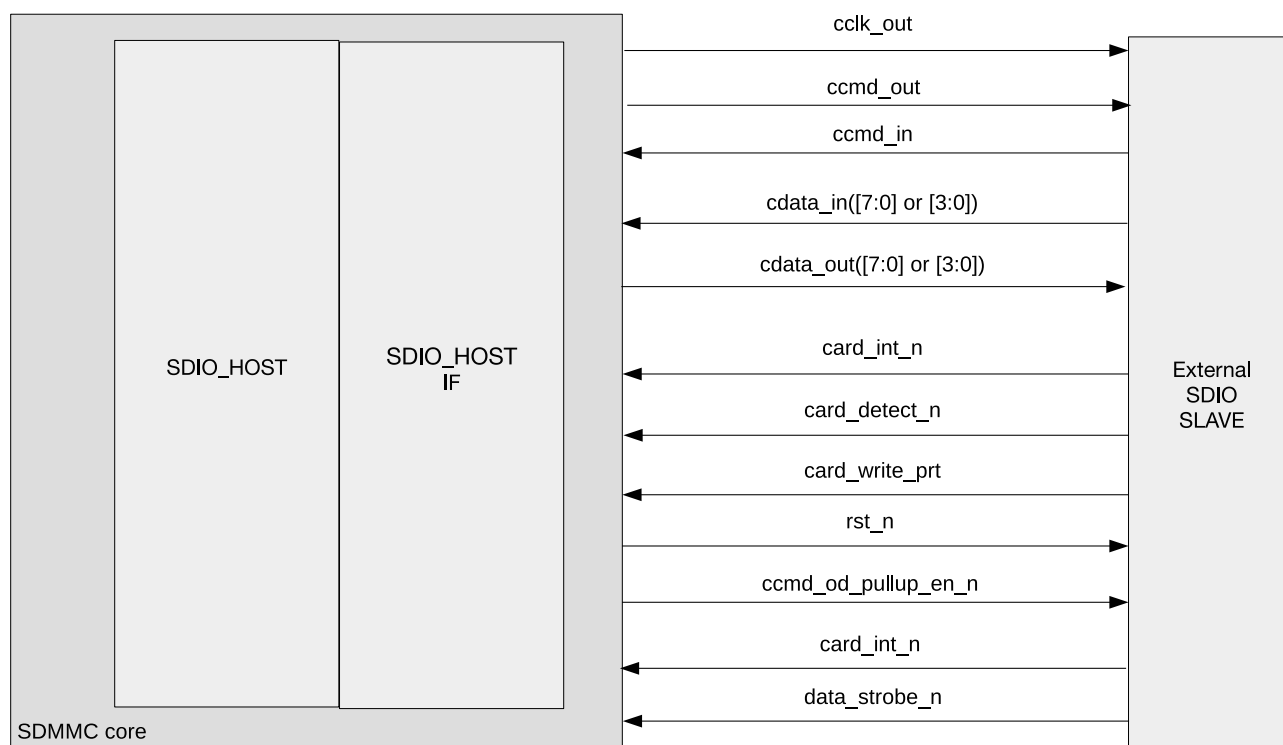

Figure 49.3-1. SD/MMC Controller External Interface Signals

Table 49.3-1. SD/MMC Signal Description

| Signal                | Direction | Description                        |
|-----------------------|-----------|------------------------------------|
| sdhost_cclk_out       | Output    | Clock signals for slave device     |
| sdhost_ccmd           | Duplex    | Duplex command/response lines      |
| sdhost_cdata          | Duplex    | Duplex data read/write lines       |
| sdhost_card_detect_n  | Input     | Card detection input line          |
| sdhost_card_write_prt | Input     | Card write protection status input |

## 49.4 Functional Description

### 49.4.1 SD/MMC Host Controller Architecture

The SD/MMC host controller consists of two main functional blocks, as shown in Figure 49.4-1:

- Bus Interface Unit (BIU): Provides the APB interface for registers, access to RAM data, and DMA data read and write operations.

- Card Interface Unit (CIU): Handles external memory card interface protocols and provides clock control.

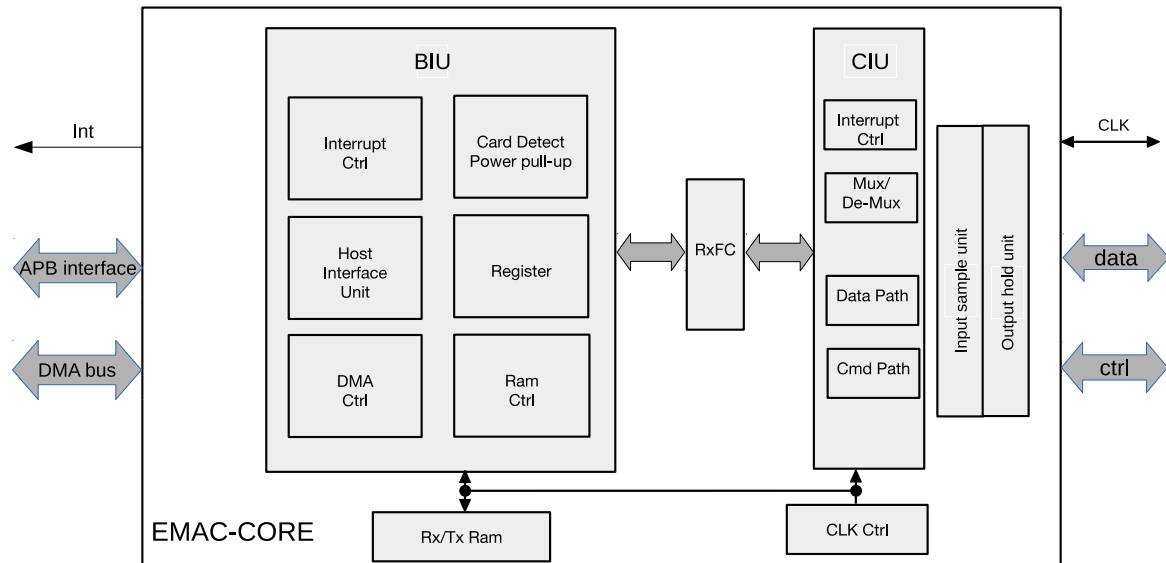

Figure 49.4-1. SDIO Host Block Diagram

#### 49.4.1.1 Bus Interface Unit (BIU)

The BIU provides access to registers and RAM data through the Host Interface Unit (HIU). Additionally, it provides a method to access to memory data through a DMA interface. Figure 49.4-1 illustrates the internal components of the BIU.

The BIU provides the following functions:

- Host interface
- DMA interface
- Interrupt control
- Register access
- FIFO access
- Power-up/pull-up control and card detection

#### 49.4.1.2 Card Interface Unit (CIU)

The CIU module implements the dedicated card slot specifications. Within the CIU, the command path control unit and data path control unit are used to interface with the command and data ports, respectively, of the SD/MMC/CE-ATA cards. The CIU also provides clock control. Figure 49.4-1 illustrates the internal structure of the CIU, which consists of the following primary functional blocks:

- Command path
- Data path
- SDIO interrupt control
- Clock control
- MUX (multiplexer) and De-MUX (de-multiplexer) unit

## 49.4.2 Command Path

The command path performs the following functions:

- Configures clock parameters
- Configures card command parameters
- Sends commands to card bus (sdhost\_ccmd\_out line)
- Receives responses from card bus (sdhost\_ccmd\_in line)
- Sends responses to BIU
- Drives the P-bit on the command line

The command path state machine is shown in Figure 49.4-2.

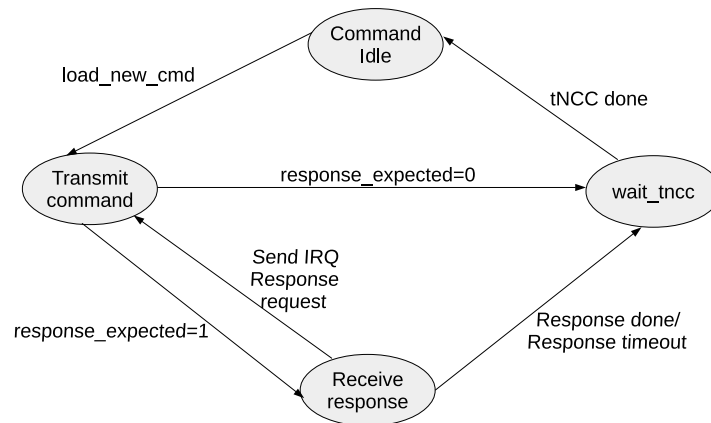

Figure 49.4-2. Command Path State Machine

## 49.4.3 Data Path

The data path block pops RAM data and transmits them on sdhost\_cdata\_out during a write-data transfer, or it receives data on sdhost\_cdata\_in and pushes them into RAM during a read-data transfer. The data path loads new data parameters, i.e., expected data, read/write data transfer, stream/block transfer, block size, byte count, card type, timeout registers, etc., whenever a data transfer command is not in progress.

If the `SDHOST_DATA_EXPECTED` bit is set in the `SDHOST_CMD_REG` register, the new command is a data transfer command and the data path starts one of the following operations:

- Transmitting data if the `SDHOST_READ_WRITE` bit is 1
- Receiving data if the `SDHOST_READ_WRITE` bit is 0

### 49.4.3.1 Data Transmit

The module starts data transmission two clock cycles after a response for the data write command is received. This occurs even if the command path detects a response error or a cyclic redundancy check (CRC) error in a response. If no response is received from the card until the response timeout, no data will be transmitted. Depending on the value of the `SDHOST_TRANSFER_MODE` bit in the `SDHOST_CMD_REG` register, the data transmit state machine adds data to the card's data bus in a stream or in block(s). The data transmit state machine is shown in Figure 49.4-3.

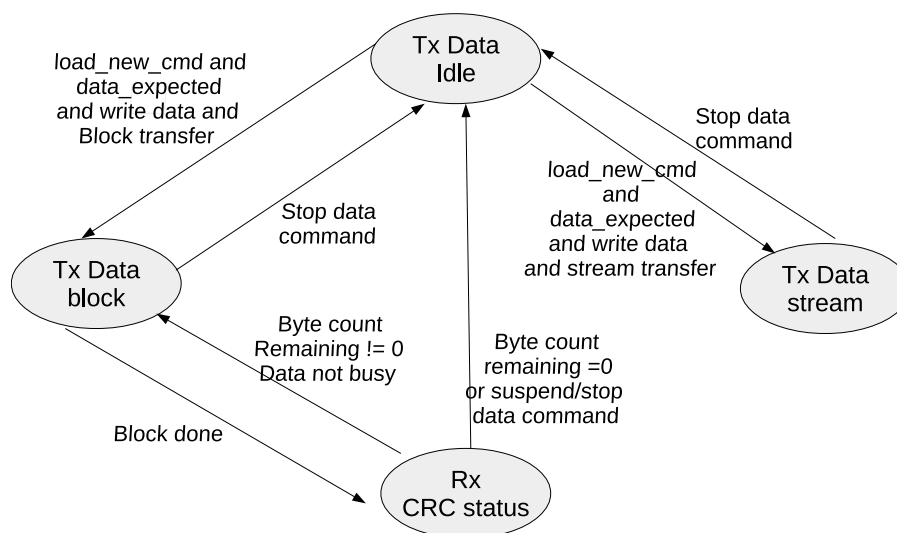

Figure 49.4-3. Data Transmit State Machine

### 49.4.3.2 Data Receive

The module receives data two clock cycles after the end bit of a data read command, even if the command path detects a response error or a CRC error. If no response is received from the card and a response timeout occurs, the BIU does not receive a signal about the completion of the data transfer. If the command sent by the CIU is an illegal operation for the card, it would prevent the card from starting a read-data transfer, and the BIU will not receive a signal about the completion of the data transfer.

If no data is received by the data timeout, the data path signals a data timeout to the BIU, which marks an end to the data transfer. Based on the value of the `SDHOST_TRANSFER_MODE` bit in the `SDHOST_CMD_REG` register, the data receive state machine gets data from the card's data bus in a stream or block(s). The data receive state machine is shown in Figure 49.4-4.

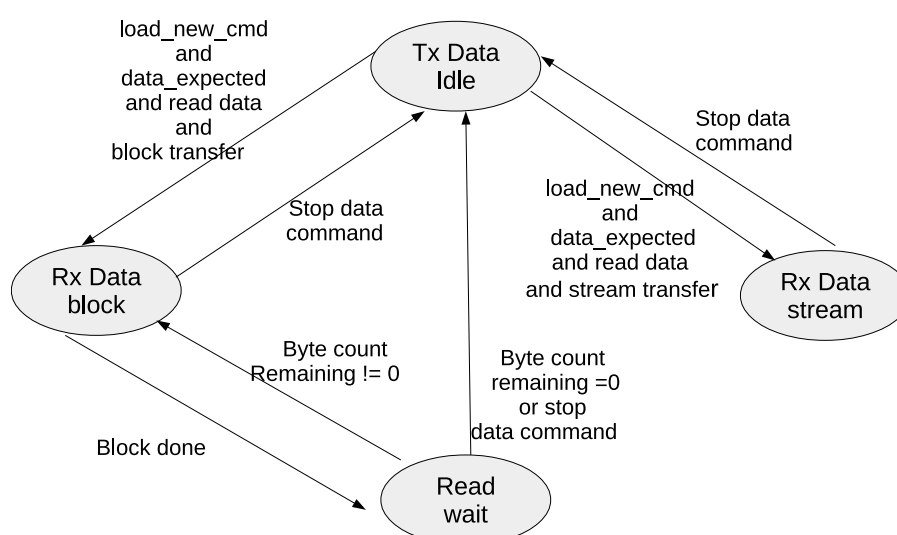

Figure 49.4-4. Data Receive State Machine

## 49.5 Software Restrictions for CIU Operations

- Only one card at a time can be selected to execute a command or data transfer. For example, when data are being transferred to or from a card, a new command must not be issued to another card. A new command, however, can be issued to the same card, allowing it to read the device status or stop the transfer.
- Only one data transfer command can be issued at a time.
- During an open-ended card write operation, if the card clock is stopped because RAM is empty, the software must first fill RAM with data, and start the card clock. Only then can it issue a stop/abort command to the card.
- During an SDIO/Combo card transfer, if the card function is suspended and the software wants to resume the suspended transfer, it must first reset and then release RAM by configuring the [SDHOST\\_FIFO\\_RESET](#) bit, and then issue the resume command as if it were a new data transfer command.
- When issuing card reset commands (CMD0, CMD15 or CMD52\_reset) while a card data transfer is in progress, the software must set the [SDHOST\\_STOP\\_ABORT\\_CMD](#) bit in the [SDHOST\\_CMD\\_REG](#) register, so that the CIU can stop the data transfer after issuing the card reset command.
- When the controlling bit for end bit error is set in the [SDHOST\\_RINTSTS\\_REG](#) register, the CIU cannot control SDIO interrupts. In such a case, the software must ignore SDIO interrupts and issue a stop/abort command to the card, so that the card stops transmitting data.
- If the card clock is stopped because RAM is full during a card read, the software must read at least two RAM addresses to restart the card clock.
- Only one CE-ATA device at a time can be selected for a command or data transfer. For example, when data are transferred from a CE-ATA device, a new command must not be sent to another CE-ATA device.
- If the CE-ATA device interrupts are enabled (nIEN=0), a new SDHOST\_RW\_BLK command must not be sent to the same device if the execution of a SDHOST\_RW\_BLK command is already in progress. Only the Command Completion Signal Disable (CCSD) command can be sent while waiting for the Command Completion Signal (CCS).
- If, however, the CE-ATA device interrupts are disabled (nIEN=1), a new command can be issued to the same device, allowing it to read status information.
- Open-ended transfers are not supported for CE-ATA devices.
- The sdhost\_send\_auto\_stop signal is not supported (software must not set the [SDHOST\\_SEND\\_AUTO\\_STOP](#) bit) for CE-ATA transfers.

After configuring the command start bit to 1, the values of the following registers cannot be changed before a command has been issued:

- CMD - command
- CMDARG - command argument
- BYTCNT - byte count
- BLKSIZ - block size
- CLKDIV - clock divider

- CKLENA - clock enable
- CLKSRC - clock source
- TMOUT - timeout
- CTYPE - card type

## 49.6 RAM for Receiving and Transmitting Data

The submodule RAM is a buffer area for transmitting and receiving data. It can be divided into two units: one is for transmitting data, and the other is for receiving data. The process of transmitting and receiving data can be achieved by the CPU and DMA for reading and writing. The latter method is described in detail in Section [49.8](#).

### 49.6.1 TX RAM Module

There are two ways to enable a write operation: CPU and DMA write.

For CPU write operations to TX RAM, write the data directly into the [SDHOST\\_BUFFIFO\\_REG](#) register via the APB interface. The corresponding FIFO width is 32 bits and the depth is 512.

For DMA write operations to TX RAM, set up DMA linked list descriptors as described in Section [49.8](#).

### 49.6.2 RX RAM Module

There are two ways to enable a read operation: CPU and DMA read.

For CPU read operations from RX RAM, read the data directly from the [SDHOST\\_BUFFIFO\\_REG](#) register via the APB interface. The corresponding FIFO width is 32 bits and the depth is 512.

For DMA read operations from RX RAM, set up DMA linked list descriptors as described in Section [49.8](#).

## 49.7 DMA Linked List

Each unit in the linked list structure consists of two parts: a descriptor and a data buffer. In other words, each descriptor points to a unique data buffer and to the next descriptor in the linked list. Figure [49.7-1](#) shows the linked list.

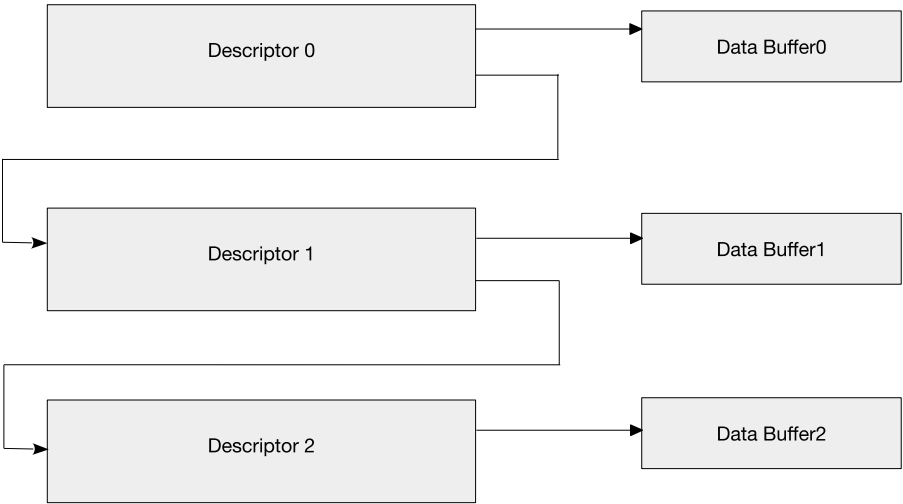

Figure 49.7-1. Linked List Structure

49.8 DMA Descriptor Format

Each descriptor consists of four words as shown in 49.8-1. Table 49.8-1, Table 49.8-2, Table 49.8-3, Table 49.8-4 provide the descriptions of these four words.

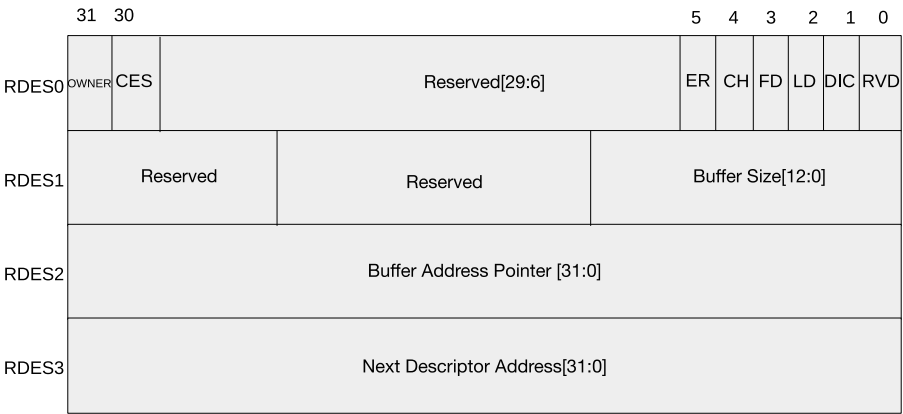

Figure 49.8-1. Descriptor Format

The DES0 field contains control and status information.

Table 49.8-1. DES0 Descriptor Field

| Bits | Name  | Description  |
|------|-------|--|
| 31   | OWNER | When set to 1, this bit indicates that the descriptor is owned by the DMA Controller. When reset to 0, it indicates that the descriptor is owned by the host. The DMA clears this bit when it completes the data transfer. |

| Bits | Name                                  | Description  |
|------|---------------------------------------|--|
| 30   | CES (Card Error Summary)              | <p>This bit indicates the status of the card's read/write operations.</p> <p>This bit is the logical OR of the following bits in the <a href="#">SDHOST_RINTSTS_REG</a> register.</p> <ul style="list-style-type: none"> <li>• EBE: End Bit Error</li> <li>• RTO: Response Timeout</li> <li>• RCRC: Response CRC</li> <li>• SBE: Start Bit Error</li> <li>• DRTO: Data Read Timeout</li> <li>• DCRC: Data CRC for Receive</li> <li>• RE: Response Error</li> </ul> |
| 29:6 | Reserved                              | Reserved   |
| 5    | ER (End of Ring)                      | When set to 1, this bit indicates that the linked list has reached its final descriptor. The DMA Controller then returns to the base address of the linked list, creating a linked list ring.  |
| 4    | CH (Second Address Chained)           | When set to 1, this bit indicates that the second address in the descriptor is the next descriptor address. When this bit is set to 1, BS2 (DES1[25:13]) must be all zeros.  |
| 3    | FD (First Descriptor)                 | When set to 1, this bit indicates that this descriptor contains the first buffer of the data. If the size of the first buffer is 0, the next descriptor contains the beginning of the data.  |
| 2    | LD (Last Descriptor)                  | This bit is associated with the last data block of a DMA transfer. When set to 1, the bit indicates that the buffers pointed by this descriptor are the last buffers of the data. After this descriptor is completed, the remaining byte count is 0. In other words, after the descriptor with the LD bit set is completed, the remaining byte count should be 0.  |
| 1    | DIC (Disable Interrupt on Completion) | When set to 1, this bit prevents the setting of the TI/RI bit of the DMA Status Register ( <a href="#">SDHOST_IDSTS_REG</a> ) for the data that ends in the buffer pointed by this descriptor.   |
| 0    | Reserved                              | Reserved   |

The DES1 field contains the buffer size.

**Table 49.8-2. DES1 Descriptor Field**

| Bits  | Name     | Description |
|-------|----------|-------------|
| 31:26 | Reserved | Reserved    |
| 25:13 | Reserved | Reserved    |

| Bits | Name             | Description  |
|------|------------------|--|
| 12:0 | BS (Buffer Size) | These bits indicate the size of the data buffer byte size, which must be a multiple of four. When the buffer size is not a multiple of four, the resulting behavior is undefined. This field must not be zero. |

The DES2 field contains the address pointer to the data buffer.

**Table 49.8-3. DES2 Descriptor Field**

| Bits | Name                   | Description  |
|------|------------------------|--|
| 31:0 | Buffer Address Pointer | These bits indicate the address of the data buffer. The buffer address must be word-aligned. |

The DES3 field contains the address pointer to the next descriptor if the present descriptor is not the last one in a linked list structure.

**Table 49.8-4. DES3 Descriptor Field**

| Bits | Name                    | Description  |
|------|-------------------------|--|
| 31:0 | Next Descriptor Address | If CH (DESO[4]) is set to 1, these bits contains the pointer to the next descriptor.<br>If this is not the last descriptor in a linked list structure, bits 1 and 0 must be zero, i.e., DES3[1:0] = 0. |

## 49.9 Programming Procedures

### 49.9.1 Initializing Registers

To initialize registers, perform the following steps:

1. Write to the control register [SDHOST\\_CTRL\\_REG](#), the raw interrupt register [SDHOST\\_RINTSTS\\_REG](#), and SDIO interrupt mask register [SDHOST\\_INTMASK\\_REG](#) to clear pending interrupts and configure controlling and interrupt parameters.
2. Write clock divider configuration register [SDHOST\\_CLKDIV\\_REG](#), clock source selection register [SDHOST\\_CLKSRC\\_REG](#), and clock enable register [SDHOST\\_CLKENA\\_REG](#) to configure the card clock.
3. Write other configuration registers based on card parameters. For example, configure
  - card bus width ([SDHOST\\_CTYPE\\_REG](#))
  - user ID ([SDHOST\\_USRID\\_REG](#))
  - UHS mode voltage and DDR ([SDHOST\\_UHS\\_REG](#))
  - EMMC mode start bit ([SDHOST\\_EMMCDDR\\_REG](#))
  - SDIO mode ([SDHOST\\_CLK\\_EDGE\\_SEL\\_REG](#))
  - timeout value ([SDHOST\\_TMOUT\\_REG](#))

- debounce filter ([SDHOST\\_DEBNCE\\_REG](#))
- internal phase shift ([SDHOST\\_ENSHIFT\\_REG](#))

You can reset the card with [SDHOST\\_RST\\_N\\_REG](#).

## 49.9.2 Sending Commands

To send commands, perform the following steps:

1. Write the command argument register [SDHOST\\_CMDARG\\_REG](#) with the appropriate command argument parameter.
2. For data transfer, write the data size register [SDHOST\\_BYTCNT\\_REG](#), the block size register [SDHOST\\_BLKSIZE\\_REG](#) register, and the card threshold control register [SDHOST\\_CARDTHRCTL\\_REG](#) to configure data transfer parameters.
3. Data transfer can be achieved by DMA or FIFO, and DMA is preferable.
  - To transmit and receive data via DMA, configure the DMA Controller according to Section [49.9.3](#), Section [49.9.4](#), and Section [49.9.5](#).
  - To transmit and receive data via FIFO, configure the FIFO threshold via FIFO configuration register [SDHOST\\_FIFOTH\\_REG](#). For writing to a card, software should write data to the FIFO via [SDHOST\\_BUFFIFO\\_REG](#) continuously during command execution.
4. Configure and start the command via the [SDHOST\\_CMD\\_REG](#).
5. Wait until the [SDHOST\\_START\\_CMD](#) bit in the [SDHOST\\_CMD\\_REG](#) register is cleared by hardware upon command reception. When hardware cannot receive the command, it will set the 12th bit HLE in the [SDHOST\\_RINTSTS\\_REG](#) register to 1.
6. Read the [SDHOST\\_RINTSTS\\_REG](#) register or enable interrupts to check command execution status. If needed, read the [SDHOST\\_RESP<sub>n</sub>\\_REG](#) (*n* ranges from 0 ~ 3) register to get command response from the card.
7. If data is read from the card via FIFO, software can get the data returned by the card via reading the [SDHOST\\_BUFFIFO\\_REG](#) register.

Please refer to the card specification for the command format, and configure register field values depending on the command format.

## 49.9.3 Initializing DMA

To initialize the DMA Controller, perform the following steps:

1. Write to the DMA bus mode register ([SDHOST\\_BMOD\\_REG](#)) to configure the host bus's access parameters.
2. Write to the DMA interrupt enable register ([SDHOST\\_IDINTEN\\_REG](#)) to mask unnecessary interrupt causes.
3. Create either a transmit or receive linked list. Then write the starting address of the first descriptor in the linked list to the DMA Controller's linked list base address register ([SDHOST\\_DBADDR\\_REG](#)).
4. The DMA Controller engine proceeds to get descriptors from the linked list.

## 49.9.4 Initializing DMA Transmission

To initialize DMA transmission, perform the following steps:

1. The host sets up the descriptor fields (DESO-DES3) for transmission, and sets the OWNER bit (DESO[31]) to 1. The host also prepares the data buffer.
2. The host writes the write data command to the command register [SDHOST\\_CMD\\_REG](#).
3. The host sets the required transmit threshold via the [SDHOST\\_TX\\_WMARK](#) field in the [SDHOST\\_FIFOTH\\_REG](#) register.
4. The DMA Controller engine fetches the descriptor and checks the OWNER bit. If the OWNER bit is not set, it means that the host owns the descriptor. In this case, the DMA Controller enters a suspend state and asserts the Descriptor Unable interrupt via the [SDHOST\\_IDSTS\\_REG](#) register. The host then needs to release the DMA Controller by writing any value to [SDHOST\\_PLDMND\\_REG](#).
5. The DMA Controller waits for the Command Done (CMDD) bit in the [SDHOST\\_RINTSTS\\_REG](#) register to be set to 1 with no errors from BIU, which indicates that a transfer has completed.
6. The DMA Controller engine waits for a DMA interface request from BIU. This request is generated based on the configured transmit threshold value. For the last byte of data that cannot be accessed using a burst, a single transfer is performed on the AHB bus.
7. The DMA Controller fetches the transmit data from the data buffer in the host memory and transfers them to RAM in preparation for transmission to the card.
8. When data span across multiple descriptors, the DMA Controller fetches the next descriptor and continues with its operation with the next descriptor. The Last Descriptor bit indicates whether the data span multiple descriptors or not.
9. When data transmission is complete, the status information is updated in the [SDHOST\\_IDSTS\\_REG](#) register by setting the [SDHOST\\_IDSTS\\_TI](#) bit to 1 if it has already been enabled. Also, the OWNER bit is cleared by the DMA Controller by updating the DESO field.

## 49.9.5 Initializing DMA Reception

To initialize DMA reception, perform the following steps:

1. The host sets up the descriptor fields (DESO-DES3) for reception, and sets the OWNER bit (DESO[31]) to 1.
2. The host writes the read data command in the [SDHOST\\_CMD\\_REG](#) register in BIU.
3. The host sets the required receive threshold level via the [SDHOST\\_RX\\_WMARK](#) field in the [SDHOST\\_FIFOTH\\_REG](#) register.
4. The DMA Controller engine fetches the descriptor and checks the OWNER bit. If the OWNER bit is not set, it means that the host owns the descriptor. In this case, the DMA enters suspend state and asserts the Descriptor Unable interrupt via the [SDHOST\\_IDSTS\\_REG](#) register. The host then needs to release the DMA Controller by writing any value to [SDHOST\\_PLDMND\\_REG](#).
5. The DMA Controller waits for the Command Done (CMDD) bit in the [SDHOST\\_RINTSTS\\_REG](#) register to be set to 1 with no errors from BIU, which indicates that a reception has been completed.

6. The DMA Controller engine waits for a DMA interface request from BIU. This request is generated based on the configured receive threshold value. For the last byte of data that cannot be accessed using a burst, a single transfer is performed on the AHB bus.
7. The DMA Controller fetches the data from RAM and transfers them to the host memory.
8. When data span across multiple descriptors, the DMA Controller fetches the next descriptor and continues with its operation with the next descriptor. The Last Descriptor bit indicates whether the data span multiple descriptors or not.
9. When data reception is complete, the status information is updated in the [SDHOST\\_IDSTS\\_REG](#) register by setting the [SDHOST\\_IDSTS\\_RI](#) bit to 1, if it has already been enabled. Also, the OWNER bit is cleared by the DMA Controller by updating the DESO field.

## 49.10 Clock Phase Selection

The phase of the SD/MMC Host Controller clock source is configurable, so as to adjust the setup time sequence for the input or output data signals.

The clock source of the SD/MMC Host Controller can be a high-performance clock at a high frequency or a low-power clock at a low frequency. When the clock source is a high-performance clock, the internal signal clock phase, output signal driving clock phase, and input signal sampling clock phase can be configured via the [SDHOST\\_DLL\\_CLK\\_CONF\\_REG](#), in the unit of 1/64 clock source period. When the clock source is a low-power clock, the internal signal clock phase, output signal driving clock phase, and input signal sampling clock phase can be configured via the system clock register. The phase options are 0 degrees, 90 degrees, 180 degrees, and 270 degrees, or in other words the unit is 1/4 clock source period.

For details, please see Chapter 9 [Reset and Clock](#).

## 49.11 Interrupt

The SD/MMC Host Controller can generate interrupt signal SDIO\_HOST\_INTR triggered by the following interrupt sources, and send the interrupt signals to the [Interrupt Matrix](#).

- SDIO\_INT: Interrupts from SDIO cards
- EBE: Triggered when an error in end bit occurs, or no data CRC received
- ACD: Triggered when an automatically sent command has been executed
- SBE/BCI: Triggered when an error in the start bit occurs
- HLE: Triggered when a write error occurs during hardware-lock period
- FRUN: Triggered when the FIFO is empty or full
- HTO: Triggered when the host does not fill data before timeout period
- DRTO: Triggered when a data read operation times out
- RTO: Triggered when card response times out
- DCRC: Triggered when data CRC error occurs
- RCRC: Triggered when a card response CRC error occurs

- RXDR: Triggered during read operations from card when FIFO level is greater than Receive-Threshold level
- TXDR: Triggered during write operations to card when FIFO level reaches less than or equal to Transmit-Threshold level.
- DTO: Triggered when data transfer completes
- CMDD: Triggered when a command has been executed
- RE: Triggered when response error occurs
- CD: Triggered when a card is detected
- IDSTS\_RI: Triggered when data pointed by a DMA descriptor list have been received
- IDSTS\_TI: Triggered when data pointed by a DMA descriptor list have been transmitted
- IDSTS\_FBE: Triggered when a fatal bus error occurs and the host is stopped during data transmission or reception. When triggered, the DMA disables all bus access.
- IDSTS\_DU: Triggered when a DMA descriptor list is not available because the OWNER bit is 0 (DESO [31] = 0)

The [SDHOST\\_RINTSTS\\_REG](#) and [SDHOST\\_IDSTS\\_REG](#) register contains all the bits that might cause an interrupt. The [SDHOST\\_INTMASK\\_REG](#) and [SDHOST\\_IDINTEN\\_REG](#) register contains an enable bit for each of the events that can cause an interrupt.

There are three interrupt summary bits in the [SDHOST\\_IDSTS\\_REG](#) register: the card error interrupt summary bit (bit 5 [SDHOST\\_IDSTS\\_CES](#)), the normal interrupt summary bit (bit 8 [SDHOST\\_IDSTS\\_NIS](#)), and the abnormal interrupt summary bit (bit 9 [SDHOST\\_IDSTS\\_AIS](#)). Interrupts are cleared by writing 1 to the corresponding bit. When all the enabled interrupts within a group are cleared, the corresponding summary bit is also cleared.

Interrupts are not queued. If another interrupt event occurs before the driver has responded to the previous interrupt, no additional interrupts are generated. For example, the [SDHOST\\_IDSTS\\_RI](#) indicates that one or more data were transferred to the host buffer.

An interrupt is generated only once for simultaneous multiple events. The driver must scan the [SDHOST\\_RINTSTS\\_REG](#) and [SDHOST\\_IDSTS\\_REG](#) register for the interrupt cause.

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter [11 Interrupt Matrix](#) > Section [11.2 Interrupt Terminology in ESP32-P4](#).

## 49.12 Register Summary

The addresses in this section are relative to the SD/MMC Host Controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name                                    | Description                             | Address | Access |
|---|---|---------|--------|
| <b>Configuration registers</b>          |   |         |        |
| <a href="#">SDHOST_CTRL_REG</a>         | Control register                        | 0x0000  | R/W    |

| <a href="#">SDHOST_TBBCNT_REG</a>          | Transferred byte count                        | 0x0060  | RO     |
| <a href="#">SDHOST_DSCADDR_REG</a>         | Host descriptor address pointer               | 0x0094  | RO     |
| <a href="#">SDHOST_BUFADDR_REG</a>         | Host buffer address pointer                   | 0x0098  | RO     |
| <b>Transmit and receive data registers</b> |   |         |        |
| <a href="#">SDHOST_BUFFIFO_REG</a>         | Software write and read transmit data by FIFO | 0x0200  | R/W    |

## 49.13 Registers

The addresses in this section are relative to the SD/MMC Host Controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

**Register 49.1. SDHOST\_CTRL\_REG (0x0000)**

|            |   |   |   |   |   |                          |    |    |   |   |   |   |   |   |   |            |    |    |   |   |   |  |   |   |   |   |   |   |       |  |  |
|------------|---|---|---|---|---|--------------------------|----|----|---|---|---|---|---|---|---|------------|----|----|---|---|---|--|---|---|---|---|---|---|-------|--|--|
| (reserved) |   |   |   |   |   | SDHOST_USE_INTERNAL_DMAC |    |    |   |   |   |   |   |   |   | (reserved) |    |    |   |   |   | SDHOST_CEATA_DEVICE_INTERRUPT_STATUS<br>SDHOST_SEND_AUTO_STOP_CCSD<br>SDHOST_SEND_ABORT_READ_DATA<br>SDHOST_SEND_IRQ_RESPONSE<br>(reserved)<br>(reserved)<br>SDHOST_INT_ENABLE<br>SDHOST_DMA_RESET<br>SDHOST_FIFO_RESET<br>SDHOST_CONTROLLER_RESET |   |   |   |   |   |   |       |  |  |
| 31         |   |   |   |   |   | 26                       | 25 | 24 |   |   |   |   |   |   |   | 12         | 11 | 10 | 9 | 8 | 7 | 6  | 5 | 4 | 3 | 2 | 1 | 0 | Reset |  |  |
| 0          | 0 | 0 | 0 | 0 | 0 | 0                        | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0          | 0  | 0  | 0 | 0 | 0 | 0  | 0 | 0 | 0 | 0 | 0 |   |       |  |  |

**SDHOST\_CONTROLLER\_RESET** Configures whether to reset the controller. This bit is auto-cleared after controller reset.

0: No effect

1: Reset

(R/W)

**SDHOST\_FIFO\_RESET** Configures whether to reset FIFO. This bit is auto-cleared after FIFO reset.

0: No effect

1: Reset

(R/W)

**SDHOST\_DMA\_RESET** Configures whether to reset DMA interface. This bit is auto-cleared after DMA reset.

0: No effect

1: Reset

(R/W)

**SDHOST\_INT\_ENABLE** Write 1 to enable global interrupt port. (R/W)

**SDHOST\_READ\_WAIT** Configures whether to send read-wait to SDIO cards.

0: Clear read wait

1: Assert read wait

(R/W)

Continued on the next page...

**Register 49.1. CTRL\_REG (0x0000)**

Continued from the previous page...

**SDHOST\_SEND\_IRQ\_RESPONSE** Configures whether to send auto interrupt request (IRQ) response.

This bit automatically clears once a response is sent.

To wait for MMC card interrupts, the host issues a CMD40 command and waits for an interrupt response from MMC card(s). In the meantime, if the host wants SD/MMC to exit waiting for the interrupt state, it can set this bit, at which time SD/MMC command state-machine sends a CMD40 response on the bus and returns to the idle state.

0: No effect

1: Send auto IRQ response

(R/W)

**SDHOST\_ABORT\_READ\_DATA** Configures whether to abort read data. This bit is automatically cleared once the data state machine is reset to idle.

After a suspend-command is issued during a read-operation, software polls the card to find when the suspend-event occurred. Once the suspend-event has occurred, software sets the bit which will reset the data state machine that is waiting for the next block of data.

0: No effect

1: Abort read data

(R/W)

**SDHOST\_SEND\_CCSD** Configures whether to send Command Completion Signal Disable (CCSD) to CE-ATA device. Once the CCSD pattern is sent to the device, SD/MMC automatically clears the SDHOST\_SEND\_CCSD bit. It also sets the Command Done (CD) bit in the SDHOST\_RINTSTS\_REG register.

Software sets this bit only if the current command is expecting CCS (that is, RW\_BLK), and if interrupts are enabled for the CE-ATA device.

0: No effect

1: Send CCSD to CE-ATA device

(R/W)

**SDHOST\_SEND\_AUTO\_STOP\_CCSD** Configures whether to send an internally-generated STOP command (CMD12) to the CE-ATA device. After sending the CCSD, SD/MMC automatically clears the SDHOST\_SEND\_AUTO\_STOP\_CCSD bit. After sending this internally-generated STOP command, the Auto Command Done (ACD) bit in SDHOST\_RINTSTS\_REG is set.

Always Set SDHOST\_SEND\_AUTO\_STOP\_CCSD and SDHOST\_SEND\_CCSD bits together, SDHOST\_SEND\_AUTO\_STOP\_CCSD should not be set independently of SDHOST\_SEND\_CCSD.

0: No effect

1: Send internally-generated STOP command (CMD12) to the CE-ATA device

(R/W)

Continued on the next page...

**Register 49.1. CTRL\_REG (0x0000)**

Continued from the previous page...

**SDHOST\_CEATA\_DEVICE\_INTERRUPT\_STATUS** Write 1 to enable interrupts in CE-ATA device (nIEN = 0 in ATE control register).

Software should appropriately write to this bit after the power-on reset or any other reset to the CE-ATA device. After reset, the CE-ATA device's interrupt is usually disabled (nIEN = 1). If the host enables the CE-ATA device's interrupt, then software should set this bit. (R/W)

**SDHOST\_USE\_INTERNAL\_DMACH** Configures whether to use DMA for data transfer.

0: Not use

1: Use

(R/W)

**Register 49.2. SDHOST\_CLKDIV\_REG (0x0008)**

|                     |  |  |  |  |  |  |  |                     |  |  |  |  |  |  |  |                     |  |  |  |  |  |  |  |                     |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |
|---------------------|--|--|--|--|--|--|--|---------------------|--|--|--|--|--|--|--|---------------------|--|--|--|--|--|--|--|---------------------|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|
| SDHOST_CLK_DIVIDER3 |  |  |  |  |  |  |  | SDHOST_CLK_DIVIDER2 |  |  |  |  |  |  |  | SDHOST_CLK_DIVIDER1 |  |  |  |  |  |  |  | SDHOST_CLK_DIVIDER0 |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |
| 31                  |  |  |  |  |  |  |  | 24                  |  |  |  |  |  |  |  | 23                  |  |  |  |  |  |  |  | 16                  |  |  |  |  |  |  |  | 15    |  |  |  |  |  |  |  | 8 |  |  |  |  |  |  |  | 7 |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |
| 0x0                 |  |  |  |  |  |  |  | 0x0                 |  |  |  |  |  |  |  | 0x0                 |  |  |  |  |  |  |  | 0x0                 |  |  |  |  |  |  |  | Reset |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |

**SDHOST\_CLK\_DIVIDER0** Configures clock divider0 value. Clock divisor is  $2^n$ , where  $n = 0$  bypasses the divider (divisor of 1). For example, a value of 1 means divided by  $2^1 = 2$ , a value of 0xFF means divided by  $2^{255} = 510$ , and so on. (R/W)

**SDHOST\_CLK\_DIVIDER1** Configures clock divider1 value. Clock divisor is  $2^n$ , where  $n = 0$  bypasses the divider (divisor of 1). For example, a value of 1 means divided by  $2^1 = 2$ , a value of 0xFF means divided by  $2^{255} = 510$ , and so on. (R/W)

**SDHOST\_CLK\_DIVIDER2** Configures clock divider2 value. Clock divisor is  $2^n$ , where  $n = 0$  bypasses the divider (divisor of 1). For example, a value of 1 means divided by  $2^1 = 2$ , a value of 0xFF means divided by  $2^{255} = 510$ , and so on. (R/W)

**SDHOST\_CLK\_DIVIDER3** Configures clock divider3 value. Clock divisor is  $2^n$ , where  $n = 0$  bypasses the divider (divisor of 1). For example, a value of 1 means divided by  $2^1 = 2$ , a value of 0xFF means divided by  $2^{255} = 510$ , and so on. (R/W)

### Register 49.3. SDHOST\_CLKSRC\_REG (0x000C)

Diagram illustrating the SDHOST\_CLKSRC\_REG register structure. The register is 32 bits wide, divided into three fields:

- Reserved:** 28 bits (bits 31-4), labeled "(reserved)".
- SDHOST\_CLKSRC:** 4 bits (bits 3-0), labeled "SDHOST\_CLKSRC\_REG".
- Reset:** 4 bits (bits 3-0), labeled "Reset", with a value of 0x0.

**SDHOST\_CLKSRC\_REG** Configures clock divider source for two SD cards. Each card has two bits assigned to it. For example, bit[1:0] are assigned to card 0, and bit[3:2] are assigned to card 1. Card 1/0 maps and internally routes clock divider[0:3] outputs to cclk\_out[1:0] pins, depending on bit value. For every card's clock divider source:

0x0: Clock divider 0

0x1: Clock divider 1

0x2: Clock divider 2

0x3: Clock divider 3

(R/W)

#### Register 49.4. SDHOST\_CLKENA\_REG (0x0010)

[illegible]

**SDHOST\_CCLK\_ENABLE** Configures whether to enable two SD card clocks or one MMC card clock.

One bit per card. For every card's bit:

0: Clock disabled

1: Clock enabled

(R/W)

**SDHOST\_LP\_ENABLE** Configures whether to disable the clock when the card is in an IDLE state.

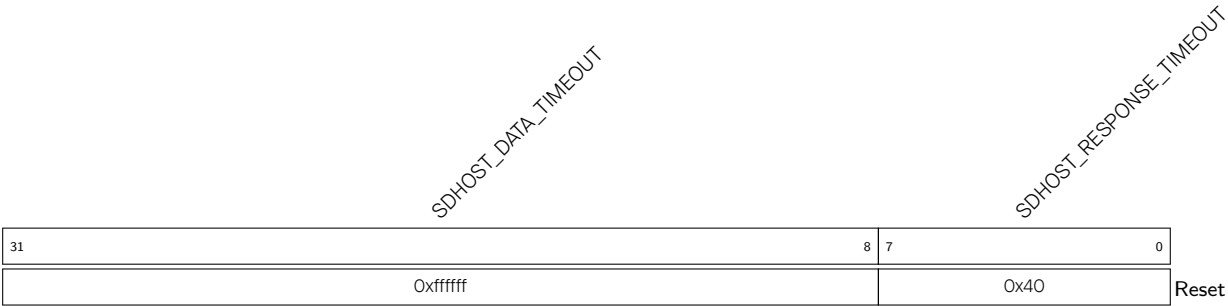

One bit per card. For every card's bit:

0: Clock disabled

1: Clock enabled

(R/W)

Register 49.5. SDHOST\_TMOUT\_REG (0x0014)

**SDHOST\_RESPONSE\_TIMEOUT** Configures response timeout value. Measurement unit: Card output clock period. (R/W)

**SDHOST\_DATA\_TIMEOUT** Configures card data read timeout value. This value is also used for data starvation by host timeout. The timeout counter is started only after the card clock is stopped. Measurement unit: Card output clock period.

NOTE: The software timer should be used if the timeout value is in the order of 100 ms. In this case, read data timeout interrupt (DRT0) needs to be disabled.  
(R/W)

Register 49.6. SDHOST\_CTYPE\_REG (0x0018)

**SDHOST\_CARD\_WIDTH4** Configures whether the card is 1-bit or 4-bit mode. One bit per card. Bit[0] corresponds to card[0]. For every card's bit:

- 0: 1-bit mode
- 1: 4-bit mode

(R/W)

**SDHOST\_CARD\_WIDTH8** Configures whether the card is 8-bit mode. One bit per card. Bit[0] corresponds to card[0]. For every card's bit:

- 0: Non 8-bit mode
- 1: 8-bit mode

(R/W)

**Register 49.7. SDHOST\_BLKSIZE\_REG (0x001C)**

**SDHOST\_BLOCK\_SIZE** Configures the Block Size. (R/W)

**Register 49.8. SDHOST\_BYTCNT\_REG (0x0020)**

**SDHOST\_BYTE\_COUNT** Configures the number of bytes to be transferred, should be an integral multiple of Block Size for block transfers. For data transfers of undefined byte lengths, the byte count should be set to 0. When the byte count is set to 0, it is the responsibility of the host to explicitly send a stop/abort command to terminate data transfer. (R/W)

**Register 49.9. SDHOST\_CMDARG\_REG (0x0028)**

**SDHOST\_CMDARG\_REG** Configures the value indicates the command argument to be passed to the card. (R/W)

**Register 49.10. SDHOST\_CMD\_REG (0x002C)**

|                                |    |    |    |   |    |   |    |   |    |    |     |                    |    |    |    |   |    |    |   |                  |   |   |     |   |       |
|--------------------------------|----|----|----|---|----|---|----|---|----|----|-----|--------------------|----|----|----|---|----|----|---|------------------|---|---|-----|---|-------|
| SDHOST_START_CMD<br>(reserved) |    |    |    | SDHOST_USE_HOLE_REG<br>SDHOST_VOLT_SWITCH<br>(reserved) |    |   |    | SDHOST_CCS_EXPECTED<br>SDHOST_READ_CEATA_DEVICE<br>SDHOST_UPDATE_CLOCK_REGISTERS_ONLY |    |    |     | SDHOST_CARD_NUMBER |    |    |    | SDHOST_SEND_INITIALIZATION<br>SDHOST_STOP_ABORT_CMD<br>SDHOST_WAIT_PRIVDATA_COMPLETE<br>SDHOST_SEND_AUTO_STOP<br>SDHOST_TRANSFER_MODE<br>SDHOST_READ_WRITE<br>SDHOST_DATA_EXPECTED<br>SDHOST_CHECK_RESPONSE CRC<br>SDHOST_RESPONSE_LENGTH<br>SDHOST_RESPONSE_EXPECT |    |    |   | SDHOST_CMD_INDEX |   |   |     |   |       |

**SDHOST\_CMD\_INDEX** Configures the Command index send to card. (R/W)

**SDHOST\_RESPONSE\_EXPECT** Configures whether to expect response from card.

0: No response expected from card

1: Response expected from card

(R/W)

**SDHOST\_RESPONSE\_LENGTH** Configures response length from card.

0: Short response expected from card

1: Long response expected from card

(R/W)

**SDHOST\_CHECK\_RESPONSE\_CRC** Configures whether to check response CRC.

0: Do not check

1: Check response CRC

(R/W)

**SDHOST\_DATA\_EXPECTED** Configures whether to expect data transfer.

0: No data transfer expected

1: Data transfer expected

(R/W)

**SDHOST\_READ\_WRITE** Configures data transfer direction.

0: Read from card

1: Write to card

(R/W)

**SDHOST\_TRANSFER\_MODE** Configures data transfer mode.

0: Block data transfer command

1: Stream data transfer command

(R/W)

**SDHOST\_SEND\_AUTO\_STOP** Configures whether to automatically send stop command.

0: No stop command is sent at the end of data transfer

1: Send stop command at the end of data transfer

(R/W)

Continued on the next page...

**Register 49.10. SDHOST\_CMD\_REG (0x002C)**

Continued from the previous page...

**SDHOST\_WAIT\_PRVDATA\_COMPLETE** Configures whether to send command at once.

0: Send command at once, even if previous data transfer has not completed

1: Wait for previous data transfer to complete before sending Command

(R/W)

**SDHOST\_STOP\_ABORT\_CMD** Configures whether the stop/abort command stops data transfer.

0: Neither stop nor abort command can stop the current data transfer. If abort is sent to the card device currently selected, or the card device is not in data-transfer mode, then bit should be set to 0

1: Stop or abort command intended to stop current data transfer in progress

(R/W)

**SDHOST\_SEND\_INITIALIZATION** Configures whether to send initialization sequence (80 clocks of 1) before sending this command. After powered on, 80 clocks must be sent to card for initialization before sending any commands to card. Bit should be set while sending the first command to card so that the controller will initialize clocks before sending command to card.

0: Do not send initialization sequence before sending this command

1: Send initialization sequence before sending this command

(R/W)

**SDHOST\_CARD\_NUMBER** Configures card number in use, the physical slot number of the card being accessed. In SD-only mode, up to two cards are supported. (R/W)

**SDHOST\_UPDATE\_CLOCK\_REGISTERS\_ONLY** Configures whether to only update clock register value into card clock domain.

Following register values are transferred into card clock domain: SDHOST\_CLKDIV\_REG, SDHOST\_CLRSRC\_REG, and SDHOST\_CLKENA\_REG.

When this bit is set, there will be no Command Done interrupts because no command is sent to SD\_MMC\_CEATA cards.

0: Normal command sequence

1: Do not send commands, just update clock register value into card clock domain

(R/W)

**SDHOST\_READ\_CEATA\_DEVICE** Configures whether to read access CE-ATA device.

This bit is used to disable read data timeout indication while performing CE-ATA read transfers.

0: Host is not performing read access (RW\_REG or RW\_BLK) towards CE-ATA device

1: Host is performing read access (RW\_REG or RW\_BLK) towards CE-ATA device

(R/W)

Continued on the next page...

**Register 49.10. SDHOST\_CMD\_REG (0x002C)**

Continued from the previous page...

**SDHOST\_CCS\_EXPECTED** Configures whether to expect Command Completion Signal (CCS).

0: Interrupts are not enabled in CE-ATA device (nIEN = 1 in ATA control register), or command does not expect CCS from CE-ATA device

1: Interrupts are enabled in CE-ATA device (nIEN = 0), and RW\_BLK command expects CCS from CE-ATA device

(R/W)

**SDHOST\_VOLT\_SWITCH** Configures whether to enable voltage switching.

0: No voltage switching

1: Voltage switching enabled, must be set for CMD11 only

(R/W)

**SDHOST\_USE\_HOLE\_REG** Configures whether to use Hold Register.

0: CMD and DATA sent to card bypassing HOLD Register

1: CMD and DATA sent to card through the HOLD Register

(R/W)

**SDHOST\_START\_CMD** Configures whether to start the command.

0: Not start

1: Start

Once command is served by the CIU, this bit is automatically cleared.

When this bit is set, host should not attempt to write to any command registers. If a write is attempted, hardware lock error is set in raw interrupt register. (R/W/SC)

**Register 49.11. SDHOST\_FIFOTH\_REG (0x004C)**

|            |     |    |    |                                      |     |  |    |            |   |    |    |                 |  |  |  |            |  |  |  |                 |  |  |       |
|------------|-----|----|----|--------------------------------------|-----|--|----|------------|---|----|----|-----------------|--|--|--|------------|--|--|--|-----------------|--|--|-------|
| (reserved) |     |    |    | SDHOST_DMA_MULTIPLE_TRANSACTION_SIZE |     |  |    | (reserved) |   |    |    | SDHOST_RX_WMARK |  |  |  | (reserved) |  |  |  | SDHOST_TX_WMARK |  |  |       |
| 31         | 30  | 28 | 27 | 26                                   |     |  | 16 | 15         |   | 12 | 11 |                 |  |  |  |            |  |  |  |                 |  |  | 0     |
| 0          | 0x0 | 0  |    |                                      | 0x0 |  |    | 0          | 0 | 0  | 0  |                 |  |  |  | 0x0        |  |  |  |                 |  |  | Reset |

**SDHOST\_TX\_WMARK** Configures FIFO threshold watermark level when transmitting data to card.

When FIFO data count is less than or equal to this number, DMA/FIFO request is raised. During end of packet, request or interrupt is generated, regardless of threshold programming.

In non-DMA mode, when transmitting FIFO threshold (TXDR) interrupt is enabled, then interrupt is generated instead of DMA request. During end of packet, on last interrupt, host is responsible for filling FIFO with only the required remaining bytes (not before FIFO is full or after CIU completes data transfers, because FIFO may not be empty).

In DMA mode, at end of packet, if last transfer is less than burst size, DMA controller does single cycles until required bytes are transferred. (R/W)

**SDHOST\_RX\_WMARK** Configures FIFO threshold watermark level when receiving data from card.

When FIFO data count reaches greater than this number, DMA/FIFO request is raised. During end of packet, request is generated regardless of threshold programming in order to complete any remaining data.

In non-DMA mode, when receiver FIFO threshold (RXDR) interrupt is enabled, then interrupt is generated instead of DMA request. During end of packet, interrupt is not generated if threshold programming is larger than any remaining data. It is responsibility of host to read remaining bytes on seeing Data Transfer Done interrupt.

In DMA mode, at end of packet, even if remaining bytes are less than threshold, DMA request does single transfers to flush out any remaining bytes before Data Transfer Done interrupt is set. (R/W)

**SDHOST\_DMA\_MULTIPLE\_TRANSACTION\_SIZE** Configures burst size of multiple transaction, should be programmed same as DMA controller multiple-transaction-size SDHOST\_SRC/DEST\_MSIZ.

0x0: 1-byte transfer

0x1: 4-byte transfer

0x2: 8-byte transfer

0x3: 16-byte transfer

0x4: 32-byte transfer

0x5: 64-byte transfer

0x6: 128-byte transfer

0x7: 256-byte transfer

(R/W)

Register 49.12. SDHOST\_DEBNCE\_REG (0x0064)

**SDHOST\_DEBOUNCE\_COUNT** Configures the number of host clocks (clk) used by debounce filter logic. The typical debounce time is 5 ~ 25 ms to prevent the card instability when the card is inserted or removed. (R/W)

Register 49.13. SDHOST\_USRID\_REG (0x0068)

**SDHOST\_USRID\_REG** Configures user identification, value set by users. Can also be used as a scratchpad register by users. (R/W)

**Register 49.14. SDHOST\_UHS\_REG (0x0074)**

|                             |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                |  |  |                                 |    |    |  |  |  |  |  |  |  |  |  |  |  |  |                 |  |   |       |  |   |   |

| 0 0 0 0 0 0 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0x0            |  |  | 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 |    |    |  |  |  |  |  |  |  |  |  |  |  |  | 0x0             |  |   | Reset |  |   |   |

**SDHOST\_VOLT\_REG** Configures High Voltage mode per card. Bit[0] corresponds to card[0]. For every card bit:

0: 3.3 V VDD

1: 1.8 V VDD

(R/W)

**SDHOST\_DDR\_REG** Configures DDR (double data rate) mode selecton per card. Bit[0] corresponds to card[0]. For every card bit:

0: Non-DDR mdoe

1: DDR mdoe

(R/W)

**Register 49.15. SDHOST\_RST\_N\_REG (0x0078)**

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                   |   |   |       |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------------------|---|---|-------|
| (reserved)  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | SDHOST_CARD_RESET |   |   |       |
| 31  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 2                 | 1 | 0 |       |
| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0x1               |   |   | Reset |

**SDHOST\_CARD\_RESET** Configures hardware reset per card. Bit[0] corresponds to card[0]. These bits cause the cards to enter the pre-idle state, which requires them to be re-initialized. For every card bit:

0: Reset

1: Active mode

(R/W)

**Register 49.16. SDHOST\_BMOD\_REG (0x0080)**

|            |   |   |   |   |   |   |   |   |   |    |                 |   |                |   |            |   |                |   |                 |   |

|            |   |   |   |   |   |   |   |   |   |    | 0x0             |   | 0              | 0 | 0          | 0 | 0              | 0 | 0               | 0 |
|            |   |   |   |   |   |   |   |   |   |    |                 |   |                |   |            |   |                |   | Reset           |   |

**SDHOST\_BMOD\_SWR** Configures whether to reset all DMA internal registers. It is automatically cleared after one clock cycle.

0: No effect

1: Reset

(R/W)

**SDHOST\_BMOD\_FB** Configures whether the AHB Master interface performs fixed burst transfers.

0: Use SINGLE and INCR burst transfer operations

1: Only use SINGLE, INCR4, INCR8 or INCR16 burst transfers

(R/W)

**SDHOST\_BMOD\_DE** Configures whether to enable the DMA.

0: Not enable

1: Enable

(R/W)

**SDHOST\_BMOD\_PBL** Configures the maximum number of beats to be performed in one DMA transaction.

0x0: 1-beat transfer

0x1: 4-beat transfer

0x2: 8-beat transfer

0x3: 16-beat transfer

0x4: 32-beat transfer

0x5: 64-beat transfer

0x6: 128-beat transfer

0x7: 256-beat transfer

(R/W)

**Register 49.17. SDHOST\_PLDMND\_REG (0x0084)**

**SDHOST\_PLDMND\_PD** Configures the DMA FSM to resume normal descriptor fetch operation. If the OWNER bit of a descriptor is not set, the FSM goes to the Suspend state, software needs to write any value into this field for the FSM to resume normal descriptor fetch operation. (WO)

**Register 49.18. SDHOST\_DBADDR\_REG (0x0088)**

**SDHOST\_DBADDR\_REG** Configures the base address of the linked list (First Descriptor). Bit[1:0] are ignored and taken as all-zero by the DMA internally. (R/W)

### Register 49.19. SDHOST\_CARDTHRCTL\_REG (0x0100)

|                          |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |   |   |       |  |  |  |  |  |  |  |  |  |  |  |  |  |   |   |
|--------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|---------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|---|---|-------|--|--|--|--|--|--|--|--|--|--|--|--|--|---|---|
| SDHOST_CARDTHRESHOLD_REG |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | (reserved)                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | SDHOST_CARDCLRINTEN_REG<br>SDHOST_CARDRDTHREN_REG |   |       |  |  |  |  |  |  |  |  |  |  |  |  |  |   |   |
| 31                       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 15                              |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 2   |   |       |  |  |  |  |  |  |  |  |  |  |  |  |  | 1 | 0 |
| 0x00                     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0   | 0 | Reset |  |  |  |  |  |  |  |  |  |  |  |  |  |   |   |

**SDHOST\_CARDRDTHREN\_REG** Configures whether to enable card read threshold.

0: Not enable

1: Enable

(R/W)

**SDHOST\_CARDCLRINTEN\_REG** Configures whether to enable busy clear interrupt generation.

0: Not enable

1: Enable

(R/W)

**SDHOST\_CARDTHRESHOLD\_REG** Configures the card read threshold. Measurement unit: byte.

This field is valid only when SDHOST\_CARDRDTHREN\_REG is set to 1.

The value should be less than the FIFO size 512.(R/W)

### Register 49.20. SDHOST\_EMMCDDR\_REG (0x010C)

Diagram illustrating the structure of the `SDHOST_HALFSTARTBIT_REG` register. The register is 32 bits wide, divided into two main sections:

- Reserved Bits (31-1):** A large section labeled `(reserved)` occupies bits 31 down to bit 1.
- SDHOST\_HALFSTARTBIT\_REG (0):** A single bit field at bit 0, labeled `SDHOST_HALFSTARTBIT_REG`.

The bottom right corner shows the value `0x0` and the label `Reset`.

**SDHOST\_HALFSTARTBIT\_REG** Configures the start bit detection mechanism duration of start bit.

Each bit refers to one card. Set this bit to 1 for eMMC4.5 and above, set to 0 for SD applications.

For eMMC4.5, start bit can be:

0: Full cycle

1: Less than one full cycle

(R/W)

Register 49.21. SDHOST\_ENSHIFT\_REG (0x0110)

**SDHOST\_ENABLE\_SHIFT\_REG** Configures the amount of phase shift provided on the default enables in the design. Two bits are assigned for each card, e.g., bit[1:0] are assigned to card 0. For every card:

- 0x0: Default phase shift
- 0x1: Enables shifted to next immediate positive edge
- 0x2: Enables shifted to next immediate negative edge
- 0x3: Reserved

(R/W)

Register 49.22. SDHOST\_CLK\_EDGE\_SEL\_REG (0x0800)

**SDHOST\_ESDIO\_MODE** Configures whether to enable eSDIO mode.

- 0: Not enable
- 1: Enable

(R/W)

**SDHOST\_ESD\_MODE** Configures whether to enable eSD mode.

- 0: Not enable
- 1: Enable

(R/W)

### Register 49.23. SDHOST\_DLL\_CLK\_CONF\_REG (0x0808)

|                     |  |  |  |  |  |  |  |  |  |                              |  |  |  |  |  |  |  |  |  |                              |  |  |  |  |    |  |  |  |  |                              |  |  |  |  |       |  |  |  |  |            |  |  |  |  |   |  |  |  |  |   |  |   |  |  |

| (reserved)          |  |  |  |  |  |  |  |  |  | SDHOST_DLL_CCLK_IN_SAM_PHASE |  |  |  |  |  |  |  |  |  | SDHOST_DLL_CCLK_IN_DRV_PHASE |  |  |  |  |    |  |  |  |  | SDHOST_DLL_CCLK_IN_SLF_PHASE |  |  |  |  |       |  |  |  |  | (reserved) |  |  |  |  |   |  |  |  |  |   |  |   |  |  |
| 31                  |  |  |  |  |  |  |  |  |  | 21                           |  |  |  |  |  |  |  |  |  | 20                           |  |  |  |  | 15 |  |  |  |  | 14                           |  |  |  |  | 9     |  |  |  |  | 8          |  |  |  |  | 3 |  |  |  |  | 2 |  | 0 |  |  |
| 0 0 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  |  |  | 0                            |  |  |  |  |  |  |  |  |  | 0                            |  |  |  |  | 0  |  |  |  |  | 0                            |  |  |  |  | 0 0 0 |  |  |  |  | Reset      |  |  |  |  |   |  |  |  |  |   |  |   |  |  |

**SDHOST\_DLL\_CCLK\_IN\_SLF\_PHASE** Configures the clock phase of the internal signal when selecting high frequency clock. Unit is 1/64 of clock cycle. (R/W)

**SDHOST\_DLL\_CCLK\_IN\_DRV\_PHASE** Configures the clock phase of the output signal when selecting high frequency clock. Unit is 1/64 of clock cycle. (R/W)

**SDHOST\_DLL\_CCLK\_IN\_SAM\_PHASE** Configures the clock phase of the input signal when selecting high frequency clock. Unit is 1/64 of clock cycle. (R/W)

Register 49.24. SDHOST\_INTMASK\_REG (0x0024)

**SDHOST\_INT\_MASK** Write 1 to correspond bit to enable correspond interrupt. For every bit:

- Bit 15 (EBE): End-bit error/no CRC error
  - Bit 14 (ACD): Auto command done
  - Bit 13 (SBE/BCI): Rx Start Bit Error
  - Bit 12 (HLE): Hardware locked write error
  - Bit 11 (FRUN): FIFO underrun/overflow error
  - Bit 10 (HTO): Data starvation-by-host timeout
  - Bit 9 (DRT0): Data read timeout
  - Bit 8 (RTO): Response timeout
  - Bit 7 (DCRC): Data CRC error
  - Bit 6 (RCRC): Response CRC error
  - Bit 5 (RXDR): Receive FIFO data request
  - Bit 4 (TXDR): Transmit FIFO data request
  - Bit 3 (DTO): Data transfer over
  - Bit 2 (CMDD): Command done
  - Bit 1 (RE): Response error
  - Bit 0 (CD): Card detect
- (R/W)

**SDHOST\_SDIO\_INT\_MASK** Write 1 to correspond bit to enable interrupt from correspond card. One bit per card. Bit[0] corresponds to card[0]. (R/W)

Register 49.25. SDHOST\_MINTSTS\_REG (0x0040)

**SDHOST\_INT\_STATUS\_MSK** The masked interrupt status. For every bit:

- Bit 15 (EBE): End-bit error/no CRC error
- Bit 14 (ACD): Auto command done
- Bit 13 (SBE/BCI): RX Start Bit Error
- Bit 12 (HLE): Hardware locked write error
- Bit 11 (FRUN): FIFO underrun/overflow error
- Bit 10 (HTO): Data starvation by host timeout
- Bit 9 (DTRO): Data read timeout
- Bit 8 (RTO): Response timeout
- Bit 7 (DCRC): Data CRC error
- Bit 6 (RCRC): Response CRC error
- Bit 5 (RXDR): Receive FIFO data request
- Bit 4 (TXDR): Transmit FIFO data request
- Bit 3 (DTO): Data transfer over
- Bit 2 (CMDD): Command done
- Bit 1 (RE): Response error
- Bit 0 (CD): Card detect (RO)

**SDHOST\_SDIO\_INTERRUPT\_MSK** The masked interrupt status from SDIO card. One bit for each card. Bit[0] corresponds to card[0]. (RO)

### Register 49.26. SDHOST\_RINTSTS\_REG (0x0044)

**SDHOST\_INT\_STATUS\_RAW** The raw interrupt status. For every bit:

- Bit 15 (EBE): End-bit error/no CRC error
  - Bit 14 (ACD): Auto command done
  - Bit 13 (SBE/BCI): RX Start Bit Error
  - Bit 12 (HLE): Hardware locked write error
  - Bit 11 (FRUN): FIFO underrun/overflow error
  - Bit 10 (HTO): Data starvation by host timeout
  - Bit 9 (DTRO): Data read timeout
  - Bit 8 (RTO): Response timeout
  - Bit 7 (DCRC): Data CRC error
  - Bit 6 (RCRC): Response CRC error
  - Bit 5 (RXDR): Receive FIFO data request
  - Bit 4 (TXDR): Transmit FIFO data request
  - Bit 3 (DTO): Data transfer over
  - Bit 2 (CMDD): Command done
  - Bit 1 (RE): Response error
  - Bit 0 (CD): Card detect
- (R/WIC)

**SDHOST\_SDIO\_INTERRUPT\_RAW** The raw interrupt status from SDIO card. One bit per card. Bit[0] corresponds to card[0]. (R/W1C)

### Register 49.27. SDHOST\_IDSTS\_REG (0x008C)

[illegible]

**SDHOST\_IDSTS\_TI** The raw interrupt status of Transmit Interrupt. Indicates that data transmission is finished for a descriptor. (R/W1C)

**SDHOST\_IDSTS\_RI** The raw interrupt status of Receive Interrupt. Indicates the completion of data reception for a descriptor. (R/W1C)

**SDHOST\_IDSTS\_FBE** The raw interrupt status of Fatal Bus Error Interrupt. Indicates that a Bus Error occurred (SDHOST\_IDSTS\_REG[12:10]). (R/W1C)

**SDHOST\_IDSTS\_DU** The raw interrupt status of Descriptor Unavailable Interrupt. This bit is set when the descriptor is unavailable due to OWNER bit = 0 (DESO[31] = 0). (R/W1C)

**SDHOST\_IDSTS\_CES** The raw interrupt status of Card Error Summary. Indicates the status of the transaction to/from the card, also present in SDHOST\_RINTSTS\_REG. Indicates the logical OR of the following bits:

EBE: End-bit error/no CRC error

SBE/BCI: RX Start Bit Error

DRT0: Data read timeout

RTO: Response timeout

DCRC: Data CRC error

RCRC: Response CRC error

RE: Response error

The abort condition of the DMA depends on the setting of this field. If this field is enabled, then the DMA aborts on a response error. (R/W1C)

**SDHOST\_IDSTS\_NIS** The raw interrupt status of Normal Interrupt Summary. Logical OR of SDHOST\_IDSTS\_REG[1:0]. Only unmasked bits affect this bit. This is a sticky bit and must be cleared each time a corresponding bit that causes this field to be set is cleared by software. (R/WIC)

**SDHOST\_IDSTS\_AIS** The raw interrupt status of Abnormal Interrupt Summary. Logical OR of SDHOST\_IDSTS\_REG[2], SDHOST\_IDSTS\_REG[4]. Only unmasked bits affect this bit. This is a sticky bit and must be cleared each time a corresponding bit that causes this field to be set is cleared by software. (R/W1C)

**SDHOST\_COMMAND\_FSM\_STATES** Represents the command FSM states.

0x0: Idle  
0x1: Send init sequence  
0x2: Send cmd start bit  
0x3: Send cmd tx bit  
0x4: Send cmd index + arg  
0x5: Send cmd crc7  
0x6: Send cmd end bit  
0x7: Receive resp start bit  
0x8: Receive resp IRQ response  
0x9: Receive resp tx bit  
0xA: Receive resp cmd idx  
0xB: Receive resp data  
0xC: Receive resp crc7  
0xD: Receive resp end bit  
0xE: Cmd path wait NCC  
0xF: Wait, cmd-to-response turnaround  
(RO)

**SDHOST\_DATA\_3\_STATUS** Represents the value of the sdhost\_card\_data[3] signal, which indicates whether card is present.

0: Card not present  
1: Card present  
(RO)

**SDHOST\_DATA\_BUSY** Represents inverted value of the sdhost\_card\_data[0] signal, which indicates card data is busy.

0: Card data not busy  
1: Card data busy  
(RO)

**SDHOST\_DATA\_STATE\_MC\_BUSY** Represents whether the data transmit or receive state-machine is busy.

0: Not busy  
1: Busy  
(RO)

**SDHOST\_RESPONSE\_INDEX** Represents index of previous response, including any auto-stop sent by core. (RO)

**SDHOST\_FIFO\_COUNT** Represents FIFO count, number of filled locations in FIFO. (RO)

Register 49.34. SDHOST\_CDETECT\_REG (0x0050)

**SDHOST\_CARD\_DETECT\_N** Represents value on sdhost\_card\_detect\_n input ports. One bit per card. Bit[0] corresponds to card[0]. (RO)

Register 49.35. SDHOST\_WRTprt\_REG (0x0054)

**SDHOST\_WRITE\_PROTECT** Represents value on sdhost\_card\_write\_prt input ports, one bit per card. Bit[0] corresponds to card[0]. (RO)

Register 49.36. SDHOST\_TCBCNT\_REG (0x005C)

**SDHOST\_TCBCNT\_REG** Represents the number of bytes transferred by the CIU unit to the card. (RO)

**Register 49.37. SDHOST\_TBBCNT\_REG (0x0060)**

**SDHOST\_TBBCNT\_REG** Represents the number of bytes transferred between Host/DMA memory and BIU FIFO. (RO)

**Register 49.38. SDHOST\_DSCADDR\_REG (0x0094)**

**SDHOST\_DSCADDR\_REG** Represents the Descriptor Address Pointer, points to the start address of current descriptor read by DMA. (RO)

**Register 49.39. SDHOST\_BUFADDR\_REG (0x0098)**

**SDHOST\_BUFADDR\_REG** Represents the Buffer Address Pointer, points to the current Data Buffer Address being accessed by the DMA. (RO)

Register 49.40. SDHOST\_BUFFIFO\_REG (0x0200)

**SDHOST\_BUFFIFO\_REG**    Date received or to be transmitted between FIFO and software directly. This register points to the current Data FIFO. (R/W)

## Chapter 50

### LED PWM Controller (LEDC)

#### 50.1 Overview

The LED PWM Controller is a peripheral designed to generate PWM signals for LED control. It has specialized features such as automatic duty cycle fading. However, the LED PWM Controller can also be used to generate PWM signals for other purposes.

#### 50.2 Features

The LED PWM Controller has the following features:

- Eight independent PWM generators (i.e., eight channels)
- Maximum PWM duty cycle resolution: 20 bits
- Four independent timers that support fractional division
- Adjustable phase of PWM signal output
- PWM duty cycle dithering
- Automatic duty cycle fading — gradual increase/decrease of a PWM's duty cycle without interference from the processor. An interrupt will be generated upon fade completion
- Up to 16 duty cycle ranges for each PWM generator to generate gamma curve signals - each range can be independently configured in terms of fading direction (increase or decrease), fading amount (the amount by which the duty cycle increases or decreases each time), the number of fades (how many times the duty cycle fades in one range), and fading frequency
- PWM signal output in low-power mode (Light-sleep mode)
- Event generation and task response related to the Event Task Matrix (ETM) peripheral

Note that the four timers are identical regarding their features and operation. The following sections refer to the timers collectively as Timer $x$  (where  $x$  ranges from 0 to 3). Likewise, the eight PWM generators are also identical in features and operation, and thus are collectively referred to as PWM $n$  (where  $n$  ranges from 0 to 7).

#### 50.3 Architectural Overview

Figure 50.3-1 shows the architecture of the LED PWM Controller.

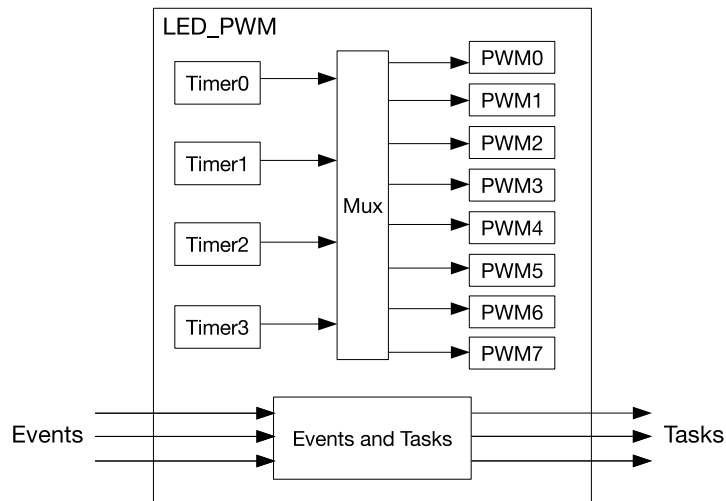

Figure 50.3-1. LED PWM Architecture

Each of the four timers has an internal timebase counter (i.e., a counter that counts on cycles of a reference clock) and thus can be independently configured (i.e., configurable clock divider, and counter overflow value). Each PWM generator selects one of the timers by configuring the `LEDC_TIMER_SEL_CHn`, and uses the timer's counter value `timerx_cnt` as a reference to generate its PWM signal.

Figure 50.3-2 illustrates the main functional blocks of the timer and the PWM generator.

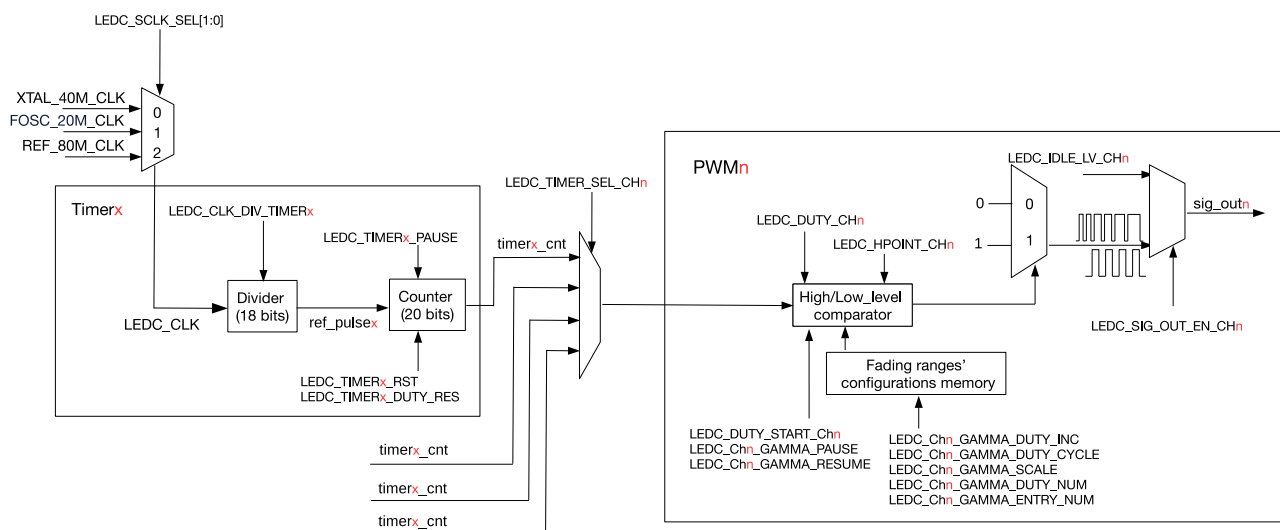

Figure 50.3-2. Timer and PWM Generator Block Diagram

## 50.4 Functional Description

### 50.4.1 Timers

Each timer in LED PWM Controller internally maintains a timebase counter. Referring to Figure 50.3-2, this clock signal used by the timebase counter is named `ref_pulsex`. All timers use the same clock source `LEDC_CLK`, which is then passed through a clock divider to generate `ref_pulsex` for the counter.

### 50.4.1.1 Clock Source

LED PWM registers configured by software are clocked by APB\_CLK. To use the LED PWM peripheral, the APB\_CLK signal going to the LED PWM has to be enabled. The APB\_CLK signal to LED PWM can be enabled by setting the HP\_SYS\_CLKRST\_LEDC\_APB\_CLK\_EN field in the HP\_SYS\_CLKRST\_SOC\_CLK\_CTRL3\_REG register. The LEDC\_CLK signal to LED PWM can be enabled by setting the HP\_SYS\_CLKRST\_LEDC\_CLK\_EN field in the HP\_SYS\_CLKRST\_PERI\_CLK\_CTRL22\_REG register. The LED PWM peripheral can be reset via software by setting the HP\_SYS\_CLKRST\_RST\_EN\_LEDC field in the HP\_SYS\_CLKRST\_HP\_RST\_EN1\_REG register.

Timers in the LED PWM Controller choose their common clock source from one of the following clock signals: XTAL\_40M\_CLK, FOSC\_20M\_CLK, and REF\_80M\_CLK. The procedure for selecting a clock source signal for LEDC\_CLK is described below:

- XTAL\_40M\_CLK: Set PCR\_LEDC\_SCLK\_SEL[1:0] to 0
- FOSC\_20M\_CLK: Set PCR\_LEDC\_SCLK\_SEL[1:0] to 1
- REF\_80M\_CLK: Set PCR\_LEDC\_SCLK\_SEL[1:0] to 2

The LEDC\_CLK signal will then be passed through the clock divider.

For more information, please refer to Chapter 9 [Reset and Clock](#).

### 50.4.1.2 Clock Divider Configuration

The LEDC\_CLK signal is passed through a clock divider to generate the ref\_pulse<sub>x</sub> signal for the counter. The frequency of ref\_pulse<sub>x</sub> is equal to the frequency of LEDC\_CLK divided by the divisor LEDC\_CLK\_DIV (see Figure 50.3-2).

The clock divider is a fractional divider. Thus, the divisor LEDC\_CLK\_DIV can be non-integer values. LEDC\_CLK\_DIV is configured according to the following equation.

$$\text{LEDC\_CLK\_DIV} = A + \frac{B}{256}$$

- The integer part  $A$  corresponds to the most significant 10 bits of LEDC\_CLK\_DIV\_TIMER<sub>x</sub> (i.e., LEDC\_TIMER<sub>x</sub>\_CONF\_REG[22:13])
- The fractional part  $B$  corresponds to the least significant 8 bits of LEDC\_CLK\_DIV\_TIMER<sub>x</sub> (i.e., LEDC\_TIMER<sub>x</sub>\_CONF\_REG[12:5])

When the fractional part  $B$  is 0, LEDC\_CLK\_DIV is equivalent to an integer divisor (i.e., an integer prescaler). In other words, a ref\_pulse<sub>x</sub> clock pulse is generated after every  $A$  number of LEDC\_CLK clock pulses.

However, when  $B$  is not 0, LEDC\_CLK\_DIV becomes a non-integer divisor. The clock divider implements non-integer frequency division by alternating between  $A$  and  $(A+1)$  LEDC\_CLK clock pulses per ref\_pulse<sub>x</sub> clock pulse. In this way, the average frequency of ref\_pulse<sub>x</sub> clock pulse will be the desired frequency (i.e., the non-integer divided frequency). For every 256 ref\_pulse<sub>x</sub> clock pulses:

- A number of  $B$  ref\_pulse<sub>x</sub> clock pulses are generated every  $(A+1)$  LEDC\_CLK clock pulses
- A number of  $(256-B)$  ref\_pulse<sub>x</sub> clock pulses are generated every  $A$  LEDC\_CLK clock pulses
- The ref\_pulse<sub>x</sub> clock pulses generated every  $(A+1)$  pulses are evenly distributed amongst those generated every  $A$  pulses

Figure 50.4-1 illustrates the relation between LEDC\_CLK clock pulses and ref\_pulse $x$  clock pulses when LEDC\_CLK\_DIV is a non-integer value.

**Figure 50.4-1. Frequency Division When LEDC\_CLK\_DIV is a Non-Integer Value**

To change the timer's clock divisor at runtime, first configure the `LEDC_CLK_DIV_TIMER $x$`  field, and then set the `LEDC_TIMER $x$ _PARA_UP` field to apply the new configuration. This will cause the newly configured values to take effect upon the next overflow of the counter. The `LEDC_TIMER $x$ _PARA_UP` field will be automatically cleared by hardware.

### 50.4.1.3 20-Bit Counter

Each timer contains a 20-bit timebase counter that uses ref\_pulse $x$  as its reference clock (see Figure 50.3-2). The `LEDC_TIMER $x$ _DUTY_RES` field configures the actual used bit width of this 20-bit counter. Hence, the maximum resolution of the PWM signal is 20 bits. The counter counts up to  $2^{\text{LEDC\_TIMER}_x\text{\_DUTY\_RES}} - 1$ , overflows and begins counting from 0 again. The counter's value can be read, reset, and suspended by software. Figure 50.4-2 shows the relationship between the counter and PWM resolution.

**Figure 50.4-2. Relationship Between Counter And Resolution**

Every time the counter overflows, it can trigger the `LEDC_TIMER $x$ _OVF_INT` interrupt (generated automatically by hardware without configuration). It can also be configured to trigger `LEDC_OVF_CNT_CH $n$ _INT` interrupt after overflowing `LEDC_OVF_NUM_CH $n$  + 1` times. To configure `LEDC_OVF_CNT_CH $n$ _INT` interrupt, please:

1. Configure `LEDC_TIMER_SEL_CH $n$`  to select the timer for the PWM generator
2. Enable the overflow counter by setting `LEDC_OVF_CNT_EN_CH $n$`
3. Configure `LEDC_OVF_NUM_CH $n$`  with the number of counter overflows (that triggers an interrupt) minus 1
4. Enable the overflow interrupt by setting `LEDC_OVF_CNT_CH $n$ _INT_ENA`
5. Configure `LEDC_TIMER $x$ _DUTY_RES` to specify the counter bit width for the selected Timer $x$  and wait for a `LEDC_OVF_CNT_CH $n$ _INT` interrupt

To change the overflow value at runtime, first set the `LEDC_TIMERx_DUTY_RES` field, and then set the `LEDC_TIMERx_PARA_UP` field. This will cause the newly configured values to take effect upon the next overflow of the counter. If `LEDC_OVF_CNT_EN_CHn` field is reconfigured, `LEDC_PARA_UP_CHn` should be set to apply the new configuration. In summary, these configuration values need to be updated by setting `LEDC_TIMERx_PARA_UP` or `LEDC_PARA_UP_CHn`. `LEDC_TIMERx_PARA_UP` and `LEDC_PARA_UP_CHn` will be automatically cleared by hardware.

Referring to Figure 50.3-2, the frequency of a PWM generator output signal (`sig_outn`) is dependent on the frequency of the timer's clock source `LEDC_CLK`, the clock divisor `LEDC_CLK_DIV`, and the duty resolution (counter width) `LEDC_TIMERx_DUTY_RES`:

$$f_{\text{PWM}} = \frac{f_{\text{LEDC\_CLK}}}{\text{LEDC\_CLK\_DIV} \cdot 2^{\text{LEDC\_TIMERx\_DUTY\_RES}}}$$

Based on the formula above, the desired duty resolution can be calculated as follows:

$$\text{LEDC\_TIMERx\_DUTY\_RES} = \log_2 \left( \frac{f_{\text{LEDC\_CLK}}}{f_{\text{PWM}} \cdot \text{LEDC\_CLK\_DIV}} \right)$$

Table 50.4-1 lists the commonly-used frequencies and their corresponding resolutions.

**Table 50.4-1. Commonly-used Frequencies and Resolutions**

| LEDC_CLK              | PWM Frequency | Highest Resolution (bit) <sup>1</sup> | Lowest Resolution (bit) <sup>2</sup> |
|-----------------------|---------------|---------------------------------------|--------------------------------------|
| REF_80M_CLK (80 MHz)  | 1 kHz         | 16                                    | 6                                    |
| REF_80M_CLK (80 MHz)  | 5 kHz         | 13                                    | 3                                    |
| REF_80M_CLK (80 MHz)  | 10 kHz        | 12                                    | 2                                    |
| XTAL_40M_CLK (40 MHz) | 1 kHz         | 15                                    | 5                                    |
| XTAL_40M_CLK (40 MHz) | 4 kHz         | 13                                    | 3                                    |
| FOSC_20M_CLK (20 MHz) | 1 kHz         | 14                                    | 4                                    |
| FOSC_20M_CLK (20 MHz) | 2 kHz         | 13                                    | 3                                    |

<sup>1</sup> The highest resolution is calculated when the clock divisor `LEDC_CLK_DIV` is 1. If the highest resolution calculated by the formula is higher than the counter's width 20 bits, then the highest resolution should be 20 bits.

<sup>2</sup> The lowest resolution is calculated when the clock divisor `LEDC_CLK_DIV` is  $1023 + \frac{255}{256}$ . If the lowest resolution calculated by the formula is lower than 0, then the lowest resolution should be 1.

## 50.4.2 PWM Generators

To generate a PWM signal, a PWM generator (`PWMn`) needs a timer (`Timerx`). Each PWM generator can be configured separately by setting `LEDC_TIMER_SEL_CHn` to use one of four timers to generate the PWM output.

As shown in Figure 50.3-2, each PWM generator has a comparator and two multiplexers. A PWM generator compares the timer's 20-bit counter value (`Timerx_cnt`) to two trigger values `Hpointn` and `Lpointn`. When the timer's counter value is equal to `Hpointn` or `Lpointn`, the PWM signal is high or low, respectively, as described below:

- If `Timer $x$ _cnt == Hpoint $n$` , `sig_out $n$`  is 1.
- If `Timer $x$ _cnt == Lpoint $n$` , `sig_out $n$`  is 0.

Figure 50.4-3 illustrates how `Hpoint $n$`  and `Lpoint $n$`  are used to generate a fixed duty cycle PWM output signal.

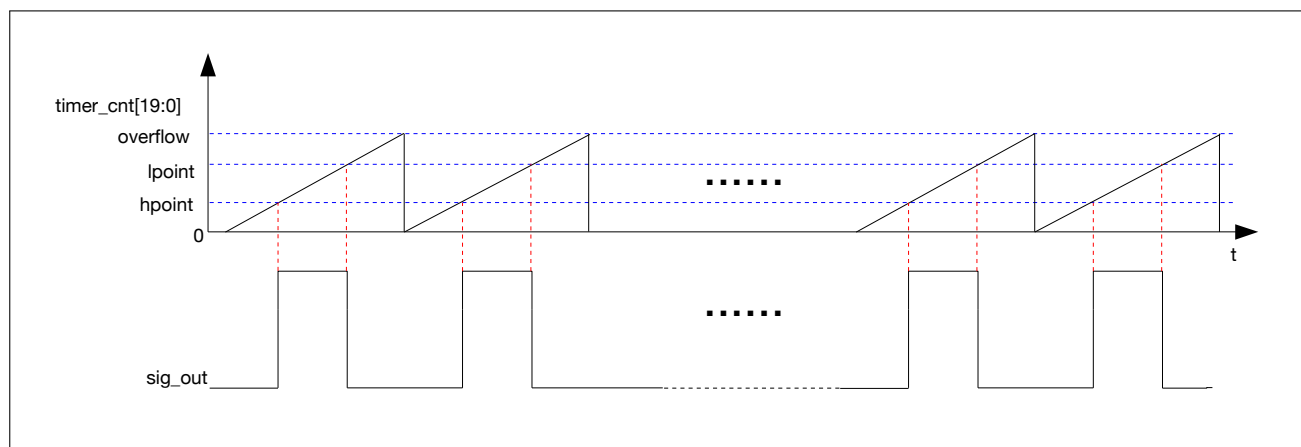

Figure 50.4-3. LED PWM Output Signal Diagram

For a particular PWM generator (PWM $n$ ), its `Hpoint $n$`  is sampled from the `LEDC_HPOINT_CH $n$`  field each time the selected timer's counter overflows. Likewise, `Lpoint $n$`  is also sampled on every counter overflow and is calculated from the sum of the `LEDC_DUTY_CH $n$ [24:4]` and `LEDC_HPOINT_CH $n$`  fields. By setting `Hpoint $n$`  and `Lpoint $n$`  via the `LEDC_HPOINT_CH $n$`  and `LEDC_DUTY_CH $n$ [24:4]` fields, the relative phase and duty cycle of the PWM output can be set.

The PWM output signal (`sig_out $n$` ) is enabled by setting `LEDC_SIG_OUT_EN_CH $n$` . When `LEDC_SIG_OUT_EN_CH $n$`  is cleared, PWM signal output is disabled, and the output signal (`sig_out $n$` ) will output a constant level specified by `LEDC_IDLE_LV_CH $n$` .

The bits `LEDC_DUTY_CH $n$ [3:0]` are used to dither the duty cycles of the PWM output signal (`sig_out $n$` ) by periodically altering the duty cycle of `sig_out $n$` . When `LEDC_DUTY_CH $n$ [3:0]` is not 0, then for every 16 cycles of `sig_out $n$` , `LEDC_DUTY_CH $n$ [3:0]` of those cycles will have PWM pulses that are one timer tick longer than the other (16- `LEDC_DUTY_CH $n$ [3:0]`) cycles. For instance, if `LEDC_DUTY_CH $n$ [24:4]` is set to 10 and `LEDC_DUTY_CH $n$ [3:0]` is set to 5, then 5 of 16 cycles will have a PWM pulse with a duty value of 11 and the rest of the 16 cycles will have a PWM pulse with a duty value of 10. The average duty cycle after 16 cycles is 10.3125.

If fields `LEDC_TIMER_SEL_CH $n$` , `LEDC_HPOINT_CH $n$` , `LEDC_DUTY_CH $n$ [24:4]`, and `LEDC_SIG_OUT_EN_CH $n$`  are reconfigured, `LEDC_PARA_UP_CH $n$`  must be set to apply the new configuration. This will cause the newly configured values to take effect upon the next overflow of the counter. `LEDC_PARA_UP_CH $n$`  field will be automatically cleared by hardware.

### 50.4.3 Duty Cycle Fading

The PWM generators can fade the duty cycle of a PWM output signal (i.e., gradually change the duty cycle from one value to another). Each PWM generator can have up to 16 duty cycle ranges, which can be independently configured in terms of fading direction (increase or decrease), fading amount, the number of fades, and fading frequency. If Duty Cycle Fading is enabled, every range's `Lpoint $n$`  value will change

according to its fading configuration.

### 50.4.3.1 Linear Duty Cycle Fading

Linear fading PWM signals can be generated by configuring the direction, fading amount, the number of fades, and fading frequency of the first duty cycle range.

The programming procedures will be described in detail in the section [50.6](#).

After the procedures, the PWM generator can fade the duty cycle of a PWM signal once per LEDC\_CH $n$ \_GAMMA\_DUTY\_CYCLE times of counter overflows. Every time when the PWM signal is faded, Lpoint $n$  increases or decreases (configured by LEDC\_CH $n$ \_GAMMA\_DUTY\_INC) by LEDC\_CH $n$ \_GAMMA\_SCALE, and the duty cycle increases or decreases (configured by LEDC\_CH $n$ \_GAMMA\_DUTY\_INC) by

$$\frac{\text{LEDC\_CH}_n\text{\_GAMMA\_SCALE}}{\text{LEDC\_TIMER}_x\text{\_DUTY\_RES}}$$

The duty cycle is faded for LEDC\_CH $n$ \_GAMMA\_DUTY\_NUM times. After that, the PWM generator stops fading and keeps outputting signals at this duty cycle. Upon each fading the duty cycle increases or decreases by the same amount, and therefore the PWM signal is a linear fading signal.

Figure 50.4-4 shows a linear fading PWM signal.

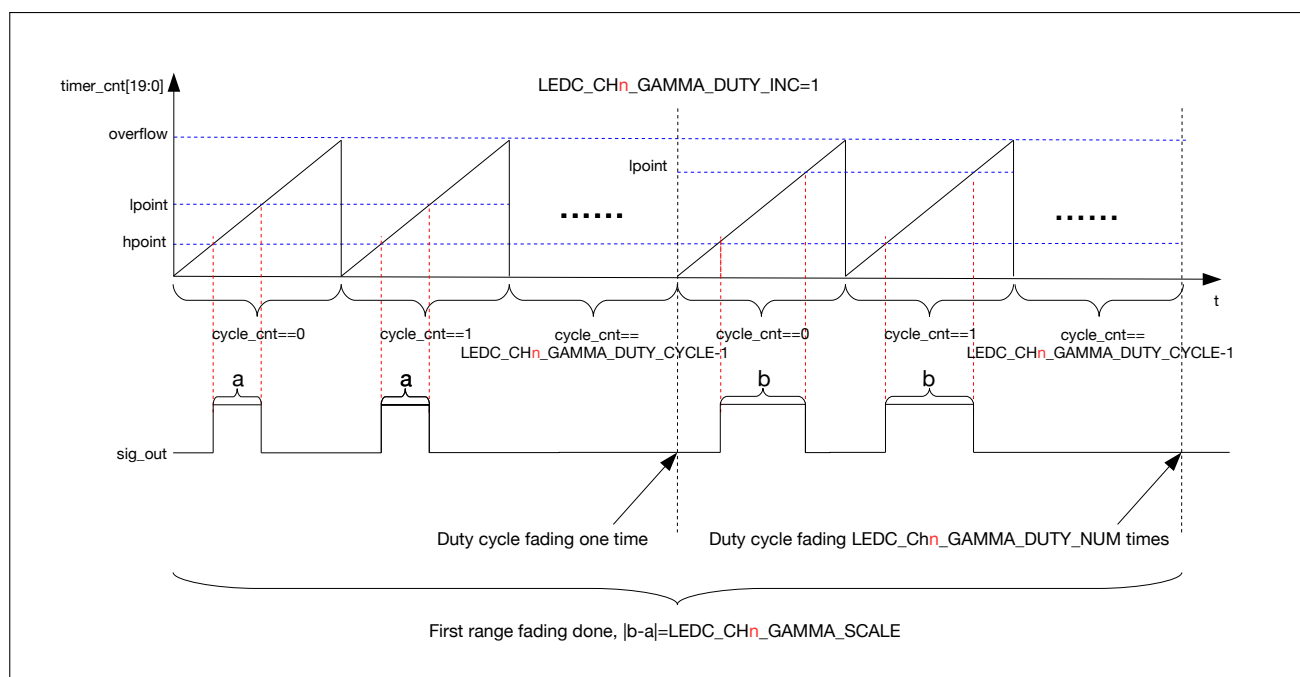

Figure 50.4-4. Output Signal of Linear Duty Cycle Fading

### 50.4.3.2 Gamma Curve Fading

Gamma curve fading PWM signals can be generated by configuring the fading direction, fading amount, the number of fades and fading frequency of multiple duty cycle fading ranges.

The programming procedures will be described in detail in the section [50.6](#).

After the procedures, the PWM generator can generate a PWM signal with `LEDC_CH $n$ _GAMMA_ENTRY_NUM` ranges. The duty cycle of the PWM signal fades according to the configurations of range 0 first, and then range 1, till range (`LEDC_CH $n$ _GAMMA_ENTRY_NUM` – 1) (the last range) where Duty Cycle Fading ends. The PWM signal fades independently in each range. According to the configuration of each range, every time when the counter overflows for `LEDC_CH $n$ _GAMMA_DUTY_CYCLE` times, `Lpoint $n$`  increases or decreases (configured by `LEDC_CH $n$ _GAMMA_DUTY_INC`) by `LEDC_CH $n$ _GAMMA_SCALE`, and accordingly the duty cycle increases or decreases (configured by `LEDC_CH $n$ _GAMMA_DUTY_INC`) by

$$\frac{\text{LEDC\_CH}_n\text{\_GAMMA\_SCALE}}{\text{LEDC\_TIMER}_x\text{\_DUTY\_RES}}$$

After the duty cycle fades for `LEDC_CH $n$ _GAMMA_DUTY_NUM` times in a range, Duty Cycle Fading in this range finishes.

When Duty Cycle Fading finishes in all ranges (the number of ranges is specified by `LEDC_CH $n$ _GAMMA_ENTRY_NUM`), the PWM signal stops fading and keeps the duty cycle of the last fade. Given that the duty cycle fades differently and linearly in each range, several linear fading ranges would be fitted to a gamma curve.

Figure 50.4-5 illustrates a gamma curve fading PWM signal.

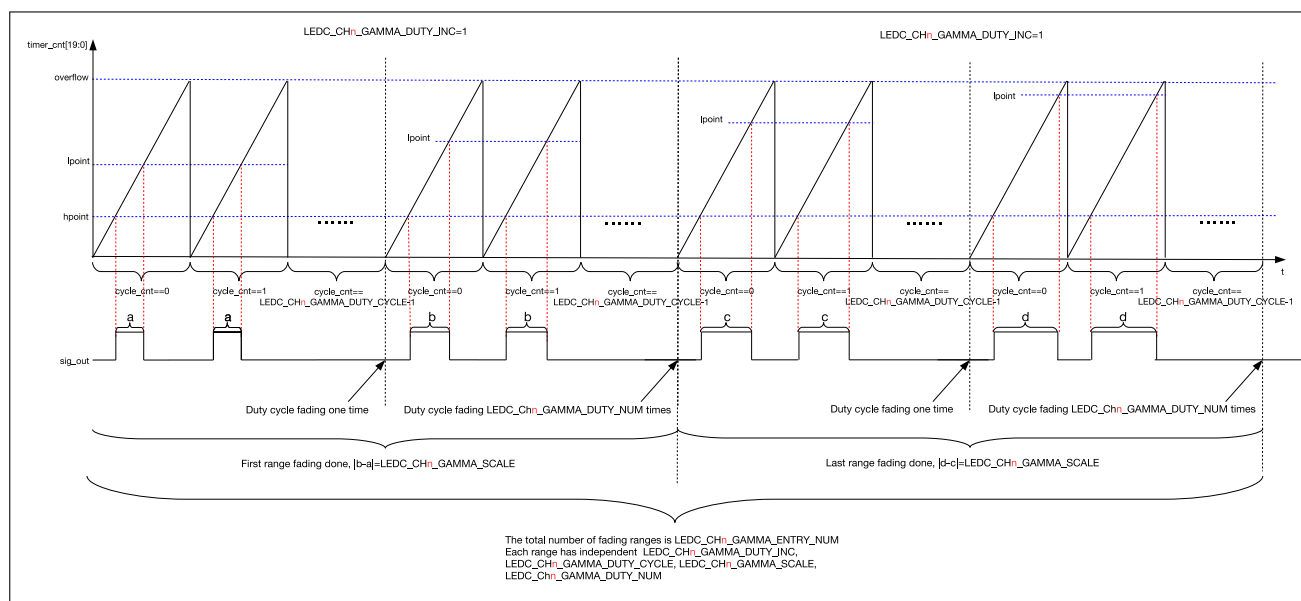

Figure 50.4-5. Output Signal of Gamma Curve Fading

### 50.4.3.3 Suspend and Resume Duty Cycle Fading

To suspend Duty Cycle Fading that has already been started, write 1 to the `LEDC_CH $n$ _GAMMA_PAUSE` field of the `LEDC_CH $n$ _GAMMA_CONF_REG` register. Once `LEDC_CH $n$ _GAMMA_PAUSE` is set to 1, the PWM signal keeps the duty cycle of the most recent fade.

To resume Duty Cycle Fading, write 1 to the `LEDC_CH $n$ _GAMMA_RESUME` field of the `LEDC_CH $n$ _GAMMA_CONF_REG` register. Once `LEDC_CH $n$ _GAMMA_RESUME` is set to 1, the PWM signal resumes fading from the range where the suspension occurs, until fading in the last range finishes. The fading will continue from the state when it was paused until all the ranges complete duty cycle fading (when

`LEDC_CH $n$ _GAMMA_RESUME` is set to 1, `LEDC_CH $n$ _GAMMA_PAUSE` is cleared automatically by hardware.

### 50.4.4 Event Task Matrix Feature

The LEDC on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows LEDC's ETM tasks to be triggered by any peripherals' ETM events, or LEDC's ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM tasks and events related to LEDC. For more information, please refer to [Chapter 12 Event Task Matrix \(ETM\)](#).

ETM-related events and tasks are enabled by configuring corresponding fields of `LEDC_EVT_TASK_ENO_REG`, `LEDC_EVT_TASK_EN1_REG` and `LEDC_EVT_TASK_EN2_REG` registers. For the correspondence between events, tasks, and fields, Please refer to [Section 50.8](#)).

LEDC can receive the following ETM tasks:

- `LEDC_TASK_DUTY_SCALE_UPDATE_CH $n$` : If the `LEDC_TASK_DUTY_SCALE_UPDATE_CH $n$ _EN` field is enabled, upon receiving the `LEDC_TASK_DUTY_SCALE_UPDATE_CH $n$`  task, PWM $n$  generates fading PWM signals according to the newly configured `LEDC_CH $n$ _GAMMA_SCALE` field.
- `LEDC_TASK_TIMER $x$ _RES_UPDATE`: If the `LEDC_TASK_TIMER $x$ _RES_UPDATE_EN` field is enabled, upon receiving the `LEDC_TASK_TIMER $x$ _RES_UPDATE` task, Timer $x$  updates its counter's overflow value to the value configured in the `LEDC_TIMER $x$ _DUTY_RES` field at the next overflow of the counter.
- `LEDC_TASK_TIMER $x$ _CAP`: If the `LEDC_TASK_TIMER $x$ _CAP_EN` field is enabled, upon receiving the `LEDC_TASK_TIMER $x$ _CAP` task, Timer $x$  captures its counter's value, and stores the value into the `LEDC_TIMER $x$ _CNT_CAP` field of register `LEDC_TIMER $x$ _CNT_CAP_REG`.
- `LEDC_TASK_SIG_OUT_DIS_CH $n$` : If the `LEDC_TASK_SIG_OUT_DIS_CH $n$ _EN` field is enabled, upon receiving the `LEDC_TASK_SIG_OUT_DIS_CH $n$`  task, PWM $n$ 's signal output is disabled, and the output signal (sig\_out $n$ ) outputs a constant level as specified by field `LEDC_IDLE_LV_CH $n$` , as shown in [Figure 50.3-2](#).
- `LEDC_TASK_OVF_CNT_RST_CH $n$` : If the `LEDC_TASK_OVF_CNT_RST_CH $n$ _EN` field is enabled, upon receiving the `LEDC_TASK_OVF_CNT_RST_CH $n$`  task, PWM $n$  timer's overflow counter is reset to 0.
- `LEDC_TASK_TIMER $x$ _RST`: If the `LEDC_TASK_TIMER $x$ _RST_EN` field is enabled, upon receiving the `LEDC_TASK_TIMER $x$ _RST` task, Timer $x$ 's counter is reset to 0.
- `LEDC_TASK_TIMER $x$ _RESUME` and `LEDC_TASK_TIMER $x$ _PAUSE`: If the `LEDC_TASK_TIMER $x$ _PAUSE_RESUME_EN` field is enabled, upon receiving the `LEDC_TASK_TIMER $x$ _RESUME` and `LEDC_TASK_TIMER $x$ _PAUSE` task, Timer $x$  is suspended and resumed alternately. That is, when the task is received, Timer $x$  is paused; and when the task is received again, Timer $x$  is resumed.
- `LEDC_TASK_GAMMA_RESTART_CH $n$` : If the `LEDC_TASK_GAMMA_RESTART_CH $n$ _EN` field is enabled, upon receiving the `LEDC_TASK_GAMMA_RESTART_CH $n$`  task, the PWM $n$  restarts to generate the fading PWM signal.
- `LEDC_TASK_GAMMA_PAUSE_CH $n$` : If the `LEDC_TASK_GAMMA_PAUSE_CH $n$ _EN` field is enabled, upon receiving the `LEDC_TASK_GAMMA_PAUSE_CH $n$`  task, PWM $n$  suspends Duty Cycle Fading at the next timer overflow. That is, after the task has been received, PWM $n$  keeps the duty cycle of the last fade.

- LEDC\_TASK\_GAMMA\_RESUME\_CH $n$ : If the [LEDC\\_TASK\\_GAMMA\\_RESUME\\_CH \$n\$ \\_EN](#) field is enabled, upon receiving the LEDC\_TASK\_GAMMA\_RESUME\_CH $n$  task, PWM $n$  resumes Duty Cycle Fading at the next counter overflow. That is, after the task has been received, PWM $n$  resumes fading from the range where the suspension occurs.

LEDC can generate the following ETM events:

- LEDC\_EVT\_DUTY\_CHNG\_END\_CH $n$ : Generated when the [LEDC\\_EVT\\_DUTY\\_CHNG\\_END\\_CH \$n\$ \\_EN](#) field is enabled, and PWM $n$  has finished Duty Cycle Fading.
- LEDC\_EVT\_OVF\_CNT\_PLS\_CH $n$ : Generated when the [LEDC\\_EVT\\_OVF\\_CNT\\_PLS\\_CH \$n\$ \\_EN](#) field is enabled and when PWM $n$  timer's counter overflows for [LEDC\\_OVF\\_NUM\\_CH \$n\$](#)  + 1 times.
- LEDC\_EVT\_TIME\_OVF\_TIMER $x$ : Generated when the [LEDC\\_EVT\\_TIME\\_OVF\\_TIMER \$x\$ \\_EN](#) field is enabled and Timer $x$ 's counter overflows.
- LEDC\_EVT\_TIMER $x$ \_CMP: Generated when the [LEDC\\_EVT\\_TIMER \$x\$ \\_CMP\\_EN](#) field is enabled and the value of Timer $x$ 's counter reaches that of the [LEDC\\_TIMER \$x\$ \\_CMP](#) field of register [LEDC\\_TIMER \$x\$ \\_CMP\\_REG](#).

In practical applications, LEDC's ETM events can trigger its own ETM tasks. For example, LEDC\_EVT\_DUTY\_CHNG\_END\_CH $n$  event can trigger the LEDC\_TASK\_GAMMA\_RESTART\_CH $n$  task, thus starting the next fading directly after the current fading is completed.

## 50.5 Interrupts

ESP32-P4's LEDC can generate the LEDC\_INT interrupt signal, which will be sent to the [Interrupt Matrix](#).

Interrupt signal LEDC\_INT can be generated by the following internal interrupt sources:

- LEDC\_OVF\_CNT\_CH $n$ \_INT: Triggered when the timer counter overflows for [LEDC\\_OVF\\_NUM\\_CH \$n\$](#)  + 1 times and the register [LEDC\\_OVF\\_CNT\\_EN\\_CH \$n\$](#)  is set to 1.
- LEDC\_DUTY\_CHNG\_END\_CH $n$ \_INT: Triggered when a fade on PWM $n$  has finished.
- LEDC\_TIMER $x$ \_OVF\_INT: Triggered when Timer $x$  has reached its maximum counter value.

The above interrupt sources can only be triggered when the interrupt enable register [XXX\\_ENA](#) is set to 1. Write 1 to [XXX\\_CLR](#) will clear the interrupt ([XXX](#) is the interrupt source name).

## 50.6 Programming Procedures

The configuration process of the LED PWM controller to generate PWM signals is as follows:

1. Configure the Timer $x$  according to section [50.4.1](#). After that, the clock source, divider, and counter are ready.
2. Configure the PWM $n$  generator according to section [50.4.2](#). After that, PWM $n$  selects one of the four timers and the phase and duty cycle of the PWM $n$  output is set.
3. Choose the corresponding configuration process based on the different duty cycle fading types:
  - (a) Linear duty cycle fading:
    - i. Configure the [LEDC\\_DUTY\\_CH \$n\$](#)  field with the initial value of [Lpoint \$n\$](#) .

- ii. Set the `LEDC_DUTY_START_CHn` field to enable Duty Cycle Fading. When this field is cleared, Duty Cycle Fading will be disabled.
  - iii. Write the linear duty cycle fading configuration to (`LEDC_CHn_MEM` starting address + duty cycle range number \* 4), the `LEDC_CHn_MEM` starting address is provided in Table 50.7-1. Please note that the following bit names are just for easier description, and there are no such register fields.
    - Bit 0 of the configuration data is used to configure the direction (hereafter referred to as `LEDC_CHn_GAMMA_DUTY_INC`). When it is set or cleared, the `Lpointn` will increase or decrease in the current configured range.
    - Bit 1 to 10 of the configuration data is used to configure the number of times the counter overflows per an increment or decrement of `Lpointn` (hereafter referred to as `LEDC_CHn_GAMMA_DUTY_CYCLE`). In other words, `Lpointn` will increase or decrease after the counter overflows for the configured number of times.
    - Bit 11 to 20 of the configuration data is used to configure the amount by which `Lpointn` increase or decrease in the current configured range (hereafter referred to as `LEDC_CHn_GAMMA_SCALE`).
    - Bit 21 to 30 of the configuration data is used to configure the number of fades in the current configured range (hereafter referred to as `LEDC_CHn_GAMMA_DUTY_NUM`).
    - The duty cycle range number (from 0 to 15) specifies to which range the above configuration data apply. For linear duty cycle fading only the first range needs to be configured, so the duty cycle range number should be configured as 0.
  - iv. Configure the number of ranges per each fading (1 in this case) via the `LEDC_CHn_GAMMA_ENTRY_NUM` field of the `LEDC_CHn_GAMMA_CONF_REG`. Once the specified number of ranges have been faded, Duty Cycle Fading stops and the PWM generator triggers the `LEDC_DUTY_CHNG_END_CHn_INT` interrupt. For linear duty cycle fading there is only one duty cycle range (i.e., the first one), so configure `LEDC_CHn_GAMMA_ENTRY_NUM` as 1.
  - v. Set the `LEDC_PARA_UP_CHn` field to apply the above configurations. After this field is set, the configurations for Duty Cycle Fading will take effect upon the next overflow of the counter, and the PWM generator will output a linear fading PWM signal following configurations. `LEDC_PARA_UP_CHn` field will be automatically cleared by hardware.
- (b) Gamma curve fading:
- i. The same as Step 1 in Section 50.4.3.1.
  - ii. The same as Step 2 in Section 50.4.3.1.
  - iii. Configure multiple duty cycle ranges with the following steps. Write the gamma curve fading configuration to (`LEDC_CHn_MEM` starting address + duty cycle range number \* 4), the `LEDC_CHn_MEM` starting address is provided in Table 50.7-1.
    - Bit 0 of the configuration data is used to configure the direction (hereafter referred to as `LEDC_CHn_GAMMA_DUTY_INC`). When it is set or cleared, the `Lpointn` will increment or decrement in the current configured range.

- Bit 1 to 10 of the configuration data is used to configure the number of times the counter overflows per an increase or decrease of Lpoint $n$  (hereafter referred to as LEDC\_CH $n$ \_GAMMA\_DUTY\_CYCLE). In other words, Lpoint $n$  will increase or decrease after the counter overflows for the configured number of times.
  - Bit 11 to 20 of the configuration data is used to configure the amount by which Lpoint $n$  increase or decrease in the current configured range (hereafter referred to as LEDC\_CH $n$ \_GAMMA\_SCALE).
  - Bit 21 to 30 of the configuration data is used to configure the number of fades in the current configured range (hereafter referred to as LEDC\_CH $n$ \_GAMMA\_DUTY\_NUM).
  - The duty cycle range number (from 0 to 15) specifies to which range the above configuration data apply. For gamma curve fading, it must start from 0 and increase by 1 for the next range to be configured.
  - Once the above procedures are finished, the configuration for one range is complete. Other ranges are configured by repeating the same set of procedures. You can configure any number of ranges from 0 to 15, and each can be configured independently.
- iv. After all required ranges are configured, write the total number of ranges configured in Step 3 to the LEDC\_CH $n$ \_GAMMA\_ENTRY\_NUM field of the LEDC\_CH $n$ \_GAMMA\_CONF\_REG register.
- v. Set the LEDC\_PARA\_UP\_CH $n$  field to apply the above configuration. After this field is set, the configurations for duty cycle fading will take effect upon the next overflow of the counter, and the PWM generator will output a gamma curve fading PWM signal following the configurations. LEDC\_PARA\_UP\_CH $n$  field will be automatically cleared by hardware.

After the above procedures, the LED PWM controller will generate the desired PWM signals.

At any time, duty cycle fading can be suspended or resumed, more details can be found in section 50.4.3.3. If the duty cycle fading configurations need to be changed before the PWM signals stop fading (that is, the LEDC\_DUTY\_CHNG\_END\_CH $n$ \_INT has not been triggered), the duty cycle fading needs to be suspended before changing the configurations. However, if the duty cycle fading configurations need to be changed after the PWM signals stop fading (that is, the LEDC\_DUTY\_CHNG\_END\_CH $n$ \_INT has been triggered), the configurations can be changed directly.

At any time, PWM signal output can be enabled or disabled by software, and the output signal level can be changed, more details can be found in section 50.4.2.

## 50.7 Memory Blocks

Each LEDC channel has a memory to store duty cycle fading configuration data. Each memory can store configuration data for up to 16 ranges. The addresses in this section are relative to LED PWM Controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

**Table 50.7-1. LEDC Memory Blocks**

| Name             | Description       | Size | Starting Address           | Ending Address                   | Access |
|------------------|-------------------|------|----------------------------|----------------------------------|--------|
| LEDC_CH $n$ _MEM | Memory of PWM $n$ | 64 B | $0x400 + \text{PWM}n * 64$ | $0x400 + (\text{PWM}n + 1) * 64$ | WR     |

## 50.8 Register Summary

The addresses in this section are relative to LED PWM Controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name                                 | Description                               | Address | Access |
|--------------------------------------|---|---------|--------|
| <b>Configuration Register</b>        |   |         |        |
| <a href="#">LEDC_CHO_CONFO_REG</a>   | Configuration register 0 for channel 0    | 0x0000  | varies |
| <a href="#">LEDC_CHO_HPOINT_REG</a>  | High point register for channel 0         | 0x0004  | R/W    |
| <a href="#">LEDC_CHO_DUTY_REG</a>    | Initial duty cycle register for channel 0 | 0x0008  | R/W    |
| <a href="#">LEDC_CHO_CONF1_REG</a>   | Configuration register 1 for channel 0    | 0x000C  | R/W/SC |
| <a href="#">LEDC_CH1_CONFO_REG</a>   | Configuration register 0 for channel 1    | 0x0014  | varies |
| <a href="#">LEDC_CH1_HPOINT_REG</a>  | High point register for channel 1         | 0x0018  | R/W    |
| <a href="#">LEDC_CH1_DUTY_REG</a>    | Initial duty cycle register for channel 1 | 0x001C  | R/W    |
| <a href="#">LEDC_CH1_CONF1_REG</a>   | Configuration register 1 for channel 1    | 0x0020  | R/W/SC |
| <a href="#">LEDC_CH2_CONFO_REG</a>   | Configuration register 0 for channel 2    | 0x0028  | varies |
| <a href="#">LEDC_CH2_HPOINT_REG</a>  | High point register for channel 2         | 0x002C  | R/W    |
| <a href="#">LEDC_CH2_DUTY_REG</a>    | Initial duty cycle register for channel 2 | 0x0030  | R/W    |
| <a href="#">LEDC_CH2_CONF1_REG</a>   | Configuration register 1 for channel 2    | 0x0034  | R/W/SC |
| <a href="#">LEDC_CH3_CONFO_REG</a>   | Configuration register 0 for channel 3    | 0x003C  | varies |
| <a href="#">LEDC_CH3_HPOINT_REG</a>  | High point register for channel 3         | 0x0040  | R/W    |

## 50.9 Registers

The addresses in this section are relative to LED PWM Controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

Register 50.1. LEDC\_CH $n$ \_CONFO\_REG ( $n$ : 0-7) (0x0000+0x14\* $n$ )

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |   |    |    |   |                              |   |   |   |   |   |   |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|----|---|----|----|---|------------------------------|---|---|---|---|---|---|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    | LEDC_OVF_CNT_RESET_CH <sub>n</sub><br>LEDC_OVF_CNT_EN_CH <sub>n</sub> |    |    |   | LEDC_OVF_NUM_CH <sub>n</sub> |   |   |   | LEDC_PARA_UP_CH <sub>n</sub><br>LEDC_IDLE_LV_CH <sub>n</sub><br>LEDC_SIG_OUT_EN_CH <sub>n</sub><br>LEDC_TIMER_SEL_CH <sub>n</sub> |   |   |   |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 17 | 16  | 15 | 14 |   |                              |   |   | 5 | 4   | 3 | 2 | 1 | 0     |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0  | 0   | 0  | 0  | 0 | 0                            | 0 | 0 | 0 | 0   | 0 | 0 | 0 | Reset |

**LEDC\_TIMER\_SEL\_CH $n$**  Configures which timer is channel  $n$  selected.

- 0: Select Timer 0
  - 1: Select Timer 1
  - 2: Select Timer 2
  - 3: Select Timer 3
- (R/W)

**LEDC\_SIG\_OUT\_EN\_CH $n$**  Configures whether to enable signal output on channel  $n$ .

- 0: Signal output disable
  - 1: Signal output enable
- (R/W)

**LEDC\_IDLE\_LV\_CH $n$**  Configures the output value when channel  $n$  is inactive. Valid only when [LEDC\\_SIG\\_OUT\\_EN\\_CH \$n\$](#)  is 0.

- 0: Output level is low
  - 1: Output level is high
- (R/W)

**LEDC\_PARA\_UP\_CH $n$**  Configures whether to update [LEDC\\_HPOINT\\_CH \$n\$](#) , [LEDC\\_DUTY\\_START\\_CH \$n\$](#) , [LEDC\\_SIG\\_OUT\\_EN\\_CH \$n\$](#) , [LEDC\\_TIMER\\_SEL\\_CH \$n\$](#) , [LEDC\\_OVF\\_CNT\\_EN\\_CH \$n\$](#)  fields and duty cycle range configurations for channel  $n$ , and will be automatically cleared by hardware.

- 0: Invalid. No effect
  - 1: Update
- (WT)

**LEDC\_OVF\_NUM\_CH $n$**  Configures the maximum times of overflow minus 1. The [LEDC\\_OVF\\_CNT\\_CH \$n\$ \\_INT](#) interrupt will be triggered when channel  $n$  overflows for ([LEDC\\_OVF\\_NUM\\_CH \$n\$](#)  + 1) times. (R/W)

**LEDC\_OVF\_CNT\_EN\_CH $n$**  Configures whether to enable the [ovf\\_cnt](#) of channel  $n$ .

- 0: Disable
  - 1: Enable
- (R/W)

Continued on the next page...

**Register 50.4. LEDC\_CH $n$ \_CONF1\_REG ( $n$ : 0-7) (0x000C+0x14\* $n$ )**

Diagram illustrating the structure of the LEDC\_DUTY\_START\_CHn register. The register is 32 bits wide. Bit 31 is labeled LEDC\_DUTY\_START\_CHn. Bits 30-0 are labeled (reserved). Bit 0 is labeled Reset.

**LEDC\_DUTY\_START\_CH<sub>n</sub>** Configures whether the duty cycle fading configurations take effect.

0: Not take effect

1: Take effect

(R/W/SC)

**Register 50.5. LEDC\_TIMER<sub>x</sub>\_CONF\_REG (x: 0-3) (0x00A0+0x8\*x)**

|            |  |  |  |  |    |  |  |  |  |  |    |    |    |    |   |  |  |  |  |  |  |  |  |  |   |  |  |  |   |                                 |  |  |  |   |       |  |  |  |  |                                   |  |  |  |  |       |  |  |  |  |
|------------|--|--|--|--|----|--|--|--|--|--|----|----|----|----|---|--|--|--|--|--|--|--|--|--|---|--|--|--|---|---------------------------------|--|--|--|---|-------|--|--|--|--|-----------------------------------|--|--|--|--|-------|--|--|--|--|
| (reserved) |  |  |  |  |    |  |  |  |  | LEDC_TIMER <del>×</del> _PARA_UP<br>(reserved) |    |    |    |    |   |  |  |  |  | LEDC_TIMER <del>×</del> _RST<br>LEDC_TIMER <del>×</del> _PAUSE |  |  |  |  |   |  |  |  |   | LEDC_CLK_DIV_TIMER <del>×</del> |  |  |  |   |       |  |  |  |  | LEDC_TIMER <del>×</del> _DUTY_RES |  |  |  |  |       |  |  |  |  |

| 0          |  |  |  |  | 0  |  |  |  |  | 0  |    |    |    |    | 0 |  |  |  |  | 0  |  |  |  |  | 0 |  |  |  |   | 0                               |  |  |  |   | 0x000 |  |  |  |  | 0x0                               |  |  |  |  | Reset |  |  |  |  |

**LEDC\_TIMERx\_DUTY\_RES** Configures the bit width of the counter in timer **x**. Valid values are 1 to 20. (R/W)

**LEDC\_CLK\_DIV\_TIMER $x$**  Configures the divisor for the divider in timer  $x$ .

The least significant eight bits represent the fractional part. The most significant ten bits represent the integer part. (R/W)

**LEDC\_TIMER<sub>x</sub>\_PAUSE** Configures whether to pause the counter in timer *x*.

0: Normal

1: Pause

(R/W)

**LEDC\_TIMER $x$ \_RST** Configures whether to reset timer  $x$ . The counter will show 0 after reset.

0: Not reset

1: Reset

(R/W)

**LEDC\_TIMERx\_PARA\_UP** Configures whether to update LEDC\_CLK\_DIV\_TIMERx and LEDC\_TIMERx DUTY RES.

0: Invalid. No effect

1: Update

(WT)

Register 50.6. LEDC\_CHn\_GAMMA\_CONF\_REG (n: 0-7) (0x0100+0x4\*n)

**LEDC\_CHn\_GAMMA\_ENTRY\_NUM** Configures the number of duty cycle fading ranges for LEDC channel n. (R/W)

**LEDC\_CHn\_GAMMA\_PAUSE** Configures whether to pause duty cycle fading of LEDC channel n.

0: Invalid. No effect

1: Pause

(WT)

**LEDC\_CHn\_GAMMA\_RESUME** Configures whether to resume duty cycle fading of LEDC channel n.

0: Invalid. No effect

1: Resume

(WT)

### Register 50.7. LEDC\_EVT\_TASK\_EN0\_REG (0x0120)

[illegible]

**LEDC\_EVT\_DUTY\_CHNG\_END\_CH $n$ \_EN ( $n$ : 0-7)** Configures whether to enable the LEDC\_EVT\_DUTY\_CHNG\_END\_CH $n$  event.

0: Disable

1: Enable

(R/W)

**LEDC\_EVT\_OVF\_CNT\_PLS\_CH $n$ \_EN ( $n$ : 0-7)** Configures whether to enable the LEDC\_EVT\_OVF\_CNT\_PLS\_CH $n$  event.

0: Disable

1: Enable

(R/W)

**LEDC\_EVT\_TIME\_OVF\_TIMER<sub>x</sub>\_EN (x: 0-3)** Configures whether to enable the LEDC\_EVT\_TIME\_OVF\_TIMER<sub>x</sub> event.

0: Disable

1: Enable

(R/W)

**LEDC\_EVT\_TIMER<sub>x</sub>\_CMP\_EN (x: 0-3)** Configures whether to enable the LEDC\_EVT\_TIMER<sub>x</sub>\_CMP event.

0: Disable

1: Enable

(R/W)

**LEDC\_TASK\_DUTY\_SCALE\_UPDATE\_CH $n$ \_EN ( $n$ : 0-7)** Configures whether to enable the LEDC\_TASK\_DUTY\_SCALE\_UPDATE\_CH $n$  task.

0: Disable

1: Enable

(R/W)

### Register 50.8. LEDC\_EVT\_TASK\_EN1\_REG (0x0124)

[illegible]

|  |            |         |    |        |
|--|------------|---------|----|--------|
| <b>LEDC_TASK_TIMER<sub>x</sub>_RES_UPDATE_EN</b> ( <b>x</b> : 0-3) | Configures | whether | to | enable |
| LEDC_TASK_TIMER <sub>x</sub> _RES_UPDATE task.                     |            |         |    |        |
| 0: Disable   |            |         |    |        |
| 1: Enable  |            |         |    |        |
| (R/W)  |            |         |    |        |

**LEDC\_TASK\_TIMER<sub>x</sub>\_CAP\_EN (x: 0-3)** Configures whether to enable LEDC\_TASK\_TIMER<sub>x</sub>\_CAP task.

0: Disable

1: Enable

(R/W)

|  |            |         |    |        |
|--|------------|---------|----|--------|
| <b>LEDC_TASK_SIG_OUT_DIS_CH<math>n</math>_EN (<math>n</math>: 0-7)</b> | Configures | whether | to | enable |
| LEDC_TASK_SIG_OUT_DIS_CH $n$ task.                                     |            |         |    |        |
| 0: Disable   |            |         |    |        |

Reset

**LEDC\_GAMMA\_RAM\_CLK\_EN\_CH $n$  ( $n$ : 0-7)** Configures whether to open LEDC channel  $n$  gamma RAM clock gate.

0: Open the clock gate only when an application writes or reads LEDC channel *n* gamma RAM

1: Force open the clock gate for LEDC channel *n* gamma RAM

(R/W)

**LEDC\_CLK\_EN** Configures whether to open the register clock gate.

0: Open the clock gate only when an application writes registers

1: Force open the clock gate for register

(R/W)

Register 50.12. LEDC\_CH $n$ \_DUTY\_R\_REG ( $n$ : 0-7) (0x0010+0x14\* $n$ )

Register structure for LEDC\_DUTY\_CHn\_R:

- Bits 31-25: (reserved)
- Bits 24-0: LEDC\_DUTY\_CHn\_R (Duty value, shown as 0x000000)
- Reset: Indicated at the bottom right of the register structure.

**LEDC\_DUTY\_CH $n$ \_R** Represents the current duty cycle of output signal on channel  $n$ . (RO)

**Register 50.13. LEDC\_TIMER<sub>x</sub>\_VALUE\_REG (x: 0-3) (0x00A4+0x8\*x)**

**LEDC\_TIMER $x$ \_OVF\_INT\_RAW ( $x$ : 0-3)** Raw status bit: The raw interrupt status of LEDC\_TIMER $x$ \_OVF\_INT. Triggered when the timer  $x$  has reached its maximum counter value. (R/WTC/SS)

**LEDC\_DUTY\_CHNG\_END\_CH $n$ \_INT\_RAW ( $n$ : 0-7)** Raw status bit: The raw interrupt status of LEDC\_DUTY\_CHNG\_END\_CH $n$ \_INT. Triggered when the fading of duty has finished. (R/WTC/SS)

**LEDC\_OVF\_CNT\_CH $n$ \_INT\_RAW ( $n$ : 0-7)** Raw status bit: The raw interrupt status of LEDC\_OVF\_CNT\_CH $n$ \_INT. Triggered when the ovf\_cnt has reached the value specified by LEDC\_OVF\_NUM\_CH $n$ . (R/WTC/SS)

## Register 50.16. LEDC\_INT\_ST\_REG (0x00C4)

## Chapter 51

# Motor Control PWM (MCPWM)

## 51.1 Overview

The **Motor Control Pulse Width Modulator** (MCPWM) peripheral is intended for motor and power control. It provides six PWM outputs that can be set up to operate in several topologies. One common topology uses a pair of PWM outputs driving an H-bridge to control motor rotation speed and rotation direction.

The MCPWM can be divided into five main modules: PWM timers, PWM operators, Capture module, Event Task Matrix (ETM) module, and Fault Detection module. Each PWM timer provides timing references that can either run freely or be synced to other timers or external sources. Each PWM operator has all the necessary control resources to generate waveform pairs for one PWM channel. The Capture module is used for systems that need to accurately time external events. The ETM module responds to tasks received by the MCPWM, generating corresponding events depending on the state of motion. The Fault Detection module is used to capture external faults, allowing the system to respond by choice.

ESP32-P4 has two MCPWM peripherals, which are MCPWM0 and MCPWM1.

## 51.2 Features

An MCPWM peripheral has one clock divider (prescaler), three PWM timers, three PWM operators, a Capture module, an ETM module, and a Fault Detection module. MCPWM's core clock can be selected from three clock sources: PLL\_F160M\_CLK, XTAL\_CLK, and RC\_FAST\_CLK (configured by the HP\_SYS\_CLKRST\_MCPWM $n$ \_CLK\_SRC\_SEL field of the [HP\\_SYS\\_CLKRST\\_PERI\\_CLK\\_CTRL20\\_REG](#) register). Figure 51.2-1 shows the submodules inside MCPWM and the signals on the interface. PWM timers are used for generating timing references. The PWM operators generate the desired waveform based on the timing references. Any PWM operator can be configured to use the timing references of any PWM timers. Different PWM operators can use the same PWM timer's timing reference to generate PWM signals, or different PWM timers' values to generate separate PWM signals. Different PWM timers can also be synchronized together.

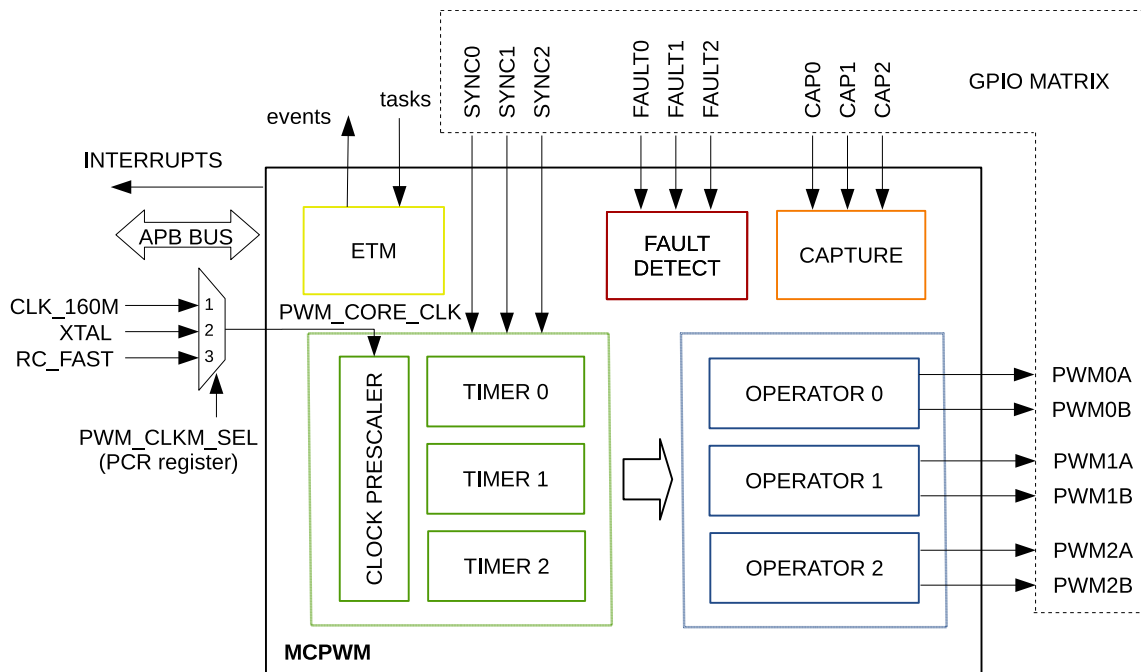

Figure 51.2-1. MCPWM Module Overview

Below is an overview of the submodules' functionality in Figure 51.2-1:

- PWM Timers 0, 1, and 2:
  - Every PWM timer has a dedicated 8-bit clock prescaler.
  - The 16-bit counter in the PWM timer can work in Count-Up Mode, Count-Down Mode, or Count-Up-Down Mode.
  - A hardware sync or software sync can trigger a reload on the PWM timer with a phase register. It will also trigger the prescaler's restart, so that the timer's clock can also be synced. The source of the hard sync can come from any GPIO or any other PWM timer's sync\_out. The source of the soft sync comes from writing toggle value to the `MCPWM_TIMERn_SYNC_SW` bit.
- PWM Operators 0, 1, and 2:
  - Every PWM operator has two PWM outputs: PWMxA and PWMxB. They can work independently, in symmetric or asymmetric configurations.
  - The control of the PWM signal can be updated asynchronously.
  - Configurable dead time on rising and falling edges; each set up independently.
  - All events can trigger CPU interrupts.
  - Modulating of PWM output by high-frequency carrier signals, useful when gate drivers are insulated with a transformer.
  - Period, time stamps, and important control registers have shadow registers with flexible updating methods.
- Fault Detection Module:
  - Programmable fault handling in both cycle-by-cycle mode and one-shot mode.

- A fault condition can force the PWM output to either high or low logic levels.
- Capture Module:
  - Clock of the capture module is the same as MCPWM's core clock.
  - Speed measurement of rotating machinery.
  - Measurement of elapsed time between position sensor pulses
  - Period and duty cycle measurement of pulse train signals
  - Decoding current or voltage amplitude derived from duty-cycle-encoded signals of current/voltage sensors
  - Three individual capture channels, each of which with a time-stamp register (32-bit)
  - Selection of edge polarity and prescaling of input capture signals
  - The capture timer can sync with a PWM timer or external signals.
  - Interrupt on each of the three capture channels
- ETM Module:
  - Generation of different events depending on the different running states of each timer and operator.
  - Each timer and operator responds to its corresponding task and automatically performs the corresponding operation.
  - Each event and task can be enabled independently. When an event is not enabled, the corresponding event will not be generated. When a task is not enabled, the corresponding task will not be responded to.

## 51.3 Modules

### 51.3.1 Overview

The key modules in each MCPWM are timer module, operator module, fault detection module, capture module, and ETM module. See their functions in the following sections.

#### 51.3.1.1 Timer Module

Figure 51.3-1. Timer Module

This module generates a timer, which can count at a specified period. It can work in Count-Up Mode, Count-Down Mode, or Count-Up-Down Mode. It supports different synchronization input sources (a total of seven optional input sources) for reloading the count value and direction, allowing synchronization among multiple timers. Furthermore, it provides synchronization output options (a total of four optional output sources) for use by other timers.

The timer $x$  status in the figure represents the timer status output by the timer module, such as the counting mode, and count value equal to zero or period.

#### 51.3.1.2 Operator Module

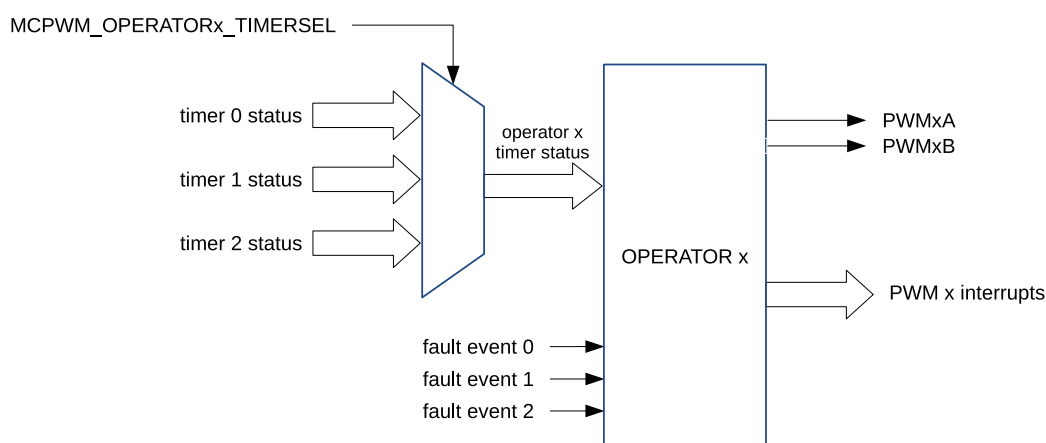

Figure 51.3-2. Operator Module

A PWM operator contains a PWM generator, a dead time generator, and a PWM carrier module. Their functions are shown in Table 51.3-1.

**Table 51.3-1. Functions of Each Submodule in the Operator Module**

| Submodule           | Functions   |
|---------------------|---|
| PWM Generator       | Generate PWM signals according to the configured duty cycle and waveform.   |
| Dead Time Generator | Choose to add dead time to the rising and falling edges of the PWM signal generated by the PWM generator (add delays to the rising and falling edges), and perform operations such as inversion.  |
| PWM Carrier         | Choose to add a carrier to the PWM signal generated by the dead time generator. The carrier frequency and the first pulse duration of the PWM waveform after adding the carrier can be configured.  |
| Fault Detector      | Detect faults and generate corresponding fault events, respond to fault events based on the specified interval mode (one-shot mode or cycle-by-cycle mode), and when a fault event occurs, take action on the PWM signal generated by the PWM carrier in the specified way. |

### 51.3.1.3 Capture Module

**Figure 51.3-3. Capture Module**

The module contains a timer that can be synchronized. When the input capture signal is valid, the count value of the timer is captured.

### 51.3.1.4 ETM Module

**Figure 51.3-4. ETM Module**

The module responds to received tasks, or generate and output events. Each event and task can be enabled independently.

## 51.3.2 PWM Timer Module

MCPWM has three PWM timer modules. Any of them can determine the necessary event timing for any of the three PWM operator modules. By using the synchronization signals from the GPIO matrix, built-in synchronization logic allows multiple PWM timer modules in one or more MCPWM peripherals to work together as a system.

### 51.3.2.1 Configurations of the PWM Timer Module

Users can configure the following functions of the PWM timer module:

- Control how often events occur by specifying the PWM timer frequency or period.
- Configure a particular PWM timer to synchronize phases with other PWM timers or modules.
- Configure the following timer counting modes: count-up, count-down, count-up-down.
- Change the rate of the PWM timer clock (PT\_CLK) with a prescaler. Each timer has its own prescaler configured with `MCPWM_TIMER $n$ _PRESCALE` of the register `MCPWM_TIMER0_CFGO_REG`. The PWM timer increments or decrements at a slower pace, depending on the setting of this field. The new `MCPWM_TIMER $n$ _PRESCALE` configuration value will take effect when the timer stops and starts counting again.

### 51.3.2.2 PWM Timer's Working Modes and Timing Event Generation

The PWM timer has three working modes, selected by the PWM $x$  timer mode field:

- Count-Up Mode:  
The PWM timer increments from zero until reaching the value configured in the period field. Once done, the PWM timer returns to zero and starts increasing again. PWM period = the value of the period field + 1.  
Note: The period field is `MCPWM_TIMER $n$ _PERIOD` ( $x = 0, 1, 2$ ), i.e., `MCPWM_TIMER0_PERIOD`, `MCPWM_TIMER1_PERIOD`, `MCPWM_TIMER2_PERIOD`.
- Count-Down Mode:  
The PWM timer decrements to zero, starting from the value configured in the period field. Once done, the PWM timer returns to the period value and starts decrementing again. In this case, the PWM period = the value of period field + 1.
- Count-Up-Down Mode:  
This is a combination of the two modes mentioned above. The PWM timer starts increasing from zero until the period value is reached. Then, the timer decreases back to zero. The PWM timer cycles incrementally and decrementally in this mode. The PWM period = the value of the period field  $\times$  2.

Figures 51.3-5 to 51.3-8 show PWM timer waveforms in different modes, including timer behavior during synchronization events. In Count-Up mode, the counting direction after synchronization is always counting up. In Count-Down mode, the counting direction after synchronization is always counting down. In Count-Up-Down Mode, the counting direction after synchronization can be chosen by setting the `MCPWM_TIMER $n$ _PHASE_DIRECTION`.

Figure 51.3-5. Count-Up Mode Waveform

Figure 51.3-6. Count-Down Mode Waveforms

Figure 51.3-7. Count-Up-Down Mode Waveforms, Count-Down at Synchronization Event

Figure 51.3-8. Count-Up-Down Mode Waveforms, Count-Up at Synchronization Event

When the PWM timer is running, it generates the following timing events periodically and automatically:

- UTEP: The timing event generated when the PWM timer's value is equal to the value of the period field (`MCPWM_TIMER $n$ _PERIOD`) and when the PWM timer is increasing.
- UTEZ: The timing event generated when the PWM timer's value equals zero and when the PWM timer is increasing.
- DTEP: The timing event generated when the PWM timer's value equals the value of the period field (`MCPWM_TIMER $n$ _PERIOD`) and when the PWM timer is decreasing.
- DTEZ: The timing event generated when the PWM timer's value equals zero and when the PWM timer is decreasing.

Figures 51.3-9 to 51.3-11 show the timing waveforms of U/DTEP and U/DTEZ.

Figure 51.3-9. UTEP and UTEZ Generation in Count-Up Mode

Figure 51.3-10. DTEP and DTEZ Generation in Count-Down Mode

Figure 51.3-11. DTEP and UTEZ Generation in Count-Up-Down Mode

Please note that in the Count-Up-Down Mode, when the counting direction is increasing, the timer range is [0, period value - 1], and when the counting direction is decreasing, the timer range is [period value, 1]. That is, in this mode, when synchronizing the timer to 0, decreasing counting direction will be illegal, namely, `MCPWM_TIMER $n$ _PHASE_DIRECTION` cannot be set to 1. Similarly, when synchronizing the timer to period value, increasing counting direction will be illegal, namely, `MCPWM_TIMER $n$ _PHASE_DIRECTION` cannot be set to 0. Therefore, when the timer is synchronized to 0, the counting direction can only be increasing, and `MCPWM_TIMER $n$ _PHASE_DIRECTION` will be 0. When the timer is synchronized to the period value, the counting direction can only be decreasing, and `MCPWM_TIMER $n$ _PHASE_DIRECTION` will be 1.

### 51.3.2.3 Shadow Register of PWM Timer

The PWM timer's period register and the PWM timer's clock prescaler register have shadow registers. The shadow registers can back up the values that are about to be written to the valid registers. It also supports writing the values saved into the active register at a specific moment of hardware synchronization. The functionality of both register types is as follows:

- Active Register: Directly responsible for controlling all actions performed by hardware.
- Shadow Register: Acts as a temporary buffer for a value to be written to the active register. At a specific, user-configured point in time, the value saved in the shadow register is copied to the active register. Before this happens, the content of the shadow register has no direct effect on the controlled hardware. This helps to prevent erroneous operation of the hardware, which may happen when a register is asynchronously modified by software. Both the shadow register and the active register have the same memory address. The software always writes into, or reads from the shadow register.

The moment of updating the clock prescaler's active register is at the time when the timer starts operating. When `MCPWM_GLOBAL_UP_EN` is set to 1, the moment of updating the period active register can be selected by the following ways:

- By configuring the update method register `MCPWM_TIMERn_PERIOD_UPMETHOD` to 0, the update will start immediately.
- By configuring the update method register `MCPWM_TIMERn_PERIOD_UPMETHOD` to 1, the update can start when the PWM timer is equal to zero.
- By configuring the update method register `MCPWM_TIMERn_PERIOD_UPMETHOD` to 2, the update can start when the PWM timer is synchronized.
- By configuring the update method register `MCPWM_TIMERn_PERIOD_UPMETHOD` to 3, the update can start when the PWM timer is equal to zero or is synchronized.
- Software can also trigger a globally forced update bit `MCPWM_GLOBAL_FORCE_UP` which will prompt all registers in the module to be updated according to shadow registers.

### 51.3.2.4 PWM Timer Synchronization and Phase Locking

The PWM modules adopt a flexible synchronization method. Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from three synchronization outputs of the three PWM timers and three synchronization signals from the GPIO matrix. The synchronization output can be generated when the PWM timer's value equals to period or zero, the synchronization input signal is active, or software synchronizes. Thus, each PWM timer can flexibly select the synchronization input for different phase synchronization methods. During synchronization, the PWM timer clock prescaler will reset its counter and restart dividing the clock in order to ensure the correctness of the timer.

## 51.3.3 PWM Operator Module

The PWM Operator module has the following functions:

- Generates a PWM signal pair, based on timing references obtained from the corresponding PWM timer.

- Each signal out of the PWM signal pair includes a specific pattern of dead time (i.e., adding delays to the rising and falling edges of the PWM signal).
- Superimposes a carrier on the PWM signal, if configured to do so.
- Handles response under fault conditions.

Figure 51.3-12 shows the block diagram of a PWM operator.

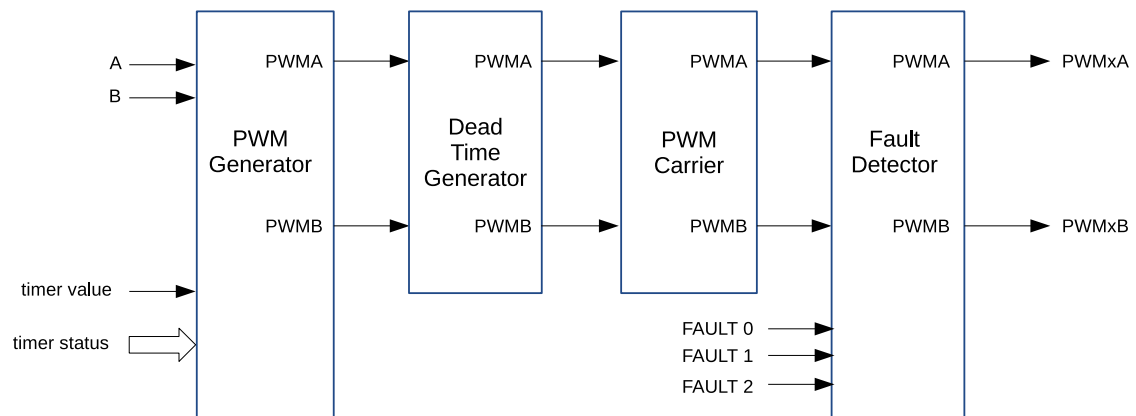

Figure 51.3-12. Block Diagram of A PWM Operator

### 51.3.3.1 PWM Generator Module

#### Purpose of the PWM Generator Module

In this module, important timing events are generated or imported. The events are then converted into specific actions to generate the desired waveforms at the PWMxA and PWMxB outputs.

The PWM generator module performs the following actions:

- Generation of timing events based on time stamps configured using the A and B registers. Events happen when the following conditions are met (for the configuration of registers A and B, see section [51.3.3.1](#)):
  - UTEA: the PWM timer is counting up and its value is equal to register A.
  - UTEB: the PWM timer is counting up and its value is equal to register B.
  - DTEA: the PWM timer is counting down and its value is equal to register A.
  - DTEB: the PWM timer is counting down and its value is equal to register B.
- Generation of U/DTO, U/DT1 timing events based on fault or synchronization events.
  - UTO: the PWM timer is counting up and FAULT0 detected (field [MCPWM\\_GENn\\_TO\\_SEL](#) is set to 0) or FAULT1 detected (field [MCPWM\\_GENn\\_TO\\_SEL](#) is set to 1) or FAULT2 detected (field [MCPWM\\_GENn\\_TO\\_SEL](#) is set to 2) or synchronized (field [MCPWM\\_GENn\\_TO\\_SEL](#) is set to 3).
  - UT1: the PWM timer is counting up and FAULT0 detected (field [MCPWM\\_GENn\\_T1\\_SEL](#) is set to 0) or FAULT1 detected (field [MCPWM\\_GENn\\_T1\\_SEL](#) is set to 1) or FAULT2 detected (field [MCPWM\\_GENn\\_T1\\_SEL](#) is set to 2) or synchronized (field [MCPWM\\_GENn\\_T1\\_SEL](#) is set to 3).
  - DTO: the PWM timer is counting down and FAULT0 detected (field [MCPWM\\_GENn\\_TO\\_SEL](#) is set to 0) or FAULT1 detected (field [MCPWM\\_GENn\\_TO\\_SEL](#) is set to 1) or FAULT2 detected (field [MCPWM\\_GENn\\_TO\\_SEL](#) is set to 2) or synchronized (field [MCPWM\\_GENn\\_TO\\_SEL](#) is set to 3).
  - DT1: the PWM timer is counting down and FAULT0 detected (field [MCPWM\\_GENn\\_T1\\_SEL](#) is set to 0) or FAULT1 detected (field [MCPWM\\_GENn\\_T1\\_SEL](#) is set to 1) or FAULT2 detected (field [MCPWM\\_GENn\\_T1\\_SEL](#) is set to 2) or synchronized (field [MCPWM\\_GENn\\_T1\\_SEL](#) is set to 3).
- Management of priority when these timing events occur concurrently.
- Generation of set, clear, and toggle actions, based on the timing events.
- Controlling of the PWM duty cycle, depending on the configuration of the PWM generator module.
- Handling of new time stamp values, using shadow registers to prevent glitches in the PWM cycle.

#### Shadow Register of PWM Generator

The time stamp registers A and B used by the hardware have shadow registers, which are registers [MCPWM\\_GENn\\_A\\_REG](#) and [MCPWM\\_GENn\\_B\\_REG](#). Shadowing provides a way of updating registers in sync with the hardware.

When [MCPWM\\_GLOBAL\\_UP\\_EN](#) is set to 1, the shadow registers can be written to the active register at a specified time. The update method field for [MCPWM\\_GENn\\_A\\_REG](#) and [MCPWM\\_GENn\\_B\\_REG](#) is [MCPWM\\_GENn\\_CFG\\_UPMETHOD](#). Software can also trigger a globally forced update bit

[MCPWM\\_GLOBAL\\_FORCE\\_UP](#) which will prompt all registers in the module to be updated according to shadow registers. For a description of the shadow registers, please see Section 51.3.2.3.

### Timing Events

For convenience, all timing signals and events are summarized in Table 51.3-2.

**Table 51.3-2. Timing Events Used in PWM Generator**

| Signal               | Event Description                                     | PWM Timer Operation   |
|----------------------|---|-----------------------|
| DTEP                 | PWM timer value is equal to the period register value | PWM timer counts down |
| DTEZ                 | PWM timer value is equal to zero                      |                       |
| DTEA                 | PWM timer value is equal to register A                |                       |
| DTEB                 | PWM timer value is equal to register B                |                       |
| DTO event            | Based on fault or synchronization events              |                       |
| DT1 event            | Based on fault or synchronization events              |                       |
| UTEP                 | PWM timer value is equal to the period register value | PWM timer counts up   |
| UTEZ                 | PWM timer value is equal to zero                      |                       |
| UTEA                 | PWM timer value is equal to register A                |                       |
| UTEB                 | PWM timer value is equal to register B                |                       |
| UTO event            | Based on fault or synchronization events              |                       |
| UT1 event            | Based on fault or synchronization events              |                       |
| Software-force event | Software-initiated asynchronous event                 | N/A                   |

The purpose of a software-force event is to impose non-continuous or continuous changes on the PWM<sub>x</sub>A and PWM<sub>x</sub>B outputs. The change is done asynchronously. Software-force control is handled by the [MCPWM\\_GEN<sub>n</sub>\\_FORCE\\_REG](#) registers.

The selection and configuration of T0/T1 in the PWM generator module is independent of the configuration of fault events in the fault handler module. A particular trip event may or may not be configured to cause trip action in the fault handler submodule, but the same event can be used by the PWM generator to trigger T0/T1 for controlling PWM waveforms.

It is important to know that when the PWM timer is in Count-Up-Down Mode. It will always decrement after a TEP event, and increment after a TEZ event. So, when the PWM timer is in Count-Up-Down Mode, DTEP and UTEZ events will occur, while UTEP and DTEZ events never occurs.

The PWM generator can handle multiple events at the same time. Events are prioritized by the hardware and relevant details are provided in Table 51.3-3 and Table 51.3-4. Priority levels range from 1 (the highest) to 7 (the lowest). Please note that the priority of TEP and TEZ events depends on the PWM timer's counting mode.

If the value of A or B is set to be greater than the period, then U/DTEA and U/DTEB will never occur.

**Table 51.3-3. Timing Events Priority When PWM Timer Increments**

| Priority Level | Event                 |
|----------------|-----------------------|
| 1 (highest)    | Software-forced event |
| 2              | UTEP                  |

| Priority Level | Event |
|----------------|-------|
| 3              | UTO   |
| 4              | UT1   |
| 5              | UTEB  |
| 6              | UTEA  |
| 7 (lowest)     | UTEZ  |

Table 51.3-4. Timing Events Priority when PWM Timer Decrements

| Priority level | Event                 |
|----------------|-----------------------|
| 1 (highest)    | Software-forced event |
| 2              | DTEZ                  |
| 3              | DT0                   |
| 4              | DT1                   |
| 5              | DTEB                  |
| 6              | DTEA                  |
| 7 (lowest)     | DTEP                  |

## Notes:

1. UTEP and UTEZ do not happen simultaneously. When the PWM timer is in Count-Up Mode, UTEP will always happen one cycle earlier than UTEZ, as demonstrated in Figure 51.3-9, so their action on PWM signals will not interrupt each other. When the PWM timer is in Count-Up-Down Mode, UTEP will not occur.
2. DTEP and DTEZ do not happen simultaneously. When the PWM timer is in Count-Down Mode, DTEZ will always happen one cycle earlier than DTEP, as demonstrated in Figure 51.3-10, so their action on PWM signals will not interrupt each other. When the PWM timer is in Count-Up-Down Mode, DTEZ will not occur.

**PWM Signal Generation**

The PWM generator module controls the behavior of outputting PWMxA and PWMxB when a particular timing event occurs. The timing events are further qualified by the PWM timer's counting mode (increment or decrement). Knowing the counting mode, the module may then perform an independent action at each stage of the PWM timer counting up or down.

The following actions may be configured on PWMxA and PWMxB outputs:

- Set High: Set the output of PWMxA or PWMxB to a high level.
- Clear Low: Clear the output of PWMxA or PWMxB by setting it to a low level.
- Toggle: Change the current output level of PWMxA or PWMxB to the opposite value. If it is currently pulled up, then pull it down, or vice versa.
- Do Nothing: Keep both outputs PWMxA and PWMxB unchanged. In this state, interrupts can still be triggered.

Actions on outputs is configured by using registers `MCPWM_GENn_A_REG` and

[MCPWM\\_GENn\\_B\\_REG](#). So, the action to be taken on each output is set independently. Also, there is great flexibility in selecting actions to be taken on a given output based on events. More specifically, any event listed in Table 51.3-2 can operate on either output of PWMx<sub>A</sub> or PWMx<sub>B</sub>. To check out registers for particular generator 0, 1, or 2, please refer to the register description in Section 51.5.

### Waveforms for Common Configurations

In the configuration of various waveforms below, period refers to the configuration value stored in the period register of the PWM timer selected by the PWM operator (i.e., [MCPWM\\_TIMERn\\_PERIOD](#) ( $x = 0, 1, 2$ )). For configuration methods, please refer to the section 51.3.2. A and B denote the time stamp registers A and B used by the hardware. For register configuration, please refer to the section 51.3.3.1. UTEA/B, UTEZ/P, DTEA/B, DTEZ/P, DTO/1, and UTO/1 represent different timing events of the PWM generator. For event definition, please refer to the section 51.3.3.1. The upward arrow, downward arrow, and T mark signify setting the PWM waveform high, setting it low, toggling it when the timing event occurs. See section 51.3.3.1 for configuration. PWMx<sub>A</sub> and PWMx<sub>B</sub> are the output signals of PWM generator $x$ .

Figure 51.3-13 presents the symmetrical PWM waveform generated when the PWM timer is in Count-Up-Down mode. DC 0%–100% modulation can be calculated via the formula below:

$$Duty = (Period - A) \div Period$$

If A matches the PWM timer value and the PWM timer is incrementing, then the PWM output is pulled up. If A matches the PWM timer value while the PWM timer is decrementing, then the PWM output is pulled low.

Figure 51.3-13. Symmetrical Waveform in Count-Up-Down Mode

The PWM waveforms in Figures 51.3-14 to 51.3-17 show some common PWM generator configurations.

Figure 51.3-14. Count-Up, Single Edge Asymmetric Waveform, with Independent Modulation on PWMxA and PWMxB — Active High

The duty modulation for PWMxA is set by B, active high and proportional to B.

The duty modulation for PWMxB is set by A, active high and proportional to A.

$$Period = (MCPWM\_TIMER\_PERIOD + 1) \times T_{PT\_clk}$$

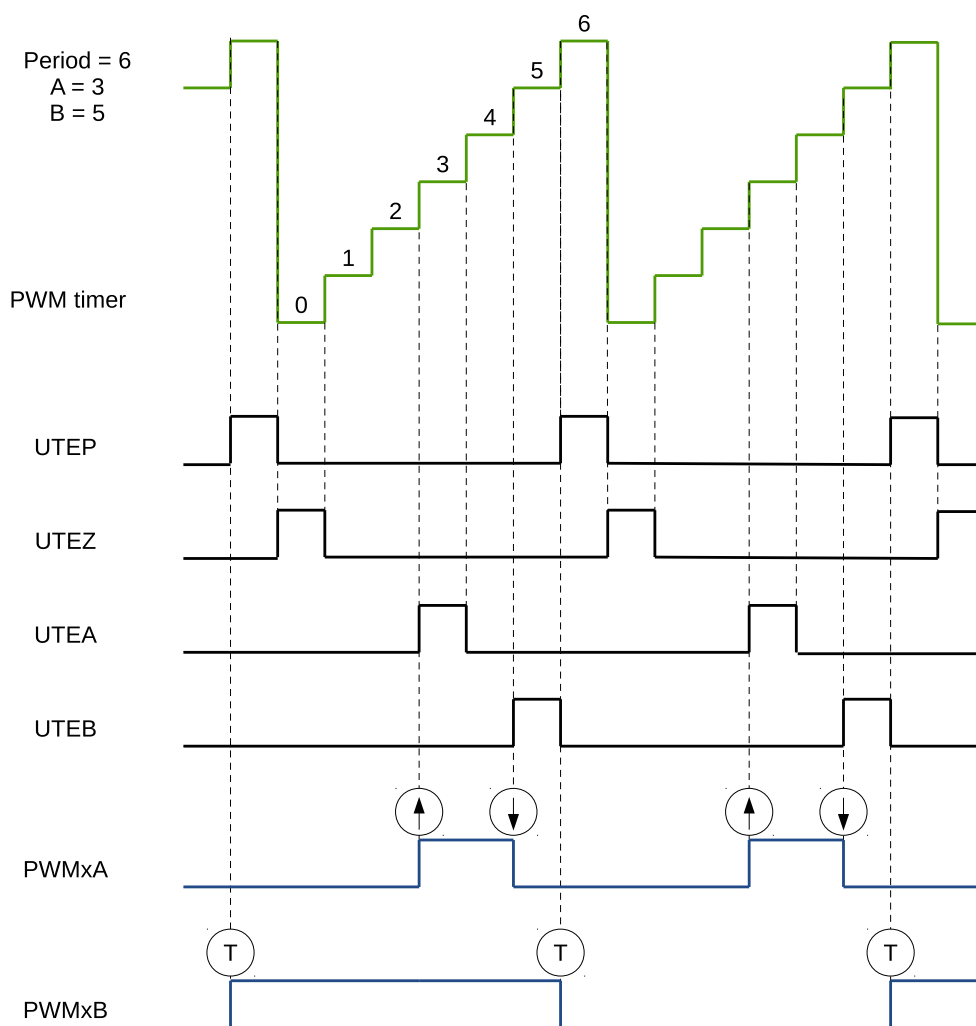

Figure 51.3-15. Count-Up, Pulse Placement Asymmetric Waveform with Independent Modulation on PWMxA

Pulses may be generated anywhere within the PWM cycle (zero to period).

PWMxA's high time duty is proportional to (B - A).

$$Period = (MCPWM\_TIMERn\_PERIOD + 1) \times T_{PT\_clk}$$

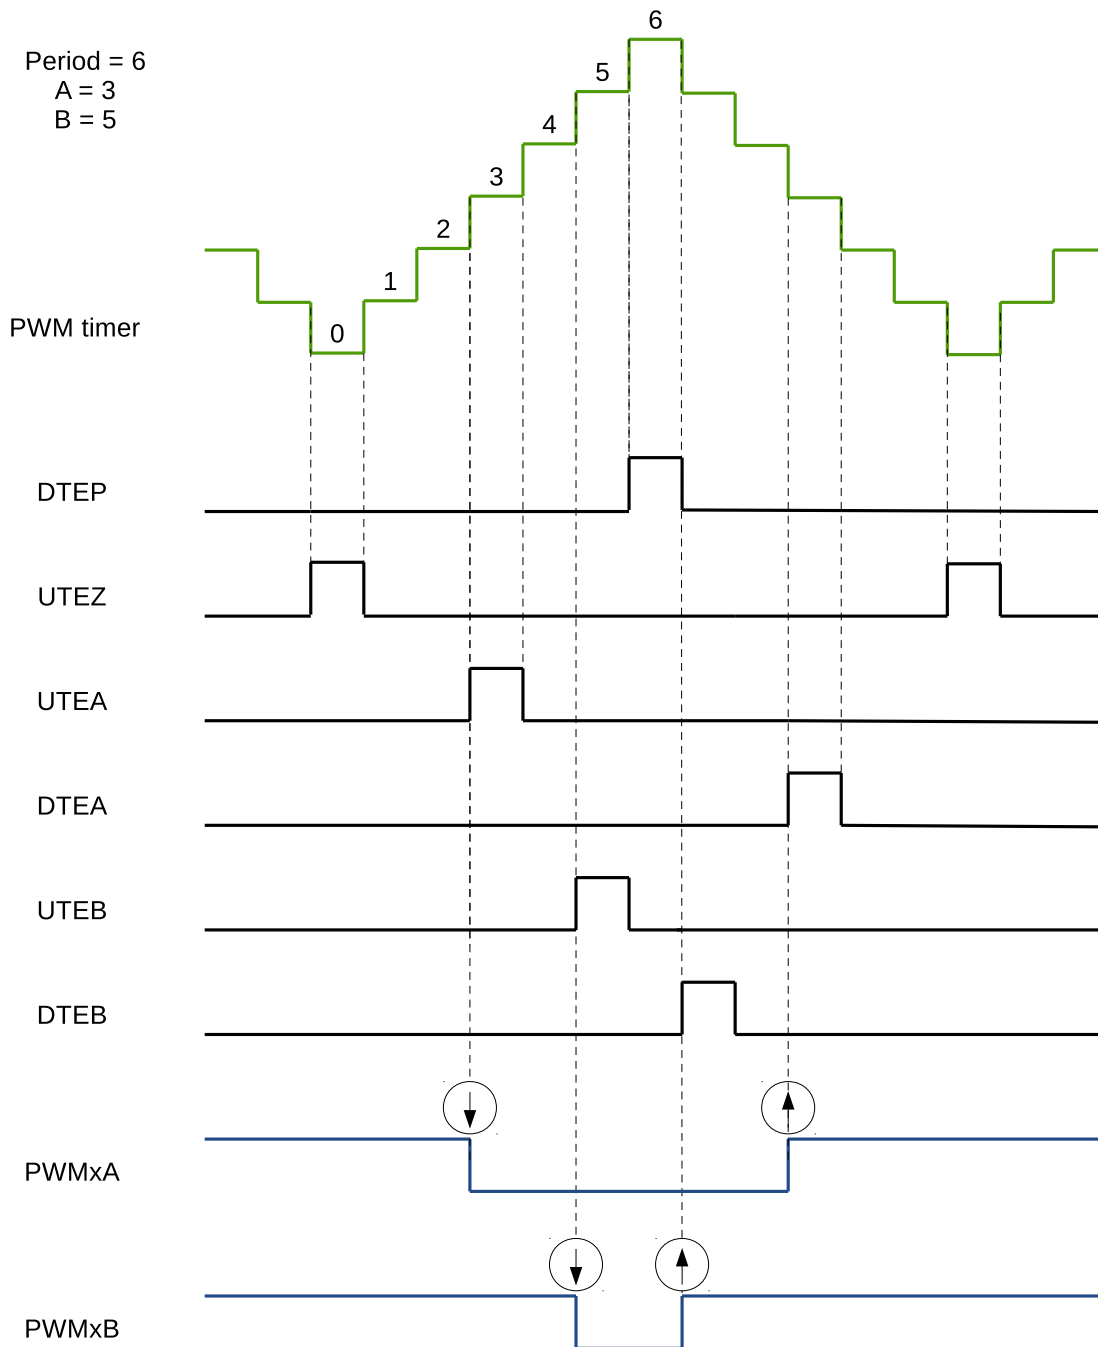

Figure 51.3-16. Count-Up-Down, Dual Edge Symmetric Waveform, with Independent Modulation on PWMxA and PWMxB — Active High

The duty modulation for PWMxA is set by A, active high and proportional to A.  
The duty modulation for PWMxB is set by B, active high and proportional to B.  
Outputting PWMxA and PWMxB can drive separate switches.

$$Period = (2 \times MCPWM\_TIMER\_PERIOD) \times T_{PT\_clk}$$

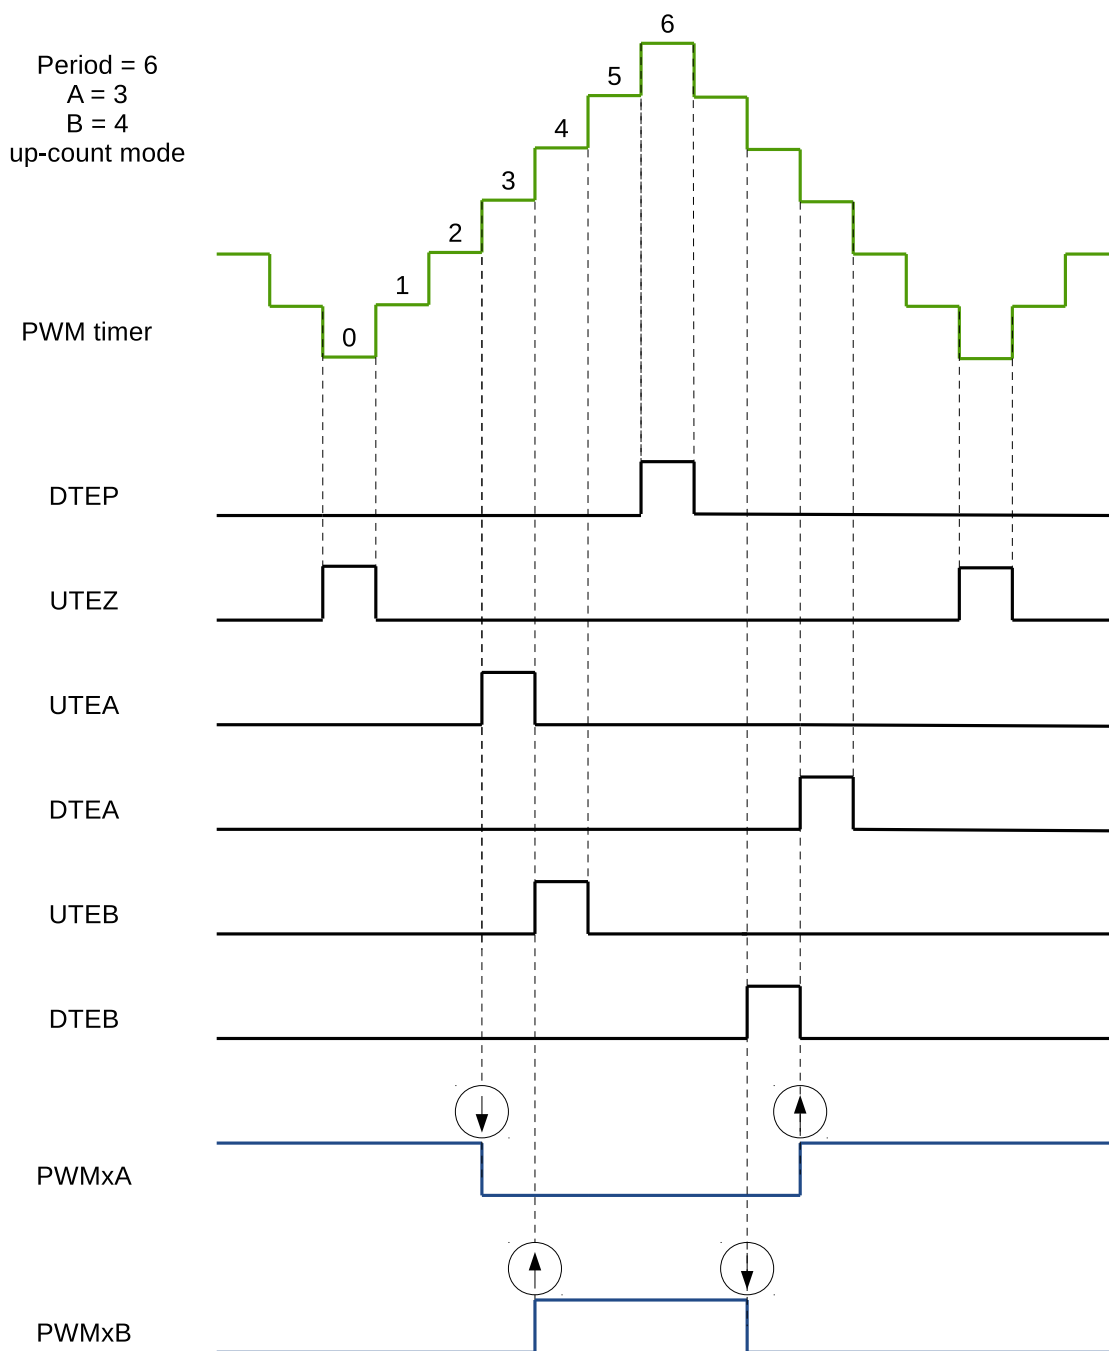

Figure 51.3-17. Count-Up-Down, Dual Edge Symmetric Waveform, with Independent Modulation on PWMxA and PWMxB – Complementary

The duty modulation of PWMxA is set by A, is active high and proportional to A.

The duty modulation of PWMxB is set by B, is active low and proportional to B.

Outputs PWMx can drive upper/lower (complementary) switches.

Dead time = B – A. Edge placement is configurable by software. Dead time generator module supports configuring edge delay methods when required.

$$Period = (2 \times MCPWM\_TIMERn\_PERIOD) \times T_{PT\_clk}$$

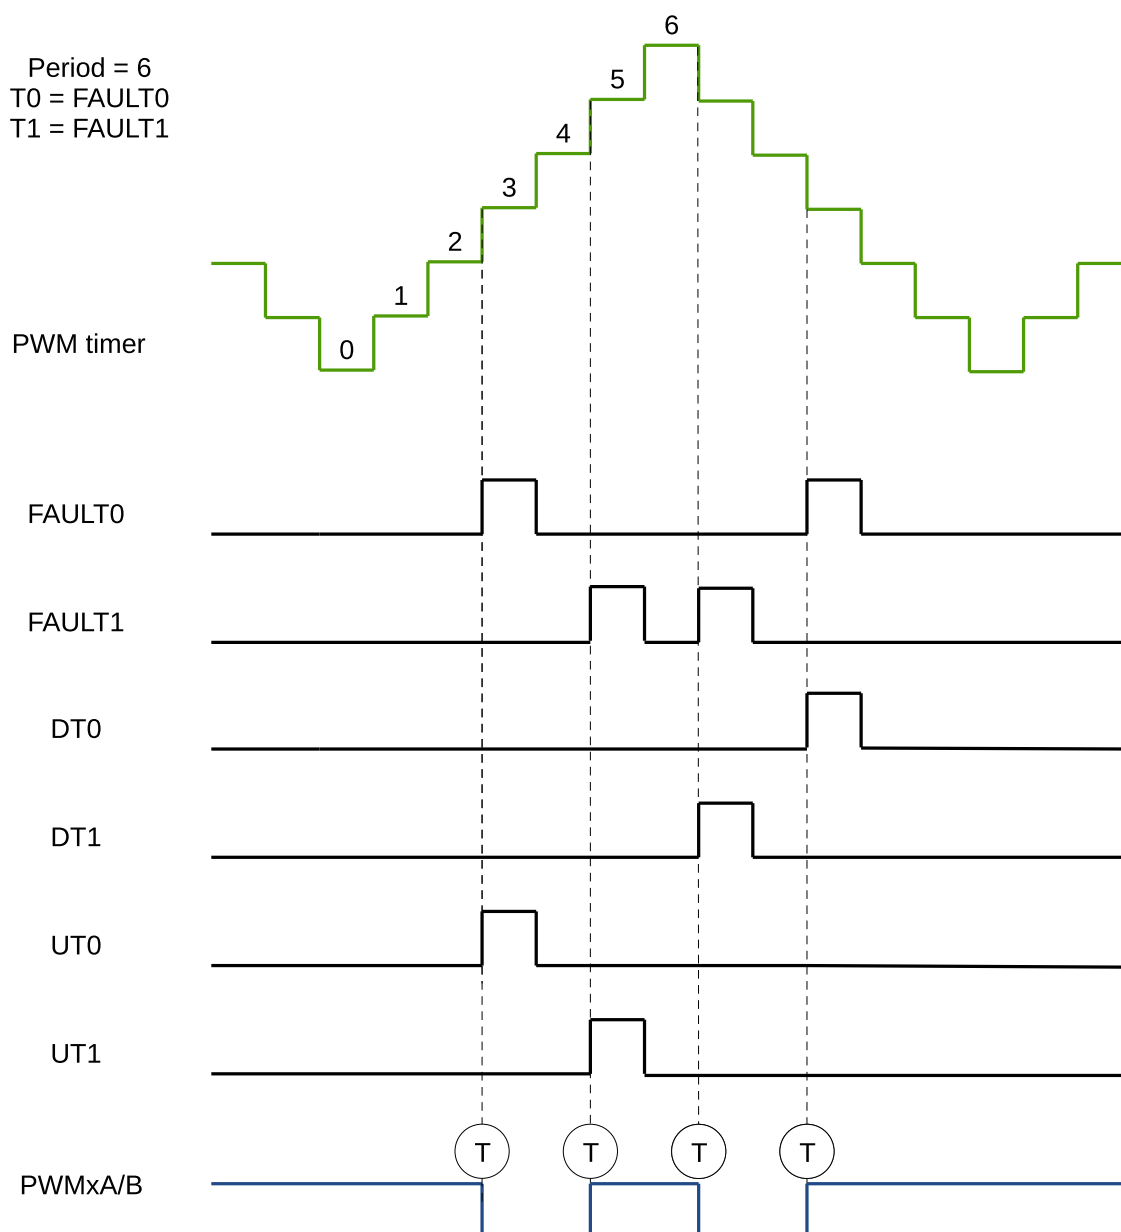

Figure 51.3-18. Count-Up-Down, Fault or Synchronization Events, with Same Modulation on PWMxA and PWMxB

Figure 51.3-18 shows a waveform when UT0/1 and DT0/1 events are generated. In this example, T0 selects FAULT0 and T1 selects FAULT1. The events selected by T0 and T1 can be configured independently, these events can be FAULT0, FAULT1, FAULT2 or synchronous. For detailed configuration, see section 51.3.3.1.

### Software-Force Events

There are two types of software-force events inside the PWM generator:

- Non-continuous-immediate (NCI) software-force events: Such types of events are immediately effective on PWM outputs when triggered by software. The forcing is non-continuous, which means the next active timing events will be able to alter the PWM outputs.
- Continuous (CNTU) software-force events: Such types of events are continuous. The forced PWM outputs will continue until they are released by software. The events' triggers are configurable. They can

be configured to be timing events or immediate events.

For NCI software-force events, set register [MCPWM\\_GENn\\_A\\_NCIFORCE](#) or [MCPWM\\_GENn\\_B\\_NCIFORCE](#) to 1 and then to 0 to trigger the NCI software-forced events of PWMxA or PWMxB. Configure register [MCPWM\\_GENn\\_A\\_NCIFORCE\\_MODE](#) or [MCPWM\\_GENn\\_B\\_NCIFORCE\\_MODE](#) to specify the operation on the PWMxA or PWMxB waveform when the NCI software-force event occurs. Configuring the registers to 0 or 3 means no operation, 1 means low level, and 2 means high level.

For CNTU software-force events, set register [MCPWM\\_GENn\\_CNTUFORCE\\_UPMETHOD](#) to specify the trigger method of CNTU software-force events. Setting all bits to 0 means trigger CNTU software-force events immediately, setting bit 0 to 1 means the TEZ event triggers CNTU software-force events, setting bit 1 to 1 means the TEP event triggers CNTU software-force events, setting bit 2 to 1 means the TEA event triggers CNTU software-force events, setting bit 3 to 1 means the TEB event triggers CNTU software-force events, setting bit 4 to 1 means CNTU software-force events triggered when the PWM timer selected by the PWM generator is synchronized, and setting bit 5 to 1 means the CNTU software-forced events will not be triggered. Configure register [MCPWM\\_GENn\\_A\\_CNTUFORCE\\_MODE](#) or [MCPWM\\_GENn\\_B\\_CNTUFORCE\\_MODE](#) to specify the operation on the PWMxA or PWMxB waveform when the CNTU software-force events occur. Configuring the registers to 0 or 3 means no operation, 1 means low level, and 2 means high level.

Figure 51.3-19 shows a waveform of NCI software-force events. NCI events are used to force PWMxA output low. Forcing on PWMxB is disabled in this case.

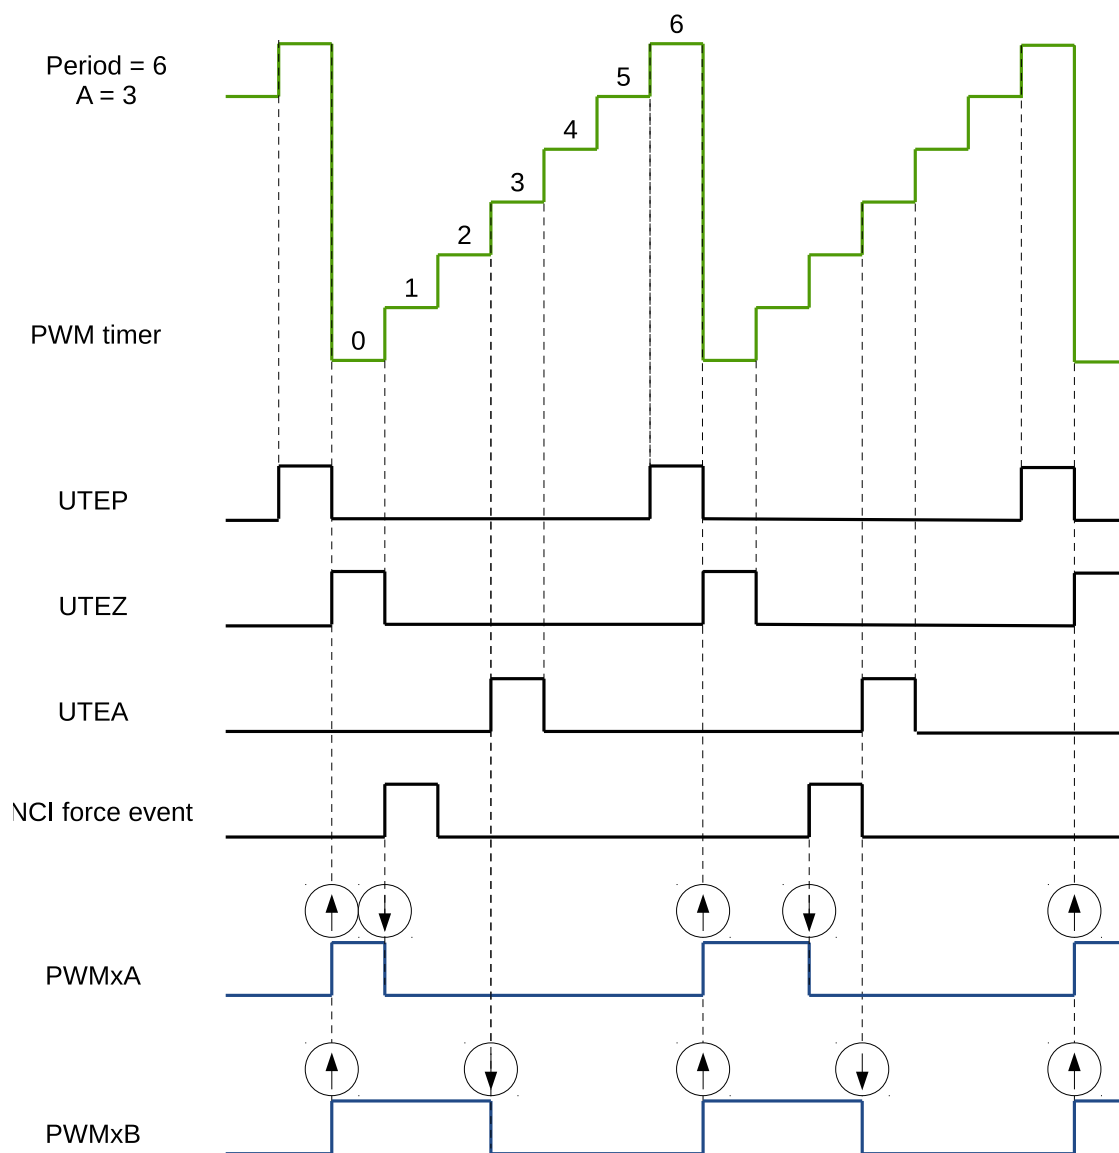

Figure 51.3-19. Example of an NCI Software-Force Event on PWMxA

Figure 51.3-20 shows a waveform of CNTU software-force events. TEZ events are selected as triggers for CNTU software-force events. CNTU is used to force the PWMxB output low. Forcing on PWMxA is disabled.

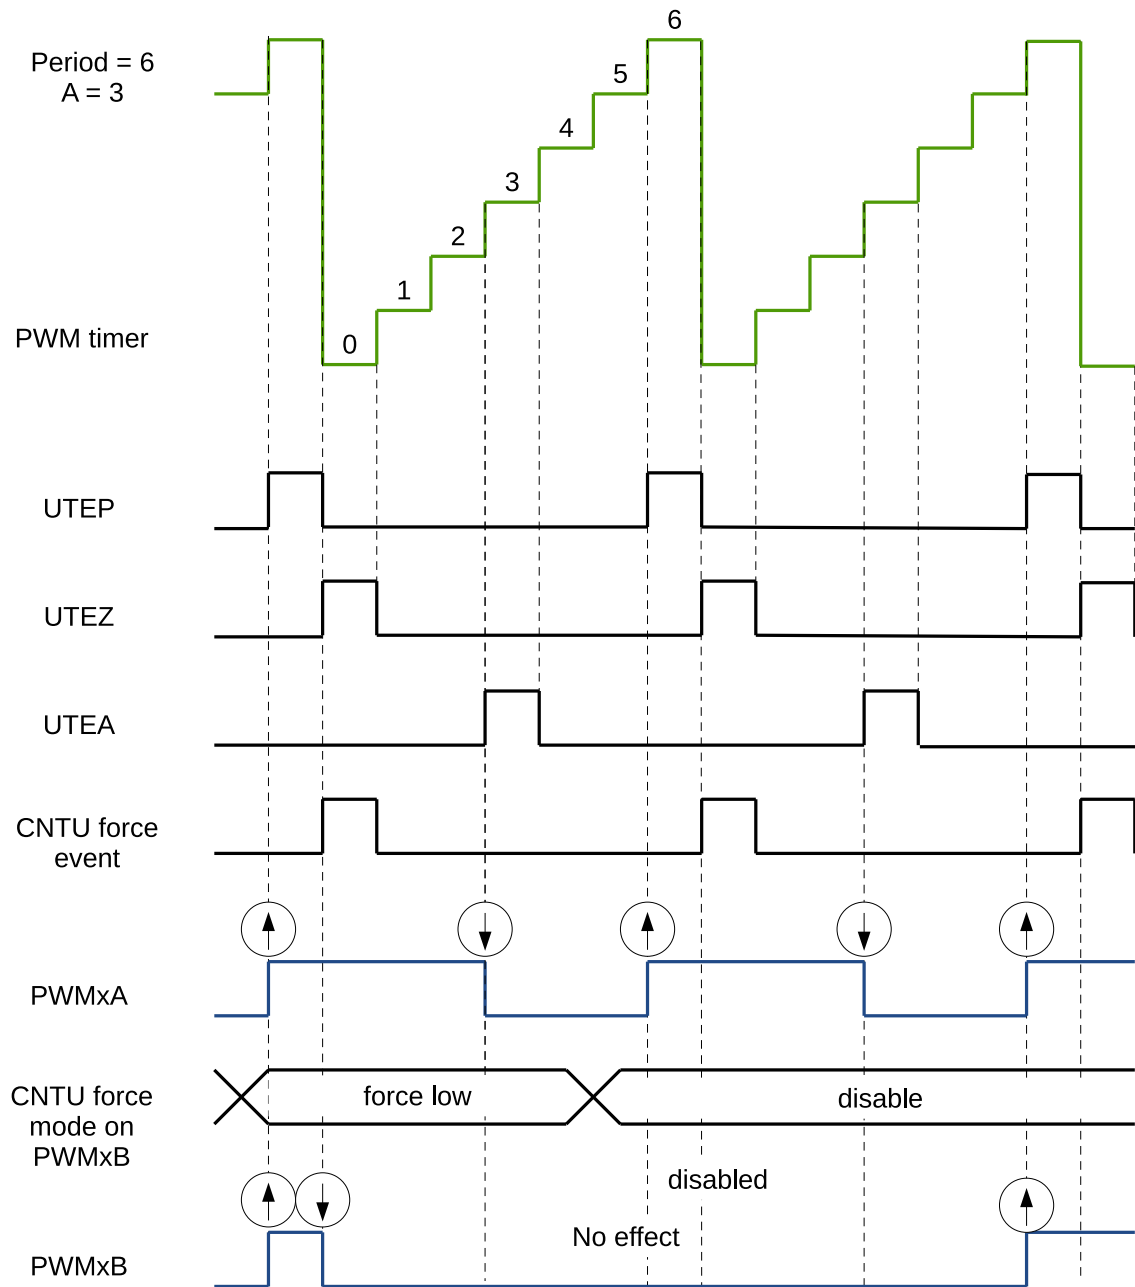

Figure 51.3-20. Example of a CNTU Software-Force Event on PWMxB

### 51.3.3.2 Dead Time Generator Module

#### Purpose of the Dead Time Generator Module

Section 51.3.3.1 introduced several options to generate signals on PWMxA and PWMxB outputs, with a specific placement of signal edges. The required dead time is obtained by altering the edge placement between signals and by setting the signal's duty cycle. Another option to control the dead time is to use a specialized module – Dead Time Generator.

The key functions of the Dead Time Generator module are as follows:

- Generating output signal pairs (PWMxA and PWMxB) with a dead time from a common source, which can be either the input signal PWMxA or PWMxB.
- Creating a dead time by adding delay to signal edges:
  - Rising edge delay (RED)
  - Falling edge delay (FED)
- Can generate PWM signal in various format. The typical dead time configurations are:
  - Active high complementary (AHC)
  - Active low complementary (ALC)
  - Active high (AH)
  - Active low (AL)
- This module may also be bypassed, if the dead time is configured directly in the generator module.

#### Shadow Register of Dead Time Generator

Delay registers RED and FED are shadowed with registers `MCPWM_DT $n$ _RED_CFG_REG` and `MCPWM_DT $n$ _FED_CFG_REG`. When `MCPWM_GLOBAL_UP_EN` is set to 1, the values saved in the shadow registers can be written to the active register at the specified time. The update method register for `MCPWM_DT $n$ _RED_CFG_REG` is `MCPWM_DB $n$ _RED_UPMETHOD`. The update method register for `MCPWM_DT $n$ _FED_CFG_REG` is `MCPWM_DB $n$ _FED_UPMETHOD`. The Software can also trigger a globally forced update bit `MCPWM_GLOBAL_FORCE_UP` which will prompt all registers in the module to be updated according to shadow registers. For the description of shadow registers, please see section 51.3.2.3.

## Highlights for Operation of the Dead Time Generator

Options for setting up the dead time module are shown in Figure 51.3-21.

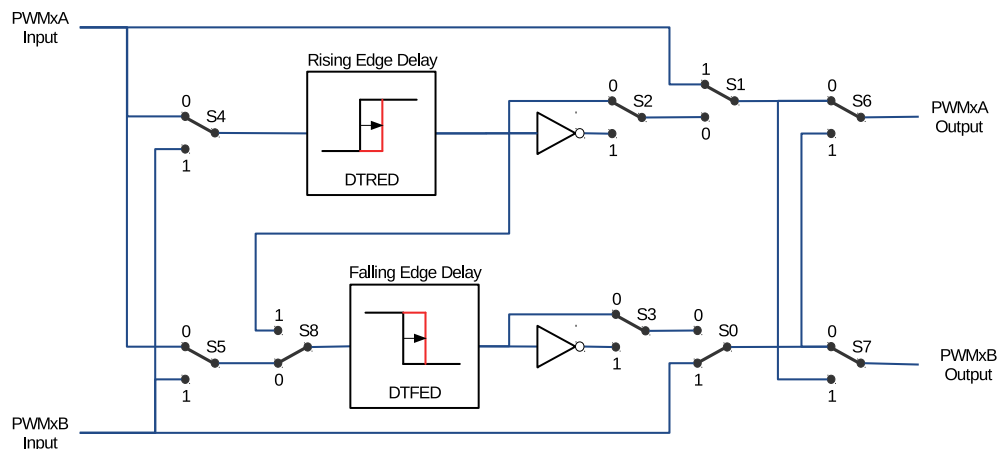

Figure 51.3-21. Options for Setting up the Dead Time Generator Module

S0-S8 in the figure above are switches controlled by fields in register `MCPWM_DTn_CFG_REG` shown in Table 51.3-5.

Table 51.3-5. Dead Time Generator Switches Control Fields

| Switch | Field                                |
|--------|--------------------------------------|
| S0     | <code>MCPWM_DBn_B_OUTBYPASS</code>   |
| S1     | <code>MCPWM_DBn_A_OUTBYPASS</code>   |
| S2     | <code>MCPWM_DBn_RED_OUTINVERT</code> |
| S3     | <code>MCPWM_DBn_FED_OUTINVERT</code> |
| S4     | <code>MCPWM_DBn_RED_INSEL</code>     |
| S5     | <code>MCPWM_DBn_FED_INSEL</code>     |
| S6     | <code>MCPWM_DBn_A_OUTSWAP</code>     |
| S7     | <code>MCPWM_DBn_B_OUTSWAP</code>     |
| S8     | <code>MCPWM_DBn_DEB_MODE</code>      |

All switch combinations are supported, but not all of them represent the typical modes of use. Table 51.3-6 documents some typical dead time configurations. In these configurations, the position of S4 and S5 sets PWMxA as the common source of both falling edge delay (FED) and rising edge delay (RED). The modes presented in table 51.3-6 may be categorized as follows:

Table 51.3-6. Typical Dead Time Generator Operating Modes

| Mode | Mode Description                                    | S0 | S1 | S2 | S3 |
|------|---|----|----|----|----|
| 1    | PWMxA and PWMxB Pass Through/No Delay               | 1  | 1  | X  | X  |
| 2    | Active High Complementary (AHC), see Figure 51.3-22 | 0  | 0  | 0  | 1  |
| 3    | Active Low Complementary (ALC), see Figure 51.3-23  | 0  | 0  | 1  | 0  |
| 4    | Active High (AH), see Figure 51.3-24                | 0  | 0  | 0  | 0  |

| Mode | Mode Description  | S0 | S1 | S2     | S3     |
|------|---|----|----|--------|--------|
| 5    | Active Low (AL), see Figure 51.3-25   | 0  | 0  | 1      | 1      |
| 6    | PWMxA Output = PWMxA In (No Delay)<br>PWMxB Output = PWMxA Input with Falling Edge Delay      | 0  | 1  | 0 or 1 | 0 or 1 |
| 7    | PWMxA Output = PWMxA Input with Rising Edge Delay<br>PWMxB Output = PWMxB Input with No Delay | 1  | 0  | 0 or 1 | 0 or 1 |

**Note:**

For all the modes above, the position of the binary switches S4 to S8 is set to 0.

- **Mode 1: Bypass delays on both FED and RED**

In this mode, the dead time module is disabled. Signals of PWMxA and PWMxB pass through without any modifications.

- **Mode 2-5: Classical Dead Time Polarity Settings**

These four modes represent typical configurations of polarity and should cover the active-high/low modes in available industry power switch gate drivers. The typical waveforms are shown in Figures 51.3-22 to 51.3-25.

- **Modes 6 and 7: Bypass delay on the falling edge (FED) or rising edge (RED)**

In these two modes, either RED or FED is bypassed. As a result, the corresponding delay is not applied.

Figure 51.3-22. Active High Complementary (AHC) Dead Time Waveforms

Figure 51.3-23. Active Low Complementary (ALC) Dead Time Waveforms

Figure 51.3-24. Active High (AH) Dead Time Waveforms

Figure 51.3-25. Active Low (AL) Dead Time Waveforms

RED and FED delays may be set up independently. The delay value is programmed using the 16-bit field `MCPWM_DB $n$ _RED` and `MCPWM_DB $n$ _FED`. The register value represents the number of clock (DT\_CLK) periods by which a signal edge is delayed. DT\_CLK can be selected from PWM\_clk or PT\_clk through register `MCPWM_DB $n$ _CLK_SEL`.

To calculate the delay on the falling edge (FED) and rising edge (RED), use the following formulas:

$$FED = MCPWM\_DTn\_FED \times T_{DT\_clk}$$

$$RED = MCPWM\_DTn\_RED \times T_{DT\_clk}$$

### 51.3.3.3 PWM Carrier Module

The coupling of PWM output to a motor driver may need isolation with a transformer. Transformers deliver only AC signals, while the duty cycle of a PWM signal may range anywhere from 0% to 100%. The PWM carrier module passes such a PWM signal through a transformer by using a high frequency carrier to modulate the signal.

#### Function Overview

The following key characteristics of this module are configurable:

- Carrier frequency
- Pulse width of the first pulse
- Duty cycle of the second and the subsequent pulses
- Enabling/disabling the carrier function

#### Operational Highlights

The PWM carrier clock (PC\_clk) is derived from PWM\_CLK. The frequency and duty cycle are configured by the `MCPWM_CHOPPERn_PRESCALE` and `MCPWM_CHOPPERn_DUTY` bits in the `MCPWM_CARRIERn_CFG_REG` register. The purpose of one-shot pulses is to provide the high-energy impulse to reliably turn on the power switch. Subsequent pulses sustain the power-on status. The width of a one-shot pulse is configurable with the `MCPWM_CHOPPERn_OSHTWTH` field. Enabling/disabling of the carrier module is done with the `MCPWM_CHOPPERn_EN` bit.

#### Waveform Examples

Figure 51.3-26 shows an example of waveforms, where a carrier is superimposed on original PWM pulses. This figure does not show the first one-shot pulse and the duty-cycle control. Related details are covered in the following two sections.

Figure 51.3-26. Example of Waveforms Showing PWM Carrier Action

## One-Shot Pulse

The width of the first pulse can be configured to 16 different values, which can be calculated by the following equation:

$$T_{1stpulse} = T_{PWM\_clk} \times 8 \times (MCPWM\_CARRIERn\_PRESCALE + 1) \times (MCPWM\_CARRIERn\_OSHTWTH + 1)$$

Where:

- $T_{PWM\_clk}$  is the period of the PWM clock (PWM\_clk).
- $(MCPWM\_CARRIERn\_OSHTWTH + 1)$  is the width of the first pulse (whose value ranges from 1 to 16).
- $(MCPWM\_CARRIERn\_PRESCALE + 1)$  is the PWM carrier clock's (PC\_clk) prescaler value.

The first one-shot pulse and subsequent sustaining pulses are shown in Figure 51.3-27.

Figure 51.3-27. Example of the First Pulse and the Subsequent Sustaining Pulses of the PWM Carrier Sub-module

## Duty Cycle Control

After issuing the first one-shot pulse, the remaining PWM signal is modulated according to the carrier frequency. Users can configure the duty cycle of this signal. Tuning of duty may be required, so that the signal passes through the isolating transformer and can still operate (turn on/off) the motor drive, changing rotation speed and direction.

The duty cycle may be set to one of seven values, using `MCPWM_CHOPPERn_DUTY`, or bits [7:5] of register `MCPWM_CARRIERn_CFG_REG`.

Below is the formula for calculating the duty cycle:

$$Duty = MCPWM\_CARRIERn\_DUTY \div 8$$

All seven settings of the duty cycle are shown in Figure 51.3-28.

Figure 51.3-28. Possible Duty Cycle Settings for Sustaining Pulses in the PWM Carrier Submodule

#### 51.3.3.4 Fault Detection Module

Each MCPWM peripheral is connected to three fault signals (FAULT0, FAULT1, and FAULT2) which are sourced from the GPIO matrix. These signals are intended to indicate external fault conditions, and may be preprocessed by the Fault Detection module to generate fault events. Fault events can then execute the user code to control MCPWM outputs in response to specific faults.

##### Function of Fault Detection Module

The key actions performed by the fault detection module are:

- Forcing outputs PWMxA and PWMxB, upon detected fault, to one of the following states:
  - High
  - Low
  - Toggle
  - No action taken
- Execution of one-shot trip (OST) upon detection of over-current conditions/short circuits.
- Cycle-by-cycle trip (CBC) to provide current-limiting operation.
- Allocation of either one-shot or cycle-by-cycle operation for each fault signal.
- Generation of interrupts for each fault input.
- Support for software-force tripping.
- Enabling or disabling of module function as required.

## Operation and Configuration Tips

This section provides the operational tips and set-up options for the Fault Detection module.

Fault signals coming from pins are sampled and synced in the GPIO matrix. In order to guarantee the successful sampling of fault pulses, each pulse duration must be at least two APB clock cycles. The Fault Detection module will then sample fault signals by using PWM\_clk. So, the duration of fault pulses coming from GPIO matrix must be at least one PWM\_clk cycle. Differently put, regardless of the period relation between APB clock and PWM\_clk, the width of fault signal pulses on pins must be at least equal to the sum of two APB clock cycles and one PWM\_clk cycle.

Each level of fault signals, FAULT0 to FAULT2, can be used by the Fault Detection module to generate fault events (fault\_event0 to fault\_event2). Every fault event can be configured individually to provide CBC action, OST action, or none.

- **Cycle-by-Cycle (CBC) action:**

When CBC action is triggered, the state of PWMxA and PWMxB will be changed immediately according to the configuration of fields [MCPWM\\_TZn\\_A\\_CBC\\_U/D](#) and [MCPWM\\_TZn\\_B\\_CBC\\_U/D](#). Different actions can be indicated when the PWM timer is incrementing or decrementing. Different CBC action interrupts can be triggered for different fault events. Status field [MCPWM\\_TZn\\_CBC\\_ON](#) indicates whether a CBC action is on or off. When the fault event is no longer present, CBC actions on PWMxA/B will be cleared at a specified point, which is either a D/UTEP or D/UTEZ event. Field [MCPWM\\_TZn\\_CBCPULSE](#) determines at which event PWMxA and PWMxB will be able to resume normal actions. Therefore, in this mode, the CBC action is cleared or refreshed upon every PWM cycle.

- **One-Shot (OST) action:**

When OST action is triggered, the state of PWMxA and PWMxB will be changed immediately, depending on the setting of fields [MCPWM\\_TZn\\_A\\_OST\\_U/D](#) and [MCPWM\\_TZn\\_B\\_OST\\_U/D](#). Different actions can be configured when PWM timer is incrementing or decrementing. Different OST action interrupts can be triggered from different fault events. Status field [MCPWM\\_TZn\\_OST\\_ON](#) indicates whether an OST action is on or off. The OST actions on PWMxA/B are not automatically cleared when the fault event is no longer present. One-shot actions must be cleared manually by setting the [MCPWM\\_TZn\\_CLR\\_OST](#) bit.

## 51.3.4 Capture Module

### 51.3.4.1 Introduction

The capture module contains three complete capture channels. Channel inputs CAPO, CAP1, and CAP2 are sourced from the GPIO matrix. Thanks to the flexibility of the GPIO matrix, CAPO, CAP1, and CAP2 can be configured from any pin input. Multiple capture channels can be sourced from the same pin input, while prescaling for each channel can be set differently. Also, capture channels are sourced from different pins. This provides several options for handling capture signals by hardware in the background, instead of having them processed directly by the CPU. A capture module has the following independent key resources:

- One 32-bit timer (counter) which can be synchronized with the PWM timer, another module, or software.
- Three capture channels, each equipped with a 32-bit time-stamp and a capture prescaler.
- Independent edge polarity (rising/falling edge) selection for any capture channel.
- Input capture signal prescaling (from 1 to 256).

- Interrupt capabilities on any of the three capture events.

### 51.3.4.2 Capture Timer

The capture timer is a 32-bit counter incrementing continuously. It is enabled by setting `MCPWM_CAP_TIMER_EN` to 1. Its operating clock source is MCPWM core clock. When `MCPWM_CAP_SYNCI_EN` is configured, the counter will be loaded with phase stored in register `MCPWM_CAP_TIMER_PHASE_REG` at the time of a sync event. Sync events can select from PWM timers sync-out, or PWM module sync-in by configuring `MCPWM_CAP_SYNCI_SEL`. Sync events can also be generated by setting `MCPWM_CAP_SYNC_SW`. The capture timer provides timing references for all three capture channels.

### 51.3.4.3 Capture Channel

The capture signal coming to a capture channel will be inverted first, if needed, and then prescaled. Each capture channel has a prescaler register of `MCPWM_CAPn_PRESCALE`. Finally, specified edges of preprocessed capture signal will trigger capture events. Setting `MCPWM_CAPn_EN` to enable a capture channel. The capture event occurs at the time selected by the `MCPWM_CAPn_MODE`. When a capture event occurs, the capture timer's value is stored in time-stamp register `MCPWM_CAP_CHn_REG`. Different interrupts can be generated for different capture channels at capture events. The edge that triggers a capture event is recorded in register `MCPWM_CAPn_EDGE`. The capture event can be also forced by software setting `MCPWM_CAPn_SW`.

## 51.3.5 ETM Module

### 51.3.5.1 Overview

The MCPWM peripheral on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows MCPWM's ETM tasks to be triggered by any peripherals' ETM events, or MCPWM's ETM events to trigger any peripherals' ETM tasks. The capture module, the fault detection module, three timers, and three operators can generate events and respond to tasks independently. This section introduces the ETM tasks and events related to MCPWM. For more information, please refer to Chapter 12 [Event Task Matrix \(ETM\)](#).

### 51.3.5.2 MCPWM-Related ETM Events

When setting enable field to 1, after the generation condition is met, the corresponding event would be generated. For details, please refer to Table 51.3-7 below:

Table 51.3-7. MCPWM-Related ETM Events

| Enable Field                                 | Generation Condition   | Event Generated                                       |
|--|--|---|
| <code>MCPWM_EVT_CAP<sub>n</sub>_EN</code>    | CAP <sub>n</sub> capture event occurs                                    | <code>MCPWM<sub>m</sub>_EVT_CAP<sub>n</sub></code>    |
| <code>MCPWM_EVT_TZ<sub>n</sub>_OST_EN</code> | PWM operator <sub>n</sub> performs a One-Shot trip (OST) operation       | <code>MCPWM<sub>m</sub>_EVT_TZ<sub>n</sub>_OST</code> |
| <code>MCPWM_EVT_TZ<sub>n</sub>_CBC_EN</code> | PWM operator <sub>n</sub> performs a cycle-by-cycle trip (CBC) operation | <code>MCPWM<sub>m</sub>_EVT_TZ<sub>n</sub>_CBC</code> |
| <code>MCPWM_EVT_F<sub>n</sub>_CLR_EN</code>  | Fault event fault_event <sub>n</sub> is cleared                          | <code>MCPWM<sub>m</sub>_EVT_F<sub>n</sub>_CLR</code>  |

<sup>1</sup> See Section 51.3.3.1 for a detailed description of timer stamp A and B.

| Enable Field             | Generation Condition  | Event Generated            |
|--------------------------|---|----------------------------|
| MCPWM_EVT_Fn_EN          | Fault event fault_event $n$ is generated  | MCPWM $m$ _EVT_Fn          |
| MCPWM_EVT_OPn_TEB_EN     | The count value of the timer that PWM operator $n$ selects is equal to the value of timer stamp B <sup>1</sup>      | MCPWM $m$ _EVT_OPn_TEB     |
| MCPWM_EVT_OPn_TEA_EN     | The count value of the timer that PWM operator $n$ selects is equal to the value of timer stamp A <sup>1</sup>      | MCPWM $m$ _EVT_OPn_TEA     |
| MCPWM_EVT_OPn_TEE1_EN    | The count value of the timer that PWM operator $n$ selects is equal to the value of register MCPWM_OPn_TSTMP_E1_REG | MCPWM $m$ _EVT_OPn_TEE1    |
| MCPWM_EVT_OPn_TEE2_EN    | The count value of the timer that PWM operator $n$ selects is equal to the value of register MCPWM_OPn_TSTMP_E2_REG | MCPWM $m$ _EVT_OPn_TEE2    |
| MCPWM_EVT_TIMERn_TEP_EN  | The count value of timer $n$ is equal to the period value MCPWM_TIMERn_PERIOD                                       | MCPWM $m$ _EVT_TIMERn_TEP  |
| MCPWM_EVT_TIMERn_TEZ_EN  | The count value of timer $n$ is equal to 0  | MCPWM $m$ _EVT_TIMERn_TEZ  |
| MCPWM_EVT_TIMERn_STOP_EN | Timer $n$ 's count stops  | MCPWM $m$ _EVT_TIMERn_STOP |

<sup>1</sup> See Section 51.3.3.1 for a detailed description of timer stamp A and B.

### 51.3.5.3 MCPWM-Related ETM Tasks

When setting the enable field to 1, after inputting valid tasks, the corresponding response operation would be generated. For details, please refer to Table 51.3-8 below:

Table 51.3-8. ETM Related Tasks

| Enable Field                   | Valid Task Input                 | Response Operation  |
|--------------------------------|----------------------------------|---|
| MCPWM_TASK_CAPn_EN             | MCPWM $m$ _TASK_CAPn             | CAP $n$ channel performs a capture operation  |
| MCPWM_TASK_CLRn_OST_EN         | MCPWM $m$ _TASK_CLRn_OST         | PWM operator $n$ clears the One-Shot Trip operation   |
| MCPWM_TASK_TZn_OST_EN          | MCPWM $m$ _TASK_TZn_OST          | PWM operator $n$ performs a One-Shot Trip (OST) operation   |
| MCPWM_TASK_TIMERn_PERIOD_UP_EN | MCPWM $m$ _TASK_TIMERn_PERIOD_UP | The period of timer $n$ is updated to the value configured in the period register MCPWM_TIMERn_PERIOD |
| MCPWM_TASK_TIMERn_SYNC_EN      | MCPWM $m$ _TASK_TIMERn_SYNC      | Timer $n$ performs a sync operation   |
| MCPWM_TASK_GEN_STOP_EN         | MCPWM $m$ _TASK_GEN_STOP         | All the timers stop counting and the PWM signals output by all PWM operators remain unchanged         |

| Enable Field                 | Valid Task Input               | Response Operation  |
|------------------------------|--------------------------------|---|
| MCPWM_TASK_CMPR $n$ _B_UP_EN | MCPWM $m$ _TASK_CMPR $n$ _B_UP | Timer stamp B of the PWM operator $n$ is updated to the value of the shadow register MCPWM_GEN $n$ _B |
| MCPWM_TASK_CMPR $n$ _A_UP_EN | MCPWM $m$ _TASK_CMPR $n$ _A_UP | Timer stamp A of the PWM operator $n$ is updated to the value of the shadow register MCPWM_GEN $n$ _A |

## 51.4 Interrupts

ESP32-P4's MCPWM0 can generate the PWM0\_INTR interrupt signal and MCPWM1 can generate the PWM1\_INTR interrupt signal. The PWM $n$ \_INTR will be sent to the [Interrupt Matrix](#).

Interrupt signal PWM $n$ \_INTR can be generated by the following internal interrupt sources:

- MCPWM\_TIMER $x$ \_STOP\_INT: Triggered when timer $x$  stops.
- MCPWM\_TIMER $x$ \_TEZ\_INT: Triggered by the TEZ event of PWM timer $x$ .
- MCPWM\_TIMER $x$ \_TEP\_INT: Triggered by the TEP event of PWM timer $x$ .
- MCPWM\_FAULT $x$ \_INT: Triggered when fault\_event $x$  starts.
- MCPWM\_FAULT $x$ \_CLR\_INT: Triggered after fault\_event $x$  ends.
- MCPWM\_CMPR $x$ \_TEA\_INT: Triggered by the TEA event of PWM operator $x$ .
- MCPWM\_CMPR $x$ \_TEB\_INT: Triggered by the TEB event of PWM operator $x$ .
- MCPWM\_TZ $x$ \_CBC\_INT: Triggered by the CBC action of PWM $x$ .
- MCPWM\_TZ $x$ \_OST\_INT: Triggered by the OST action of PWM $x$ .
- MCPWM\_CAP $x$ \_INT: Triggered by the capture event on channel $x$ .

The above interrupt sources can only be triggered when the interrupt enable register `interrupt_source_name_ENA` is set to 1. Write 1 to `interrupt_source_name_CLR` will clear the interrupt.

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter [11 Interrupt Matrix](#) > Section [11.2 Interrupt Terminology in ESP32-P4](#).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section [51.5 Register Summary](#).

## 51.5 Register Summary

The addresses in this section are relative to Motor Control PWM base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name   | Description   | Address | Access |
|--|---|---------|--------|
| <b>Prescaler Configuration</b>                   |   |         |        |
| <a href="#">MCPWM_CLK_CFG_REG</a>                | PWM clock prescaler register  | 0x0000  | R/W    |
| <b>MCPWM Timer 0 Configuration and Status</b>    |   |         |        |
| <a href="#">MCPWM_TIMER0_CFG0_REG</a>            | PWM timer0 period and update method configuration register            | 0x0004  | R/W    |
| <a href="#">MCPWM_TIMER0_CFG1_REG</a>            | PWM timer0 working mode and start/stop control configuration register | 0x0008  | varies |
| <a href="#">MCPWM_TIMER0_SYNC_REG</a>            | PWM timer0 sync function configuration register                       | 0x000C  | R/W    |
| <a href="#">MCPWM_TIMER0_STATUS_REG</a>          | PWM timer0 status register  | 0x0010  | RO     |
| <b>MCPWM Timer 1 Configuration and Status</b>    |   |         |        |
| <a href="#">MCPWM_TIMER1_CFG0_REG</a>            | PWM timer1 period and update method configuration register            | 0x0014  | R/W    |
| <a href="#">MCPWM_TIMER1_CFG1_REG</a>            | PWM timer1 working mode and start/stop control configuration register | 0x0018  | varies |
| <a href="#">MCPWM_TIMER1_SYNC_REG</a>            | PWM timer1 sync function configuration register                       | 0x001C  | R/W    |
| <a href="#">MCPWM_TIMER1_STATUS_REG</a>          | PWM timer1 status register  | 0x0020  | RO     |
| <b>MCPWM Timer 2 Configuration and status</b>    |   |         |        |
| <a href="#">MCPWM_TIMER2_CFG0_REG</a>            | PWM timer2 period and update method configuration register            | 0x0024  | R/W    |
| <a href="#">MCPWM_TIMER2_CFG1_REG</a>            | PWM timer2 working mode and start/stop control configuration register | 0x0028  | varies |
| <a href="#">MCPWM_TIMER2_SYNC_REG</a>            | PWM timer2 sync function configuration register                       | 0x002C  | R/W    |
| <a href="#">MCPWM_TIMER2_STATUS_REG</a>          | PWM timer2 status register  | 0x0030  | RO     |
| <b>Common Configuration for MCPWM Timers</b>     |   |         |        |
| <a href="#">MCPWM_TIMER_SYNCI_CFG_REG</a>        | Synchronization input selection for three PWM timers                  | 0x0034  | R/W    |
| <a href="#">MCPWM_OPERATOR_TIMERSEL_REG</a>      | Select specific timer for PWM operators                               | 0x0038  | R/W    |
| <b>MCPWM Operator 0 Configuration and Status</b> |   |         |        |
| <a href="#">MCPWM_GEN0_STMP_CFG_REG</a>          | Transfer status and update method for time stamp registers A and B    | 0x003C  | varies |
| <a href="#">MCPWM_GEN0_TSTMP_A_REG</a>           | Shadow register for register A  | 0x0040  | R/W    |
| <a href="#">MCPWM_GEN0_TSTMP_B_REG</a>           | Shadow register for register B  | 0x0044  | R/W    |
| <a href="#">MCPWM_GEN0_CFG0_REG</a>              | Fault event T0 and T1 handling  | 0x0048  | R/W    |
| <a href="#">MCPWM_GEN0_FORCE_REG</a>             | Permissives to force PWMOA and PWMOB outputs by software              | 0x004C  | R/W    |

| Name   | Description  | Address | Access |
|--|--|---------|--------|
| <a href="#">MCPWM_GEN0_A_REG</a>                 | Actions triggered by events on PWM0A                               | 0x0050  | R/W    |
| <a href="#">MCPWM_GEN0_B_REG</a>                 | Actions triggered by events on PWM0B                               | 0x0054  | R/W    |
| <a href="#">MCPWM_DTO_CFG_REG</a>                | Dead time type selection and configuration                         | 0x0058  | R/W    |
| <a href="#">MCPWM_DTO_FED_CFG_REG</a>            | Shadow register for falling edge delay (FED)                       | 0x005C  | R/W    |
| <a href="#">MCPWM_DTO_RED_CFG_REG</a>            | Shadow register for rising edge delay (RED)                        | 0x0060  | R/W    |
| <a href="#">MCPWM_CARRIER0_CFG_REG</a>           | Carrier enable and configuratoin                                   | 0x0064  | R/W    |
| <a href="#">MCPWM_FH0_CFG0_REG</a>               | Actions on PWM0A and PWM0B trip events                             | 0x0068  | R/W    |
| <a href="#">MCPWM_FH0_CFG1_REG</a>               | Software triggers for fault handler actions                        | 0x006C  | R/W    |
| <a href="#">MCPWM_FH0_STATUS_REG</a>             | Status of fault events   | 0x0070  | RO     |
| <b>MCPWM Operator 1 Configuration and Status</b> |  |         |        |

## 51.6 Registers

The addresses in this section are relative to Motor Control PWM base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

**Register 51.1. MCPWM\_CLK\_CFG\_REG (0x0000)**

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                    |   |   |  |  |  |  |  |       |  |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--------------------|---|---|--|--|--|--|--|-------|--|
| (reserved)  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | MCPWM_CLK_PRESCALE |   |   |  |  |  |  |  |       |  |
| 31  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 8                  | 7 | 0 |  |  |  |  |  |       |  |
| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0x0                |   |   |  |  |  |  |  | Reset |  |

**MCPWM\_CLK\_PRESCALE** Configures the prescaler value of the clock, so that the period of  $PWM\_clk = 6.25ns * (PWM\_CLK\_PRESCALE + 1)$ . (R/W)

**Register 51.2. MCPWM\_TIMER<sub>n</sub>\_CFG0\_REG (*n*: 0-2) (0x0004+0x10\**n*)**

|            |  |  |  |  |  |   |  |  |  |  |  |    |  |    |  |    |  |   |  |      |  |  |  |                                  |  |  |  |  |  |  |  |   |  |     |  |  |  |  |  |  |  |                                    |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |  |  |
|------------|--|--|--|--|--|---|--|--|--|--|--|----|--|----|--|----|--|---|--|------|--|--|--|----------------------------------|--|--|--|--|--|--|--|---|--|-----|--|--|--|--|--|--|--|------------------------------------|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|--|--|
| (reserved) |  |  |  |  |  | MCPWM_TIMER <sub>n</sub> _PERIOD_UPMETHOD |  |  |  |  |  |    |  |    |  |    |  |   |  |      |  |  |  | MCPWM_TIMER <sub>n</sub> _PERIOD |  |  |  |  |  |  |  |   |  |     |  |  |  |  |  |  |  | MCPWM_TIMER <sub>n</sub> _PRESCALE |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |  |  |
| 31         |  |  |  |  |  | 26  |  |  |  |  |  | 25 |  | 24 |  | 23 |  |   |  |      |  |  |  |                                  |  |  |  |  |  |  |  | 8 |  | 7   |  |  |  |  |  |  |  |                                    |  |  |  |  |  |  |  | 0     |  |  |  |  |  |  |  |  |  |
| 0          |  |  |  |  |  | 0   |  |  |  |  |  | 0  |  | 0  |  | 0  |  | 0 |  | 0xff |  |  |  |                                  |  |  |  |  |  |  |  |   |  | 0x0 |  |  |  |  |  |  |  |                                    |  |  |  |  |  |  |  | Reset |  |  |  |  |  |  |  |  |  |

**MCPWM\_TIMER<sub>n</sub>\_PRESCALE** Configures the prescaler value of timer<sub>n</sub>, so that the period of  $PTO\_clk = \text{Period of } PWM\_clk * (PWM\_TIMER_n\_PRESCALE + 1)$ . (R/W)

**MCPWM\_TIMER<sub>n</sub>\_PERIOD** Configures the period shadow of PWM timer<sub>n</sub>.  
(R/W)

**MCPWM\_TIMER<sub>n</sub>\_PERIOD\_UPMETHOD** Configures the update method for active register of PWM timer<sub>n</sub> period.

0: Immediate

1: TEZ

2: Sync

3: TEZ or sync

TEZ here and below means timer equals zero event.

(R/W)

Register 51.3. MCPWM\_TIMERn\_CFG1\_REG(*n*: 0-2) (0x0008+0x10\**n*)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                  |   |                    |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|------------------|---|--------------------|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | MCPWM_TIMERn_MOD |   | MCPWM_TIMERn_START |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 5 | 4                | 3 | 2                  | 0     |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0x0              |   | 0x0                | Reset |

**MCPWM\_TIMERn\_START** Configures conditions to start/stop PWM timer*n*.

- 0: If PWM timer0 starts, then stops at TEZ
- 1: If timer0 starts, then stops at TEP
- 2: PWM timer0 starts and runs on
- 3: Timer0 starts and stops at the next TEZ
- 4: Timer0 starts and stops at the next TEP
- 5: Invalid. No effect
- 6: Invalid. No effect
- 7: Invalid. No effect

TEP here and below means the event that happens when the timer equals to period.

(R/W/SC)

**MCPWM\_TIMERn\_MOD** Configures the working mode of PWM timer*n*.

- 0: Freeze
- 1: Increase mode
- 2: Decrease mode
- 3: Up-down mode

(R/W)

Register 51.4. MCPWM\_TIMER $n$ \_SYNC\_REG ( $n$ : 0-2) (0x000C+0x10\* $n$ )

|            |   |   |   |   |   |   |   |   |   |    |   |    |                                   |  |  |   |   |       |   |   |   |  |
|------------|---|---|---|---|---|---|---|---|---|----|---|----|-----------------------------------|--|--|---|---|-------|---|---|---|--|
| (reserved) |   |   |   |   |   |   |   |   |   |    | MCPWM_TIMER <sub>n</sub> _PHASE_DIRECTION |    | MCPWM_TIMER <sub>n</sub> _SYNC_SW |  |  |   |   |       |   |   |   |  |
| 31         |   |   |   |   |   |   |   |   |   | 21 | 20  | 19 |                                   |  |  |   | 4 | 3     | 2 | 1 | 0 |  |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0  | 0   | 0  |                                   |  |  | 0 | 0 | 0     | 0 | 0 |   |  |
|            |   |   |   |   |   |   |   |   |   |    |   |    |                                   |  |  |   |   | Reset |   |   |   |  |

**MCPWM\_TIMERn\_SYNCI\_EN** Configures whether to enable timer $n$  reloading with phase on sync input event.

0: Disable

1: Enable

(R/W)

**MCPWM\_TIMER $n$ \_SYNC\_SW** Configures whether to trigger a software sync.

0: No effect

1: Trigger a software sync

(R/W)

**MCPWM\_TIMER $n$ \_SYNCO\_SEL** Configures PWM timer $n$  sync out selection.

0: sync\_in. The sync out will always generate when toggling the `MCPWM_TIMER0_SYNC_SW` bit.

1: TEZ

2: TEP

3: No effect

(R/W)

**MCPWM\_TIMER $n$ \_PHASE** Configures the phase for timer $n$  reload on sync event.

(R/W)

**MCPWM\_TIMER $n$ \_PHASE\_DIRECTION** Configures the PWM timer $n$ 's direction when timer $n$  mode is up-down mode.

0: Increase

1: Decrease

(R/W)

Register 51.7. MCPWM\_OPERATOR\_TIMERSEL\_REG (0x0038)

**MCPWM\_OPERATOR***n***\_TIMERSEL** Configures which PWM timer will be the timing reference for PWM operator*n*.

0: timer0

1: timer1

2: timer2

3: Invalid, will select timer2

(R/W)

**Register 51.8. MCPWM\_GEN $n$ \_STMP\_CFG\_REG ( $n$ : 0-2) (0x003C+0x38\* $n$ )**

|   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                                      |   |   |   |                                      |   |  |   |                                     |  |       |  |                                     |  |  |  |
|---|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--------------------------------------|---|---|---|--------------------------------------|---|--|---|-------------------------------------|--|-------|--|-------------------------------------|--|--|--|
| (reserved)  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | MCPWM_CMPR <sub>n</sub> _B_SHDW_FULL |   |   |   | MCPWM_CMPR <sub>n</sub> _A_SHDW_FULL |   |  |   | MCPWM_CMPR <sub>n</sub> _B_UPMETHOD |  |       |  | MCPWM_CMPR <sub>n</sub> _A_UPMETHOD |  |  |  |
| 31  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 10                                   |   | 9 | 8 | 7                                    | 4 |  | 3 | 0                                   |  | Reset |  |                                     |  |  |  |
| 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0                                    | 0 | 0 |   | 0                                    |   |  |   |                                     |  |       |  |                                     |  |  |  |

**MCPWM\_CMPR $n$ \_A\_UPMETHOD** Configures the update method for PWM generator $n$  time stamp A's active register.

When all bits are set to 0: Immediately

When bit0 is set to 1: TEZ

When bit1 is set to 1: TEP

When bit2 is set to 1: Sync

When bit3 is set to 1: Disable the update

(R/W)

**MCPWM\_CMPR $n$ \_B\_UPMETHOD** Configures the update method for PWM generator $n$  time stamp B's active register.

When all bits are set to 0: Immediately

When bit0 is set to 1: TEZ

When bit1 is set to 1: TEP

When bit2 is set to 1: Sync

When bit3 is set to 1: Disable the update

(R/W)

**MCPWM\_CMPR $n$ \_A\_SHDW\_FULL** Configures whether the value in the shadow register is written to the corresponding active register at a specific time. This field is set and reset by hardware.

0: Write the latest value in the shadow register to A's active register

1: Write the value to the PWM generator $n$  time stamp A's shadow register, and wait to be transferred to A's active register

(R/SC/WTC)

**MCPWM\_CMPR $n$ \_B\_SHDW\_FULL** Configures whether the value in the shadow register is written to the corresponding active register at a specific time. This field is set and reset by hardware.

0: Write the latest value in the shadow register to B's active register

1: Write the value to the PWM generator $n$  time stamp B's shadow register, and wait to be transferred to B's active register

(R/SC/WTC)

Register 51.9. MCPWM\_GEN $n$ \_TSTMP\_A\_REG( $n$ : 0-2) (0x0040+0x38\* $n$ )

|                                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                            |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|---------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|----------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| (reserved)                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | MCPWM_CMPR <sub>n</sub> _A |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 31                              |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 15                         |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0                          |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

**MCPWM\_CMPR $n$ \_A** Configures the value of PWM generator  $n$  time stamp A's shadow register.  
(R/W)

Register 51.10. MCPWM\_GEN $n$ \_TSTMP\_B\_REG( $n$ : 0-2) (0x0044+0x38\* $n$ )

|                                 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |                           |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|---------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|---------------------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| (reserved)                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | MCPWM_CMPR <sub>n</sub> B |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 31                              |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 15                        |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0     |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0                         |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

**MCPWM\_CMPR $n$ \_B** Configures the value of PWM generator  $n$  time stamp B's shadow register.  
(R/W)

Register 51.11. MCPWM\_GEN $n$ \_CFG\_REG( $n$ : 0-2) (0x0048+0x38\* $n$ )

**MCPWM\_GEN $n$ \_CFG\_UPMETHOD** Configures the update method for PWM generator $n$ 's active register.

When all bits are set to 0: Immediately

When bit0 is set to 1: TEZ

When bit1 is set to 1: TEP

When bit2 is set to 1: Sync

When bit3 is set to 1: Disable the update

(R/W)

**MCPWM\_GEN $n$ \_TO\_SEL** Configures source selection for PWM generator $n$  event\_t0, take effect immediately.

0: fault\_event0

1: fault\_event1

2: fault\_event2

3: sync\_taken

4: Invalid, selects nothing

(R/W)

**MCPWM\_GEN $n$ \_T1\_SEL** Configures source selection for PWM generator $n$  event\_t1, take effect immediately.

0: fault\_event0

1: fault\_event1

2: fault\_event2

3: sync\_taken

4: Invalid, selects nothing

(R/W)

**Register 51.12. MCPWM\_GEN $n$ \_FORCE\_REG( $n$ : 0-2) (0x004C+0x38\* $n$ )**

**MCPWM\_GEN $n$ \_CNTUFORCE\_UPMETHOD** Configures the update method for continuous software force of PWM generator $n$ .

When all bits are set to 0: Immediately

When bit0 is set to 1: TEZ

When bit1 is set to 1: TEP

When bit2 is set to 1: TEA

When bit3 is set to 1: TEB

When bit4 is set to 1: Sync

When bit5 is set to 1: Disable update

TEA/B means an event generated when the timer's value equals to that of register A/B.

(R/W)

**MCPWM\_GEN $n$ \_A\_CNTUFORCE\_MODE** Configures the continuous software force mode for PWM $n$

A.

0: Disabled

1: Low

**MCPWM\_CHOPPER $n$ \_EN** Configures whether to enable carrier $n$ .

0: Bypassed

1: Enabled

(R/W)

**MCPWM\_CHOPPER $n$ \_PRESCALE** Configures the prescale value of PWM carrier $n$  clock (PC\_clk), so that period of PC\_clk = period of PWM\_clk \* (PWM\_CARRIER $n$ \_PRESCALE + 1). (R/W)

**MCPWM\_CHOPPER $n$ \_DUTY** Configures carrier duty. Duty = PWM\_CARRIER $n$ \_DUTY / 8. (R/W)

**MCPWM\_CHOPPER $n$ \_OSHTWTH** Configures width of the first pulse. Measurement unit: Periods of the carrier. (R/W)

**MCPWM\_CHOPPER $n$ \_OUT\_INVERT** Configures whether to invert the output of PWM $n$  A and PWM $n$  B for this submodule.

0: Normal

1: Invert

(R/W)

**MCPWM\_CHOPPER $n$ \_IN\_INVERT** Configures whether to invert the input of PWM $n$  A and PWM $n$  B for this submodule.

0: Normal

1: Invert

(R/W)

**MCPWM\_TZ<sub>n</sub>\_CLR\_OST** Configures whether to generate a one-shot mode action clear by software.

0: No effect

1: Triggers a clear for ongoing one-shot mode action by software

(R/W)

**MCPWM\_TZ<sub>n</sub>\_CBCPULSE** Configures the refresh moment selection of cycle-by-cycle mode action.

0: Select nothing, will not refresh

Bit0 is set to 1: TEZ

Bit1 is set to 1: TEP

(R/W)

**MCPWM\_TZ<sub>n</sub>\_FORCE\_CBC** Configures whether to generate a software cycle-by-cycle mode action.

0: No effect

1: Triggers a cycle-by-cycle mode action by software

(R/W)

**MCPWM\_TZ<sub>n</sub>\_FORCE\_OST** Configures whether to generate a software one-shot mode action.

0: No effect

1: Triggers a one-shot mode action by software

**MCPWM\_TZ<sub>*n*</sub>\_CBC\_ON** Represents whether an cycle-by-cycle mode action is on going.

0: No action

1: Ongoing

(RO)

**MCPWM\_TZ<sub>*n*</sub>\_OST\_ON** Represents whether a one-shot mode action is ongoing.

0: No action

1: Ongoing

**MCPWM\_F<sub>*n*</sub>\_EN** Configures whether to enable event\_*fn* generation.

0: Disable

1: Enable

(R/W)

**MCPWM\_F<sub>*n*</sub>\_POLE** Configures event\_*fn* trigger polarity on FAULT<sub>*n*</sub> source from GPIO matrix.

0: Level low

1: Level high

(R/W)

**MCPWM\_EVENT\_F<sub>*n*</sub>** Represents whether an event\_*fn* is ongoing. This field is set and reset by hardware.

0: No action

1: Ongoing

(RO)

Register 51.23. MCPWM\_CAP\_TIMER\_CFG\_REG (0x00E8)

**MCPWM\_CAP\_TIMER\_EN** Configures whether to enable capture timer increment incrementing under APB\_CLK.

0: Disable

1: Enable

(R/W)

**MCPWM\_CAP\_SYNC1\_EN** Configures whether to enable capture timer sync.

0: Disable

1: Enable

(R/W)

**MCPWM\_CAP\_SYNC1\_SEL** Configures the selection of capture module sync input.

0: None

1: Timer0 sync\_out

2: Timer1 sync\_out

3: Timer2 sync\_out

4: SYNC0 from GPIO matrix

5: SYNC1 from GPIO matrix

6: SYNC2 from GPIO matrix

7: None

(R/W)

**MCPWM\_CAP\_SYNC\_SW** When [MCPWM\\_CAP\\_SYNC1\\_EN](#) is set to 1, configures whether to trigger a capture timer sync so that capture timer is loaded with value in phase register.

0: No effect

1: Trigger a capture timer sync

(WT)

### Register 51.24. MCPWM\_CAP\_TIMER\_PHASE\_REG (0x00EC)

Diagram illustrating the MCPWM\_CAP\_PHASE register structure. The register is 32 bits wide, with bit 31 on the left and bit 0 on the right. Bit 0 is labeled "Reset".

**MCPWM\_CAP\_PHASE** Configures phase value for capture timer sync operation.  
(R/W)

Register 51.25. MCPWM\_CAP\_CH $n$ \_CFG\_REG ( $n$ : 0-2) (0x00F0+0x4\* $n$ )

[illegible]

**MCPWM\_CAP $n$ \_EN** Configures whether to enable capture on channel  $n$ .

0: Disable

1: Enable

(R/W)

**MCPWM\_CAPn\_MODE** Configures the edge of capture on channel 0 after prescaling.  
When bit0 is set to 1: enable capture on the falling edge.  
When bit1 is set to 1: enable capture on the rising edge.  
(R/W)

**MCPWM\_CAPn\_PRESALE** Configures the prescale value on the rising edge of CAPO. Prescale value = PWM\_CAPO\_PRESALE + 1. (R/W)

**MCPWM\_CAP $n$ \_IN\_INVERT** Configures whether to invert CAP $n$  from GPIO matrix before prescale.  
 0: Normal  
 1: Invert  
 (R/W)

**MCPWM\_CAP<sub>n</sub>\_SW** Configures whether to trigger a software-forced capture on channel 0.

0: Not trigger

1: Trigger

(WT)

Register 51.26. MCPWM\_CAP\_CH $n$ \_REG ( $n$ : 0-2) (0x00FC+0x4\* $n$ )

**MCPWM\_CAP $n$ \_VALUE** Represents value of last capture on CAP $n$ . (RO)

### Register 51.27. MCPWM\_CAP\_STATUS\_REG (0x0108)

**MCPWM\_CAP $n$ \_EDGE** Represents the edge of the last capture trigger on channel  $n$ .

0: Rising edge

1: Falling edge

(RO)

**Register 51.28. MCPWM\_UPDATE\_CFG\_REG (0x010C)**

Continued from the previous page...

**MCPWM\_OP1\_FORCE\_UP** Configures whether to trigger a forced update of active registers in PWM operator 1.

0: No effect

1: Trigger a forced update

(R/W)

**MCPWM\_OP2\_UP\_EN** Configures whether to update active registers in PWM operator 2 when [MCPWM\\_GLOBAL\\_UP\\_EN](#) is set to 1.

0: No effect

1: Update active registers in PWM operator 2

(R/W)

**MCPWM\_OP2\_FORCE\_UP** Configures whether to trigger a forced update of active registers in PWM operator 2.

0: No effect

1: Trigger a forced update

(R/W)

Register 51.29. MCPWM\_INT\_ENA\_REG (0x0110)

**MCPWM\_CLK\_EN** Configures whether to force open register clock gate.

0: Open the clock gate only when application writes registers

1: Force open the clock gate for register

(R/W)

Register 51.39. MCPWM\_VERSION\_REG (0x0148)

## Chapter 52

# Remote Control Peripheral (RMT)

## 52.1 Overview

The Remote Control (RMT) module is designed to transmit and receive infrared remote control signals. A variety of remote control protocols can be encoded/decoded via software based on the RMT module. The RMT module converts pulse codes stored in the module's built-in RAM into output signals, or converts input signals into pulse codes and stores them in RAM. In addition, the RMT module optionally modulates its output signals with a carrier wave, or optionally demodulates and filters its input signals.

The RMT module has eight channels, numbered from zero to seven. Each channel is able to independently transmit or receive signals.

- Channel 0 ~ 3 (TX channel) are dedicated to transmitting signals;
- Channel 4 ~ 7 (RX channel) are dedicated to receiving signals.

Each TX/RX channel has the same functionality controlled by a dedicated set of registers and is able to independently transmit or receive data. Channel 3 and channel 7 support GDMA access, so the two channels also have a set of GDMA-related control and status registers. TX channels are indicated by *n* which is used as a placeholder for the channel number, and by *m* for RX channels.

## 52.2 Features

The RMT module has the following features:

- Eight channels:
  - TX channels 0 ~ 3
  - RX channels 4 ~ 7
  - Eight channels share a 384 x 32-bit RAM
- The transmitter supports:
  - Normal TX mode
  - Wrap TX mode
  - Continuous TX mode
  - Modulation on TX pulses
  - Multiple channels transmitting data simultaneously (programmable)
  - GDMA access supported by TX channel 3

- The receiver supports:
  - Normal RX mode
  - Wrap RX mode
  - RX filtering
  - Demodulation on RX pulses
  - GDMA access supported by RX channel 7

## 52.3 Functional Description

### 52.3.1 Architecture

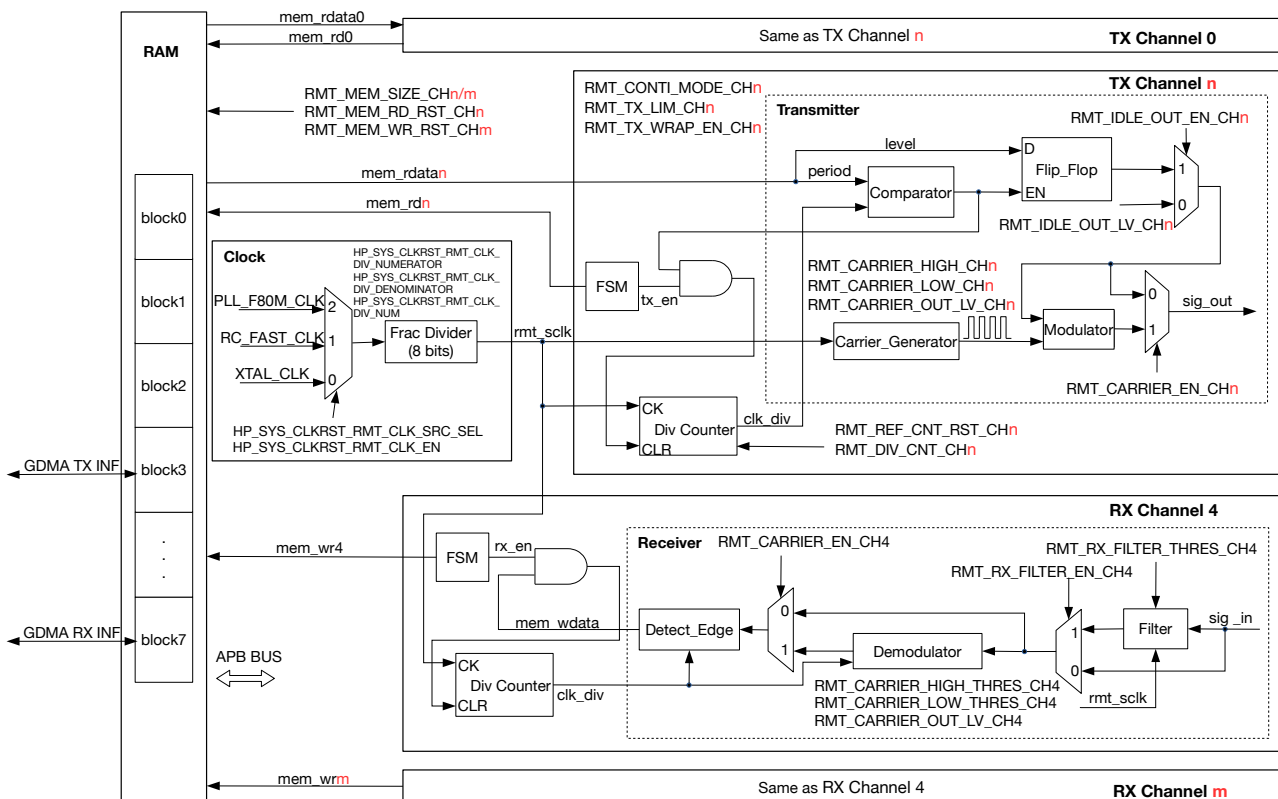

Figure 52.3-1. RMT Architecture

As shown in Figure 52.3-1, each TX channel has:

- 1 x clock divider counter (Div Counter)
- 1 x state machine (FSM)
- 1 x transmitter

Each RX channel has:

- 1 x clock divider counter (Div Counter)

- 1 x state machine (FSM)
- 1 x receiver

The eight channels share a 384 x 32-bit RAM.

## 52.3.2 RAM

### 52.3.2.1 Structure of RAM

Figure 52.3-2 shows the format of pulse code in RAM. Each pulse code contains a 16-bit entry with two fields: “level” and “period”. “level” (0 or 1) indicates a low-/high-level value that has been received or is going to be sent, while “period” points out the number of clock cycles (see `clk_div` in Figure 52.3-1) that the level lasts for.

Figure 52.3-2. Format of Pulse Code in RAM

The minimum value for the period is zero (0) and is interpreted as a transmission end-marker. For a non-zero period (i.e., not an end-marker), its value is limited by APB clock and RMT clock according to the formula below:

$$3 \times T_{apb\_clk} + 5 \times T_{rmt\_sclk} < period \times T_{clk\_div} \quad (1)$$

**Note:**

According to the formula above and the frequency of `rmt_sclk`, the pulse width (i.e.,  $period \times T_{clk\_div}$ ) able to be captured by RMT is limited as follows:

- The minimum value of pulse width should be larger than  $(3 \times T_{apb\_clk} + 5 \times T_{rmt\_sclk})$ .
- The maximum value of pulse width should be smaller than or equal to (the maximum period  $\times$  the maximum  $T_{clk\_div}$ ), i.e.,  $((2^{15} - 1) \times \text{the maximum } T_{rmt\_sclk} \times 256)$ .

For more information about the `rmt_sclk` frequency, or APB\_CLK frequency, see Section 52.3.3, or Chapter 9 [Reset and Clock](#).

### 52.3.2.2 Use of RAM

The RAM is divided into eight 48 x 32-bit blocks. By default, each channel uses one block (block 0 for channel 0, block 1 for channel 1, and so on).

If the data size of one single transfer is larger than one block size of TX channel  $n$  or RX channel  $m$ , users can configure the channel:

- to enable [wrap mode](#) by setting [RMT\\_MEM\\_TX/RX\\_WRAP\\_EN\\_CH \$n/m\$](#) ;
- or to use more blocks by configuring [RMT\\_MEM\\_SIZE\\_CH \$n/m\$](#) .

Setting [RMT\\_MEM\\_SIZE\\_CH \$n/m\$](#)  > 1 allows channel  $n/m$  to use the memory of the subsequent channels, i.e., block  $(n/m) \sim \text{block } (n/m + \text{RMT\_MEM\_SIZE\_CH}_{n/m} - 1)$ . In such case, the subsequent channels  $(n/m + 1) \sim (n/m + \text{RMT\_MEM\_SIZE\_CH}_{n/m} - 1)$  can not be used since their RAM blocks are occupied. For example, if channel 0 is configured to use block 0 and block 1, then channel 1 will be unavailable since its block is occupied, while channel 2 and channel 3 are not affected and can be used normally.

Note that the RAM used by each channel is mapped from low address to high address. Under such mapping, channel 0 is able to use the RAM blocks for channels 1, 2 ... and 7 by setting [RMT\\_MEM\\_SIZE\\_CH0](#), but channel 7 can not use the blocks for channels 0, 1, ... or 6. Therefore, the value of [RMT\\_MEM\\_SIZE\\_CH \$n\$](#)  should not exceed  $(8 - n)$  and the value of [RMT\\_MEM\\_SIZE\\_CH \$m\$](#)  should not exceed  $(8 - m)$ .

The RMT RAM can be accessed via APB bus, or read by the transmitter and written by the receiver. To avoid any possible access conflict between the receiver writing RAM and the APB bus reading RAM, RMT can be configured to designate the RAM block's owner, be it the receiver or the APB bus, by configuring [RMT\\_MEM\\_OWNER\\_CH \$m\$](#) . If this ownership is violated, a flag signal [RMT\\_MEM\\_OWNER\\_ERR\\_CH \$m\$](#)  will be generated.

### 52.3.2.3 RAM Access

APB bus is able to access RAM in FIFO mode and in NONFIFO (Direct Address) mode, depending on the configuration of [RMT\\_APB\\_FIFO\\_MASK](#):

- 0: Use FIFO mode;
- 1: Use NONFIFO mode.

Channels 3 and 7 also support GDMA access.

#### FIFO Mode

In FIFO mode, the APB reads data from or writes data to RAM via a fixed address stored in [RMT\\_CH \$n/m\$ DATA\\_REG](#).

#### NONFIFO Mode

In NONFIFO mode, the APB writes data to or reads data from a continuous address range.

- The write-starting address of TX channel  $n$  is: RMT base address +  $0x800 + (n - 1) \times 48$ . The access address for the second data and the following data are RMT base address +  $0x800 + (n - 1) \times 48 + 0x4$ , and so on, incremented by  $0x4$ .
- The read-starting address of RX channel  $m$  is: RMT base address +  $0x8C0 + (m - 1) \times 48$ . The access address for the second data and the following data are RMT base address +  $0x8C0 + (m - 1) \times 48 + 0x4$ , and so on, incremented by  $0x4$ .

#### GDMA Mode

Channel 3 also supports GDMA access. If [RMT\\_DMA\\_ACCESS\\_EN\\_CH3](#) is set, RAM of channel 3 only allows GDMA access. FIFO access or NOFIFO access to channel 3 by the APB bus are forbidden, otherwise

**unpredictable consequences may occur.**

To ensure correct data transmission,

1. GDMA should be started first.
2. RMT can only start transmitting data after GDMA channel gets data ready, otherwise, unexpected data may be sent.

In **normal TX mode**, when the RAM of channel 3 is fully written by GDMA, an [RMT\\_APB\\_MEM\\_WR\\_ERR\\_CH3](#) interrupt is triggered. Setting [RMT\\_MEM\\_TX\\_WRAP\\_EN\\_CH3](#) allows channel 3 to transmit more data than one block can fit, with no software operation needed.

Channel 7 also supports GDMA access. If [RMT\\_DMA\\_ACCESS\\_EN\\_CH7](#) is set, the RAM of channel 7 is allowed to transmit data to GDMA. Note in this mode, channel 7's RAM can also be accessed by APB via NONFIFO mode.

In **normal RX mode**, when the size of data read by GDMA from channel 7 is equal to its RAM size, an [RMT\\_APB\\_MEM\\_RD\\_ERR\\_CH7](#) is triggered and the subsequent data is discarded. If [RMT\\_MEM\\_RX\\_WRAP\\_EN\\_CH7](#) is set, data of more than one block size can be received with no software wrap operation needed. If channel 7's RAM is full but the GDMA still does not start receiving data from the channel, the newly received data by this channel will replace the previous data.

**Note:**

When channel 7 receives an end-marker, a GDMA `in_suc_eof` interrupt is generated. Two bytes are written to GDMA if the `period[14:0]` is 0, and four bytes to GDMA if the `period[30:16]` is 0.

### 52.3.3 Clock

The clock source of RMT can be `PLL_F80M_CLK`, `RC_FAST_CLK`, or `XTAL_CLK`, depending on the configuration of [HP\\_SYS\\_CLKRST\\_RMT\\_CLK\\_SRC\\_SEL](#). RMT clock can be enabled by setting [HP\\_SYS\\_CLKRST\\_RMT\\_CLK\\_EN](#). RMT working clock (see `rmt_sclk` in Figure 52.3-1) is obtained by dividing the selected clock source with a fractional divider. The divider is  $\text{HP\_SYS\_CLKRST\_RMT\_CLK\_DIV\_NUM} + 1 + \text{HP\_SYS\_CLKRST\_RMT\_CLK\_DIV\_NUMERATOR}$  or [HP\\_SYS\\_CLKRST\\_RMT\\_CLK\\_DIV\\_DENOMINATOR](#).

For more information, see Chapter 9 *Reset and Clock*. [RMT\\_DIV\\_CNT\\_CHn/m](#) is used to configure the divider coefficient of internal clock divider for RMT channels. The coefficient is normally equal to the value of [RMT\\_DIV\\_CNT\\_CHn/m](#), except value 0 that represents divider 256. The clock divider can be reset by setting [RMT\\_REF\\_CNT\\_RST\\_CHn/m](#). The clock generated from the divider can be used by the counter (see Figure 52.3-1).

### 52.3.4 Transmitter

**Note:**

Updating the configuration described in this and subsequent sections requires setting [RMT\\_CONF\\_UPDATE\\_CHn/m](#) first. See Section 52.3.6.

### 52.3.4.1 Normal TX Mode

When `RMT_TX_START_CH $n$`  is set, the transmitter of channel  $n$  starts reading and transmitting pulse codes from the starting address of its RAM block. The codes are sent starting from low-address entry. When an end-marker (a zero period) is encountered, the transmitter stops the transmission, returns to idle state and generates an `RMT_CH $n$ _TX_END_INT` interrupt. Setting `RMT_TX_STOP_CH $n$`  to 1 also stops the transmission and immediately sets the transmitter back to idle. The output level of a transmitter in idle state is determined by the “level” field of the end-marker or by the content of `RMT_IDLE_OUT_LV_CH $n$` , depending on the configuration of `RMT_IDLE_OUT_EN_CH $n$` :

- 0: The level in idle state is determined by the “level” field of the end-marker;
- 1: The level is determined by `RMT_IDLE_OUT_LV_CH $n$` .

### 52.3.4.2 Wrap TX Mode

To transmit more pulse codes than that can be fitted in the channel's RAM, users can enable wrap TX mode for channel  $n$  by setting `RMT_MEM_TX_WRAP_EN_CH $n$` . In this mode, the transmitter transmits the data from RAM in loops till an end-marker is encountered. For example, if `RMT_MEM_SIZE_CH $n$`  = 1, the transmitter starts transmitting data from the address  $48 \times n$ , and then the data from higher RAM address. Once the transmitter finishes transmitting data from  $(48 \times (n + 1) - 1)$ , it continues transmitting data from  $48 \times n$  again till an end-marker is encountered. Wrap mode is also applicable for `RMT_MEM_SIZE_CH $n$`  > 1.

When the size of transmitted pulse codes is larger than or equal to the value set by `RMT_TX_LIM_CH $n$` , an `RMT_CH $n$ _TX_THR_EVENT_INT` interrupt is generated. In wrap mode, `RMT_TX_LIM_CH $n$`  can be set to a half or a fraction of the size of the channel's RAM block. When an `RMT_CH $n$ _TX_THR_EVENT_INT` interrupt is detected by software, the already used RAM region can be updated by new pulse codes. In such way, the transmitter can seamlessly transmit unlimited pulse codes in wrap mode.

**Note:**

If RAM is accessed by GDMA, more pulse codes than one block size can be transmitted with no additional operation needed. If accessed by APB bus, wrap mode has to be enabled via software to transmit more data than one block size.

### 52.3.4.3 TX Modulation

Transmitter output can be modulated with a carrier wave by setting `RMT_CARRIER_EN_CH $n$` . The carrier waveform is configurable. In a carrier cycle, the high level lasts for  $(\text{RMT\_CARRIER\_HIGH\_CH}_n + 1)$  `rmt_sclk` cycles, while the low level lasts for  $(\text{RMT\_CARRIER\_LOW\_CH}_n + 1)$  `rmt_sclk` cycles. When `RMT_CARRIER_OUT_LV_CH $n$`  is set, carrier wave is added on the high-level of output signals; while `RMT_CARRIER_OUT_LV_CH $n$`  is cleared, carrier wave is added on the low-level of output signals. Carrier wave can be added on all output signals during modulation, or just added on valid pulse codes (the data stored in RAM), which can be set by configuring `RMT_CARRIER_EFF_EN_CH $n$` :

- 0: Add carrier wave on all output signals;
- 1: Add carrier wave only on valid signals.

#### 52.3.4.4 Continuous TX Mode

The continuous TX mode can be enabled by setting `RMT_TX_CONTI_MODE_CHn`. In this mode, the transmitter transmits the pulse codes from RAM in loops:

- If an end-marker is encountered, the transmitter starts transmitting from the first data of the channel's RAM again.
- If no end-marker is encountered, the transmitter starts transmitting from the first data again after the last data is transmitted.

If `RMT_TX_LOOP_CNT_EN_CHn` is set, the loop counting is incremented by 1 each time an end-marker is encountered. If the counting reaches the value set by `RMT_TX_LOOP_NUM_CHn`, an `RMT_CHn_TX_LOOP_INT` interrupt is generated. If `RMT_LOOP_STOP_EN_CHn` is set, the transmission stops immediately once an `RMT_CHn_TX_LOOP_INT` interrupt is generated, otherwise, the transmission will continue. In an end-maker, if its period[14:0] is 0, then the period of the previous data must satisfy:

$$6 \times T_{apb\_clk} + 12 \times T_{rmt\_sclk} < period \times T_{clk\_div} \quad (2)$$

The period of the other data only need to satisfy [relation \(1\)](#).

#### 52.3.4.5 Simultaneous TX Mode

RMT module supports multiple channels transmitting data simultaneously. To use this function, follow the steps below:

1. Configure `RMT_TX_SIM_CHn` to choose which multiple channels are used to transmit data simultaneously.
2. Set `RMT_TX_SIM_EN` to enable this transmission mode.
3. Set `RMT_TX_START_CHn` for each selected channel, to start data transmitting.

The transmission starts once the final channel is configured. RMT module also supports simultaneous transmission of channels 0 ~ 2's RAM accessed by APB bus and channel 3's RAM accessed by GDMA.

### 52.3.5 Receiver

#### 52.3.5.1 Normal RX Mode

The receiver of channel *m* is controlled by `RMT_RX_EN_CHm`:

- 0: The receiver stops receiving data;
- 1: The receiver starts working.

When the receiver becomes active, it starts counting from the first edge of the signal, detecting signal levels and counting clock cycles the level lasts for. Each cycle count (period) is then written back to RAM together with the level information (level). When the receiver detects no change in a signal level for a number of clock cycles more than the value set by `RMT_IDLE_THRES_CHm`, the receiver will stop receiving data, return to idle state, and generate an `RMT_CHm_RX_END_INT` interrupt. Please note that `RMT_IDLE_THRES_CHm` should be configured to a maximum value according to your application, otherwise a valid received level may be mistaken as a level in idle state. If the RAM space of this RX channel is used up by the received data, the receiver stops receiving data, and an `RMT_CHm_ERR_INT` interrupt is triggered by RAM FULL event.

### 52.3.5.2 Wrap RX Mode

To receive more pulse codes than can be fitted in the channel's RAM, users can enable wrap mode for channel  $m$  by configuring `RMT_MEM_RX_WRAP_EN_CHm`. But if RAM is accessed by GDMA, more pulse codes than one block size can be received with no additional operation needed. If accessed by APB bus, wrap mode has to be enabled to transmit more data than one block size. In wrap mode, the receiver stores the received data to RAM space of this channel in loops. Receiving ends, when the receiver detects no change in a signal level for a number of clock cycles more than the value set by `RMT_IDLE_THRES_CHm`. The receiver returns to idle state and generates an `RMT_CHm_RX_END_INT` interrupt. For example, if `RMT_MEM_SIZE_CHm` is set to 1, the receiver starts receiving data and stores the data to address  $48 * m$ , and then to higher RAM address. When the receiver finishes storing the received data to  $(48 * (m + 1) - 1)$ , the receiver continues receiving data and storing data to the address  $48 * m$  again, till no change is detected on a signal level for more than `RMT_IDLE_THRES_CHm` clock cycles. Wrap mode is also applicable for `RMT_MEM_SIZE_CHm > 1`.

An `RMT_CHm_RX_THR_EVENT_INT` interrupt is generated when the size of received pulse codes is larger than or equal to the value set by `RMT_CHm_RX_LIM_REG`. In wrap mode, `RMT_CHm_RX_LIM_REG` can be set to a half or a fraction of the size of the channel's RAM block. When an `RMT_CHm_RX_THR_EVENT_INT` interrupt is detected, the already used RAM region can be updated by subsequent data.

### 52.3.5.3 RX Filtering

Users can enable the receiver to filter input signals by setting `RMT_RX_FILTER_EN_CHm` for channel  $m$ . The filter samples input signals continuously, and detects the signals which remain unchanged for a continuous `RMT_RX_FILTER_THRES_CHm` rmt\_sclk cycles as valid, otherwise, the signals will be detected as invalid. Only the valid signals can pass through this filter. The filter removes pulses with a length of less than `RMT_RX_FILTER_THRES_CHm` rmt\_sclk cycles.

### 52.3.5.4 RX Demodulation

Users can enable RX demodulation on input signals or on filtered signals by setting `RMT_CARRIER_EN_CHm`. RX demodulation can be applied to high-level carrier wave or low-level carrier wave, depending on the configuration of `RMT_CARRIER_OUT_LV_CHm`:

- 0: Demodulate low-level carrier wave;
- 1: Demodulate high-level carrier wave.

Users can configure `RMT_CARRIER_HIGH_THRES_CHm` and `RMT_CARRIER_LOW_THRES_CHm` to set the thresholds to demodulate high-level carrier or low-level carrier. If the high-level of a signal lasts for less than `RMT_CARRIER_HIGH_THRES_CHm` clk\_div cycles, or the low-level lasts for less than `RMT_CARRIER_LOW_THRES_CHm` clk\_div cycles, such level is detected as a carrier and then is filtered out.

## 52.3.6 Configuration Update

To update RMT registers configuration, please set `RMT_CONF_UPDATE_CHn/m` for each channel first. All the bits/fields listed in the second column of Table 52.3-1 should follow this rule.

Table 52.3-1. Configuration Update

| Register                     | Bit/Field Configuration Update |
|------------------------------|--------------------------------|
| TX Channel                   |                                |
| RMT_CH $n$ CONFO_REG         | RMT_CARRIER_OUT_LV_CH $n$      |
|                              | RMT_CARRIER_EN_CH $n$          |
|                              | RMT_CARRIER_EFF_EN_CH $n$      |
|                              | RMT_DIV_CNT_CH $n$             |
|                              | RMT_TX_STOP_CH $n$             |
|                              | RMT_IDLE_OUT_EN_CH $n$         |
|                              | RMT_IDLE_OUT_LV_CH $n$         |
|                              | RMT_TX_CONTI_MODE_CH $n$       |
| RMT_CH $n$ CARRIER_DUTY_REG  | RMT_CARRIER_HIGH_CH $n$        |
|                              | RMT_CARRIER_LOW_CH $n$         |
| RMT_CH $n$ TX_LIM_REG        | RMT_TX_LOOP_CNT_EN_CH $n$      |
|                              | RMT_TX_LOOP_NUM_CH $n$         |
|                              | RMT_TX_LIM_CH $n$              |
| RMT_TX_SIM_REG               | RMT_TX_SIM_EN                  |
| RX Channel                   |                                |
| RMT_CH $m$ CONFO_REG         | RMT_CARRIER_OUT_LV_CH $m$      |
|                              | RMT_CARRIER_EN_CH $m$          |
|                              | RMT_IDLE_THRES_CH $m$          |
|                              | RMT_DIV_CNT_CH $m$             |
| RMT_CH $m$ CONF1_REG         | RMT_RX_FILTER_THRES_CH $m$     |
|                              | RMT_RX_EN_CH $m$               |
| RMT_CH $m$ RX_CARRIER_RM_REG | RMT_CARRIER_HIGH_THRES_CH $m$  |
|                              | RMT_CARRIER_LOW_THRES_CH $m$   |
| RMT_CH $m$ RX_LIM_REG        | RMT_RX_LIM_CH $m$              |
| RMT_REF_CNT_RST_REG          | RMT_REF_CNT_RST_CH $m$         |

## 52.4 Interrupts

ESP32-P4's RMT can generate the RMT\_INTR interrupt signal that will be sent to the [Interrupt Matrix](#).

The following interrupt sources can generate the RMT\_INTR interrupt signal:

- RMT\_CH $n$ \_ERR\_INT: Triggered when channel  $n$  does not read or write data correctly. For example, the transmitter still tries to read data from RAM when the RAM is empty.
- RMT\_CH $m$ \_ERR\_INT: Triggered when channel  $m$  does not read or write data correctly. For example, the receiver still tries to write data into RAM when the RAM is full.
- RMT\_CH $n$ \_TX\_THR\_EVENT\_INT: Triggered when the amount of data the transmitter has sent matches the value of RMT\_CH $n$ \_TX\_LIM\_REG.
- RMT\_CH $m$ \_RX\_THR\_EVENT\_INT: Triggered each time when the amount of data received by the receiver reaches the value set in RMT\_CH $m$ \_RX\_LIM\_REG.
- RMT\_CH $n$ \_TX\_END\_INT: Triggered when the transmitter has finished transmitting signals.

- RMT\_CH $m$ \_RX\_END\_INT: Triggered when the receiver has finished receiving signals.
- RMT\_CH $n$ \_TX\_LOOP\_INT: Triggered when the loop counting reaches the value set by [RMT\\_TX\\_LOOP\\_NUM\\_CH \$n\$](#)  in continuous TX mode.
- RMT\_CH3\_DMA\_ACCESS\_FAIL\_INT: Triggered when the result of (the entries written to channel 3's RAM - the entries transmitted by channel 3) is larger than channel 3's RAM size, but DAM keeps writing data to this channel.
- RMT\_CH7\_DMA\_ACCESS\_FAIL\_INT: Triggered when the result of (the entries received by channel 7's RAM - the entries read by GDMA) is larger than channel 7's RAM size, but channel 7 keeps receiving data.

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter [11 Interrupt Matrix](#) > Section [11.2 Interrupt Terminology in ESP32-P4](#).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section [52.5 Register Summary](#).

## 52.5 Register Summary

The addresses in this section are relative to Remote Control Peripheral base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name                                      | Description   | Address | Access |
|---|---|---------|--------|
| <b>FIFO R/W registers</b>                 |   |         |        |
| <a href="#">RMT_CH0DATA_REG</a>           | The read and write data register for channel 0 by APB FIFO access | 0x0000  | HRO    |
| <a href="#">RMT_CH1DATA_REG</a>           | The read and write data register for channel 1 by APB FIFO access | 0x0004  | HRO    |
| <a href="#">RMT_CH2DATA_REG</a>           | The read and write data register for channel 2 by APB FIFO access | 0x0008  | HRO    |
| <a href="#">RMT_CH3DATA_REG</a>           | The read and write data register for channel 3 by APB FIFO access | 0x000C  | HRO    |
| <a href="#">RMT_CH4DATA_REG</a>           | The read and write data register for channel 4 by APB FIFO access | 0x0010  | HRO    |

## 52.6 Registers

The addresses in this section are relative to Remote Control Peripheral base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

**Register 52.1. RMT\_CH $n$ DATA\_REG ( $n$ : 0-3) (0x0000+0x4\* $n$ )**

**RMT\_CH $n$ DATA** Read and write data for channel  $n$  via APB FIFO. (HRO)

**Register 52.2. RMT\_CH $m$ DATA\_REG ( $m$ : 4-7) (0x0000+0x4\* $m$ )**

**RMT\_CH $m$ DATA** Read and write data for channel  $n$  via APB FIFO. (HRO)

Register 52.3. RMT\_CH $n$ CONF0\_REG ( $n$ : 0-3) (0x0020+0x4\* $n$ )

[illegible]

**RMT\_TX\_START\_CH $n$**  Configures whether to enable sending data in channel  $n$ .

0: No effect

1: Enable

(WT)

**RMT\_MEM\_RD\_RST\_CH $n$**  Configures whether to reset RAM read address accessed by the transmitter for channel  $n$ .

0: No effect

1: Reset

(WT)

**RMT\_APB\_MEM\_RST\_CH $n$**  Configures whether to reset RAM W/R address accessed by APB FIFO for channel  $n$ .

0: No effect

1: Reset

(WT)

**RMT\_TX\_CONTI\_MODE\_CH $n$**  Configures whether to enable continuous TX mode for channel  $n$ .

0: No Effect

1: Enable

In this mode, the transmitter starts transmission from the first data. If an end-marker is encountered, the transmitter starts transmitting data from the first data again; if no end-marker is encountered, the transmitter starts transmitting the first data again when the last data is transmitted.

(R/W)

**RMT\_MEM\_TX\_WRAP\_EN\_CH $n$**  Configures whether to enable wrap TX mode for channel  $n$ .

0: No effect

1: Enable

In this mode, if the TX data size is larger than the channel's RAM block size, the transmitter continues transmitting the first data to the last data in loops.

(R/W)

**RMT\_IDLE\_OUT\_LV\_CH $n$**  Configures the level of output signal for channel  $n$  when the transmitter is in idle state. (R/W)

Continued on the next page...

**Register 52.3. RMT\_CH $n$ CONFO\_REG ( $n$ : 0-3) (0x0020+0x4\* $n$ )**

Continued from the previous page...

**RMT\_IDLE\_OUT\_EN\_CH $n$**  Configures whether to enable the output for channel  $n$  in idle state.

0: No effect

1: Enable

(R/W)

**RMT\_TX\_STOP\_CH $n$**  Configures whether to stop the transmitter of channel  $n$  sending data out.

0: No effect

1: Stop

(R/W/SC)

**RMT\_DIV\_CNT\_CH $n$**  Configures the divider for clock of channel  $n$ .

Measurement unit: rmt\_sclk

(R/W)

**RMT\_MEM\_SIZE\_CH $n$**  Configures the maximum number of memory blocks allocated to channel  $n$ .

(R/W)

**RMT\_CARRIER\_EFF\_EN\_CH $n$**  Configures whether to add carrier modulation on the output signal only at data-sending state for channel  $n$ .

0: Add carrier modulation on the output signal at data-sending state and idle state for channel  $n$

1: Add carrier modulation on the output signal only at data-sending state for channel  $n$

Only valid when RMT\_CARRIER\_EN\_CH $n$  is 1.

(R/W)

**RMT\_CARRIER\_EN\_CH $n$**  Configures whether to enable the carrier modulation on output signal for channel  $n$ .

0: Disable

1: Enable

(R/W)

**RMT\_CARRIER\_OUT\_LV\_CH $n$**  Configures the position of carrier wave for channel  $n$ .

0: Add carrier wave on low level

1: Add carrier wave on high level

(R/W)

**RMT\_CONF\_UPDATE\_CH $n$**  Synchronization bit for channel  $n$ . (WT)

**RMT\_DMA\_ACCESS\_EN\_CH3** Configures whether to enable the DMA access function for channel

3. This field is reserved for channel 0 ~ 2.

0: Disable

1: Enable

(R/W)

**Register 52.4. RMT\_CH $m$ CONFO\_REG ( $m$ : 4-7) (0x0030, 0x0038, 0x0040, 0x0048)**

|            |    |    |    |                                    |    |    |        |                                |  |  |  |                              |  |  |     |                       |   |  |  |                                |  |  |       |  |  |   |  |                             |  |  |  |
|------------|----|----|----|------------------------------------|----|----|--------|--------------------------------|--|--|--|------------------------------|--|--|-----|-----------------------|---|--|--|--------------------------------|--|--|-------|--|--|---|--|-----------------------------|--|--|--|
| (reserved) |    |    |    | RMT_CARRIER_OUT_LV_CH <sup>m</sup> |    |    |        | RMT_CARRIER_EN_CH <sup>m</sup> |  |  |  | RMT_MEM_SIZE_CH <sup>m</sup> |  |  |     | RMT_DMA_ACCESS_EN_CH7 |   |  |  | RMT_IDLE_THRES_CH <sup>m</sup> |  |  |       |  |  |   |  | RMT_DIV_CNT_CH <sup>m</sup> |  |  |  |
| 31         | 30 | 29 | 28 | 27                                 | 24 | 23 | 22     |                                |  |  |  |                              |  |  |     | 8                     | 7 |  |  |                                |  |  |       |  |  | 0 |  |                             |  |  |  |
| 0          | 0  | 1  | 1  | 0x1                                |    | 0  | 0x7fff |                                |  |  |  |                              |  |  | 0x2 |                       |   |  |  |                                |  |  | Reset |  |  |   |  |                             |  |  |  |

Reset

**RMT\_DIV\_CNT\_CH $m$**  Configures the clock divider of channel  $m$ .

Measurement unit: rmt\_sclk

(R/W)

**RMT\_IDLE\_THRES\_CH $m$**  Configures RX threshold. When no edge is detected on the input signal for continuous clock cycles longer than this field value, the receiver stops receiving data.

Measurement unit: clk\_div

(R/W)

**RMT\_DMA\_ACCESS\_EN\_CH7** Configures whether to enable the DMA access function for channel 7. This field is reserved for channel 4 ~ 6.

0: Disable

1: Enable

(R/W)

**RMT\_MEM\_SIZE\_CH $m$**  Configures the maximum number of memory blocks allocated to channel  $m$ .

(R/W)

**RMT\_CARRIER\_EN\_CH $m$**  Configures whether to enable carrier demodulation on output signal for channel  $m$ .

0: Disable

1: Enable

(R/W)

**RMT\_CARRIER\_OUT\_LV\_CH $m$**  Configures the position of carrier wave for channel  $m$ .

0: Demodulate carrier wave on low level

1: Demodulate carrier wave on high level

(R/W)

Register 52.5. RMT\_CH $m$ CONF1\_REG ( $m$ : 4-7) (0x0034, 0x003C, 0x0044, 0x004C)

|                                 |  |  |  |  |  |  |  |  |  |  |  |  |    |    |    |  |    |   |     |  |  |   |   |   |   |   |   |       |
|---------------------------------|--|--|--|--|--|--|--|--|--|--|--|--|----|----|----|--|----|---|-----|--|--|---|---|---|---|---|---|-------|
| (reserved)                      |  |  |  |  |  |  |  |  |  |  |  |  |    |    |    | RMT_CONF_UPDATE_CH <sup>m</sup><br>(reserved)<br>RMT_MEM_RX_WRAP_EN_CH <sup>m</sup><br>RMT_RX_FILTER_THRES_CH <sup>m</sup><br>RMT_RX_FILTER_EN_CH <sup>m</sup><br>RMT_MEM_OWNER_CH <sup>m</sup><br>RMT_APB_MEM_RST_CH <sup>m</sup><br>RMT_MEM_WRP_RST_CH <sup>m</sup><br>RMT_RX_EN_CH <sup>m</sup> |    |   |     |  |  |   |   |   |   |   |   |       |
| 31                              |  |  |  |  |  |  |  |  |  |  |  |  | 16 | 15 | 14 | 13   | 12 |   |     |  |  | 5 | 4 | 3 | 2 | 1 | 0 |       |
| 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  |  |  |  |  |  |    |    |    | 0  | 0  | 0 | 0xf |  |  |   | 0 | 1 | 0 | 0 | 0 | Reset |

**RMT\_RX\_EN\_CH $m$**  Configures whether to enable the receiver to start receiving data in channel  $m$ .

0: Disable

1: Enable

(R/W)

**RMT\_MEM\_WR\_RST\_CH $m$**  Configures whether to reset RAM write address accessed by the receiver for channel  $m$ .

0: No effect

1: Reset

(WT)

**RMT\_APB\_MEM\_RST\_CH $m$**  Configures whether to reset RAM W/R address accessed by APB FIFO for channel  $m$ .

0: No effect

1: Reset

(WT)

**RMT\_MEM\_OWNER\_CH $m$**  Configures the ownership of channel  $m$ 's RAM block.

0: APB bus is using the RAM

1: Receiver is using the RAM

(R/W/SC)

**RMT\_RX\_FILTER\_EN\_CH $m$**  Configures whether to enable the receiver's filter for channel  $m$ .

0: Disable

1: Enable

(R/W)

**RMT\_RX\_FILTER\_THRES\_CH $m$**  Configures whether the receiver, when receiving data, ignores the input pulse when its width is shorter than this register value in units of rmt\_sclk cycles.

0: No effect

1: Reset

(R/W)

**RMT\_MEM\_RX\_WRAP\_EN\_CH $m$**  Configures whether to enable wrap RX mode for channel  $m$ .

0: Disable

1: Enable

In this mode, if the RX data size is larger than channel  $m$ 's RAM block size, the receiver stores the RX data from the first address to the last address in loops.

(R/W)

**RMT\_CONF\_UPDATE\_CH $m$**  Synchronization bit for channel  $m$ . (WT)

**Register 52.6. RMT\_CH $m$ \_RX\_CARRIER\_RM\_REG ( $m$ : 4-7) (0x0090, 0x0094, 0x0098, 0x009C)**

**RMT\_CARRIER\_LOW\_THRES\_CH $m$**  Configures the low level period in a carrier modulation mode for channel  $m$ , which is equal to (RMT\_CARRIER\_LOW\_THRES\_CH $m$  + 1). (R/W)

**RMT\_CARRIER\_HIGH\_THRES\_CH $m$**  Configures the high level period in a carrier modulation mode for channel  $m$ , which is equal to (RMT\_CARRIER\_HIGH\_THRES\_CH $m$  + 1). (R/W)

**Register 52.7. RMT\_SYS\_CONF\_REG (0x00C0)**

**RMT\_APB\_FIFO\_MASK** Configures the memory access mode.

0: Access memory by FIFO

1: Access memory directly

(R/W)

**RMT\_CLK\_EN** Configures whether to enable signal of RMT register clock gate.

0: Power down the drive clock of registers

1: Power up the drive clock of registers

(R/W)

Register 52.8. RMT\_REF\_CNT\_RST\_REG (0x00C8)

**RMT\_REF\_CNT\_RST\_CH $n$**  ( $n$ : 0-3) Configures whether to reset the clock divider of channel  $n$ .  
0: No effect  
1: Reset  
(WT)

**RMT\_REF\_CNT\_RST\_CH $m$**  ( $m$ : 4-7) Configures whether to reset the clock divider of channel  $m$ .  
0: No effect  
1: Reset  
(WT)

Reset

**RMT\_MEM\_WADDR\_EX\_CH $m$**  Represents the memory address offset when receiver of channel  $m$  is using the RAM. (RO)

**RMT\_APB\_MEM\_RADDR\_CH $m$**  Represents the memory address offset when reads RAM over APB bus. (RO)

**RMT\_STATE\_CH $m$**  Represents the FSM status of channel  $m$ . (RO)

**RMT\_MEM\_OWNER\_ERR\_CH $m$**  Represents whether the ownership of memory block is wrong.

- 0: The ownership of memory block is correct
- 1: The ownership of memory block is wrong

(RO)

**RMT\_MEM\_FULL\_CH $m$**  Represents whether the receiver receives more data than the memory can fit.

- 0: The receiver does not receive more data than the memory can fit
- 1: The receiver receives more data than the memory can fit

(RO)

**RMT\_APB\_MEM\_RD\_ERR\_CH $m$**  Represents whether the offset address exceeds memory size (overflows) when reads RAM via APB bus.

- 0: Not exceed
- 1: Exceed

(RO)

Reset

**RMT\_TX\_LIM\_CH $n$**  Configures the maximum entries that channel  $n$  can send out. (R/W)

**RMT\_TX\_LOOP\_NUM\_CH $n$**  Configures the maximum loop count when Continuous TX mode is valid.  
(R/W)

**RMT\_TX\_LOOP\_CNT\_EN\_CH $n$**  Configures whether to enable loop count.  
0: No effect  
1: Enable  
(R/W)

**RMT\_LOOP\_COUNT\_RESET\_CH $n$**  Configures whether to reset the loop count when continuous TX mode is enabled.  
0: No effect  
1: Reset  
(WT)

**RMT\_LOOP\_STOP\_EN\_CH $n$**  Configures whether to enable the loop send stop function after the loop counter counts to loop number for channel  $n$ .  
0: No effect  
1: Enable  
(R/W)

## Register 52.17. RMT\_TX\_SIM\_REG (0x00C4)

**RMT\_DATE** Version control register. (R/W)

## Chapter 53

### Parallel IO Controller (PARLIO)

#### 53.1 Introduction

ESP32-P4 contains a Parallel IO controller (PARLIO) capable of transferring data between external devices and internal memory on a parallel bus through General Direct Memory Access (GDMA). The PARLIO consists of a TX unit and an RX unit, serving as a transmitter and a receiver respectively. With the two units combined, PARLIO achieves full-duplex communication.

Due to its flexibility, PARLIO can function as a general interface to connect various peripherals. For example, with SPI as the master device and PARLIO as the slave device, a peer-to-peer transfer can be achieved. For detailed application examples, refer to Section [53.8](#).

#### 53.2 Glossary

This section covers terminology used to describe the functionality of PARLIO.

|                           |   |
|---------------------------|---|
| <b>RX unit</b>            | Module in PARLIO responsible for receiving data from the external parallel bus and storing them into internal memory.   |
| <b>TX unit</b>            | Module in PARLIO responsible for transmitting data from internal memory to external parallel bus.   |
| <b>RXD</b>                | Parallel data received from the IO interface of the RX unit.  |
| <b>TXD</b>                | Parallel data sent from the IO interface of the TX unit.  |
| <b>Frame</b>              | Transferred data unit from the moment the START signal is set to the moment the End of Frame (EOF) signal is received.  |
| <b>Free-running clock</b> | Clock that toggles continuously as opposed to clock that only toggles when valid data is incoming, and remains constant for the rest of the time.   |
| <b>GDMA SUC EOF</b>       | Signal that indicates GDMA successful end of frame. When GDMA receives this signal, a GDMA interrupt will be triggered, indicating that the current frame is correct and the receive is finished. |
| <b>GDMA ERR EOF</b>       | Signal that indicates GDMA error end of frame. When GDMA receives this signal, a GDMA interrupt will be triggered, indicating that the current frame has error and the receive is finished.       |
| <b>CDC</b>                | Clock domain crossing.  |

#### 53.3 Features

The PARLIO module has the following main features:

- Various clock sources:
  - Including external IO clock PAD\_CLK\_TX/RX and internal system clock XTAL\_CLK, PLL\_F160M\_CLK, and RC\_FAST\_CLK
  - Maximum IO clock frequency of 40 MHz
  - Integer and fractional clock frequency division
- 1/2/4/8/16-bit configurable data bus width
- Full-duplex communication with 16-bit data bus width
- Bit reversal when data bus width is 1/2/4-bit
- RX unit for receiving IO parallel data, which supports:
  - Output clock gating
  - RX unit input and output clock inverse
  - Various receive modes
  - Configurable GDMA SUC EOF generation
  - Configurable IO pin of external enable signal
- TX unit for sending IO parallel data, which supports:
  - Output clock gating
  - TX unit input and output clock inverse
  - Configurable TX EOF generation
  - Valid signal output
  - Configurable bus idle value

## 53.4 Architectural Overview

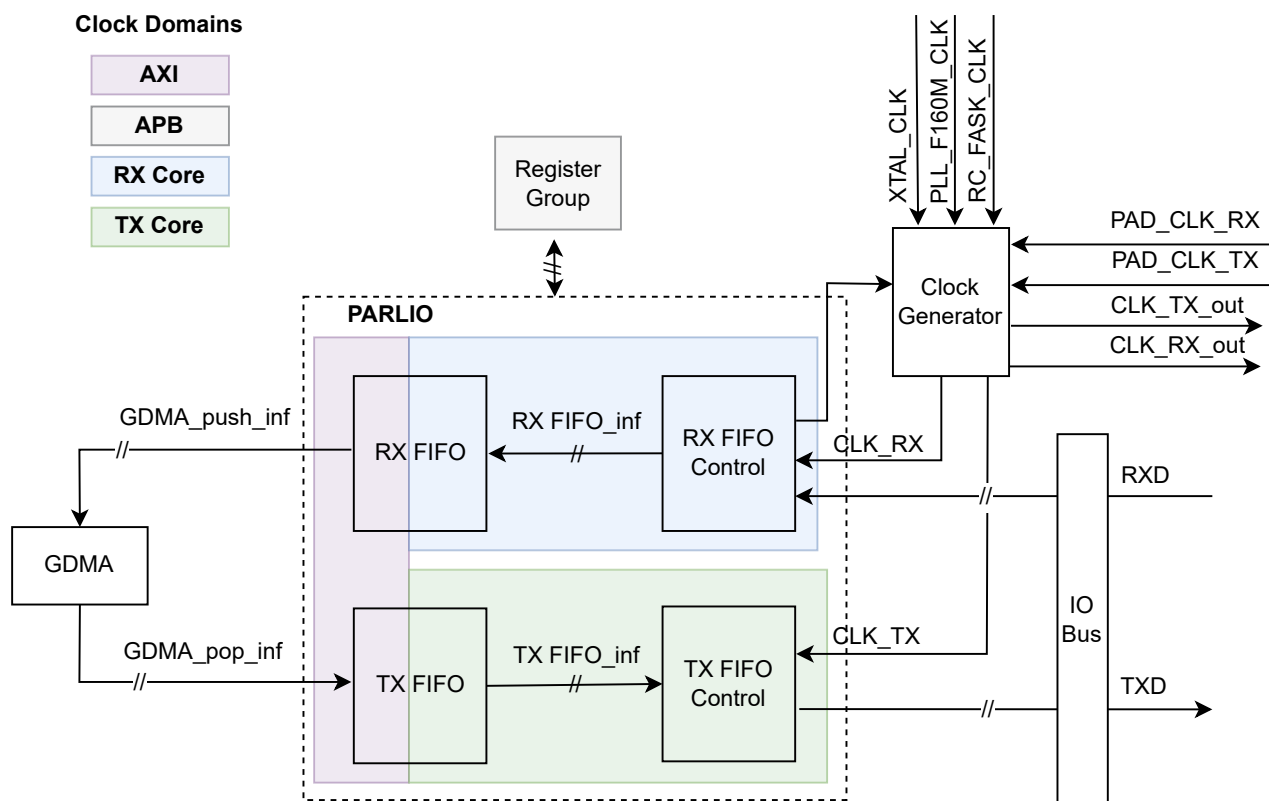

Figure 53.4-1. PARLIO Architecture

Figure 53.4-1 shows the architecture of PARLIO. In addition to the RX unit and the TX unit, a group of status configuration registers is also included.

The RX unit synchronizes RXD to the AXI clock domain through an asynchronous FIFO interface, converts RXD to standard GDMA interface data, and sends it to the internal memory.

The TX unit fetches data from internal memory through GDMA, synchronizes the data to the TX Core clock domain through an asynchronous FIFO interface, and converts the data to TXD for parallel IO bus output.

## 53.5 Functional Description

### 53.5.1 Clock Generator

There are four input clock domains in PARLIO, namely, RX Core, TX Core, AXI, and APB, as shown in Figure 53.4-1.

The status configuration register group works in the APB clock domain.

The GDMA interface logic works in the AXI clock domain.

The RX Core clock domain has four clock sources for selection, i.e., the internal system clock source XTAL\_CLK, RC\_FAST\_CLK, PLL\_F160M\_CLK, and the external clock source (PAD\_CLK\_RX), as shown in Figure 53.5-1. Clock sources can be selected by configuring `HP_SYS_CLKRST_PARLIO_RX_CLK_SRC_SEL`.

The clock can be divided by configuring `HP_SYS_CLKRST_PARLIO_RX_CLK_DIV_NUM`, `HP_SYS_CLKRST_PARLIO_RX_CLK_DIV_DENOMINATOR`, and `HP_SYS_CLKRST_PARLIO_RX_CLK_DIV_NUMERATOR`. The clock division factor can be configured up to  $(2^8 - 1)$ .

The TX Core clock domain has four clock sources for selection, i.e., the internal system clock sources `XTAL_CLK`, `RC_FAST_CLK`, `PLL_F160M_CLK` and the external clock source (`PAD_CLK_TX`), as shown in Figure 53.5-1. Clock sources can be selected by configuring `HP_SYS_CLKRST_PARLIO_TX_CLK_SRC_SEL`. The clock can be divided by configuring `HP_SYS_CLKRST_PARLIO_TX_CLK_DIV_NUM`, `HP_SYS_CLKRST_PARLIO_TX_CLK_DIV_DENOMINATOR`, and `HP_SYS_CLKRST_PARLIO_TX_CLK_DIV_NUMERATOR`. The clock division factor can be configured up to  $(2^8 - 1)$ .

The input clock of the TX and RX units can be inverted. The operating clock of the TX and RX units can also be inverted before being output to IO. The TX and RX units also support clock gating of the output clock.

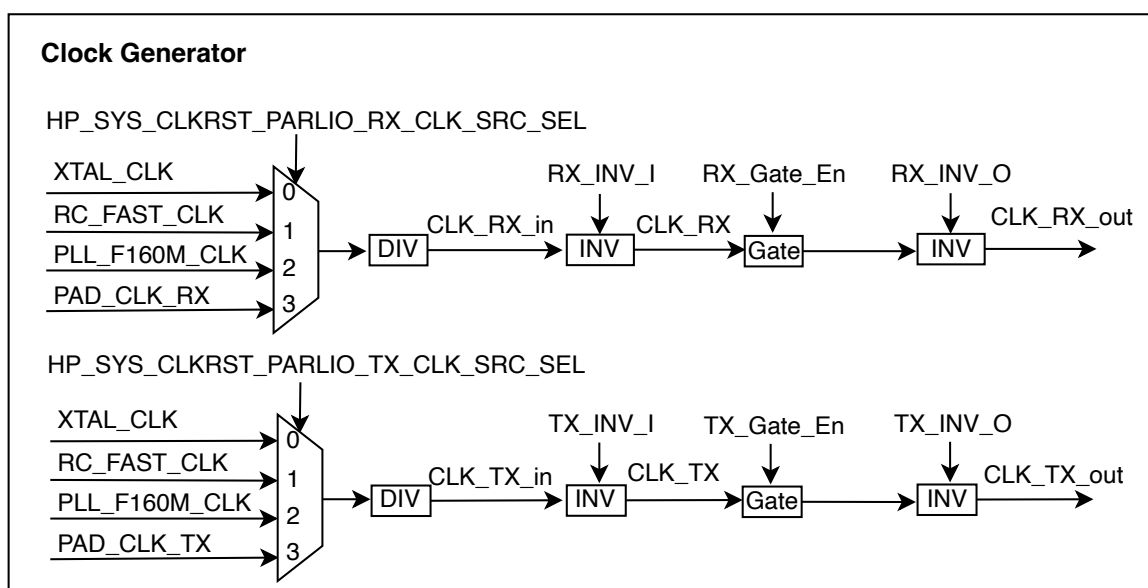

Figure 53.5-1. PARLIO Clock Generation

## 53.5.2 Clock & Reset Restriction

Due to the versatility of PARLIO, the PAD clocks (`PAD_CLK_TX/RX`) of PARLIO may come from different masters (external devices or internal clock sources). These clocks might be either free-running clock or not. If the clock is not free-running, some internal control signals of PARLIO cannot process CDC, so there are certain restrictions during the operation.

1. During the reset of the asynchronous FIFO, it takes two clock cycles to synchronize within AXI clock domain and Core clock domain. Therefore, if the reset of AXI clock domain is performed with a clock that is not free-running, the reset synchronization must be performed two clock cycles in advance. The specific operation is shown in the table below.

Table 53.5-1. Operations to Reset AXI Clock Domain with Clock Restrictions

| Clock Restriction      |                        | Specific Operation   |
|------------------------|------------------------|--|
| The Current Frame      | The Next Frame         |  |
| Free-running clock     | Not free-running clock | Users can reset the next frame transfer before switching to the clock that is not free-running. After the reset is completed, users can switch the clock.                      |
| Not free-running clock | Free-running clock     | The next frame can be reset freely. Users only need to ensure that there is an interval of two clock cycles between the reset and the start of the transfer.                   |
| Not free-running clock | Not free-running clock | If the next frame transfer needs to be reset, users need to first switch to the internal free-running clock, and then switch to the actual clock after the reset is completed. |

2. Due to the restrictions caused by a clock that is not free-running, [PARL\\_IO\\_RX\\_START](#) and [PARL\\_IO\\_TX\\_START](#) cannot perform CDC processing. Therefore, it is necessary to wait until [PARL\\_IO\\_RX\\_START](#) and [PARL\\_IO\\_TX\\_START](#) are stable before starting the data transfer. Otherwise, the transfer might enter a metastable state.

Here are the specific operation steps for the RX unit:

- Clear [HP\\_SYS\\_CLKRST\\_PARLIO\\_RX\\_CLK\\_EN](#) to turn off RX Core clock domain;
- Write 1 to [PARL\\_IO\\_RX\\_START](#);
- Set [HP\\_SYS\\_CLKRST\\_PARLIO\\_RX\\_CLK\\_EN](#) to turn on RX Core clock domain;
- Operate the external device to start sending data;
- Clear [HP\\_SYS\\_CLKRST\\_PARLIO\\_RX\\_CLK\\_EN](#) to turn off RX Core clock domain;
- Write 0 to [PARL\\_IO\\_RX\\_START](#).

Here are the specific operation steps for the TX unit:

- Clear [HP\\_SYS\\_CLKRST\\_PARLIO\\_TX\\_CLK\\_EN](#) to turn off TX Core clock domain;
- Write 1 to [PARL\\_IO\\_TX\\_START](#);
- Set [HP\\_SYS\\_CLKRST\\_PARLIO\\_TX\\_CLK\\_EN](#) to turn on TX Core clock domain;
- Operate the external device to start receiving data;
- Clear [HP\\_SYS\\_CLKRST\\_PARLIO\\_TX\\_CLK\\_EN](#) to turn off TX Core clock domain;
- Write 0 to [PARL\\_IO\\_TX\\_START](#).

3. Reset should follow the requirements below:

- The clock reset during the chip start-up should follow the sequence below:
  - (a) Reset APB clock domain;
  - (b) Reset GDMA clock domain;
  - (c) Reset Core clock domain.
- Inter-frame transfer requires Core clock domain reset and async FIFO reset.

### 53.5.3 Master-Slave Mode

The TX and RX units can function as both master and slave.

When the TX unit serves as master, it is necessary to set the internal free-running clock as the clock source. The TX unit drives TXD on the rising edge of the clock.

When the TX unit functions as a slave device, there are three scenarios, as shown in the table below.

Table 53.5-2. Requirements for TX Unit Operating as Slave with Clock Restrictions

| Clock Restriction      |                                      | Requirement   |
|------------------------|--------------------------------------|---|
| Clock Sent by Master   | Clock Waveform                       |   |
| Free-running clock     | Any waveform                         | There is no requirement for the sampling edge of the master clock.  |
| Not free-running clock | Positive waveform<br>(Figure 53.5-2) | The master clock should sample TXD at the falling edge.   |
| Not free-running clock | Negative waveform<br>(Figure 53.5-3) | The master device should invert the original clock and convert it to the waveform as Figure 53.5-2 shows before output. |

Figure 53.5-2. Positive Waveform

Figure 53.5-3. Negative Waveform

When the RX unit serves as the master, it is required to set the clock source as the internal free-running clock. The RX unit drives RXD on the rising edge of the clock.

When the RX unit functions as the slave, there are three scenarios, as shown in the table below.

Table 53.5-3. Requirements for RX Unit Operating as Slave with Clock Restrictions

| Clock Restriction      |                                   | Requirement  |
|------------------------|-----------------------------------|--|
| Clock Sent by Master   | Clock Waveform                    |  |
| Free-running clock     | Any waveform                      | There is no requirement for the sampling edge of the master clock, and the valid data is subject to the external enable signal.  |
| Not free-running clock | Positive waveform (Figure 53.5-2) | It is required for the master device to drive the data at the rising edge and the RX unit to sample the data at the falling edge (i.e., to inverse the master clock).      |
| Not free-running clock | Negative waveform (Figure 53.5-3) | It is required for the master device to drive the data at the falling edge and the RX unit to sample the data at the rising edge (i.e., to use the original master clock). |

### 53.5.4 Receive Modes of the RX Unit

PARLIO supports eight receive modes, which can be divided into three major categories according to the enable signal:

- Level Enable mode: data received is enabled by the external signal level;
- Pulse Enable mode: data received is enabled by the external signal pulse;
- Software Enable mode: the enable signal of data received can be configured by users directly.

The RX unit also supports inverse of the external enable signal. If the external enable signal is active-low, users can enable the function by setting `PARL_IO_RX_EXT_EN_INV` to switch to the corresponding receive mode introduced as follows.

#### 53.5.4.1 Level Enable Mode

Figure 53.5-4 shows the Level Enable mode. In this mode, an active level on the external enable signal must be aligned with valid data. Since the external level enable signal occupies one IO pin, there are at most 15 IO pins left usable for RXD.

| Mode                | Sub-mode | Description  |
|---------------------|----------|--|
| <b>LEVEL_ENABLE</b> | \        | <b>signal level high</b>   |
|                     |          |  |

Figure 53.5-4. Level Enable Mode for RX Unit

#### 53.5.4.2 Pulse Enable Mode

Pulse Enable mode can be divided into six sub-modes depending on the pulse active level and its alignment with valid data. For detailed classification, see Figure 53.5-5.

Sub-modes 1 ~ 4 all contain start pulse and end pulse. The difference lies in whether start pulse and end pulse are aligned with valid data.

Sub-modes 5 ~ 6 only contain start pulse and the end of valid data is signaled by configuring `PARL_IO_RX_BITLEN`.

Since the external pulse enable signal occupies one IO pin, there are at most 15 IO pins left usable for RXD. However, in sub-mode 5 and sub-mode 6, as the data is considered valid after the pulse's first edge and before the pulse's last edge, the enable signal IO pin can serve as a data IO pin at the same time. Therefore, there are 16 IO pins usable for RXD in these two sub-modes.

| Mode                | Sub-mode  | Description  |
|---------------------|-----------|--|
| <b>PULSE_ENABLE</b> | sub-mode1 | <b><i>pulse start(data bit include) &amp;&amp; pulse end(data bit include)</i></b> |
|                     |           |  |
|                     | sub-mode2 | <b><i>pulse start(data bit include) &amp;&amp; pulse end(data bit exclude)</i></b> |
|                     |           |  |
|                     | sub-mode3 | <b><i>pulse start(data bit exclude) &amp;&amp; pulse end(data bit include)</i></b> |
|                     |           |  |
|                     | sub-mode4 | <b><i>pulse start(data bit exclude) &amp;&amp; pulse end(data bit exclude)</i></b> |
|                     |           |  |
|                     | sub-mode5 | <b><i>pulse start(data bit include) &amp;&amp; length end</i></b>                  |
|                     | sub-mode6 | <b><i>pulse start(data bit exclude) &amp;&amp; length end</i></b>                  |

Figure 53.5-5. Sub-Modes of Pulse Enable Mode for RX Unit

#### 53.5.4.3 Software Enable Mode

The enable signal in Software Enable mode is determined by the internal configuration register. If users switch to this mode, the receive will only be activated when both `PARL_IO_RX_SW_EN` and `PARL_IO_RX_START` are set to 1.

Since the enable signal does not occupy IO pins on the interface, there are at most 16 IO pins usable by the RXD. Due to the differences of clock domains, the enable signal cannot be aligned with valid data. Thus, the validity of data needs to be identified by the valid clock edge. In this case, the RX Core clock needs to be aligned with valid data.

| Mode             | Sub-mode | Description  |
|------------------|----------|--|
| <b>SW_ENABLE</b> | /        | /  |
|                  |          |  |

Figure 53.5-6. Software Enable Mode for RX Unit

### 53.5.5 RX Unit GDMA SUC EOF Generation

The RX unit generates a GDMA SUC EOF signal to indicate the end of current frame transfer and sends it to the GDMA interface. GDMA SUC EOF can be generated by an external enable signal or triggered by the internally configured bit length.

- When GDMA SUC EOF is generated by the internally configured bit length, there is no restriction on the receive mode selection. However, [PARL\\_IO\\_RX\\_BITLEN](#) must be configured. If the configured value of [PARL\\_IO\\_RX\\_BITLEN](#) is less than the actual received data, the GDMA SUC EOF will be triggered in advance. In this case, the RX unit stops reading data from the FIFO, but the FIFO continues to receive external data until an [RX\\_FIFO\\_WOVF\\_INT](#) interrupt is triggered.
- When GDMA SUC EOF is generated by the external enable signal, only sub-modes 1 and 3 of Pulse Enable mode can be selected. In this mode, the transfer is not affected by the value of [PARL\\_IO\\_RX\\_BITLEN](#), and the transferred data length of the frame is not limited.

### 53.5.6 TX Unit EOF Generation

The TX unit generates an EOF signal and triggers the TX\_EOF\_INT interrupt to indicate the end of current frame transfer. The TX EOF signal can be generated by a GDMA-configured EOF signal or triggered by the internally configured bit length.

- When TX EOF is generated by the internally configured bit length, [PARL\\_IO\\_TX\\_BITLEN](#) must be configured. If the configured value of [PARL\\_IO\\_TX\\_BITLEN](#) is less than the actual transmitted data, the TX EOF signal will be triggered in advance.
- When TX EOF is generated by a GDMA-configured EOF signal, the transfer is not affected by the value of [PARL\\_IO\\_TX\\_BITLEN](#), and the transferred data length of the frame is not limited. The transfer does not end until the GDMA-configured EOF signal is received.

### 53.5.7 RX Unit Timeout

The RX unit supports the receive timeout. If the RX FIFO has not been receiving valid data for a long time, the timeout will be triggered. In such case, a GDMA ERR EOF signal will be generated and sent to the GDMA interface to indicate the end of the receiving. Configure [PARL\\_IO\\_RX\\_TIMEOUT\\_THRES](#) to set the timeout threshold.

The timeout function is enabled by default and can be disabled by users. The upper threshold of the configurable timeout is  $(2^{16} - 1)$  cycles of GDMA clock domain, and the lower threshold depends on the relative frequency relationship between GDMA clock domain and RX Core clock domain. It is recommended to set a relatively large value for [PARL\\_IO\\_RX\\_TIMEOUT\\_THRES](#) to avoid undesired GDMA ERR EOF signals.

### 53.5.8 Output Clock Gating of TX Unit

The TX unit supports output clock gating. The clock gating function is disabled by default, and can be enabled by software via setting [PARL\\_IO\\_TX\\_GATING\\_EN](#). The gating signal is fixed as the highest bit of TXD, and when the bit is at high level, the clock signal can be toggled. There are currently two configurable control sources for the highest bit of TXD, i.e., the GDMA output data and the valid signal. Write 0 to [PARL\\_IO\\_TX\\_VALID\\_OUTPUT\\_EN](#) to select the GDMA output data as the control source. In this case, it is

required to configure the bit width of the TX unit to a maximum. Write 1 to [PARL\\_IO\\_TX\\_VALID\\_OUTPUT\\_EN](#) to select the valid signal as the control source. In this case, there is no limit to the bit width.

When the gating function is enabled, there are at most 15 IO pins left usable for TXD as the gating signal occupies one IO.

### 53.5.9 Valid Signal Output of TX Unit

The TX unit can generate a valid signal aligned with TXD. Configure [PARL\\_IO\\_TX\\_VALID\\_OUTPUT\\_EN](#) to choose whether to output it to TXD. The polarity of the valid signal is fixed to active high.

The valid output function is disabled by default. When enabled, the output valid signal occupies the most significant bit (MSB) of the TXD, which means that no matter what the original value is, the 15th bit of TXD remains high and is output as the valid signal. However, the valid signal pin does not affect the bus width configuration. For example, if the data bus width is 1 bit, the valid output function can still be enabled with a fixed pin as TXD[15] while the data pin is TXD[0].

**Note:**

When the valid signal output function and the clock gating function are enabled at the same time, the highest bit of TXD (i.e., the gating signal) is continuously at high level. In cases where software requires the bit not to continuously stay at high level, do not enable the two functions simultaneously.

### 53.5.10 Bus Idle Value of TX Unit

The TX unit is regarded as in idle state when it is not transmitting data. It supports a configurable bus idle value.

The bus idle value is 0x0 by default, and its maximum configurable value is 0xFF. Note that the configured idle value should not conflict with other enabled functions. For example, when the MSB of TXD is used as the valid signal, users should avoid configuring the MSB of the idle value as 1.

### 53.5.11 Data Transfer in a Single Frame

The RX unit and the TX unit transfer data in the unit of bits, i.e., a single frame transfers 1 bit of data at least.

When the RX unit generates GDMA EOF signals through bit length, the maximum length of the single-frame transmission is  $(2^{19} - 1)$  bits. When the RX unit generates GDMA EOF signals through the enable signal from an external device, there is no limit to the amount of bits of the single-frame transmission.

When the TX unit generates EOF signals through bit length, the maximum length of a single frame transmission is  $(2^{19} - 1)$  bits. When the TX unit generates EOF signals through GDMA-configured EOF signals, there is no limit to the amount of bits of the single-frame transmission.

Since PARLIO transfers data in the unit of bytes on the GDMA side, it will process the IO data when it is not aligned with the bytes.

- When receiving data, PARLIO will automatically pad 0 to the high bits of the data stored in memory via GDMA to make it aligned with bytes.

- When sending data, PARLIO will truncate the data retrieved from memory according to the configured value of `PARL_IO_TX_BITLEN`. Data exceeding the value will not be sent.

When the configured data bus width is 2/4/8/16-bit, the bit length must be configured as a multiple of the corresponding bus width.

### 53.5.12 Bit Reversal in One Byte

The sequence of data within one byte can be reversed when data bus width is 1/2/4-bit. Taking the RX unit as an example, when the configured bus width is 2 bits, the data needs to be packed into one byte before being written into the RX FIFO.

Presume that the original bit sequence is:

{ { b\_0, b\_1 }, { b\_2, b\_3 }, { b\_4, b\_5 }, { b\_6, b\_7 } }

If the bit reversal is enabled, the sequence will be reordered to:

{ { b\_6, b\_7 }, { b\_4, b\_5 }, { b\_2, b\_3 }, { b\_0, b\_1 } }

## 53.6 Interrupts

ESP32-P4's PARLIO module can generate the following interrupt signals that will be sent to the [Interrupt Matrix](#).

- `PARL_IO_TX_INTR`
- `PARL_IO_RX_INTR`

There are several internal interrupt sources from PARLIO that can generate the above interrupt signals. The interrupt sources from PARLIO are listed with their trigger conditions and the resulted interrupt signals in Table 53.6-1.

**Table 53.6-1. PARLIO's Internal Interrupt Sources**

| Internal Interrupt Source      | Trigger Condition   | Interrupt Signal             |
|--------------------------------|---|------------------------------|
| <code>TX_FIFO_EMPTY_INT</code> | TX FIFO is empty, indicating possible error in the data sent by TX    | <code>PARL_IO_TX_INTR</code> |
| <code>RX_FIFO_WOVF_INT</code>  | RX FIFO is full, indicating possible error in the data received by RX | <code>PARL_IO_RX_INTR</code> |
| <code>TX_EOF_INT</code>        | TX finishes sending a complete frame of data                          | <code>PARL_IO_TX_INTR</code> |

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter 11 [Interrupt Matrix](#) > Section 11.2 [Interrupt Terminology in ESP32-P4](#).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section 53.9 [Register Summary](#).

## 53.7 Programming Procedures

### 53.7.1 Data Receiving Operation Process

This section introduces the programming procedure for receiving data through RX unit. To receive parallel data from IO pins that are connected to external devices and store the data in the internal memory, perform the following procedure. For a detailed description of the clock and reset operation restrictions in the RX unit, refer to Section 53.5.2.

1. Reset the RX unit. For specific reset scenarios and sequences, refer to Section 53.5.2.
2. Set [PARL\\_IO\\_RX\\_FIFO\\_WOVF\\_INT\\_CLR](#) and [PARL\\_IO\\_RX\\_FIFO\\_WOVF\\_INT\\_ENA](#).
3. Select the RXD IO pins. If a PAD clock is used, the clock IO pin also needs to be configured.
4. Select the clock source and divide the clock by configuring clock registers.
5. Turn off the clock of RX Core clock domain.
6. Select the receive mode and enable functions required as described in Sections 53.3 and 53.5.
7. Configure GDMA inlink list.
8. Set [PARL\\_IO\\_RX\\_REG\\_UPDATE](#) to synchronize the register signals.
9. Set [PARL\\_IO\\_RX\\_START](#).
10. Turn on the clock of RX Core clock domain.
11. Operate the external device to start sending data.
12. Poll the GDMA SUC EOF interrupt.
13. Clear the GDMA SUC EOF interrupt.
14. Turn off the clock of RX Core clock domain.
15. Clear [PARL\\_IO\\_RX\\_START](#).

### 53.7.2 Data Transmitting Operation Process

This section introduces the programming procedure for transmitting data through TX unit. To transmit parallel data from internal memory to the IO pins that are connected to external devices, perform the following procedure. For detailed description of the clock and reset operation restrictions for the TX unit, refer to Section 53.5.2.

1. Reset the TX unit. For specific reset scenarios and sequences, refer to Section 53.5.2.
2. Set [PARL\\_IO\\_TX\\_FIFO\\_EMPTY\\_INT\\_CLR](#), [PARL\\_IO\\_TX\\_EOF\\_INT\\_CLR](#), [PARL\\_IO\\_TX\\_FIFO\\_EMPTY\\_INT\\_ENA](#), and [PARL\\_IO\\_TX\\_EOF\\_INT\\_ENA](#) in sequence.
3. Select the TXD IO pins. If a PAD clock is used, the clock IO PAD also needs to be configured.
4. Select the clock source and divide the clock by configuring clock registers.
5. Turn off the clock of TX Core clock domain.
6. Select the functions required as described in Section 53.5.

7. Configure GDMA outlink list.
8. Poll the [PARL\\_IO\\_TX\\_READY](#).
9. Set [PARL\\_IO\\_TX\\_START](#).
10. Turn on the clock of TX Core clock domain.
11. Operate the external device to start receiving data.
12. Poll the [PARL\\_IO\\_TX\\_EOF\\_INT\\_ST](#).
13. Set [PARL\\_IO\\_TX\\_EOF\\_INT\\_CLR](#).
14. Turn off the clock of TX Core clock domain.
15. Clear [PARL\\_IO\\_TX\\_START](#).

## 53.8 Application Examples

This section introduces some PARLIO application examples and their detailed operation process. All peripherals used in the examples are from ESP series chips and can work with PARLIO to form a complete data path.

### Note:

The data paths constructed in the examples may not be the optimal. For example, users can use the SPI peripherals on two identical ESP chips to complete the peer-to-peer transfer in real case instead of using PARLIO to work with SPI. However, these examples demonstrate the flexibility of the PARLIO interface to a certain extent.

### 53.8.1 Co-working with SPI

In this example, external SPI sends data as a master device and PARLIO RX unit receives data as a slave device, and at the same time, PARLIO TX sends data as a master device and SPI receives data as a slave device, thus achieving a peer-to-peer serial data transfer.

- Follow the operation process below to achieve SPI transmit and PARLIO receive:
  1. Configure SPI clock.
  2. Configure SPI as the master device.
  3. Configure signal pins. Connect FSPICLK to PAD\_CLK\_RX, FSPICSO to RXD[15], and FSPID to RXD[0].
  4. Write the data sent into the SPI buffer and configure the bit length of the data sent.
  5. Set [SPI\\_UPDATE](#) to update the configured register value.
  6. Reset PARLIO RX unit.
  7. Configure PARLIO RX unit clock.
  8. Turn off the PARLIO RX Core clock domain.
  9. Configure PARLIO receive mode as sub-mode 1 of LEVEL Enable mode. Configure RX unit data bus width as 1 bit. Configure [PARL\\_IO\\_RX\\_BITLEN](#) according to the sending length of SPI. Set [PARL\\_IO\\_RX\\_REG\\_UPDATE](#).

10. Configure PARLIO GDMA inlink list.
  11. Set [PARL\\_IO\\_RX\\_START](#).
  12. Turn on the PARLIO RX Core clock domain.
  13. Set [SPI\\_USR](#) to start transmitting data of SPI.
  14. Poll GDMA SUC EOF interrupt.
  15. Clear [PARL\\_IO\\_RX\\_START](#).
- Follow the operation process below to achieve PARLIO transmit and SPI receive:
    1. Configure SPI clock.
    2. Configure SPI as the slave device.
    3. Configure signal pins. Connect FSPICLK to PAD\_CLK\_TX, FSPICSO to TXD[15], and FSPID to TXD[0].
    4. Set [SPI\\_RD\\_BIT\\_ORDER](#) to invert the bit order.
    5. Set [SPI\\_UPDATE](#) to update the configured register value.
    6. Reset PARLIO TX unit.
    7. Set [PARL\\_IO\\_TX\\_EOF\\_INT\\_CLR](#) and [PARL\\_IO\\_TX\\_EOF\\_INT\\_ENA](#).
    8. Configure PARLIO TX unit clock.
    9. Turn off the clock of TX Core clock domain.
    10. Configure data bus width as 1 bit. Write 1 to [PARL\\_IO\\_TX\\_VALID\\_OUTPUT\\_EN](#). Configure [PARL\\_IO\\_TX\\_BITLEN](#).
    11. Configure GDMA outlink list.
    12. Poll [PARL\\_IO\\_TX\\_READY](#).
    13. Write 1 to [PARL\\_IO\\_TX\\_START](#).
    14. Turn on the clock of TX Core clock domain.
    15. Start data transfer.
    16. Poll [PARL\\_IO\\_TX\\_EOF\\_INT\\_ST](#).
    17. Set [PARL\\_IO\\_TX\\_EOF\\_INT\\_CLR](#).
    18. Turn off the clock of TX Core clock domain.
    19. Clear [PARL\\_IO\\_TX\\_START](#).

## 53.8.2 Co-working with I2S

In this example, external I2S sends data as a master device and PARLIO RX unit receives data as a slave device. PARLIO supports the transmission of the I2S TDM MSB alignment standard and the TDM PCM standard. When the I2S transfer protocol is the TDM MSB alignment standard, it is required to configure the receive mode of PARLIO as Level Enable mode. When the I2S transfer protocol is the TDM PCM standard, it is required to configure the receive mode of PARLIO as the sub-mode 4 of Pulse Enable mode and set [PARL\\_IO\\_RX\\_EXT\\_EN\\_INV](#).

This section takes the TDM PCM alignment standard as an example. The specific operation process is as follows:

1. Configure I2S clock.
2. Configure signal pins. Connect I2SO\_BCK\_out to PAD\_CLK\_RX, I2SO\_WS\_out to RXD[15], and I2SO\_Data\_out to RXD[0].
3. Configure I2S as the master device.
4. Configure the I2S TX data mode and channel mode required. Set [I2S\\_TX\\_UPDATE](#).
5. Reset I2S TX unit and TX FIFO.
6. Enable [I2S\\_TX\\_DONE\\_INT](#).
7. Configure I2S GDMA outlink list.
8. Set [I2S\\_TX\\_STOP\\_EN](#).
9. Reset PARLIO RX unit.
10. Configure PARLIO RX unit clock.
11. Turn off PARLIO RX Core clock domain.
12. Configure PARLIO receive mode as sub-mode 4 of Pulse Enable mode and set [PARL\\_IO\\_RX\\_EXT\\_EN\\_INV](#) to configure the RX unit data bus width as 1 bit. Configure [PARL\\_IO\\_TX\\_BITLEN](#) according to the length of the data sent by I2S. Set [PARL\\_IO\\_RX\\_REG\\_UPDATE](#).
13. Configure PARLIO GDMA inlink list.
14. Set [PARL\\_IO\\_RX\\_START](#).
15. Turn on PARLIO RX Core clock domain.
16. Set [I2S\\_TX\\_START](#) to start transmitting data.
17. Poll [I2S\\_TX\\_DONE\\_INT](#).
18. Poll GDMA SUC EOF interrupt.
19. Clear [I2S\\_TX\\_START](#).
20. Clear [PARL\\_IO\\_RX\\_START](#).

### 53.8.3 Co-working with LCD

In this example, PARLIO TX unit sends data as a master device and external LCD controller receives data as a slave device. The I8080/MOTO6800 format is used. 8-bit parallel data is transferred between devices. The specific operation process is as follows:

1. Configure signal pins. Connect CLK\_TX\_out to LCD pixel clock PCLK, TXD[7:0] to LCD data input pin, TXD[8] to LCD CS pin, TXD[9] to LCD CD pin.
2. Reset PARLIO TX unit.
3. Set [PARL\\_IO\\_TX\\_FIFO\\_EMPTY\\_INT\\_CLR](#), [PARL\\_IO\\_TX\\_EOF\\_INT\\_CLR](#), [PARL\\_IO\\_TX\\_FIFO\\_EMPTY\\_INT\\_ENA](#), and [PARL\\_IO\\_TX\\_EOF\\_INT\\_ENA](#) in sequence.
4. Configure PARLIO TX unit clock.

5. Turn off the clock of TX Core clock domain.
6. Configure data bus width as 16 bit. Configure [PARL\\_IO\\_TX\\_BITLEN](#).
7. Configure GDMA outlink list. Note that the data sent in the linked list should conform to I8080/MOTO6800 format. The lower eight bits are valid parallel data. The 9th and 10th bits are respectively CS, CD. The MSB is the constant 1. The remaining bits are arbitrary values.
8. Poll [PARL\\_IO\\_TX\\_READY](#).
9. Write 1 to [PARL\\_IO\\_TX\\_START](#).
10. Turn on the clock of TX Core clock domain.
11. Start data transfer.
12. Poll [PARL\\_IO\\_TX\\_EOF\\_INT\\_ST](#).
13. Set [PARL\\_IO\\_TX\\_EOF\\_INT\\_CLR](#).
14. Turn off the clock of TX Core clock domain.
15. Clear [PARL\\_IO\\_TX\\_START](#).

## 53.9 Register Summary

The addresses in this section are relative to Parallel IO Controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name   | Description   | Address | Access   |
|--|---|---------|----------|
| <b>PARLIO RX Configuration Registers</b>                   |   |         |          |
| <a href="#">PARL_IO_RX_MODE_CFG_REG</a>                    | PARLIO RX sampling mode configuration register        | 0x0000  | R/W      |
| <a href="#">PARL_IO_RX_DATA_CFG_REG</a>                    | PARLIO RX data configuration register                 | 0x0004  | R/W      |
| <a href="#">PARL_IO_RX_GENRL_CFG_REG</a>                   | PARLIO RX general configuration register              | 0x0008  | R/W      |
| <a href="#">PARL_IO_RX_START_CFG_REG</a>                   | PARLIO RX start configuration register                | 0x000C  | R/W      |
| <b>PARLIO TX Configuration Registers</b>                   |   |         |          |
| <a href="#">PARL_IO_TX_DATA_CFG_REG</a>                    | PARLIO TX data configuration register                 | 0x0010  | R/W      |
| <a href="#">PARL_IO_TX_START_CFG_REG</a>                   | PARLIO TX start configuration register                | 0x0014  | R/W      |
| <a href="#">PARL_IO_TX_GENRL_CFG_REG</a>                   | PARLIO TX general configuration register              | 0x0018  | R/W      |
| <b>PARLIO Configuration and Status Registers</b>           |   |         |          |
| <a href="#">PARL_IO_FIFO_CFG_REG</a>                       | PARLIO FIFO configuration register                    | 0x001C  | R/W      |
| <a href="#">PARL_IO_REG_UPDATE_REG</a>                     | PARLIO register update configuration register         | 0x0020  | WT       |
| <a href="#">PARL_IO_ST_REG</a>                             | PARLIO module status register                         | 0x0024  | RO       |
| <b>PARLIO Interrupt Configuration and Status Registers</b> |   |         |          |
| <a href="#">PARL_IO_INT_ENA_REG</a>                        | PARLIO interrupt enable signal configuration register | 0x0028  | R/W      |
| <a href="#">PARL_IO_INT_RAW_REG</a>                        | PARLIO interrupt raw signal status register           | 0x002C  | R/SS/WTC |
| <a href="#">PARL_IO_INT_ST_REG</a>                         | PARLIO interrupt signal status register               | 0x0030  | RO       |
| <a href="#">PARL_IO_INT_CLR_REG</a>                        | PARLIO interrupt clear signal configuration register  | 0x0034  | WT       |
| <b>PARLIO RX/TX Status Registers</b>                       |   |         |          |

## 53.10 Registers

The addresses in this section are relative to Parallel IO Controller base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

### Register 53.1. PARL\_IO\_RX\_MODE\_CFG\_REG (0x0000)

[illegible]

**PARL\_IO\_RX\_EXT\_EN\_SEL** Configures the RX external enable signal from IO PAD. (R/W)

**PARL\_IO\_RX\_SW\_EN** Configures whether to enable data sampling by software.

0: Disable

1: Enable

(R/W)

**PARL\_IO\_RX\_EXT\_EN\_INV** Configures whether to invert the external enable signal.

0: No effect

1: Invert

(R/W)

**PARL\_IO\_RX\_PULSE\_SUBMODE\_SEL** Configures the RXD pulse sampling sub-mode.

0: Positive pulse start (data bit included) & Positive pulse end (data bit included)

1: Positive pulse start (data bit included) & Positive pulse end (data bit excluded)

2: Positive pulse start (data bit excluded) & Positive pulse end (data bit included)

3: Positive pulse start (data bit excluded) & Positive pulse end (data bit excluded)

4: Positive pulse start (data bit included) & Length end

5: Positive pulse start (data bit excluded) & Length end

(R/W)

**PARL\_IO\_RX\_SMP\_MODE\_SEL** Configures the RXD sampling mode.

0: External Level Enable mode

### 1: External Pulse Enable mode

## 2: Internal Software Enable mode

(R/W)

Register 53.2. PARL\_IO\_RX\_DATA\_CFG\_REG (0x0004)

- PARL\_IO\_RX\_BITLEN

Configures the expected bit number of RXD. (R/W)
- PARL\_IO\_RX\_DATA\_ORDER\_INV

Configures whether to invert the bit order of one byte sent from RX FIFO to GDMA. (R/W)
- PARL\_IO\_RX\_BUS\_WID\_SEL

Configures the RXD bus width.

0: 1 bit

1: 2 bits

2: 4 bits

3: 8 bits

4: 16 bits

5 ~ 15: Invalid and will incur error

(R/W)

Register 53.3. PARL\_IO\_RX\_GENRL\_CFG\_REG (0x0008)

|            |    |    |       |                        |  |  |  |  |  |  |   |                          |    |    |   |   |   |   |   |                      |   |   |   |   |   |   |   |            |   |       |  |  |  |  |  |
|------------|----|----|-------|------------------------|--|--|--|--|--|--|---|--------------------------|----|----|---|---|---|---|---|----------------------|---|---|---|---|---|---|---|------------|---|-------|--|--|--|--|--|
| (reserved) |    |    |       | PARL_IO_RX_EOF_GEN_SEL |  |  |  |  |  |  |   | PARL_IO_RX_TIMEOUT_THRES |    |    |   |   |   |   |   | PARL_IO_RX_GATING_EN |   |   |   |   |   |   |   | (reserved) |   |       |  |  |  |  |  |
| 31         | 30 | 29 | 28    |                        |  |  |  |  |  |  |   | 13                       | 12 | 11 |   |   |   |   |   |                      |   |   | 0 |   |   |   |   |            |   |       |  |  |  |  |  |
| 0          | 0  | 1  | 0xfff |                        |  |  |  |  |  |  | 0 | 0                        | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0                    | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0          | 0 | Reset |  |  |  |  |  |

**PARL\_IO\_RX\_GATING\_EN** Configures whether to enable the clock gating of the RX output clock.

0: Disable

1: Enable

(R/W)

**PARL\_IO\_RX\_TIMEOUT\_THRES** Configures the threshold of the RX timeout counter. (R/W)

**PARL\_IO\_RX\_TIMEOUT\_EN** Configures whether to enable the timeout function to generate GDMA ERR EOF.

0: Disable

1: Enable

(R/W)

**PARL\_IO\_RX\_EOF\_GEN\_SEL** Configures the generation mechanism of GDMA SUC EOF.

0: Generate GDMA SUC EOF by the configured data bit length

1: Generate GDMA SUC EOF by the external enable signal

(R/W)

Register 53.4. PARL\_IO\_RX\_START\_CFG\_REG (0x000C)

|                  |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |            |       |  |  |  |  |  |  |
|------------------|----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|------------|-------|--|--|--|--|--|--|
| PARL_IO_RX_START |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | (reserved) |       |  |  |  |  |  |  |
| 31               | 30 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 0          |       |  |  |  |  |  |  |
| 0                | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0          | Reset |  |  |  |  |  |  |

**PARL\_IO\_RX\_START** Configures whether to start RX data sampling.

0: No effect

1: Start

(R/W)

### Register 53.5. PARL\_IO\_TX\_DATA\_CFG\_REG (0x0010)

|                        |  |                           |  |    |  |       |  |                   |  |                     |  |       |  |
|------------------------|--|---------------------------|--|----|--|-------|--|-------------------|--|---------------------|--|-------|--|
| 31                     |  | 29                        |  | 28 |  | 27    |  | 9                 |  | 8                   |  | 0     |  |
| PARL_IO_TX_BUS_WID_SEL |  | PARL_IO_TX_DATA_ORDER_INV |  |    |  |       |  | PARL_IO_TX_BITLEN |  | (reserved)          |  |       |  |
| 0x3                    |  | 0                         |  |    |  | 0x000 |  |                   |  | 0 0 0 0 0 0 0 0 0 0 |  | Reset |  |

**PARL\_IO\_TX\_BITLEN** Configures the expected bit number of TXD. (R/W)

**PARL\_IO\_TX\_DATA\_ORDER\_INV** Configures whether to invert the bit order of one byte sent from TX FIFO to IO data.

0: No effect

1: Invert

(R/W)

**PARL\_IO\_TX\_BUS\_WID\_SEL** Configures the TXD bus width.

0: 1 bit

1: 2 bits

2: 4 bits

3: 8 bits

4: 16 bits

5 ~ 15: Invalid and will incur error

(R/W)

### Register 53.6. PARL\_IO\_TX\_START\_CFG\_REG (0x0014)

[illegible]

**PARL\_IO\_TX\_START** Configures whether to start TX data transmission.

0: No effect

1: Start

(R/W)

Register 53.7. PARL\_IO\_TX\_GENRL\_CFG\_REG (0x0018)

Reset

**PARL\_IO\_TX\_EOF\_GEN\_SEL** Configures the generation mechanism of TX EOF.

0: Generate TX EOF by the configured data bit length

1: Generate TX EOF by the GDMA EOF signal.

(R/W)

**PARL\_IO\_TX\_IDLE\_VALUE** Configures the data value on TX bus in idle state. (R/W)**PARL\_IO\_TX\_GATING\_EN** Configures whether to enable the clock gating of the TX output clock.

0: Disable

1: Enable

(R/W)

**PARL\_IO\_TX\_VALID\_OUTPUT\_EN** Configures whether to enable the output of TX data valid signal.

0: Disable

1: Enable

(R/W)

## Chapter 54

### BitScrambler

The ESP32-P4 has an extensive amount of DMA-capable peripherals. These can move data from memory to an external device, and vice versa, without any interference from the CPU. This only works if the external device needs or emits the data in question in the same format as the software expects it: if not, the CPU needs to rewrite the format of the data. Examples include a need to swap bytes, reverse bytes, and shift the data left or right.

As bitwise operations tend to be fairly CPU-expensive and the purpose of DMA is to not use the CPU in the transfer, ESP32-P4 includes two BitScramblers, which are dedicated peripherals to change the format of data in between memory and the peripheral. A BitScrambler is capable of performing the aforementioned operations, but as a flexible programmable state machine, it is capable of more advanced things as well. One of the two BitScramblers is dedicated to memory-to-peripheral (or memory-to-memory) transfers, the other one is dedicated to peripheral-to-memory transfers.

#### 54.1 Introduction

In ESP32-P4, a DMA-capable peripheral is one that can read data directly from memory and/or write data directly to memory using a DMA channel. The format this data is read/written in is dependent on the peripheral and generally has only a small amount of flexibility. For most DMA-capable peripherals in ESP32-P4, it is possible to attach a BitScrambler to any of these paths for additional flexibility.

When a BitScrambler is attached to a peripheral, it gets the chance to modify any data that flows down a DMA channel associated with that peripheral. Data written to the DMA channel will appear on the BitScrambler input, and what the BitScrambler writes to its output will flow down the DMA channel. The BitScrambler contains instruction memory where instructions on how to route the data between input and output can be stored. As such, by writing an appropriate BitScrambler program, the way the data is rewritten by the BitScrambler can be controlled.

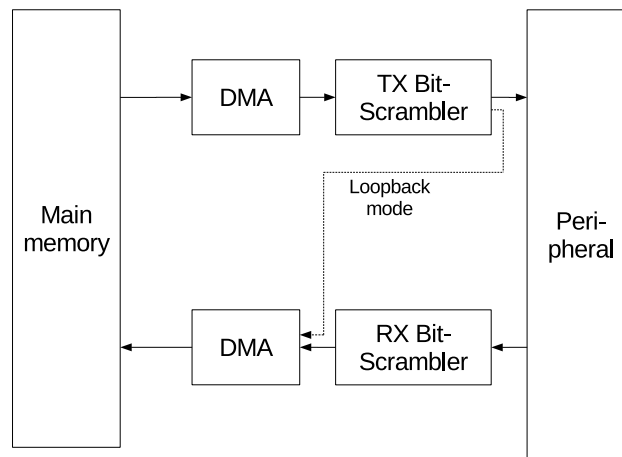

Figure 54.1-1. BitScrambler System Context Diagram

## 54.2 Feature List

The BitScrambler has the following features:

- Two BitScramblers, one for RX (peripheral-to-memory), one for TX (memory-to-peripheral)
- Support for memory-to-memory transfers
- Processing up to 32 bits per DMA clock period
- Data path controlled by a BitScrambler program stored in instruction memory
- Input registers able to read 0, 8, 16, or 32 bits per clock cycle
- Output registers:
  - Able to write 0, 8, 16, or 32 bits per clock cycle
  - Data sources for output register bits: 64 bits of input data, two counters, LUT RAM data, data output of last cycle, comparators
  - With some restrictions, each of the 32 output register bits can come from any bit on the data sources
- 8 x 257-bit instruction memory, for storing eight instructions, controlling control flow and the data path
- 2048 bytes of lookup table (LUT) memory, configurable as various word widths

## 54.3 Architectural Overview

The BitScrambler can be separated into a data path, a control path, and the registers that the CPU can use to program them. The data path moves bits between the incoming DMA stream, internal registers, and the outgoing DMA stream. The control path parses the instructions in the instruction memory to control the data path, as well as handle program flow.

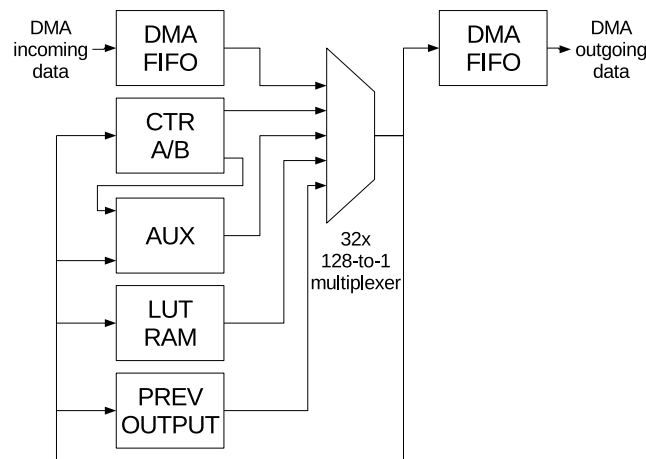

Figure 54.3-1. BitScrambler Data Path Diagram

### 54.3.1 Data Path

The data path of the BitScrambler is intended to take data from the incoming DMA stream, process it according to the program code stored in instruction memory, and write it to the outgoing DMA stream. Data is read from the incoming DMA stream into a 64-bit register. At the end of an instruction cycle, as specified in the instruction, N bits (with N being 0, 8, 16, or 32) are read from the DMA stream. The data in the register is then shifted toward the LSB of the register with the least significant N bits disappearing. Finally, the read data appears as the N most significant bits. Optionally, on startup, the BitScrambler will automatically read the first 64 bits into this register.

On the other side of the BitScrambler, data is deposited into a 32-bit output register. At the end of the instruction cycle, depending on what the instruction specifies, the least significant 0, 8, 16, or 32 bits will be written to the outgoing DMA stream.

The BitScrambler derives its name from the fact that it can put input bits in any random position in the output, and this is achieved by 32 x 128-to-1 multiplexers. For each of the 32 output register bits, there is one multiplexer that selects the input signals from one of the data sources, dependent on the output of the BitScrambler control path. These data sources are:

- 64 bits, shifted in from the input FIFO (i.e., the left DMA FIFO block in Figure 54.3-1). As described before, data from the incoming DMA stream is deposited here. In order to facilitate iterating over input bits in a loop, an instruction can enable relative addressing. In this addressing mode, any mux sourcing a bit from the input FIFO register will actually get the bit offset by the counter A register (i.e., CTR A in Figure 54.3-1).
- 32 bits that were sent to the output in the last cycle (i.e., PREV OUTPUT block in Figure 54.3-1). Data sent to the output register will appear on this register one clock cycle later. This allows the BitScrambler to 'remember' data over multiple clock cycles: by outputting a bit to the output register, even if that bit subsequently is not sent to the output FIFO, the next clock cycle can still access it by selecting from this register. Bits can be remembered longer-term by selecting bits from this register for output again, which makes them appear here in the subsequent cycle.
- 8, 16, or 32 bits that are the output of LUT RAM. The address used to select the data is the most significant bits of the output data of the last cycle. The LUT RAM is a part of the BitScrambler that takes an address, looks it up in its memory, and outputs the data located at that specific address. The LUT

RAM can be filled when the BitScrambler is initialized, but the BitScrambler itself does not have the ability to modify it. Depending on requirements, the LUT RAM can be initialized in the following modes:

- 512 x 32-bit words
- 1024 x 16-bit words
- 2048 x 8-bit words

The LUT RAM can be used to do translations of data, e.g. using a calibration curve for a given sensor. It can also be used to implement mathematical functions, with the address input split into two or more input variables and the data output used as the output of the function; the memory should be loaded with the output of the function for each of the input values.

- 32 bits from 2 x 16-bit counters (i.e., CTR A/B block in Figure 54.3-1). This register contains two 16-bit counters, named 'A' and 'B'. These can be loaded, incremented and decremented via control path instructions.
- 30 bits from comparators between counter B and the previous data on the output (PREV OUT in Figure 54.3-1; the 30 bits described here are part of the AUX block there). These allow the result of comparisons being used for output or for program flow. This can be useful in e.g. decoding run-length encoded streams, or generating PWM signals.
- 2 bits, one fixed-high, one fixed-low (i.e., part of AUX in Figure 54.3-1). These are useful if a protocol needs an always-high or always-low bit in the output that does not depend on the input data.

Note that some sources cannot be accessed at the same time. Specifically, a given instruction cannot source data from both the high 32 bits of the input FIFO source register as well as the counter registers. When data is read from the LUT, for a LUT that is set to a width of N, the top N bits of both the input FIFO register as well as the top N bits of the counter register become unavailable.

### 54.3.2 Control Path

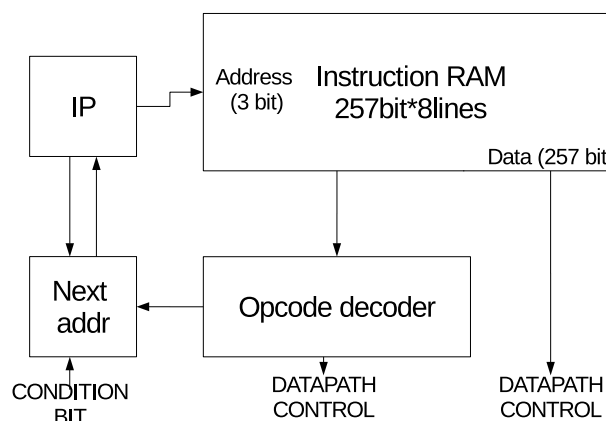

Figure 54.3-2. BitScrambler Control Path Diagram

The BitScrambler behavior is governed by a program stored in program RAM. The program RAM has space for up to eight instructions, each being 257 bits in size. An instruction configures the data path for the clock cycle the instruction runs in, as well as contains opcodes that control program flow.

A BitScrambler program is similar to a microprocessor program, in that each cycle the BitScrambler will execute the next instruction in instruction memory, unless the opcode tells it to specifically jump to another location.

Concretely, this behaviour is implemented using an instruction pointer (IP, see Figure 54.3-2), which points to the currently executing instruction. Opcodes can also affect the counter registers.

The bits of the instruction that configure the data path consist of settings for the 32 muxes, as well as some bits to select the availability of the counter bits or LUT output. It also can put the muxes into relative mode, where if they get a bit from the DMA FIFO, the position of that bit is offset by counter B.

## 54.4 Functional Description

The BitScrambler is a flexible device, with its behavior controlled by the program loaded into it as well as the configuration registers that set several global BitScrambler behaviors as well. As such, a BitScrambler program consists of the contents of the 257-bit x 8 instruction RAM as well as the settings for various configuration registers. Both are described below.

### 54.4.1 Instructions

The 257 bits that make up an instruction are structured as shown in Table 54.4-1.

**Table 54.4-1. Instruction Structure**

| Bit       | Field          | Bit       | Field           |
|-----------|----------------|-----------|-----------------|
| 0 - 6     | CTL_MUX_SEL_0  | 133 - 139 | CTL_MUX_SEL_19  |
| 7 - 13    | CTL_MUX_SEL_1  | 140 - 146 | CTL_MUX_SEL_20  |
| 14 - 20   | CTL_MUX_SEL_2  | 147 - 153 | CTL_MUX_SEL_21  |
| 21 - 27   | CTL_MUX_SEL_3  | 154 - 160 | CTL_MUX_SEL_22  |
| 28 - 34   | CTL_MUX_SEL_4  | 161 - 167 | CTL_MUX_SEL_23  |
| 35 - 41   | CTL_MUX_SEL_5  | 168 - 174 | CTL_MUX_SEL_24  |
| 42 - 48   | CTL_MUX_SEL_6  | 175 - 181 | CTL_MUX_SEL_25  |
| 49 - 55   | CTL_MUX_SEL_7  | 182 - 188 | CTL_MUX_SEL_26  |
| 56 - 62   | CTL_MUX_SEL_8  | 189 - 195 | CTL_MUX_SEL_27  |
| 63 - 69   | CTL_MUX_SEL_9  | 196 - 202 | CTL_MUX_SEL_28  |
| 70 - 76   | CTL_MUX_SEL_10 | 203 - 209 | CTL_MUX_SEL_29  |
| 77 - 83   | CTL_MUX_SEL_11 | 210 - 216 | CTL_MUX_SEL_30  |
| 84 - 90   | CTL_MUX_SEL_12 | 217 - 223 | CTL_MUX_SEL_31  |
| 91 - 97   | CTL_MUX_SEL_13 | 224 - 249 | OPCODE          |
| 98 - 104  | CTL_MUX_SEL_14 | 250 - 251 | CTL_READ_IN     |
| 105 - 111 | CTL_MUX_SEL_15 | 252 - 253 | CTL_WR_OUT      |
| 112 - 118 | CTL_MUX_SEL_16 | 254       | CTL_MUX_REL     |
| 119 - 125 | CTL_MUX_SEL_17 | 255       | CTL_CTR_SRC_SEL |
| 126 - 132 | CTL_MUX_SEL_18 | 256       | CTL_LUT_SRC_SEL |

The meanings of these fields are as follows:

- CTL\_MUX\_SEL\_n: This 7-bit field selects the source of bit n in the output register. See Table 54.4-3 for details.
- OPCODE: These bits encode an opcode. For the bit pattern of this field, please refer to Table 54.4-4.

- CTL\_READ\_IN: This selects the number of bits that are read from the input FIFO at the end of the instruction:
  - 0: Do not read any data
  - 1: Read 8 bits
  - 2: Read 16 bits
  - 3: Read 32 bits
- CTL\_WR\_OUT: This selects the number of bits that are written from the output register to the output FIFO at the end of the instruction:
  - 0: Do not write any data
  - 1: Write 8 bits
  - 2: Write 16 bits
  - 3: Write 32 bits
- CTL\_MUX\_REL, CTL\_CTR\_SRC\_SEL and CTR\_LUT\_SRC\_SEL: Select which bits are available to select using the CTL\_MUX\_SEL bits.
  - CTRL\_CTR\_SRC\_SEL (Control Counter Source Select) makes the bits from counter A and B available
  - CTL\_LUT\_SRC\_SEL (Control LUT Source Select) makes the output value of the LUT RAM available. See Table 54.4-3 for details.
  - When CTL\_MUX\_REL (Control Mux Relative) is 1, the BitScrambler applies the value of counter A as an offset to any CTL\_MUX\_SEL\_n value that is 63 or below. The exact behaviour depends on CTR\_SRC\_SEL, as detailed in Table 54.4-2.

**Table 54.4-2. Effective CTL\_MUX\_SEL\_n values when CTL\_MUX\_REL is 1**

| Condition  | Effective value of CTL_MUX_SEL     |
|--|------------------------------------|
| CTL_MUX_SEL_n >= 64                              | CTL_MUX_SEL (unchanged)            |
| CTL_MUX_SEL_n < 64 and CTL_CTR_SRC_SEL = 0       | (CTL_MUX_SEL_n + CTRA) & 63        |
| CTL_MUX_SEL_n < 31 and CTL_CTR_SRC_SEL = 1       | (CTL_MUX_SEL_n + CTRA) & 31        |
| 32 <= CTL_MUX_SEL_n < 64 and CTL_CTR_SRC_SEL = 1 | ((CTL_MUX_SEL_n + CTRA) & 31) + 32 |

Of these fields, most are data path configuration items. The field that affects the control path is OPCODE, although CTL\_MUX\_REL, CTL\_CTR\_SRC\_SEL, and CTR\_LUT\_SRC\_SEL may influence how some of the opcodes work by adjusting the source selection for the IF/IFN opcodes.

CTL\_MUX\_SEL\_n: These fields, one for each bit in the output register, select the source for that particular bit. The specific bit chosen is partially dependent on the settings of the CTL\_MUX\_REL, CTL\_CTR\_SRC\_SEL and CTR\_LUT\_SRC\_SEL. Given CTL\_MUX\_SRC\_n has value N, the bit is selected as described in Table 54.4-3. Note that the source selection for IF/IFN opcodes is affected in the same way.

Table 54.4-3. CTL\_MUX\_SEL Values

| Bit    | Description   |
|--------|---|
| 0-31   | The bit is sourced from bit N in the incoming FIFO register.  |
| 32-63  | The source of the bit depends on the setting of CTL_CTR_SRC_SEL and CTL_LUT_SRC_SEL:<br>If CTL_CTR_SRC_SEL = 0: the bit is sourced from bit N in the incoming FIFO register.<br>If CTL_CTR_SRC_SEL = 1: the bit is sourced from bit (N-32) of the counter registers. Specifically, if N is 32 to 47, the bit is sourced from bit (N-32) of counter A and if N is 48 to 63, the bit is sourced from bit (N-48) of counter B.<br>If CTL_LUT_SRC_SEL = 1: Depending on the width of the LUT (8, 16, or 32 bits), a read of the top 8, 16, or 32 bits will return data from the LUT rather than what CTL_CTR_SRC_SEL selects. Specifically, given a LUT width of N, 63 will return LUT output bit (N-1), 62 will return LUT output bit (N-2) and so on. |
| 64     | CounterB[7:0] =< last[7:0]  |
| 65     | CounterB[7:0] > last[7:0]   |
| 66     | CounterB[7:0] = last[7:0]   |
| 67     | CounterB[7:0] =< last[15:8]   |
| 68     | CounterB[7:0] > last[15:8]  |
| 69     | CounterB[7:0] = last[15:8]  |
| 70     | CounterB[7:0] =< last[23:16]  |
| 71     | CounterB[7:0] > last[23:16]   |
| 72     | CounterB[7:0] = last[23:16]   |
| 73     | CounterB[7:0] =< last[31:24]  |
| 74     | CounterB[7:0] > last[31:24]   |
| 75     | CounterB[7:0] = last[31:24]   |
| 76     | CounterB[15:8] =< last[7:0]   |
| 77     | CounterB[15:8] > last[7:0]  |
| 78     | CounterB[15:8] = last[7:0]  |
| 79     | CounterB[15:8] =< last[15:8]  |
| 80     | CounterB[15:8] > last[15:8]   |
| 81     | CounterB[15:8] = last[15:8]   |
| 82     | CounterB[15:8] =< last[23:16]   |
| 83     | CounterB[15:8] > last[23:16]  |
| 84     | CounterB[15:8] = last[23:16]  |
| 85     | CounterB[15:8] =< last[31:24]   |
| 86     | CounterB[15:8] > last[31:24]  |
| 87     | CounterB[15:8] = last[31:24]  |
| 88     | CounterB[15:0] =< last[15:0]  |
| 89     | CounterB[15:0] > last[15:0]   |
| 90     | CounterB[15:0] = last[15:0]   |
| 91     | CounterB[15:0] =< last[31:16]   |
| 92     | CounterB[15:0] > last[31:16]  |
| 93     | CounterB[15:0] = last[31:16]  |
| 94     | Always 0  |
| 95     | Always 1  |
| 96-127 | The bits selected here are the same as the bits on the output register at the end of the previous cycle.  |

The BitScrambler recognizes six opcodes, which are encoded in the opcode fields as shown in Table 54.4-4.

**Table 54.4-4. Instruction Opcode**

| Bit   | 25 | 24 | 23  | 22 | 21 | 20      | 19 | 18 | 17 | 16 | 15      | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6   | 5 | 4       | 3 | 2 | 1 | 0 |
|-------|----|----|-----|----|----|---------|----|----|----|----|---------|----|----|----|----|----|---|---|---|-----|---|---------|---|---|---|---|
| LOOP  | 1  | c  | tgt |    |    | end_val |    |    |    |    |         |    |    |    |    |    |   |   |   |     |   | ctr_add |   |   |   |   |
| ADD   | 0  | c  | h   | l  | 0  | 0       | 0  | 0  | 0  | 0  | ctr_add |    |    |    |    |    |   |   |   |     |   |         |   |   |   |   |
| IF    | 0  | 0  | tgt |    |    | 0       | 0  | 0  | 0  | 1  | 0       | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | src |   |         |   |   |   |   |
| IFN   | 0  | 0  | tgt |    |    | 0       | 0  | 0  | 1  | 0  | 0       | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | src |   |         |   |   |   |   |
| LDCTD | 0  | c  | h   | l  | 0  | 0       | 0  | 0  | 1  | 1  | ctr_set |    |    |    |    |    |   |   |   |     |   |         |   |   |   |   |
| LDCTI | 0  | c  | h   | l  | 0  | 0       | 0  | 1  | 0  | 0  | 0       | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0   | 0 | 0       | 0 | 0 | 0 | 0 |

The fields are defined as follows:

- c: Configures which counter to use.
  - 0: counter A
  - 1: counter B
- end\_val, ctr\_add, ctr\_set: 16-bit (or 5-bit) value. Please refer to the instruction descriptions below for the meanings of these fields.
- tgt: The location of an instruction. Range: 0 ~ 7.
- h: 1 if the upper 8 bits need to be written back to a counter.
- l: 1 if the lower 8 bits need to be written back to a counter.

Note that if an opcode does not specify H or L, it is assumed that the full 16 bits need to be written back and the h and l bits will both be 1.

These six opcodes affect the state of the BitScrambler as follows:

**Table 54.4-5. LOOP Opcode**

| LOOPc end_val, ctr_add, tgt  |   |
|--|---|
| Loop on counter indicated by c, add ctr_add to the counter, and loop back to tgt until the counter reaches end_val. When that happens, reset the counter and fall through. |   |
| Argument   | c: Either A or B, indicates counter to use<br>tgt: 3-bit target instruction addresses<br>end_val: 16-bit value to compare the counter to<br>ctr_add: 5-bit signed value to add to the counter |
| Pseudo-code  | <pre> if ((unsigned)ctrC &lt; end_val) begin     IP &lt;= tgt     ctr_c &lt;= ctr_c + sign_extend(ctr_add) end else begin     IP &lt;= IP + 1     ctr_c &lt;= 0 end           </pre>          |

Table 54.4-6. ADD Opcode

| ADDc[H L] ctr_add  |   |
|--|---|
| Add immediate value to counter indicated by c, and optionally write back only upper or lower 8 bits. |   |
| Argument   | <p>c: Either A or B, indicate counter to use</p> <p>ctr_add: 16-bit value to add to counter</p> <p>If opcode is ADDcH, only most significant 8 bits are written back</p> <p>If opcode is ADDcL, only least-significant 8 bits are written back</p> <p>If opcode is ADDc, all 16 bits will be written back (h=1, l=1).</p> |
| Pseudo-code  | <pre> tmp &lt;= ctr_c + ctr_add if (h) begin     ctr_c[15:8] &lt;= tmp[15:8] end if (l) begin     ctr_c[7:0] &lt;= tmp[7:0] end IP &lt;= IP + 1 </pre>  |
| Note   | The NOP (no operation) pseudo-op is encoded as 'ADDA 0'.  |

Table 54.4-7. IF Opcode

| IF ctl_cond_src, tgt                                   |  |
|--|--|
| Jump to target if the indicated mux source bit is set. |  |
| Argument   | <p>ctl_cond_src: Mux source (see <a href="#">CTR_MUX_SRC sources</a>)</p> <p>tgt: 3-bit target instruction addresses</p> |
| Pseudo-code  | <pre> if (ctl_cond_src) begin     IP &lt;= tgt end else begin     IP &lt;= IP + 1 end </pre>                             |
| Note   | The JMP (always jump) pseudo-op is implemented as an 'IF 95,tgt' opcode, using the always-1 bit from the AUX bits.       |

Table 54.4-8. IFN Opcode

| IFN ctl_cond_src, tgt  |  |
|--|--|
| Jump to target if the indicated mux source bit is NOT set (note: same as IF but condition is negated). |  |
| Argument   | <p>ctl_cond_src: Mux source (see <a href="#">CTR_MUX_SRC sources</a>)</p> <p>tgt: 3-bit target instruction addresses</p> |
| Pseudo-code  | <pre> if (ctl_cond_src) begin     IP &lt;= IP + 1 end else begin     IP &lt;= tgt end </pre>                             |

**Table 54.4-9. LDCTD Opcode**

| LDCTDc[H L] ctr_set   |  |
|---|--|
| Load counter direct (from immediate), and optionally only load high or low 8 bits of counter. |  |
| Argument  | c: Either A or B, indicate counter to use<br>ctr_set: 16-bit value to set the counter to<br>h: If opcode is LDCTDcH, only most significant 8 bits are set<br>l: If opcode is LDCTDcL, only least-significant 8 bits are set<br>If opcode is LDCTDc, all 16 bits are set (h=1, l=1) |
| Pseudo-code   | <pre> if (h) begin     ctr_c[15:8] &lt;= ctr_set[15:8] end if (l) begin     ctr_c[7:0] &lt;= ctr_set[7:0] end IP &lt;= IP + 1 </pre>   |

**Table 54.4-10. LDCTI Opcode**

| LDCTIc[H L]  |   |
|--|---|
| Load counter indirect (from most significant 16 bits of mux output), and optionally only load high or low 8 bits of counter. |   |
| Argument   | c: Either A or B, indicate counter to use<br>h: If opcode is LDCTIcH, only the most significant 8 bits are set<br>l: If opcode is LDCTIcL, only the least significant 8 bits are set<br>If opcode is LDCTIc, all 16 bits are set (h=1, l=1) |
| Pseudo-code  | <pre> if (h) begin     ctr_c[15:8] &lt;= mux_out[31:24] end if (l) begin     ctr_c[7:0] &lt;= mux_out[23:16] end IP &lt;= IP + 1 </pre>   |

## 54.4.2 Configuration Registers

The BitScrambler is configured using a set of registers. Specifically, these registers are used to write a program into BitScrambler, write its LUT RAM, configure its behaviour, and start and stop BitScrambler operation. They are also used to attach a BitScrambler to a peripheral DMA path.

The ESP32-P4 has two BitScramblers: one can be placed in the TX path (where data is sent from the memory to a peripheral) while the other can be placed in a RX path (where data is sent from the peripheral to memory). The configuration registers for the two BitScramblers are the same, with the only difference being the TX path BitScrambler registers are prefixed by BITSCRAMBLER\_TX\_ while the RX path BitScrambler uses BITSCRAMBLER\_RX\_ prefixes.

**Note:**

For convenience, in this section we will refer to the TX path BitScrambler only; to get the RX path BitScrambler descriptions, simply swap the prefixes.

When modifying the input or output of a peripheral, the BitScrambler needs to be attached to the DMA path of that peripheral. To do this, write the appropriate value for the peripheral into the `HP_SYSTEM_BITSCRAMBLER_PERI_TX_SEL` or `HP_SYSTEM_BITSCRAMBLER_PERI_RX_SEL` field of the `HP_SYSTEM_BITSCRAMBLER_PERI_SEL_REG` register.

The BitScrambler can also run in memory-to-memory mode. For this, the `BITSCRAMBLER_LOOP_MODE` bit in `BITSCRAMBLER_SYS_REG` needs to be set to one. In this mode, the TX BitScrambler is put into loopback mode while the RX BitScrambler is unused and unavailable. The BitScrambler still needs to be attached to a peripheral (although the peripheral does not need to be configured); the DMA path for this peripheral will be unusable.

Neither the program memory nor the LUT RAM are accessible to the main processor directly. Rather, they need to be written indirectly, by setting an address in one register and then writing the data in a second register.

Specifically, for the LUT RAM, the address is written in the `BITSCRAMBLER_TX_LUT_IDX` field of `BITSCRAMBLER_TX_LUT_CFG0_REG` and the data is written to or read from `BITSCRAMBLER_TX_LUT_CFG1_REG`. The width of the LUT, as visible to the BitScrambler, can be configured using the `BITSCRAMBLER_TX_LUT_MODE` field. Note that regardless of the width the LUT is configured to have on the BitScrambler side, the main processor always writes the memory in 32-bit wide words.

Similarly, the instruction memory is written by setting the address up in `BITSCRAMBLER_TX_INST_CFG0_REG` and writing the data to or reading it from `BITSCRAMBLER_TX_INST_CFG1_REG`. As the BitScrambler instructions are 257 bits, one instruction needs to be written as 9 32-bit words (with the 257th bit being in the LSB of the 9th word). To achieve that purpose, the `BITSCRAMBLER_TX_INST_CFG0_REG` register is divided into two fields. The position of the instruction is written into the `BITSCRAMBLER_TX_INST_IDX` field while the word offset within the instruction is written to `BITSCRAMBLER_TX_INST_POS`.

As the BitScrambler has the ability to generate more or less data than it gets on the input, a BitScrambler-controlled DMA stream can end in one or two ways. The first is that the receiver (either memory in case of the RX BitScrambler, or the peripheral in case of the TX BitScrambler) stops accepting data because it is configured to only receive a limited number of bytes. This case is pretty simple: the BitScrambler will simply halt as it cannot write any more data. The other way is that the transmitter (the peripheral for the RX BitScrambler and the memory for the TX BitScrambler) stops sending data. This is a more complicated situation, as the BitScrambler may or may not be processing some data that needs to be written to the output.

In order to allow the BitScrambler to send out the data it is still processing, two methods have been devised to handle a certain amount of data after the input data stream has ended. Both depend on setting `BITSCRAMBLER_RX_TAILING_BITS_REG` to a certain value N:

- EOF-on-N-reads: After the input data stream ends, the BitScrambler reads N dummy bytes from the input. The value of these bytes is zero. After the Nth byte is read, the BitScrambler halts and the DMA stream ends.
- EOF-on-N-writes: After the input data stream ends, the BitScrambler is allowed to write N more bytes to

the output. During this time, any reads on the input stream return zero-value dummy bytes. After the N'th byte is written, the BitScrambler halts and the DMA stream ends.

To configure either mode, set the option bits as follows:

**Table 54.4-11. Settings for EOF modes**

| Register                                   | EOF-on-N-reads | EOF-on-N-writes |
|--|----------------|-----------------|
| <a href="#">BITSCRAMBLER_TX_RD_DUMMY</a>   | 1              | 1               |
| <a href="#">BITSCRAMBLER_TX_FETCH_MODE</a> | 0              | 0               |
| <a href="#">BITSCRAMBLER_TX_EOF_MODE</a>   | 1              | 0               |
| <a href="#">BITSCRAMBLER_TX_HALT_MODE</a>  | 1              | 1               |

## 54.5 Programming Procedures

Note that these instructions are written for a TX BitScrambler, which is in the memory-to-peripheral path, or memory-to-memory path if in loopback mode. For the peripheral-to-memory path, the RX BitScrambler is used. Unless otherwise indicated, you can exchange "TX" for "RX" in these instructions to configure the RX BitScrambler.

1. Attach the BitScrambler to a peripheral by configuring [HP\\_SYSTEM\\_BITSCRAMBLER\\_PERI\\_TX\\_SEL](#) field in [HP\\_SYSTEM\\_BITSCRAMBLER\\_PERI\\_SEL\\_REG](#) register. Note that this step is required even in loopback mode.
2. Enable the BitScrambler by setting the [BITSCRAMBLER\\_TX\\_ENA](#) field in the [BITSCRAMBLER\\_TX\\_CTRL\\_REG](#) register.
3. Configure loopback mode if required. If loopback mode is needed, set [BITSCRAMBLER\\_LOOP\\_MODE](#) in the [BITSCRAMBLER\\_SYS\\_REG](#) register. Otherwise, clear it.
4. Load program into BitScrambler. For each instruction and each 32-bit word within the instruction, set the [BITSCRAMBLER\\_TX\\_INST\\_IDX](#) and [BITSCRAMBLER\\_TX\\_INST\\_POS](#) fields in the [BITSCRAMBLER\\_TX\\_INST\\_CFG0\\_REG](#) register, then write the word in the [BITSCRAMBLER\\_TX\\_INST\\_CFG1\\_REG](#) register. Note that the 257'th bit is written as bit 0 into [BITSCRAMBLER\\_TX\\_INST\\_CFG1\\_REG](#).
5. Load LUT into BitScrambler, if needed. Similar to loading the program, the LUT is loaded in 32-bit words by first writing the word address to the [BITSCRAMBLER\\_TX\\_LUT\\_CFG0\\_REG](#) and then writing the word itself to [BITSCRAMBLER\\_TX\\_LUT\\_CFG1\\_REG](#). After loading the LUT, configure its width by setting [BITSCRAMBLER\\_TX\\_LUT\\_MODE](#) in [BITSCRAMBLER\\_TX\\_LUT\\_CFG0\\_REG](#).
6. Configure BitScrambler. Dependent on what the BitScrambler program expects, you may need to set or clear the various bits in the [BITSCRAMBLER\\_TX\\_CTRL\\_REG](#) register. You may also need to set [BITSCRAMBLER\\_TX\\_TAILING\\_BITS\\_REG](#) to an applicable value.
7. Start the BitScrambler by clearing the [BITSCRAMBLER\\_TX\\_HALT](#) bit in the [BITSCRAMBLER\\_TX\\_CTRL\\_REG](#) register.
8. Start DMA transaction. Please refer to Chapter 3 *GDMA Controller (GDMA-AHB, GDMA-AXI)* for more information about DMA subsystem and refer to the peripheral chapter if loopback mode is not used.
9. Wait until DMA transaction is done.

10. Halt the BitScrambler by setting the [BITSCRAMBLER\\_TX\\_HALT](#) in the [BITSCRAMBLER\\_TX\\_CTRL\\_REG](#) register.
11. Wait for halt state. The BitScrambler is halted when the [BITSCRAMBLER\\_TX\\_IN\\_IDLE](#) bit in the [BITSCRAMBLER\\_TX\\_STATE\\_REG](#) register is set.
12. Reset the FIFO by writing a 1 and then a 0 to the [BITSCRAMBLER\\_TX\\_FIFO\\_RST](#) bit in the [BITSCRAMBLER\\_TX\\_CTRL\\_REG](#) register.
13. The BitScrambler is ready for a new transaction with the current program and LUT configuration. Simply start from step 7 to do this.

## 54.6 Register Summary

The addresses in this section are relative to the Bit-scrambler base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name   | Description  | Address | Access |
|--|--|---------|--------|
| <b>Control and configuration registers</b>       |  |         |        |
| <a href="#">BITSCRAMBLER_TX_INST_CFG0_REG</a>    | BitScrambler TX core instruction memory address selection register | 0x0000  | R/W    |
| <a href="#">BITSCRAMBLER_TX_INST_CFG1_REG</a>    | BitScrambler TX core instruction memory access register            | 0x0004  | R/W    |
| <a href="#">BITSCRAMBLER_RX_INST_CFG0_REG</a>    | BitScrambler RX core instruction memory address selection register | 0x0008  | R/W    |
| <a href="#">BITSCRAMBLER_RX_INST_CFG1_REG</a>    | BitScrambler RX core instruction memory access register            | 0x000C  | R/W    |
| <a href="#">BITSCRAMBLER_TX_LUT_CFG0_REG</a>     | BitScrambler TX core LUT memory address selection register         | 0x0010  | R/W    |
| <a href="#">BITSCRAMBLER_TX_LUT_CFG1_REG</a>     | BitScrambler TX core LUT memory access register                    | 0x0014  | R/W    |
| <a href="#">BITSCRAMBLER_RX_LUT_CFG0_REG</a>     | BitScrambler RX core LUT memory address selection register         | 0x0018  | R/W    |
| <a href="#">BITSCRAMBLER_RX_LUT_CFG1_REG</a>     | BitScrambler RX core LUT memory access register                    | 0x001C  | R/W    |
| <b>Configuration registers</b>                   |  |         |        |
| <a href="#">BITSCRAMBLER_TX_TAILING_BITS_REG</a> | BitScrambler TX core extra data length register                    | 0x0020  | R/W    |
| <a href="#">BITSCRAMBLER_RX_TAILING_BITS_REG</a> | BitScrambler RX core extra data length register                    | 0x0024  | R/W    |
| <a href="#">BITSCRAMBLER_TX_CTRL_REG</a>         | BitScrambler TX core control register                              | 0x0028  | varies |
| <a href="#">BITSCRAMBLER_RX_CTRL_REG</a>         | BitScrambler RX core control register                              | 0x002C  | varies |
| <a href="#">BITSCRAMBLER_SYS_REG</a>             | Loopback control register  | 0x00F8  | R/W    |
| <b>Status registers</b>                          |  |         |        |
| <a href="#">BITSCRAMBLER_TX_STATE_REG</a>        | BitScrambler TX core status register                               | 0x0030  | varies |
| <a href="#">BITSCRAMBLER_RX_STATE_REG</a>        | BitScrambler RX core status register                               | 0x0034  | varies |
| <b>Version register</b>                          |  |         |        |
| <a href="#">BITSCRAMBLER_VERSION_REG</a>         | Version control register   | 0x00FC  | R/W    |

## 54.7 Registers

The addresses in this section are relative to the Bit-scrambler base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

Register 54.1. BITSCRAMBLER\_TX\_INST\_CFG0\_REG (0x0000)

**BITSCRAMBLER\_TX\_INST\_IDX** Configures the index of the BitScrambler instruction to be accessed via [BITSCRAMBLER\\_TX\\_INST\\_CFG1\\_REG](#). (R/W)

**BITSCRAMBLER\_TX\_INST\_POS** Configures the offset into the 257-bit BitScrambler instruction (in 32-bit increments) to be accessed via [BITSCRAMBLER\\_TX\\_INST\\_CFG1\\_REG](#). (R/W)

Register 54.2. BITSCRAMBLER\_TX\_INST\_CFG1\_REG (0x0004)

**BITSCRAMBLER\_TX\_INST** Configures the instruction to be accessed at the address specified by [BITSCRAMBLER\\_TX\\_INST\\_CFG0\\_REG](#). (R/W)

Register 54.3. BITSCRAMBLER\_RX\_INST\_CFG0\_REG (0x0008)

- BITSCRAMBLER\_RX\_INST\_IDX** Configures the index of the BitScrambler instruction to be accessed via [BITSCRAMBLER\\_RX\\_INST\\_CFG1\\_REG](#). (R/W)
- BITSCRAMBLER\_RX\_INST\_POS** Configures the offset into the 257-bit BitScrambler instruction (in 32-bit increments) to be accessed via [BITSCRAMBLER\\_RX\\_INST\\_CFG1\\_REG](#). (R/W)

Register 54.4. BITSCRAMBLER\_RX\_INST\_CFG1\_REG (0x000C)

- BITSCRAMBLER\_RX\_INST** Configures the instruction to be accessed at the address specified by [BITSCRAMBLER\\_RX\\_INST\\_CFG0\\_REG](#). (R/W)

Register 54.5. BITSCRAMBLER\_TX\_LUT\_CFG0\_REG (0x0010)

**BITSCRAMBLER\_TX\_LUT\_IDX** Configures the position (in 32-bit increments) into LUT RAM to be accessed via [BITSCRAMBLER\\_TX\\_LUT\\_CFG1\\_REG](#). (R/W)

**BITSCRAMBLER\_TX\_LUT\_MODE** Configures the word size of LUT RAM for Bitscrambler programs.

- 0: 1 Byte
- 1: 2 Bytes
- 2: 4 Bytes
- 3: Reserved

(R/W)

Register 54.6. BITSCRAMBLER\_TX\_LUT\_CFG1\_REG (0x0014)

**BITSCRAMBLER\_TX\_LUT** Configures the LUT entry to be accessed at the position specified by [BITSCRAMBLER\\_TX\\_LUT\\_CFG0\\_REG](#). (R/W)

Register 54.7. BITSCRAMBLER\_RX\_LUT\_CFG0\_REG (0x0018)

**BITSCRAMBLER\_RX\_LUT\_IDX** Configures the position (in 32-bit increments) into LUT RAM to be accessed via [BITSCRAMBLER\\_RX\\_LUT\\_CFG1\\_REG](#). (R/W)

**BITSCRAMBLER\_RX\_LUT\_MODE** Configures the word size of LUT RAM for BitScrambler programs.

- 0: 1 byte
- 1: 2 bytes
- 2: 4 bytes
- 3: Reserved

(R/W)

Register 54.8. BITSCRAMBLER\_RX\_LUT\_CFG1\_REG (0x001C)

**BITSCRAMBLER\_RX\_LUT** Configures the LUT entry to be accessed at the position specified by [BITSCRAMBLER\\_RX\\_LUT\\_CFG0\\_REG](#). (R/W)

Register 54.9. BITSCRAMBLER\_TX\_TAILING\_BITS\_REG (0x0020)

**BITSCRAMBLER\_TX\_TAILING\_BITS** Configures the length of extra data after getting EOF for the TX BitScrambler core. Measurement unit: bit. (R/W)

Register 54.10. BITSCRAMBLER\_RX\_TAILING\_BITS\_REG (0x0024)

**BITSCRAMBLER\_RX\_TAILING\_BITS** Configures the length of extra data after getting EOF for the BitScrambler RX core. Measurement unit: bit. (R/W)

## Register 54.11. BITSCRAMBLER\_TX\_CTRL\_REG (0x0028)

**BITSCRAMBLER\_TX\_ENA** Configures whether to enable BitScrambler TX core.

0: Disable

1: Enable

(R/W)

**BITSCRAMBLER\_TX\_PAUSE** Configures whether to pause BitScrambler TX core. A paused core can be un-paused to resume execution.

0: Not pause

1: Pause

(R/W)

**BITSCRAMBLER\_TX\_HALT** Configures whether to halt BitScrambler TX core. Halting the BitScrambler TX core will flush the FIFOs and cannot be resumed; a FIFO reset and a restart is needed.

0: Not halt

1: Halt (R/W)

**BITSCRAMBLER\_TX\_EOF\_MODE** Configures BitScrambler TX core EOF signal generating mode.

This is combined with [BITSCRAMBLER\\_TX\\_TAILING\\_BITS](#) for use.

0: Data written to the output FIFO are counted to generate delayed EOF

1: Data read from the input FIFO are counted to generate delayed EOF

(R/W)

**BITSCRAMBLER\_TX\_COND\_MODE** Configures BitScrambler TX LOOP instruction condition mode.

0: Use the less than operator to get the condition

1: Use not equal operator to get the condition

(R/W)

**BITSCRAMBLER\_TX\_FETCH\_MODE** Configures BitScrambler TX core fetch instruction mode.

0: Prefetch by reset

1: Fetch by instructions

(R/W)

**BITSCRAMBLER\_TX\_HALT\_MODE** Configures BitScrambler TX core halt mode when [BITSCRAMBLER\\_TX\\_HALT](#) is set

0: Wait for write data back done

1: Ignore write data back

(R/W)

Continued on the next page...

**Register 54.11. BITSCRAMBLER\_TX\_CTRL\_REG (0x0028)**

Continued from the previous page...

**BITSCRAMBLER\_TX\_RD\_DUMMY** Configures BitScrambler TX core read data mode when EOF received.

0: Wait read data

1: Ignore read data

(R/W)

**BITSCRAMBLER\_TX\_FIFO\_RST** Configures whether to reset BitScrambler TX FIFO.

0: Not reset

1: Reset

(WT)

**BITSCRAMBLER\_RX\_ENA** Configures whether to enable BitScrambler RX core.

0: Disable

1: Enable

(R/W)

**BITSCRAMBLER\_RX\_PAUSE** Configures whether to pause BitScrambler RX core. A paused core can be un-paused to resume execution.

0: Not pause

1: Pause

(R/W)

**BITSCRAMBLER\_RX\_HALT** Configures whether to halt BitScrambler RX core. Halting the BitScrambler RX core will flush the FIFOs and cannot be resumed; a FIFO reset and a restart is needed.

0: Not halt

1: Halt

(R/W)

**BITSCRAMBLER\_RX\_EOF\_MODE** Configures BitScrambler RX core EOF signal generating mode.

This is combined with [BITSCRAMBLER\\_RX\\_TAILING\\_BITS](#) for use.

0: Data written to the output FIFO are counted to generate delayed EOF

1: Data read from the input FIFO are counted to generate delayed EOF

(R/W)

**BITSCRAMBLER\_RX\_COND\_MODE** Configures BitScrambler RX LOOP instruction condition mode.

0: Use the less than operator to get the condition

1: Use not equal operator to get the condition

(R/W)

**BITSCRAMBLER\_RX\_FETCH\_MODE** Configures BitScrambler RX core fetch instruction mode

0: Prefetch by reset

1: Fetch by instructions

(R/W)

Register 54.12. BITSCRAMBLER\_RX\_CTRL\_REG (0x002C)

Continued from the previous page...

**BITSCRAMBLER\_RX\_HALT\_MODE** Configures BitScrambler RX core halt mode when **BITSCRAMBLER\_RX\_HALT** is set

0: Wait for write data back done

1: Ignore write data back

(R/W)

**BITSCRAMBLER\_RX\_RD\_DUMMY** Configures BitScrambler RX core read data mode when EOF received.

0: Wait read data

1: Ignore read data

(R/W)

**BITSCRAMBLER\_RX\_FIFO\_RST** Configures whether to reset BitScrambler RX FIFO.

0: Not reset

1: Reset

(WT)

## Part VIII

# Analog Signal Processing

This part describes components related to analog-to-digital conversion, voltage comparison, on-chip sensors, and features such as temperature and touch sensing, demonstrating the system's capabilities in handling analog signals.

## Chapter 55

### Touch Sensor (TOUCH)

ESP32-P4 has 14 capacitive touch sensor units, each of which can be connected to an external touch panel via a touch pin (GPIO pin) to constitute a touch sensor system. The ESP32-P4 touch sensor system is mainly used in human-computer interactions to detect finger touch or proximity. It also features moisture resistance and waterproof design.

#### 55.1 Terminology

To better illustrate the functions of capacitive touch sensors, the following terms are used in this section.

|                            |  |
|----------------------------|--|
| <b>Touch Sensor</b>        | Touch-related internal sensing circuitry.  |
| <b>Touch Pin</b>           | Pins with touch sensing feature.   |
| <b>Touch Panel</b>         | The external device connected to touch sensor via channel (touch pin) to detect finger touch.    |
| <b>Touch Sensor System</b> | Capacitive touch sensing system, consisting of touch sensor, touch pin, traces, and touch panel. |

**Note:**

In subsequent description, “touch panel is sampled/scanned/measured” indicates the same action to touch pin, i.e. “touch pin is sampled/scanned/measured”.

#### 55.2 Feature List

The ESP32-P4 touch sensor has the following features:

- Detection of 14 capacitive touch pins
- Sampling triggered by software or dedicated hardware timer
- Two sampling methods:
  - Pulses from the touch pins used as clock signals to count the sampling period
  - Pulses from the touch pins used as digital signals; sample the rising edge of the digital signal with the system clock to count the sampling period
- Scan mode, supporting sequential sampling of multiple touch pins by configuring the Touch FSM.
- Timeout mechanism to monitor channel abnormality
- Frequency hopping to increase the anti-interference of detection
- Proximity sensing mode with up to three configurable channels

- Configuration of individual touch sensors to operate normally in sleep mode
- Wake-up by touch sensor
- Moisture resistance
- Waterproof design

## 55.3 Architectural Overview

### 55.3.1 Touch Panel

A touch panel consists of the following components:

- Electrode: Changes in capacitance when touched by a finger.
- Substrate: The base material on which the protective cover, electrode, and the electrode's connector to the channel are built.
- Protective cover: To physically separate the other components from the external environment.

When developing applications using the touch sensing feature, users should decide on the placement, the material, or the arrangement of the touch panels during mechanical design. For more information about the design guidelines, please refer to [Touch Sensor Application Note](#). Touch panel can be connected to ESP32-P4 touch sensor via touch pin (channel). See Figure 55.3-1.

Figure 55.3-1. Touch Sensor System

When users touch the protective cover, the capacitance of the electrode increases. If the electrode is connected to one of the ESP32-P4 touch sensors via a channel, the touch sensor will be able to detect the electrode's change in capacitance. If the change of capacitance exceeds the configurable threshold, the touch sensor will trigger an interrupt.

### 55.3.2 Capacitive Touch Pin

ESP32-P4 provides 14 capacitive touch pins labeled as T1 ~ T14, each connected to the chip's pin to monitor finger touch from the external environment. The mapping between the touch sensors and the chip pins is shown in Table 55.3-1.

Table 55.3-1. ESP32-P4 Capacitive Touch Pins

| Capacitive Touch Pin | Connected GPIO Pin |
|----------------------|--------------------|
| T1                   | GPIO2              |
| T2                   | GPIO3              |
| T3                   | GPIO4              |
| T4                   | GPIO5              |
| T5                   | GPIO6              |
| T6                   | GPIO7              |
| T7                   | GPIO8              |
| T8                   | GPIO9              |
| T9                   | GPIO10             |
| T10                  | GPIO11             |
| T11                  | GPIO12             |
| T12                  | GPIO13             |
| T13                  | GPIO14             |
| T14                  | GPIO15             |

### 55.3.3 Touch Sensor

The touch sensor charges and discharges the touch pin with a fixed current source, and each charge and discharge generates a pulse signal, the TOUCH\_OUT signal. The touch sensor detects the capacitance change of the touch pin. If the touch pin is touched or approached by a finger, the touch pin's capacitance increases and the charging and discharging time is extended. By measuring the time required for charging and discharging the touch pin a fixed number of times, it can be inferred whether the touch pin has been touched or not.

Figure 55.3-2 illustrates the internal structure of the touch sensors. Each of the touch sensors has a set of input and output signals, some of which are connected to the Touch FSM (see Section 55.4.1). Table 55.3-2 shows the output signals of the touch sensor and their functions.

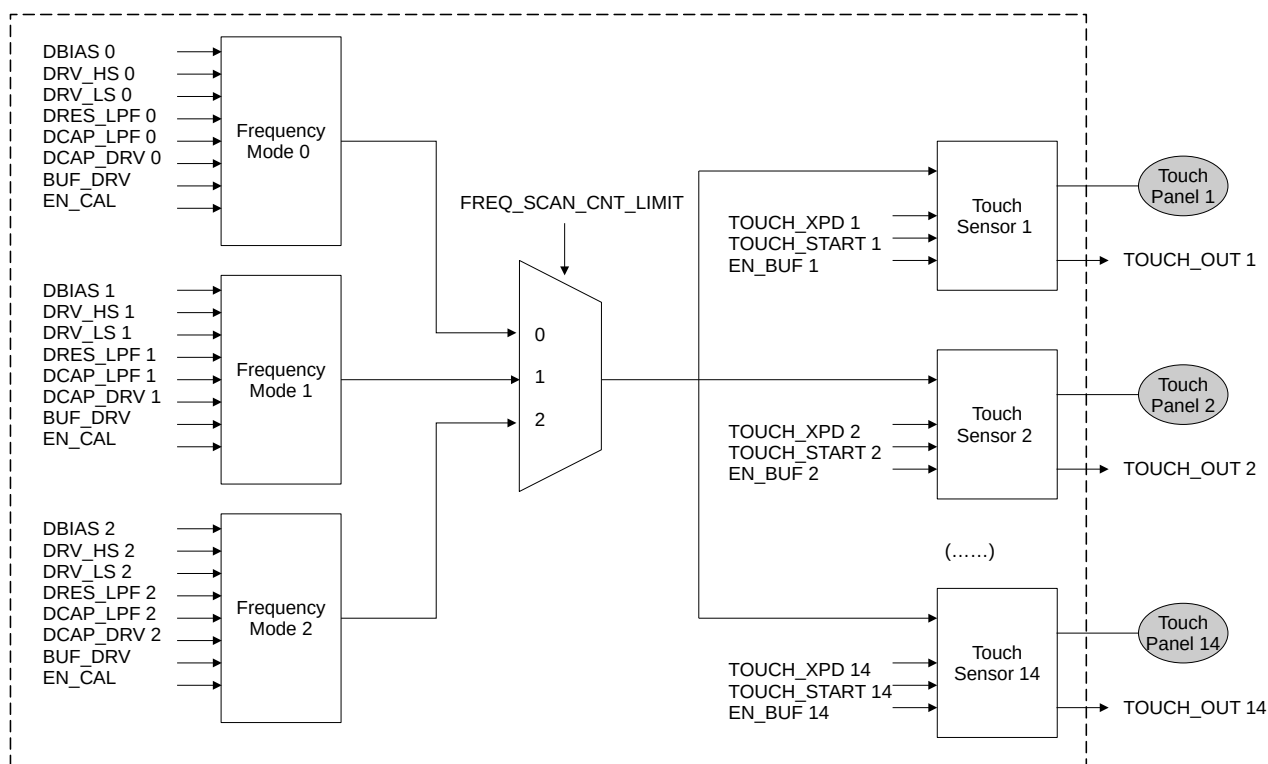

Figure 55.3-2. Touch Sensor Internal Structure

Table 55.3-2. Capacitive Touch Sensor Output Signal

| Signal      | Source    | Function   |
|-------------|-----------|--|
| TOUCH_XPD   | Touch FSM | Controls the power-up and power-down of the touch sensor   |
| TOUCH_START | Touch FSM | Controls the touch sensor to initiate a measurement. The measurement ends when the Touch FSM pulls down the TOUCH_START signal   |
| DBIAS       | Touch FSM | The FSM selects different DBIAS based on the frequency mode to adjust the voltage of the touch sensor's internal LDO, which affects the charging and discharging speed of the touch sensor   |
| DRV_HS      | Touch FSM | The FSM selects different DRV_HS based on the frequency mode to adjust the high-speed driving capability of the touch sensor   |
| DRV_LS      | Touch FSM | The FSM selects different DRV_LS based on the frequency mode to adjust the low-speed driving capability of the touch sensor  |
| DRES_LPF    | Touch FSM | The FSM selects different DRES_LPF based on the frequency mode to adjust the RC low-pass filter, which can be configured as 0 k $\Omega$ , 3 k $\Omega$ , 4.5 k $\Omega$ , or 7.5 k $\Omega$ |
| DCAP_LPF    | Touch FSM | The FSM selects different DCAP_LPF based on the frequency mode to adjust the RC low-pass filter with an adjustment range of 0-2.54 pF and a step of 20 fF                                    |
| DCAP_DRV    | Touch FSM | Used to adjust the internal capacitance connected to touch channels during measurement, usually set to 0   |
| EN_CAL      | Touch FSM | Used to disconnect from the touch pins and to test the capacitance in the touch sensor (the touch panel needs to be disabled)  |

| Signal    | Source       | Function  |
|-----------|--------------|---|
| BUF_DRV   | Touch FSM    | Adjusts the driving capability of TOUCH_BUFF  |
| EN_BUF    | Touch FSM    | Enables TOUCH_BUFF, a software-configurable touch panel, to mitigate the effects of water droplets on the sensor for moisture tolerance |
| TOUCH_OUT | Touch sensor | The Touch FSM counts the pulses in the TOUCH_OUT signal and measures the time it takes to generate N pulses                             |

## 55.4 Functional Description

### 55.4.1 Touch FSM

The Touch FSM performs a measurement by selecting a touch sensor and controlling the necessary signals to and from a touch sensor. Figure 55.4-1 shows the internal structure and operating mechanism of the Touch FSM. The Touch FSM is clocked by LP\_DYN\_FAST\_CLK. For more information on LP\_DYN\_FAST\_CLK, see Chapter 9 *Reset and Clock*.

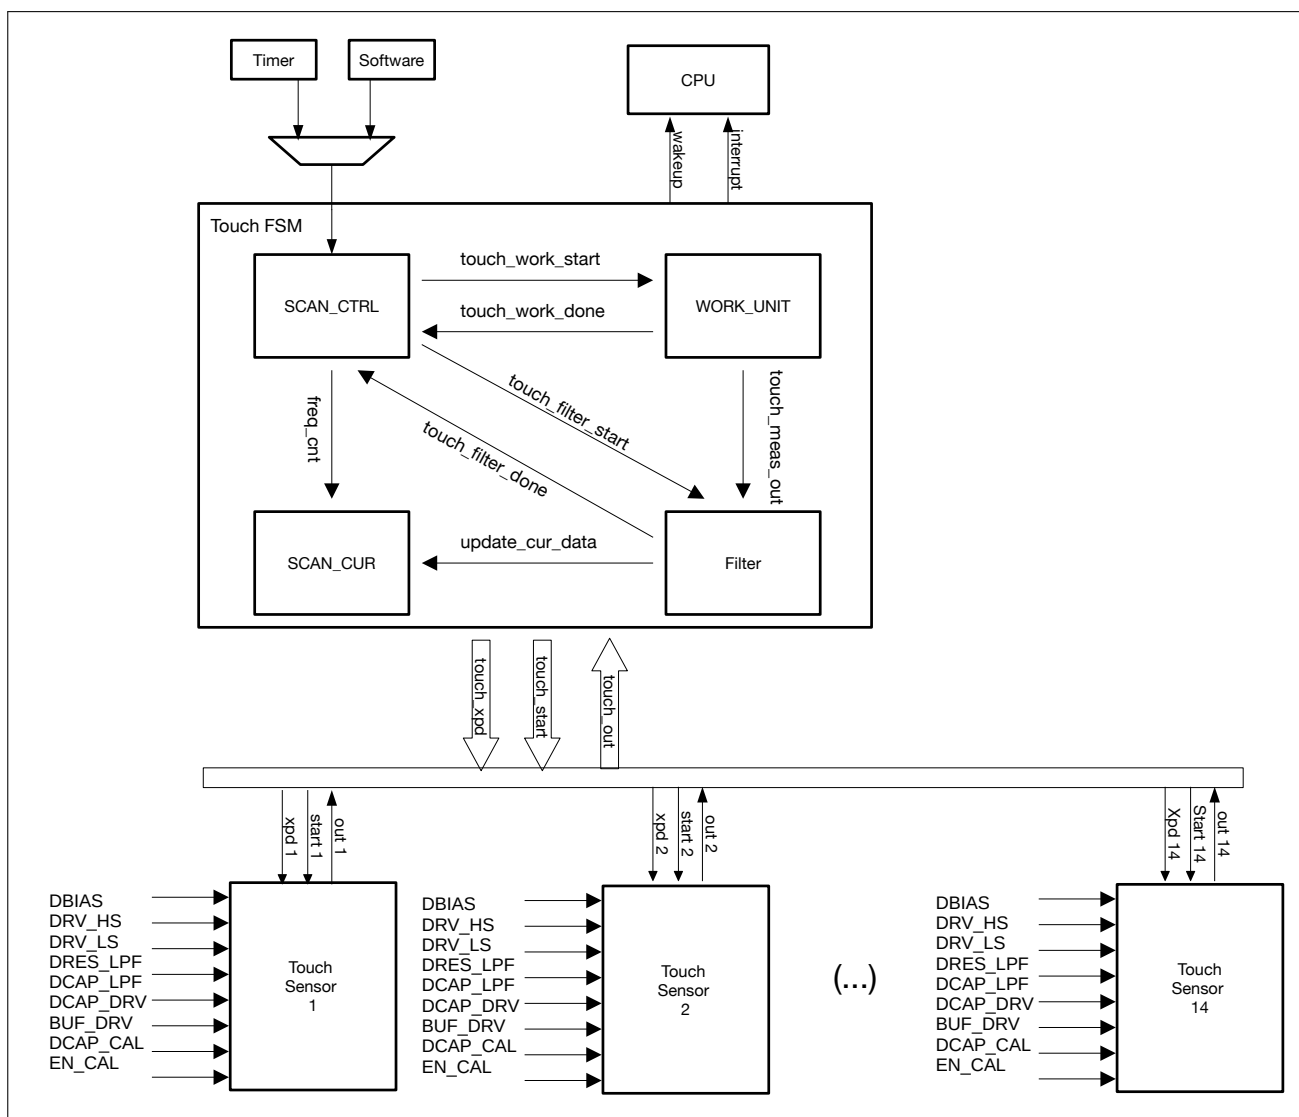

Figure 55.4-1. Touch FSM Structure and Mechanism

The following introduces the modules in the Touch FSM.

- **SCAN\_CTRL**: Select the touch pin to measure, set the parameters such as hopping frequency, and controls the start and end of measurement for each touch sensor in scan mode.
- **WORK\_UNIT**: Sample the selected touch sensors during a measurement.
- **Filter**: If enabled, each touch sensor can filter a series of measurements via an infinite impulse response (IIR) filter. The filtered value will be returned as the sampled value. See Section 55.4.3.1 for details.
- **SCAN\_CUR**: Cache the parameters of different touch sensors at different frequency modes during the measurement to be used for the next measurement.

## 55.4.2 Sampled Signal Preprocessing

The core mechanism of the touch sensor is to reflect whether the touch panel is touched or not based on the change of the output pulse wave, i.e., the TOUCH\_OUT signal, through detecting the change of capacitance on the touch panel. Therefore, the sampling of the TOUCH\_OUT signal is critical. Figure 55.4-2 shows the preprocessing of the TOUCH\_OUT signal.

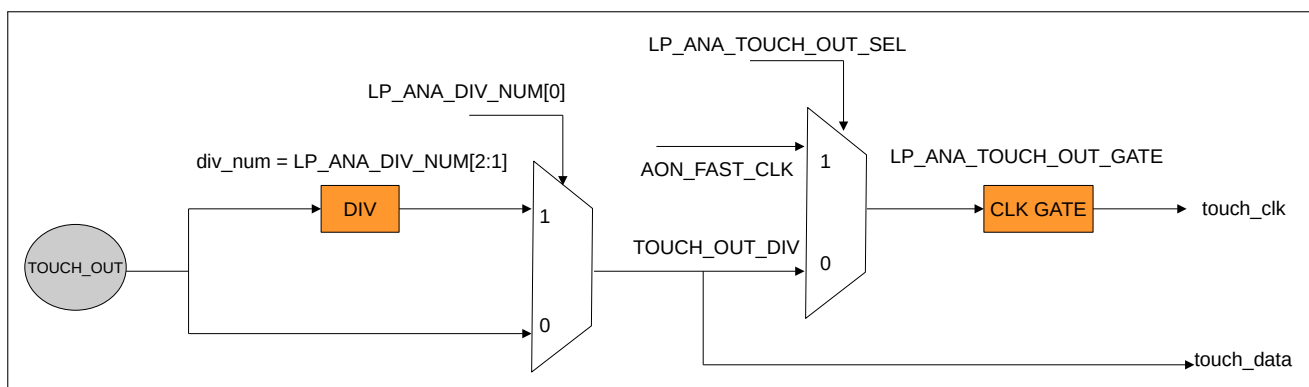

Figure 55.4-2. TOUCH\_OUT Signal Preprocessing

The frequency of TOUCH\_OUT might be much higher than the sampling frequency. Therefore, in order to improve the accuracy of the signal sampling, users can divide the TOUCH\_OUT signal by configuring `LP_ANA_DIV_NUM $n$` .  $n$  in this field represents different frequency modes in frequency hopping (refer to Section 55.4.2.4) with the value 0-2. The lowest bit configures whether to enable or disable frequency division. Set the lowest bit to 0 to disable frequency division, and set it to 1 to enable division. The highest two bits indicate the frequency division coefficient with a value of 0/1/2/3, corresponding to the 0/2/4/6 divisions.

If the frequency is still higher than twice the sampling frequency after frequency division, set `LP_ANA_TOUCH_OUT_SEL` to 1 to directly use the divided TOUCH\_OUT signal as a clock. Set `LP_ANA_TOUCH_OUT_GATE` to configure whether to enable this clock.

### 55.4.2.1 Measurement Process

Depending on whether frequency hopping is enabled, a measurement of a touch pin can be divided into the following two processes:

- Frequency hopping not enabled:

1. The Touch FSM selects the touch sensor to be measured. The relevant signals are routed to that touch sensor.
  2. The Touch FSM drives the START signal to the touch sensor to initiate the measurement. Internally, the Touch FSM starts a touch counter to time the duration of the measurement.
  3. A pulse counter in the Touch FSM is incremented on each pulse received from the touch sensor's TOUCH\_OUT signal.
  4. When the pulse counter reaches the count threshold set in [LP\\_ANA\\_TOUCH\\_MEAS\\_NUM0](#), the measurement is complete. The START signal is de-asserted, and the touch counter is stopped. The value of the stopped touch counter x LP\_DYN\_SLOW\_CLK cycles indicates the time taken to charge and discharge the touch pin for [LP\\_ANA\\_TOUCH\\_MEAS\\_NUM0](#) cycles.
- Frequency hopping enabled:
    1. The Touch FSM selects the touch sensor to be measured. The relevant signals are routed to that touch sensor.
    2. Set [LP\\_ANA\\_FREQ\\_SCAN\\_EN](#) to 1 to enable frequency hopping, configure [LP\\_ANA\\_FREQ\\_SCAN\\_CNT\\_LIMIT](#) to set the number of frequency modes supported for frequency hopping (up to three), and configure the parameters required for each frequency mode and the number of pulses for sampling the TOUCH\_OUT signal.
    3. The Touch FSM drives the START signal to the touch sensor to initiate the measurement. Internally, the Touch FSM starts a touch counter to time the duration of the measurement.
    4. A pulse counter in the Touch FSM is incremented on each pulse received from the touch sensor's TOUCH\_OUT signal.
    5. When the pulse counter reaches the count threshold set in [LP\\_ANA\\_TOUCH\\_MEAS\\_NUM0](#) of the corresponding frequency mode, the measurement is complete. The value of the stopped touch counter indicates the time taken to charge and discharge the touch pin [LP\\_ANA\\_TOUCH\\_MEAS\\_NUM0](#) cycles with the current frequency.
    6. The sampling frequency counter is incremented by 1 and the touch counter is cleared. The next frequency mode will be sampled after a small delay. When the samplings are finished for all frequency modes, the START signal is de-asserted, and the touch counter is cleared.

The sampled value (measured value) is the value of the touch counter indicated as touch\_raw\_data. The value of touch\_raw\_data can be read from [RTC\\_TOUCH\\_PADn\\_DATA](#). Note that the value returned by [RTC\\_TOUCH\\_PADn\\_DATA](#) may also be the filtered touch\_raw\_data, i.e., touch\_smooth\_data and benchmark. Configure [LP\\_ANA\\_TOUCH\\_DATA\\_SEL](#) and [LP\\_ANA\\_TOUCH\\_FREQ\\_SEL](#) to select the type of the return value. For more information on the sampled value types and how to judge touch actions based on the data, refer to Section [55.4.3.1](#).

**Note:**

Note that if the pulse does not reach the set threshold for a long time while the touch counter has reached the timeout threshold set in [LP\\_ANA\\_TOUCH\\_TIMEOUT\\_NUM](#) with [LP\\_ANA\\_TOUCH\\_TIMEOUT\\_EN](#) set as 1, the [RTC\\_TOUCH\\_TIMEOUT\\_INT\\_RAW](#) timeout interrupt will be triggered, indicating a circuit abnormality.

### 55.4.2.2 Trigger Source of Measurement

The Touch FSM initiates a measurement by sending a START signal. The START signal can either be triggered by software, or by a dedicated hardware timer known as the “touch timer”. The use of a touch timer allows periodic measurements to be taken without software intervention.

The touch timer is clocked by LP\_DYN\_SLOW\_CLK and should be configured with a period in number of LP\_DYN\_SLOW\_CLK cycles. The START signal is generated when the touch timer expires. The touch timer is reset when the measurement completes and restarts counting until the next expiration.

- To trigger the START signal by software:
  - Set [LP\\_ANA\\_TOUCH\\_START\\_FORCE](#) to 1 to trigger the START signal by software.
  - Software sets [LP\\_ANA\\_TOUCH\\_START\\_EN](#) to 1 and generates the START signal to initiate a measurement.
- To trigger the START signal by the touch timer:
  - Clear [LP\\_ANA\\_TOUCH\\_START\\_FORCE](#).
  - Configure the wait time before the timer sends the START signal (unit: LP\_DYN\_SLOW\_CLK cycle) via [PMU\\_TOUCH\\_WAIT\\_CYCLES](#).
  - Configure the wait time after the timer receives the DONE signal upon the completion of the touch sensor sampling (unit: LP\_DYN\_SLOW\_CLK cycle) via [PMU\\_TOUCH\\_SLEEP\\_CYCLES](#).
  - Set [PMU\\_TOUCH\\_SLEEP\\_TIMER\\_EN](#) to 1 to enable the touch timer.
- To force exit the current measurement cycle of the touch timer by software, there are two approaches:
  1. Generate the end signal of the touch sensor to exit the current measurement cycle of the touch timer.
    - Set [LP\\_ANA\\_TOUCH\\_DONE\\_FORCE](#) to 1 to select the DONE signal to be triggered by software.
    - Software sets [LP\\_ANA\\_TOUCH\\_DONE\\_EN](#) to 1 to generate the DONE signal to end a measurement.
  2. Use the software to directly force the touch timer to exit the current measurement cycle.
    - Set [PMU\\_TOUCH\\_FORCE\\_DONE](#) to generate the DONE signal and force the touch timer to exit the current measurement cycle.

**Note:**

The touch timer waits for a period of time before generating the START signal and after receiving the DONE signal, so the interval between two consecutive measurements is ([PMU\\_TOUCH\\_WAIT\\_CYCLES](#) + [PMU\\_TOUCH\\_SLEEP\\_CYCLES](#)) and the timing clock is LP\_DYN\_SLOW\_CLK.

### 55.4.2.3 Scan Mode

Scan mode involves the Touch FSM taking measurements of multiple touch sensors in sequential order. On every START signal, a new touch sensor is selected for measurement, thus allowing multiple touch pins to be monitored. The scan process is illustrated in Figure 55.4-3.

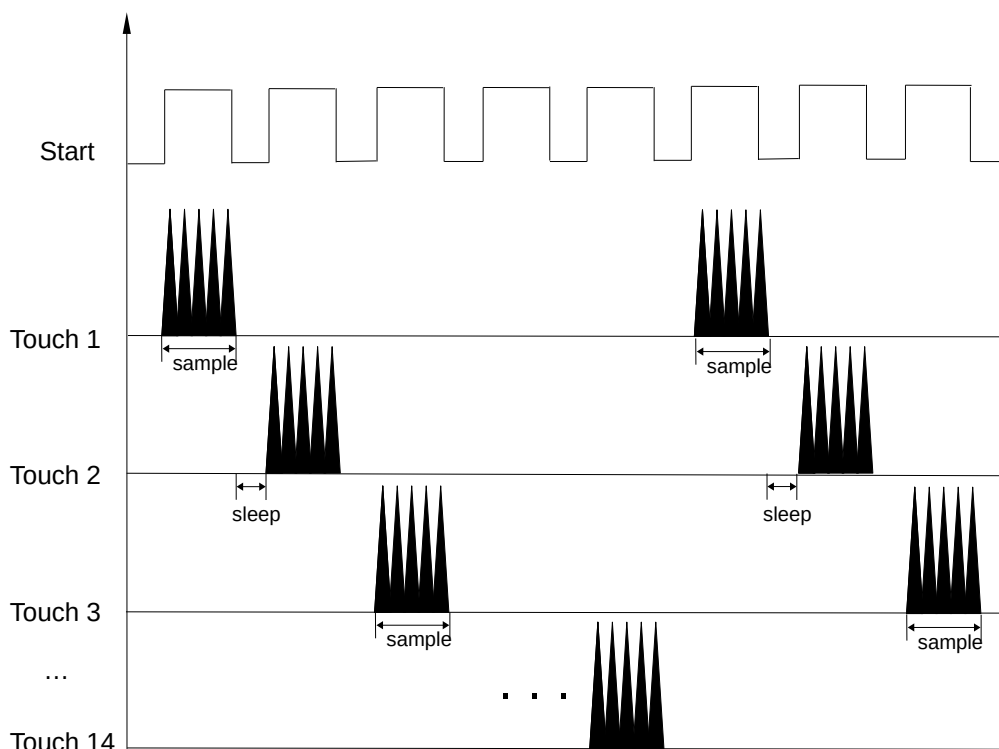

Figure 55.4-3. Timing Diagram of Scan Mode

To enable the scan mode, specify the bit map of the enabled touch pins in [LP\\_ANA\\_TOUCH\\_SCAN\\_PAD\\_MAP](#). The Touch FSM will select one touch pin from the bit map of the enabled touch pins in turn to measure per START signal, i.e., only one measurement is conducted per START signal. As multiple START signals are generated, the Touch FSM will cycle through the enabled touch pins in sequential order.

When measuring for different touch sensors, the sleep interval between two measurements is  $PMU\_TOUCH\_WAIT\_CYCLES + PMU\_TOUCH\_SLEEP\_CYCLES$  with the clock cycle of  $LP\_DYN\_SLOW\_CLK$ .

**Note:**

- After the touch sensor receives the START signal from the touch timer, it waits a short period before starting the measurement to ensure the stability of the sampling signal. The wait time is configured by [LP\\_ANA\\_TOUCH\\_XPD\\_WAIT](#). The timing clock is  $AON\_FAST\_CLK$ .
- If the touch timer is used to generate the START signal, the scanning can be conducted without software intervention.

#### 55.4.2.4 Frequency Hopping

When frequency hopping is enabled, the Touch FSM can measure the touch sensor at different frequency modes. Up to three frequency modes are supported, each corresponding to a set of configuration parameters. When a START signal is generated, the measurement will be carried out for each frequency mode sequentially, and the DONE signal will be generated when the measurements are completed for all frequency modes. Frequency hopping can be enabled together with the scan mode. In such case, users can monitor the touch condition of multiple touch sensors under different frequency modes by generating multiple START

signals. The scanning process is shown in Figure 55.4-4.

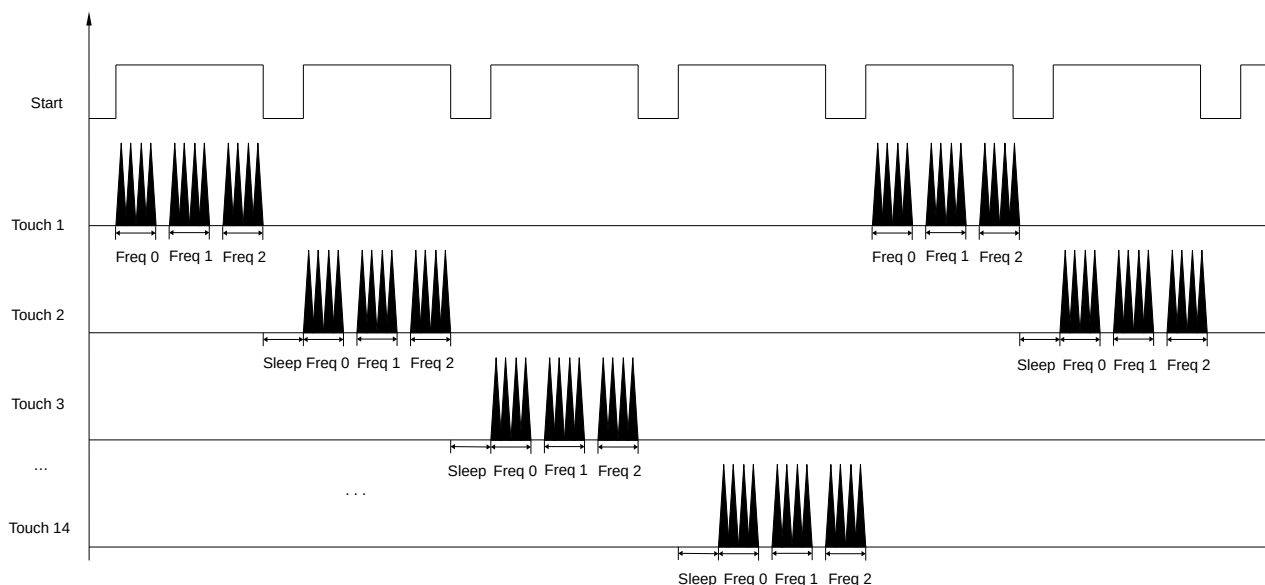

Figure 55.4-4. Touch Sensor Frequency Hopping Sequence Timing

Set `LP_ANA_FREQ_SCAN_EN` to 1 to enable frequency hopping, configure `LP_ANA_FREQ_SCAN_CNT_LIMIT` to select the maximum number of frequency mode supported, and configure the following analog parameter registers to adjust the sampling performance of the touch sensor at different frequency modes:

- `LP_ANA_TOUCH_FREQ $n$ _DBIAS` ( $n = 0-2$ )
- `LP_ANA_TOUCH_FREQ $n$ _DRV_HS` ( $n = 0-2$ )
- `LP_ANA_TOUCH_FREQ $n$ _DRV_LS` ( $n = 0-2$ )
- `LP_ANA_TOUCH_FREQ $n$ _DRES_LPF` ( $n = 0-2$ )
- `LP_ANA_TOUCH_FREQ $n$ _DCAP_LPF` ( $n = 0-2$ )

Upon each START signal, the Touch FSM measures consecutively for frequency mode 0, 1, and 2. A START signal triggers a maximum of three measurement operations. When the measurements are completed for all frequency modes, the START signal is de-asserted until the next measurement. Therefore, the Touch FSM performs measurements on the enabled touch sensors in sequence upon multiple START signals.

**Note:**

- When the same touch sensor is measured at different frequency modes, the wait time between measurements can be configured by `LP_ANA_TOUCH_XPD_WAIT` (count clock: `AON_FAST_CLK`).
- After receiving the START signal from the touch timer, the touch sensor waits for a short period of time before starting measuring to ensure the stability of the sampling signal. The wait time can be configured by `LP_ANA_TOUCH_XPD_WAIT` (count clock: `AON_FAST_CLK`).
- If a touch timer is used to generate the START signal, the scanning can be conducted without software intervention.

## 55.4.3 Touch Detection

### 55.4.3.1 Sampled Value

As introduced in Section 55.4.2.1, the sampled value of a measurement can be read from [RTC\\_TOUCH\\_PAD \$n\$ \\_DATA](#). However, the specific type of sampled value stored in [RTC\\_TOUCH\\_PAD \$n\$ \\_DATA](#) is determined together by [LP\\_ANA\\_TOUCH\\_DATA\\_SEL](#) and [LP\\_ANA\\_TOUCH\\_FREQ\\_SEL](#). The following three sampled value types are supported:

1. **touch\_raw\_data**: When the measurement is completed, the touch counter's value indicates the time taken to charge and discharge the touch pin a fixed number of times in LP\_DYN\_SLOW\_CLK cycles. After the IIR filter is turned on, the data is the filtered data.
2. **touch\_smooth\_data**: A series of moving averages generated by the touch\_raw\_data values sampled from a single touch sensor filtered by an IIR filter.

touch\_smooth\_data is less prone to noise spikes or outlier samples, thus often used for hardware touch detection. If frequency hopping is enabled, each touch pin will have a separate set of smooth\_touch\_data at different frequency modes and do not affect each other. The IIR filter that generates touch\_smooth\_data is configured via [LP\\_ANA\\_TOUCH\\_SMOOTH\\_LVL](#). See Table 55.4-1 for more information.

Table 55.4-1. touch\_smooth\_data Calculation

| <a href="#">LP_ANA_TOUCH_SMOOTH_LVL</a> | Type    | Formula  |
|---|---------|--|
| 0                                       | —       | touch_raw_data   |
| 1                                       | IIR 1/2 | $1/2 \text{ touch\_raw\_data} + 1/2 \text{ touch\_smooth\_data}$ |
| 2                                       | IIR 1/4 | $1/4 \text{ touch\_raw\_data} + 3/4 \text{ touch\_smooth\_data}$ |
| 3                                       | IIR 1/8 | $1/8 \text{ touch\_raw\_data} + 7/8 \text{ touch\_smooth\_data}$ |

3. **benchmark**: Also generated from the touch\_raw\_data values by IIR filtering. However, the moving average window for benchmark is much wider.

The benchmark value is usually used to represent the stable reading of a touch pin without the effect from a touch action. The touch detection is based on the benchmark value. Each touch sensor has a separate set of benchmark values at different frequency modes with a default value of 0xFFFF. The IIR filter that generates benchmark is configured via [LP\\_ANA\\_TOUCH\\_FILTER\\_MODE](#). Refer to Table 55.4-2 for more information.

In addition to the IIR filtering, users can also update the benchmark value directly by software. Configure [LP\\_ANA\\_TOUCH\\_BENCHMARK\\_SW](#) and [LP\\_ANA\\_TOUCH\\_UPDATE\\_BENCHMARK\\_SW](#) sequentially to update the benchmark value. This is generally used for software debugging.

Table 55.4-2. benchmark Algorithm

| <a href="#">LP_ANA_TOUCH_FILTER_MODE</a> | Type     | Formula   |
|--|----------|---|
| 0  | IIR 1/4  | $1/4 \text{ touch\_raw\_data} + 3/4 \text{ benchmark}$    |
| 1  | IIR 1/8  | $1/8 \text{ touch\_raw\_data} + 7/8 \text{ benchmark}$    |
| 2  | IIR 1/16 | $1/16 \text{ touch\_raw\_data} + 15/16 \text{ benchmark}$ |
| 3  | IIR 1/32 | $1/32 \text{ touch\_raw\_data} + 31/32 \text{ benchmark}$ |

Table 55.4-2. benchmark Algorithm

| LP_ANA_TOUCH_FILTER_MODE | Type      | Formula   |
|--------------------------|-----------|---|
| 4                        | IIR 1/64  | $1/64 \text{ touch\_raw\_data} + 63/64 \text{ benchmark}$         |
| 5                        | IIR 1/128 | $1/128 \text{ touch\_raw\_data} + 127/128 \text{ benchmark}$      |
| 6                        | IIR 1/256 | $1/256 \text{ touch\_raw\_data} + 255/256 \text{ benchmark}$      |
| 7                        | JITTER    | $\text{touch\_raw\_data} \pm \text{LP\_ANA\_TOUCH\_JITTER\_STEP}$ |

### 55.4.3.2 Hardware Touch Detection

In hardware touch detection, the touch sensor can detect finger touch or release and trigger an interrupt. To use hardware touch detection, the following key parameters need to be defined:

- **finger\_threshold:** The threshold value used to determine a touch or a touch interruption. `finger_threshold` is configured via `LP_ANA_TOUCH_PADx_THy`, where `x` (1-14) represents the touch pin index and `y` (0-2) represents the frequency mode configured in hopping frequency.
- **noise\_threshold:** Indicates the maximum threshold of the upward and downward fluctuation of `touch_smooth_data`. `noise_threshold` is configured via `LP_ANA_TOUCH_NOISE_THRES`.
- **hysteresis:** Used to avoid touch misjudgments caused by fluctuations of `touch_smooth_data` around touch thresholds. The hysteresis value is configured via `LP_ANA_TOUCH_HHYSTERESIS`.

The `finger_threshold` and `noise_threshold` values are not absolute thresholds, but offsets from the benchmark value, while the hysteresis value is an offset from `finger_threshold`. This prevents from misdiagnosing the gradual or slow changes of `touch_raw_data` caused by environmental factors such as temperature, power, or noise as a touch action.

After a series of calculations and comparisons based on the above parameters, the touch sensor will output the touch results detected on the touch pins via interrupts. Each touch sensor corresponds to a control register `LP_ANA_TOUCH_OUTEN` to configure whether to output the detection result.

### 55.4.4 Proximity Mode

When an object such as a finger is close to, but not touching, a touch pin, a small change in capacitance occurs on the touch pin, which is much smaller than the change caused by a physical touch. Proximity mode allows for the detection of these small changes.

Figure 55.4-5. Sensing Area

- The maximum detection distance “d” is 16 cm and the sensing area “S” is 20 cm<sup>2</sup>, where “d” is positively correlated with “S” as shown in Figure 55.4-5.
- Up to three touch pins can be configured to operate simultaneously in proximity mode.
- Frequency hopping is also supported in proximity mode.

In proximity mode, a touch sensor samples for a fixed number of times and accumulates the sample values. If the final cumulative value exceeds the configured threshold, a proximity object is considered to be detected and an interrupt will be triggered. Note that since the sample values are accumulated, the values introduced in Section 55.4.3.1, i.e., touch\_raw\_data, touch\_smooth\_data, and benchmark, will not be generated in proximity mode.

To operate in proximity mode:

- Configure a touch sensor to operate in proximity mode by setting [LP\\_ANA\\_TOUCH\\_APPROACH\\_PADO](#), [LP\\_ANA\\_TOUCH\\_APPROACH\\_PAD1](#), or [LP\\_ANA\\_TOUCH\\_APPROACH\\_PAD2](#).
- Configure [LP\\_ANA\\_TOUCH\\_APPROACH\\_LIMIT](#) to adjust the number of samplings to generate the cumulative value. The touch sensor contains an internal sample counter to record the number of samplings.
- Set the threshold value via [LP\\_ANA\\_TOUCH\\_PADx\\_THy](#), where **x** (1-14) represents the touch pin index and **y** (0-2) represents the frequency mode configured in hopping frequency.
- When the sample counter reaches the number of samplings configured in [LP\\_ANA\\_TOUCH\\_APPROACH\\_MEAS\\_NUMn](#):
  - If the cumulative value exceeds the threshold value, an interrupt will be triggered.
  - The sample counter and the cumulative value are reset to 0. The touch sensor restarts accumulating the sample values.

### 55.4.5 Sleep Mode

To reduce power consumption, the touch sensor also supports sleep mode. In sleep mode, users can designate one touch sensor to operate actively (hereinafter referred to as the sleeping touch sensor) to monitor whether a touch occurs in real time, while the remaining 13 touch sensors are all powered down in sleep mode. Once the sleeping touch sensor detects a touch or a touch release, it will generate an interrupt to wake up the rest of the touch sensors. The sleeping touch sensor also supports frequency hopping and proximity mode. There is a separate set of threshold parameters for the sleeping touch sensor, which can be configured as follows:

- Configure [LP\\_ANA\\_TOUCH\\_SLP\\_PAD](#) to select a particular touch sensor as the sleeping touch sensor.
- Configure [LP\\_ANA\\_TOUCH\\_SLP\\_TH0](#), [LP\\_ANA\\_TOUCH\\_SLP\\_TH1](#), and [LP\\_ANA\\_TOUCH\\_SLP\\_TH2](#) to set the touch threshold for the sleeping touch sensor at different frequency modes.
- Configure [LP\\_ANA\\_TOUCH\\_SLP\\_APPROACH\\_EN](#) to enable the proximity mode for the sleeping touch sensor.
- Configure [LP\\_ANA\\_TOUCH\\_SLP\\_CHANNEL\\_CLR](#) to clear the intermediate data for the sleeping touch sensor, such as benchmark, touch\_raw\_data, and the number of sampling.

**Note:**

The configuration for the noise\_threshold, hysteresis, touch\_smooth\_data, and benchmark values are the same for the sleeping touch sensor in sleep mode as in the normal mode.

## 55.4.6 Moisture Tolerance

If there are water droplets on the touch pads and the droplets are large enough to physically bridge two more adjacent touch pads, the adjacent touch pads may be electrically coupled. Coupled touch pads can cause false touch detection due to capacitance changes caused by the coupling. If a water droplet is connected across the touch pad and ground, a large parasitic capacitance will be introduced, also leading to false detection. The moisture tolerance feature can mitigate the impact of water droplets.

To configure moisture tolerance:

- Configure [LP\\_ANA\\_TOUCH\\_SHIELD\\_PAD\\_EN](#) to enable moisture tolerance.
- Configure [LP\\_ANA\\_TOUCH\\_BUFSEL](#) to select a touch pin to be used for moisture tolerance.

**Note:**

The moisture tolerance feature only works at frequencies below 10 MHz. Therefore, when the frequency is higher than 10 MHz, please disable the moisture tolerance feature.

## 55.4.7 Water Rejection

If the sensor array becomes wet, i.e., the majority of the sensor pads are soaked by water, most (if not all) of the touch pads will become unusable due to the possible false touch detections. ESP32-P4 supports the water rejection feature to shut down the sensor array if it is detected to be wet.

Configure [LP\\_ANA\\_TOUCH\\_OUT\\_RING](#) to select one of the touch pins to be used for the water rejection feature.

## 55.5 Interrupts

ESP32-P4's touch sensor can generate the LP\_TOUCH\_INTR signal that will be sent to the [Interrupt Matrix](#).

There are several internal interrupt sources from touch sensor that can generate the LP\_TOUCH\_INTR signal. The interrupt sources from touch sensor are listed with their trigger conditions and the resulted interrupt signal in Table [55.5-1](#).

Table 55.5-1. Touch Sensor's Internal Interrupt Sources

| Internal Interrupt Source    | Trigger Condition   | Interrupt Signal |
|------------------------------|---|------------------|
| TOUCH_APPROACH_LOOP_DONE_INT | Completion of proximity mode cumulative sampling  | LP_TOUCH_INTR    |
| TOUCH_TIMEOUT_INT            | Timeout for the TOUCH_OUT signal sampling   |                  |
| TOUCH_INACTIVE_INT           | Touch release detected  |                  |
| TOUCH_ACTIVE_INT             | Touch detected  |                  |
| TOUCH_DONE_INT               | Completion of sampling an individual touch pin at a certain frequency mode for comparison |                  |
| TOUCH_SCAN_DONE_INT          | Completion of sampling selected touch pins for comparison at all frequency modes          |                  |

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter 11 [Interrupt Matrix](#) > Section 11.2 [Interrupt Terminology in ESP32-P4](#).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section [55.6 Register Summary](#).

## 55.6 Register Summary

### 55.6.1 Interrupt and Status Register Summary

The addresses in this section are relative to Touch Sensor base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name                                     | Description                            | Address | Access   |
|--|--|---------|----------|
| <b>Interrupt Register</b>                |  |         |          |
| <a href="#">RTC_TOUCH_INT_RAW_REG</a>    | Touch sensor interrupt raw register    | 0x0000  | R/SS/WTC |

## 55.7 Registers

## 55.7.1 Interrupt and Status Registers

The addresses in this section are relative to Touch Sensor base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

### Register 55.1. RTC\_TOUCH\_INT\_RAW\_REG (0x0000)

Register 0x00000000: RTC\_TOUCH\_SCAN\_DONE\_INT\_RAW

|            |   |   |   |   |   |                                      |                           |                            |                          |                        |                             |
|------------|---|---|---|---|---|--------------------------------------|---------------------------|----------------------------|--------------------------|------------------------|-----------------------------|
| 31         | 6 | 5 | 4 | 3 | 2 | 1                                    | 0                         |                            |                          |                        |                             |
| (reserved) |   |   |   |   |   | RTC_TOUCH_APPROACH_LOOP_DONE_INT_RAW | RTC_TOUCH_TIMEOUT_INT_RAW | RTC_TOUCH_INACTIVE_INT_RAW | RTC_TOUCH_ACTIVE_INT_RAW | RTC_TOUCH_DONE_INT_RAW | RTC_TOUCH_SCAN_DONE_INT_RAW |

**RTC\_TOUCH\_SCAN\_DONE\_INT\_RAW** The raw interrupt status of [TOUCH\\_SCAN\\_DONE\\_INT](#).  
(R/SS/WTC)

**RTC\_TOUCH\_DONE\_INT\_RAW** The raw interrupt status of [TOUCH\\_DONE\\_INT](#). (R/SS/WTC)

**RTC\_TOUCH\_ACTIVE\_INT\_RAW** The raw interrupt status of **TOUCH\_ACTIVE\_INT**. (R/SS/WTC)

**RTC\_TOUCH\_INACTIVE\_INT\_RAW** The raw interrupt status of **TOUCH\_INACTIVE\_INT**. (R/SS/WTC)

**RTC\_TOUCH\_TIMEOUT\_INT\_RAW** The raw interrupt status of [TOUCH\\_TIMEOUT\\_INT](#). (R/SS/WTC)

**RTC\_TOUCH\_APPROACH\_LOOP\_DONE\_INT\_RAW** The raw interrupt status of [TOUCH\\_APPROACH\\_LOOP\\_DONE\\_INT](#). (R/SS/WTC)

### Register 55.2. RTC\_TOUCH\_INT\_ST\_REG (0x0004)

Diagram illustrating the structure of the RTC\_CR register (32 bits):

- Bits 31 to 6: (reserved)
- Bit 5: RTC\_TOUCH\_APPROACH\_LOOP\_DONE\_INT\_ST
- Bit 4: RTC\_TOUCH\_TIMEOUT\_INT\_ST
- Bit 3: RTC\_TOUCH\_INACTIVE\_INT\_ST
- Bit 2: RTC\_TOUCH\_ACTIVE\_INT\_ST
- Bit 1: RTC\_TOUCH\_DONE\_INT\_ST
- Bit 0: RTC\_TOUCH\_SCAN\_DONE\_INT\_ST

Reset

**RTC\_TOUCH\_SCAN\_DONE\_INT\_ST** The masked interrupt status of [TOUCH\\_DONE\\_INT](#). (RO)

**RTC\_TOUCH\_DONE\_INT\_ST** The masked interrupt status of [TOUCH\\_DONE\\_INT](#). (RO)

**RTC\_TOUCH\_ACTIVE\_INT\_ST** The masked interrupt status of [TOUCH\\_ACTIVE\\_INT](#). (RO)

**RTC\_TOUCH\_INACTIVE\_INT\_ST** The masked interrupt status of [TOUCH\\_INACTIVE\\_INT](#). (RO)

**RTC\_TOUCH\_TIMEOUT\_INT\_ST** The masked interrupt status of [TOUCH\\_TIMEOUT\\_INT](#). (RO)

**RTC\_TOUCH\_APPROACH\_LOOP\_DONE\_INT\_ST** The masked interrupt status of [TOUCH\\_APPROACH\\_LOOP\\_DONE\\_INT](#). (RO)

Register 55.3. RTC\_TOUCH\_INT\_ENA\_REG (0x0008)

- RTC\_TOUCH\_SCAN\_DONE\_INT\_ENA Write 1 to enable TOUCH\_DONE\_INT. (R/W)
- RTC\_TOUCH\_DONE\_INT\_ENA Write 1 to enable TOUCH\_DONE\_INT. (R/W)
- RTC\_TOUCH\_ACTIVE\_INT\_ENA Write 1 to enable TOUCH\_ACTIVE\_INT. (R/W)
- RTC\_TOUCH\_INACTIVE\_INT\_ENA Write 1 to enable TOUCH\_INACTIVE\_INT. (R/W)
- RTC\_TOUCH\_TIMEOUT\_INT\_ENA Write 1 to enable TOUCH\_TIMEOUT\_INT. (R/W)
- RTC\_TOUCH\_APPROACH\_LOOP\_DONE\_INT\_ENA Write 1 to enable TOUCH\_APPROACH\_LOOP\_DONE\_INT. (R/W)

#### Register 55.4. RTC\_TOUCH\_INT\_CLR\_REG (0x000C)

**RTC\_TOUCH\_SCAN\_DONE\_INT\_CLR** Write 1 to clear **TOUCH\_DONE\_INT**. (WT)

**RTC\_TOUCH\_DONE\_INT\_CLR** Write 1 to clear **TOUCH\_DONE\_INT**. (WT)

**RTC\_TOUCH\_ACTIVE\_INT\_CLR** Write 1 to clear **TOUCH\_ACTIVE\_INT**. (WT)

**RTC\_TOUCH\_INACTIVE\_INT\_CLR** Write 1 to clear **TOUCH\_INACTIVE\_INT**. (WT)

**RTC\_TOUCH\_TIMEOUT\_INT\_CLR** Write 1 to clear **TOUCH\_TIMEOUT\_INT**. (WT)

RTC\_TOUCH\_APPROACH\_LOOP\_DONE\_INT\_CLR Write 1 to clear TOUCH\_APPROACH\_LOOP\_DONE\_INT.  
(WT)

Register 55.5. RTC\_TOUCH\_CHN\_STATUS\_REG (0x0010)

|            |   |   |   |   |   |   |   |   |   |                     |    |     |    |    |                     |      |   |   |   |                      |   |   |   |   |   |   |   |   |   |   |       |
|------------|---|---|---|---|---|---|---|---|---|---------------------|----|-----|----|----|---------------------|------|---|---|---|----------------------|---|---|---|---|---|---|---|---|---|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   | RTC_TOUCH_SCAN_CURR |    |     |    |    | RTC_TOUCH_MEAS_DONE |      |   |   |   | RTC_TOUCH_PAD_ACTIVE |   |   |   |   |   |   |   |   |   |   |       |
| 30         |   |   |   |   |   |   |   |   |   |                     | 20 | 19  | 16 | 15 | 14                  |      |   |   |   |                      |   |   |   |   |   |   |   |   |   |   | 0     |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0                   | 0  | 0   | 0  | 0  | 0                   | 0    | 0 | 0 | 0 | 0                    | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0     |
|            |   |   |   |   |   |   |   |   |   |                     |    | 0x0 |    |    | 0                   | 0x00 |   |   |   |                      |   |   |   |   |   |   |   |   |   |   | Reset |

**RTC\_TOUCH\_PAD\_ACTIVE** Indicates whether the touch pin detects a touch. Bit 1-14 corresponds to touch pin 1-14 respectively. Other bits are invalid.

0: No touch detected

1: Touch detected

(RO)

**RTC\_TOUCH\_MEAS\_DONE** Indicates whether the touch pins have been measured at all frequency modes.

0: Not completed

1: Completed

(RO)

**RTC\_TOUCH\_SCAN\_CURR** Indicates the index number of the currently scanned touch pin. (RO)

Register 55.6. RTC\_TOUCH\_STATUS\_*n*\_REG (*n*: 1-14) (0x0018+0x4\**n*)

|            |   |   |   |   |   |   |   |   |    |                                   |    |    |     |    |   |      |  |  |  |                                 |  |  |  |  |  |  |  |  |   |       |  |
|------------|---|---|---|---|---|---|---|---|----|-----------------------------------|----|----|-----|----|---|------|--|--|--|---------------------------------|--|--|--|--|--|--|--|--|---|-------|--|
| (reserved) |   |   |   |   |   |   |   |   |    | RTC_TOUCH_PAD <sub>n</sub> NN_CNT |    |    |     |    | RTC_TOUCH_PAD <sub>n</sub> DEBOUNCE_CNT |      |  |  |  | RTC_TOUCH_PAD <sub>n</sub> DATA |  |  |  |  |  |  |  |  |   |       |  |
| 31         |   |   |   |   |   |   |   |   | 23 | 22                                | 19 | 18 | 16  | 15 |   |      |  |  |  |                                 |  |  |  |  |  |  |  |  | 0 |       |  |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0  | 0x0                               |    |    | 0x0 |    |   | 0x00 |  |  |  |                                 |  |  |  |  |  |  |  |  |   | Reset |  |

**RTC\_TOUCH\_PAD<sub>*n*</sub>DATA** Indicates the touch\_raw\_data, touch\_smooth\_data, or benchmark sampled by touch pin *n*. (RO)

**RTC\_TOUCH\_PAD<sub>*n*</sub>DEBOUNCE\_CNT** Indicates the cumulative number of consecutive touch or touch release detection by touch pin *n*. (RO)

**RTC\_TOUCH\_PAD<sub>*n*</sub>NN\_CNT** Indicates the cumulative number of consecutive instances where *touch\_smooth\_data* < *benchmark* – *passive\_noise\_threshold* has been detected by touch pin *n*. (RO)

**Register 55.7. RTC\_TOUCH\_STATUS\_15\_REG (0x0050)**

|                     |  |  |  |  |  |  |  |  |  |                      |  |  |  |                            |  |  |  |                    |  |  |  |    |  |  |  |    |  |  |  |       |  |  |  |  |  |  |  |   |  |  |  |
|---------------------|--|--|--|--|--|--|--|--|--|----------------------|--|--|--|----------------------------|--|--|--|--------------------|--|--|--|----|--|--|--|----|--|--|--|-------|--|--|--|--|--|--|--|---|--|--|--|
| (reserved)          |  |  |  |  |  |  |  |  |  | RTC_TOUCH_SLP_NN_CNT |  |  |  | RTC_TOUCH_SLP_DEBOUNCE_CNT |  |  |  | RTC_TOUCH_SLP_DATA |  |  |  |    |  |  |  |    |  |  |  |       |  |  |  |  |  |  |  |   |  |  |  |
| 31                  |  |  |  |  |  |  |  |  |  | 23                   |  |  |  | 19                         |  |  |  | 18                 |  |  |  | 16 |  |  |  | 15 |  |  |  |       |  |  |  |  |  |  |  | 0 |  |  |  |

| 0x0                        |    |  |  |  |  |  |  | 0x0                         |    |  |  |  |  |    |   | 0x0                         |  |  |  |   |   |  |  | 0x0                         |  |  |  |  |  |  |  | Reset |

**RTC\_TOUCH\_APPROACH\_PAD2\_CNT** Indicates the cumulative number of samplings of touch pin 2 in proximity mode. (RO)

**RTC\_TOUCH\_APPROACH\_PAD1\_CNT** Indicates the cumulative number of samplings of touch pin 1 in proximity mode. (RO)

**RTC\_TOUCH\_APPROACH\_PADO\_CNT** Indicates the cumulative number of samplings of touch pin 0 in proximity mode. (RO)

**RTC\_TOUCH\_SLP\_APPROACH\_CNT** Indicates the cumulative number of samplings of the sleeping touch pin in proximity mode. (RO)

**Register 55.9. RTC\_TOUCH\_STATUS\_17\_REG (0x0058)**

|            |   |   |   |   |    |    |    |                   |   |  |  |                 |    |    |  |                  |   |  |    |                  |   |  |  |                    |   |   |   |                    |   |  |  |  |       |  |  |  |
|------------|---|---|---|---|----|----|----|-------------------|---|--|--|-----------------|----|----|--|------------------|---|--|----|------------------|---|--|--|--------------------|---|---|---|--------------------|---|--|--|--|-------|--|--|--|
| (reserved) |   |   |   |   |    |    |    | RTC_FREQ_SCAN_CNT |   |  |  | RTC_TOUCH_DBIAS |    |    |  | RTC_TOUCH_DRV_HS |   |  |    | RTC_TOUCH_DRV_LS |   |  |  | RTC_TOUCH_DRES_LPF |   |   |   | RTC_TOUCH_DCAP_LPF |   |  |  |  |       |  |  |  |
| 31         |   |   |   |   | 25 | 24 | 23 | 22                |   |  |  |                 | 18 | 16 |  |                  |   |  | 12 | 12               |   |  |  |                    | 9 | 8 | 7 | 6                  |   |  |  |  | 0     |  |  |  |
| 0          | 0 | 0 | 0 | 0 | 0  | 0  | 0  | 0                 | 0 |  |  |                 | 0  |    |  |                  | 0 |  |    |                  | 0 |  |  |                    | 0 |   |   |                    | 0 |  |  |  | Reset |  |  |  |

**RTC\_TOUCH\_DCAP\_LPF** Indicates the DCAP\_LPF value of the current touch pin. (RO)

**RTC\_TOUCH\_DRES\_LPF** Indicates the DRES\_LPF value of the current touch pin. (RO)

**RTC\_TOUCH\_DRV\_LS** Indicates the DRV\_LS value of the current touch pin. (RO)

**RTC\_TOUCH\_DRV\_HS** Indicates the DRV\_HS value of the current touch pin. (RO)

**RTC\_TOUCH\_DBIAS** Indicates the DBIAS value of the current touch pin. (RO)

**RTC\_FREQ\_SCAN\_CNT** Indicates the SCAN\_CNT value of the current touch pin. (RO)

**Register 55.10. RTC\_TOUCH\_CHN\_TMP\_STATUS\_REG (0x005C)**

|            |    |      |  |  |  |  |  |  |  |  |  |  |  |  |  |                             |    |   |  |  |  |  |  |  |  |  |  |  |  |       |  |                               |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

**RTC\_TOUCH\_PAD\_INACTIVE\_STATUS** Indicates whether the touch pin detects the touch pad from being touched to being released. Bit 1-14 corresponds to touch pin 1-14 respectively. Other bits are invalid.

0: Touch release detected

1: Touch release not detected

(RO)

**RTC\_TOUCH\_PAD\_ACTIVE\_STATUS** Indicates whether the touch pin detects the process of being touched. Bit 1-14 corresponds to touch pin 1-14 respectively. Other bits are invalid.

0: Touch detected

1: Touch not detected

(RO)

**LP\_ANA\_DIV\_NUM2** Configures the enabling of the TOUCH\_OUT signal division and the coefficient for sampling frequency mode 0.

bit[0]: Configures whether to enable division.

0: Disable

1: Enable

bit[1-2]: Configures the TOUCH\_OUT signal division coefficient.

0: 0

1: 2

2: 4

3: 6

Other values: Invalid

(R/W)

**LP\_ANA\_DIV\_NUM1** Configures the enabling of the TOUCH\_OUT signal division and the coefficient for sampling frequency mode 1. For detailed configuration, refer to [LP\\_ANA\\_DIV\\_NUM2](#). (R/W)

**LP\_ANA\_DIV\_NUM0** Configures the enabling of the TOUCH\_OUT signal division and the coefficient for sampling frequency mode 2. For detailed configuration, refer to [LP\\_ANA\\_DIV\\_NUM2](#). (R/W)

**LP\_ANA\_TOUCH\_OUT\_SEL** Configures whether to use the TOUCH\_OUT signal for clock or data.

0: TOUCH\_OUT signal is used as data

1: TOUCH\_OUT signal is used as clock

(R/W)

**LP\_ANA\_TOUCH\_OUT\_GATE** Configures whether to enable gating after enabling the TOUCH\_OUT signal division.

0: Disable

1: Enable

(R/W)

Register 55.16. LP\_ANA\_TOUCH\_WORK\_MEAS\_NUM\_REG (0x010C)

**LP\_ANA\_TOUCH\_NN\_DISUPDATE\_BENCHMARK\_EN** Configures whether to turn off the benchmark data correction.

0: Do not turn off

1: Turn off

(R/W)

**LP\_ANA\_TOUCH\_HYSTERESIS** Configures the sampling hysteresis. (R/W)

**LP\_ANA\_TOUCH\_NN\_THRES** Configures the out-of-phase noise\_threshold. (R/W)

**LP\_ANA\_TOUCH\_NOISE\_THRES** Configures the noise\_threshold. (R/W)

**LP\_ANA\_TOUCH\_SMOOTH\_LVL** Configures the IIR filter module for touch\_smooth\_data.(R/W)

**LP\_ANA\_TOUCH\_JITTER\_STEP** Configures the jitter step in filter module 7 for generating benchmark data. (R/W)

**LP\_ANA\_TOUCH\_FILTER\_MODE** Configures the filter module for generating benchmark data. (R/W)

**LP\_ANA\_TOUCH\_FILTER\_EN** Configures whether to enable the filter module for generating benchmark data.

0: Disable

1: Enable

(R/W)

**LP\_ANA\_TOUCH\_NN\_LIMIT** Configures the number of consecutive sampling instances where the sampling value exceeds the out-of-phase noise\_threshold. (R/W)

**LP\_ANA\_TOUCH\_APPROACH\_LIMIT** Configures the number of sampling in proximity mode. (R/W)

**LP\_ANA\_TOUCH\_DEBOUNCE\_LIMIT** Configures the number of consecutive sampling for detecting touch state changes. (R/W)

LP\_ANA\_TOUCH\_BYPASS\_IN\_THRES  
LP\_ANA\_TOUCH\_BYPASS\_NOISE\_THRES

**LP\_ANA\_TOUCH\_PAD $n$ \_TH2** Configures the touch threshold of touch sensor  $n$  for sampling frequency mode 2. (R/W)

Register 55.31. LP\_ANA\_DATE\_REG (0x03FC)

- LP\_ANA\_LP\_ANA\_DATE Version control register. (R/W)
- LP\_ANA\_CLK\_EN Configures whether to enable the clock for accessing the registers.

0: Disable

1: Enable

(R/W)

## Chapter 56

# Temperature Sensor (TSENS)

## 56.1 Overview

ESP32-P4 provides a temperature sensor for real-time monitoring of temperature changes within the chip. The sensor converts analog voltage to digital values and provides compensation for temperature offsets.

## 56.2 Features

The temperature sensor has the following features:

- Software-triggered temperature measurement, which once triggered, the sensor continuously measures temperature. Software can read the data at any time.
- Hardware-triggered automatic temperature monitoring, supporting two wake-up modes
- Configurable temperature offset based on the application scenario for improved accuracy
- Configurable temperature measurement range
- Support for Event Task Matrix (ETM)-related events and tasks

## 56.3 Architecture

Figure [56.3-1](#) shows the internal structure of the temperature sensor.

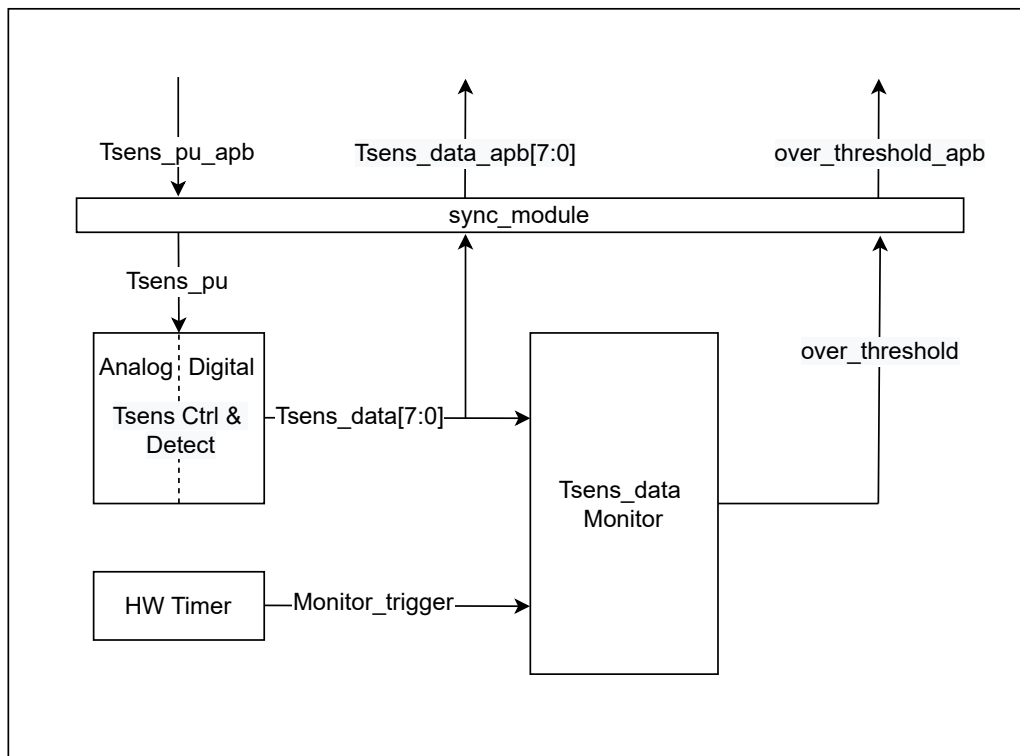

Figure 56.3-1. Temperature Sensor Architecture

As Figure 56.3-1 shows, the temperature sensor module contains the following major blocks:

- Tsens Ctrl & Detect: temperature sensor
- HW Timer: triggers automatic temperature monitoring
- Tsens\_data Monitor: monitors whether the temperature is outside the threshold range
- sync\_module: Synchronization block between APB clock domain and temperature sensor clock domain

## 56.4 Functional Description

### 56.4.1 Temperature Sensor Power Up

The temperature sensor can be powered up by setting the `TSENS_POWER_UP` register.

### 56.4.2 Temperature Sensor Clock

The temperature sensor has only one clock source: `LP_PERI_CLK`, and there is no frequency divider inside the module.

### 56.4.3 Wake-Up Modes for Automatic Temperature Monitoring

There are two wake-up modes for temperature monitoring, selected by `TSENS_WAKEUP_MODE`:

- Absolute value mode:

- Monitors the absolute value of the current temperature. Configure [TSENS\\_WAKEUP\\_TH\\_LOW](#) and [TSENS\\_WAKEUP\\_TH\\_HIGH](#) to set the temperature thresholds. Wake-up will be triggered if the sampled value is above the high threshold or below the low threshold.
- Change value mode:
  - Monitors the temperature changes inside the chip. If the temperature increment of two consecutive samplings exceeds the high threshold configured in [TSENS\\_WAKEUP\\_TH\\_HIGH](#), or the temperature decrement of two consecutive samplings exceeds the low threshold configured in [TSENS\\_WAKEUP\\_TH\\_LOW](#), a wake-up will be triggered. For example, when [TSENS\\_WAKEUP\\_TH\\_LOW](#) is set to 8, and the two consecutive sampling values are 28 and 19, resulting in a temperature decrement of 9, a wake-up will be triggered.

#### 56.4.4 Temperature Measurement Range and Offset

The temperature sensor is designed with five measurement ranges, as displayed in Table 56.4-1, to enhance accuracy. Each range has its own measurement errors, but users can select particular offsets to obtain calibrated data, so there is no need to be concerned about the errors.

**Table 56.4-1. Temperature Measurement Range and Offset**

| Temperature Measurement Range (°C) | Temperature Offset |
|------------------------------------|--------------------|
| 50 ~ 125                           | -2                 |
| 20 ~ 100                           | -1                 |
| -10 ~ 80                           | 0                  |
| -30 ~ 50                           | 1                  |
| -40 ~ 20                           | 2                  |

#### 56.4.5 Data Conversion

The sensor output value (*VALUE*) is stored in [TSENS\\_OUT](#). To calculate the actual temperature *T* (°C) based on *VALUE*, use the following equation:

$$T = 0.4386 * VALUE - 27.88 * offset - 20.52$$

where *offset* is the temperature offset displayed in Table 56.4-1.

### 56.5 Event Task Matrix Feature

The temperature sensor on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows the temperature sensor's ETM tasks to be triggered by any peripherals' ETM events, or temperature sensor's ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM tasks and events related to the temperature sensor. For more information, please refer to Chapter 12 [Event Task Matrix \(ETM\)](#).

The temperature sensor can receive the following ETM tasks:

- [TMPSNSR\\_TASK\\_START\\_SAMPLE](#): The temperature sensor starts sampling when this task is triggered.
- [TMPSNSR\\_TASK\\_STOP\\_SAMPLE](#): The temperature sensor stops sampling when this task is triggered.

The temperature sensor can generate the following ETM events:

- `TMPSNSR_EVT_OVER_LIMIT`: Generated when the temperature is beyond the threshold.

In practical applications, the temperature sensor's ETM events can trigger its own ETM tasks. For example, the `TMPSNSR_EVT_OVER_LIMIT` event can trigger the `TMPSNSR_TASK_STOP_SAMPLE` task.

## 56.6 Interrupts

ESP32-P4's Temperature Sensor can generate the following interrupt signal that will be sent to the [Interrupt Matrix](#).

- `LP_TSENS_INTR`

There is one internal interrupt source from the Temperature Sensor that can generate the above interrupt signal:

- `TSENS_COCPU_TSENS_WAKE_INT`: Triggered when the temperature sample value exceeds the threshold.

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter [11 Interrupt Matrix](#) > Section [11.2 Interrupt Terminology in ESP32-P4](#).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section [56.8 Register Summary](#).

## 56.7 Programming Procedure

The temperature sensor can be started by software as follows:

1. Set `TSENS_POWER_UP` to power up the temperature sensor.
2. Set `LPPERI_CK_EN_LP_TSENS` to enable the temperature sensor clock.
3. Wait for `TSENS_XPD_WAIT` clock cycles till the temperature sensor releases from reset and starts measuring the temperature.
4. Wait for 100  $\mu$ s (so that the output value gradually approaches the actual temperature) and then read the data from `TSENS_OUT`.

To enable hardware-triggered automatic temperature monitoring, add the following programming steps before powering up the sensor:

1. Configure `TSENS_SAMPLE_RATE` to set sampling rate.
2. Configure `TSENS_WAKEUP_MODE` to select wake-up mode for temperature monitoring.
3. Configure `TSENS_WAKEUP_TH_HIGH/LOW` to set the high and low temperature monitoring thresholds.
4. Set `TSENS_WAKEUP_EN` to start temperature monitoring.
5. Set `TSENS_SAMPLE_EN` to enable automatic temperature monitoring.

In automatic temperature monitoring mode, the output value will not be saved. Nevertheless, users can get the value at any moment by accessing `TSENS_OUT`.

## 56.8 Register Summary

The addresses in this section are relative to Temperature Sensor base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name                                   | Description  | Address | Access   |
|--|--|---------|----------|
| <b>Control Registers</b>               |  |         |          |
| <a href="#">TSENS_CTRL_REG</a>         | Temperature sensor control register 1.                   | 0x0000  | varies   |

**TSENS\_OUT** Stores the temperature sensor output value. (RO)

**TSENS\_SAMPLE\_EN** Configures whether to enable automatic temperature monitoring.

0: Disable

1: Enable

(R/W)

**TSENS\_IN\_INV** Configures whether to invert temperature sensor data.

0: No effect

1: Invert

(R/W)

**TSENS\_CLK\_DIV** Configures the clock division of the temperature sensor, which affects the frequency of temperature data generation by the analog circuits. (R/W)

**TSENS\_POWER\_UP** Configures whether to power up temperature sensor.

0: No effect

1: Power up

(R/W)

Register 56.2. TSENS\_CTRL2\_REG (0x0004)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |               |     |                 |    |                |  |  |  |  |  |  |  |  |       |  |   |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|----|---------------|-----|-----------------|----|----------------|--|--|--|--|--|--|--|--|-------|--|---|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    | TSENS_CLK_INV |     | TSENS_XPD_FORCE |    | TSENS_XPD_WAIT |  |  |  |  |  |  |  |  |       |  |   |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 15 | 14            | 13  | 12              | 11 |                |  |  |  |  |  |  |  |  |       |  | 0 |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0  | 1             | 0x0 | 0x2             |    |                |  |  |  |  |  |  |  |  | Reset |  |   |

**TSENS\_XPD\_WAIT** Configures the wait time (in clock cycles) for the sensor to release from reset.  
(R/W)

**TSENS\_XPD\_FORCE** Configures whether to enable force power up/down the temperature sensor.

- 0: Disable force power up function
- 1: Disable force power down function
- 2: Enable force power up temperature sensor
- 3: Enable force power down temperature sensor

(R/W)

**TSENS\_CLK\_INV** Configures the phase of the temperature sensor clock. (R/W)

Register 56.3. TSENS\_INT\_RAW\_REG (0x0008)

|            |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                                |   |   |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|--------------------------------|---|---|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | TSENS_COCPU_TSENS_WAKE_INT_RAW |   |   |   |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | 1                              | 0 |   |   |       |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0                              | 0 | 0 | 0 | Reset |

**TSENS\_COCPU\_TSENS\_WAKE\_INT\_RAW** The raw interrupt status of the [TSENS\\_COCPU\\_TSENS\\_WAKE\\_INT](#). (R/WTC/SS)

### Register 56.4. TSENS\_INT\_ST\_REG (0x000C)

Diagram illustrating the structure of the TSENS\_COCPU\_TSENS\_WAKE\_INT\_ST register:

- Bits 31 down to 1 are reserved (indicated by a diagonal line and the text "(reserved)").
- Bit 0 is the Reset bit.

**TSENS\_COCPU\_TSENS\_WAKE\_INT\_ST** The masked interrupt status of the [TSENS\\_COCPU\\_TSENS\\_WAKE\\_INT](#). (RO)

### Register 56.5. TSENS\_INT\_ENA\_REG (0x0010)

Diagram of the TSENS\_C0CPU\_TSENS\_WAKE\_INT\_ENA register. The register is 32 bits wide. Bit 31 is labeled '31'. Bit 0 is labeled '0'. The register is divided into two sections: 'TSENS\_C0CPU\_TSENS\_WAKE\_INT\_ENA' (bits 0-31) and '(reserved)' (bits 32-63). The 'Reset' value for bit 0 is 0.

**TSENS\_COCPU\_TSENS\_WAKE\_INT\_ENA** Write 1 to enable [TSENS\\_COCPU\\_TSENS\\_WAKE\\_INT](#).  
(R/WTC)

Register 56.6. TSENS\_INT\_CLR\_REG (0x0014)

TSENS\_COCPU\_TSENS\_WAKE\_INT\_CLR Write 1 to clear TSENS\_COCPU\_TSENS\_WAKE\_INT. (WT)

Register 56.7. TSENS\_INT\_ENA\_WITS\_REG (0x001C)

TSENS\_COCPU\_TSENS\_WAKE\_INT\_ENA\_WITS Write 1 to set TSENS\_INT\_ENA\_REG. (WT)

Register 56.8. TSENS\_INT\_ENA\_W1TC\_REG (0x0020)

TSENS\_COCPU\_TSENS\_WAKE\_INT\_ENA\_W1TC Write 1 to clear TSENS\_INT\_ENA\_REG. (WT)

Register 56.9. TSENS\_WAKEUP\_CTRL\_REG (0x0024)

**TSENS\_WAKEUP\_TH\_LOW** Configures the low threshold for temperature monitoring wake-up function. (R/W)

**TSENS\_WAKEUP\_TH\_HIGH** Configures the high threshold for temperature monitoring wake-up function. (R/W)

**TSENS\_WAKEUP\_OVER\_UPPER\_TH** Represents whether the temperature output value exceeds the threshold.

0: The temperature output value is below the low threshold.

1: The temperature output value is above the high threshold.

(RO)

**TSENS\_WAKEUP\_EN** Configures whether to enable temperature monitoring wake-up function.

0: Disable

1: Enable

(R/W)

**TSENS\_WAKEUP\_MODE** Selects the wake-up mode for temperature monitoring. Valid only when [TSENS\\_WAKEUP\\_EN](#) = 1.

0: Absolute value mode

1: Change value mode

(R/W)

**TSENS\_SAMPLE\_RATE** Configures the sampling rate for hardware-triggered temperature monitoring. The sampling period = configured value × sensor's working clock cycle. (R/W)

## Chapter 57

### ADC Controller (ADC)

#### 57.1 Overview

ESP32-P4 integrates two 12-bit successive approximation ADCs (SAR ADCs) for measuring analog signals from up to 14 pins. Figure 57.1-1 shows the basic architecture of the SAR ADC module on ESP32-P4.

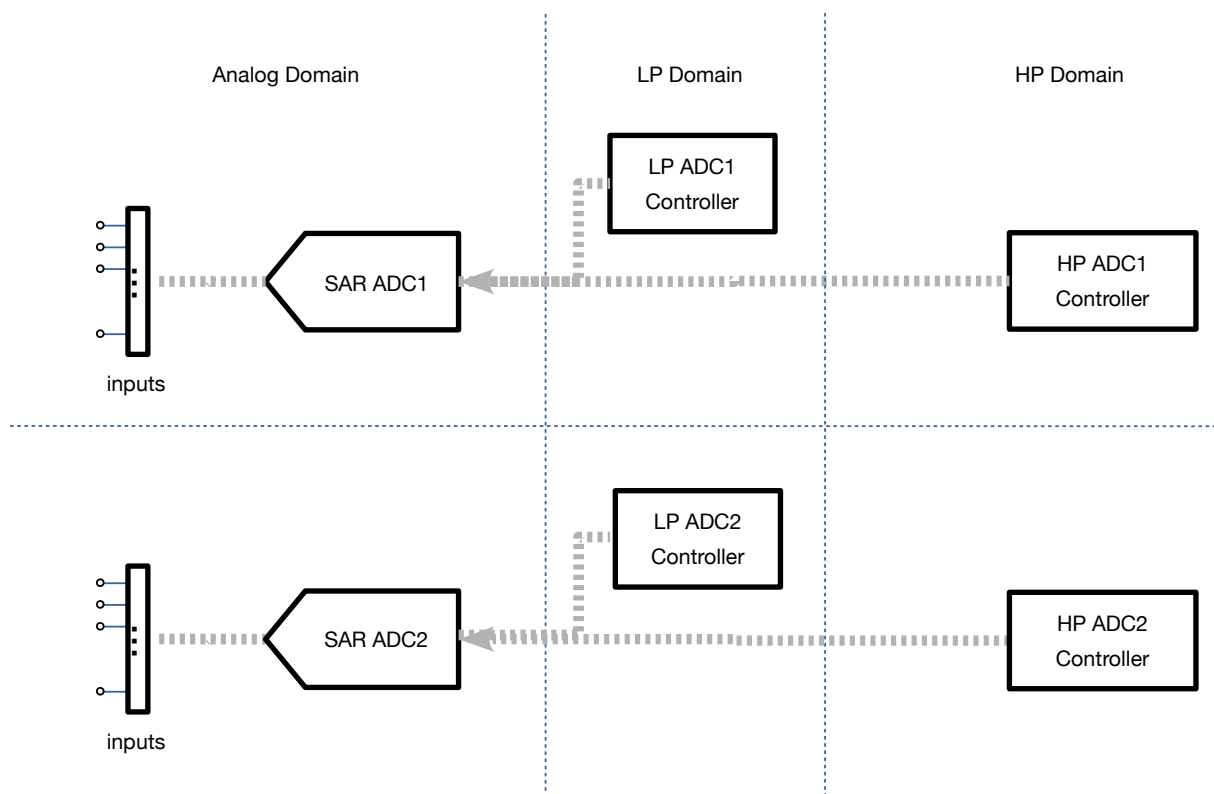

Figure 57.1-1. SAR ADC Simplified Architecture

As the figure shows, the SAR ADCs are managed by four dedicated controllers:

- Two HP (high-performance) controllers: HP ADC1 Controller and HP ADC2 Controller, designed for multi-channel sampling mode, supporting continuous transfer of conversion results to memory via the GDMA interface.
- Two LP (low-power) controllers: LP ADC1 Controller and LP ADC2 Controller, supporting operation in sleep mode and one-shot sampling mode.

## 57.2 Terminology

The following terms related to SAR ADC are defined in the context of the *ESP32-P4 Technical Reference Manual* to help readers better understand this document:

|                                     |   |
|-------------------------------------|---|
| <b>SAR ADC:</b>                     | Including analog ADC circuit and digital ADC controller. The HP ADC and LP ADC in the following text share the analog ADC circuit, but have their own controllers, namely the HP ADC controllers and LP ADC controllers. The SAR ADC mentioned in the text refers to both HP ADC and LP ADC.  |
| <b>HP ADC:</b>                      | High-performance ADC, supporting multi-channel sampling, GDMA data transfer, etc., not available in sleep mode.   |
| <b>LP ADC:</b>                      | Low-power ADC, supporting one-shot sampling mode, can be used in sleep mode.  |
| <b>One-shot sampling mode:</b>      | In this mode, LP ADC samples one channel at a time.   |
| <b>Multi-channel sampling mode:</b> | In this mode, HP ADC sequentially samples a group of channels or continuously samples a single channel.   |
| <b>Dual HP ADC sampling:</b>        | It means two HP ADCs sample either simultaneously or alternatively.   |
| <b>Conversion result:</b>           | The conversion result is the binary digital value obtained after the analog-to-digital conversion process. It is sometimes written as conversion data.  |
| <b>Filtered data:</b>               | Filtered data is the result of processing conversion data through a filter.   |
| <b>Sampling:</b>                    | The term typically refers to the entire process of sampling analog inputs, converting the sampled data, and transferring the conversion results to memory. In certain contexts and stages of the process, sampling may also refer to the SAR ADC capturing data points from an analog signal. |

## 57.3 Features

The SAR ADCs have the following features:

- Support HP ADC<sub>x</sub> controllers and LP ADC<sub>x</sub> controllers to get control of SAR ADC<sub>x</sub> via software, <sub>x</sub> = 1, 2
- 12-bit resolution
- Analog inputs sampling from up to 14 pins
- HP ADC<sub>x</sub> controllers:
  - Provide multi-channel sampling control module, supporting multi-channel sampling mode, with configurable channel sampling sequence
  - Provide mode control module, supporting dual HP ADC sampling
  - Provide two filters with configurable filter coefficients

- Provide two threshold monitors that can trigger an interrupt when the filtered data is above a high threshold or below a low threshold
- Support continuous transfer of conversion results to memory via the GDMA interface
- LP ADC~~x~~ controllers:
  - Support one-shot sampling mode
  - Support sampling in sleep mode (e.g., Deep-sleep)
- Support for several Event Task Matrix (ETM) related events and tasks

## 57.4 Architecture

The major components of SAR ADCs and their interconnections are shown in Figure 57.4-1.

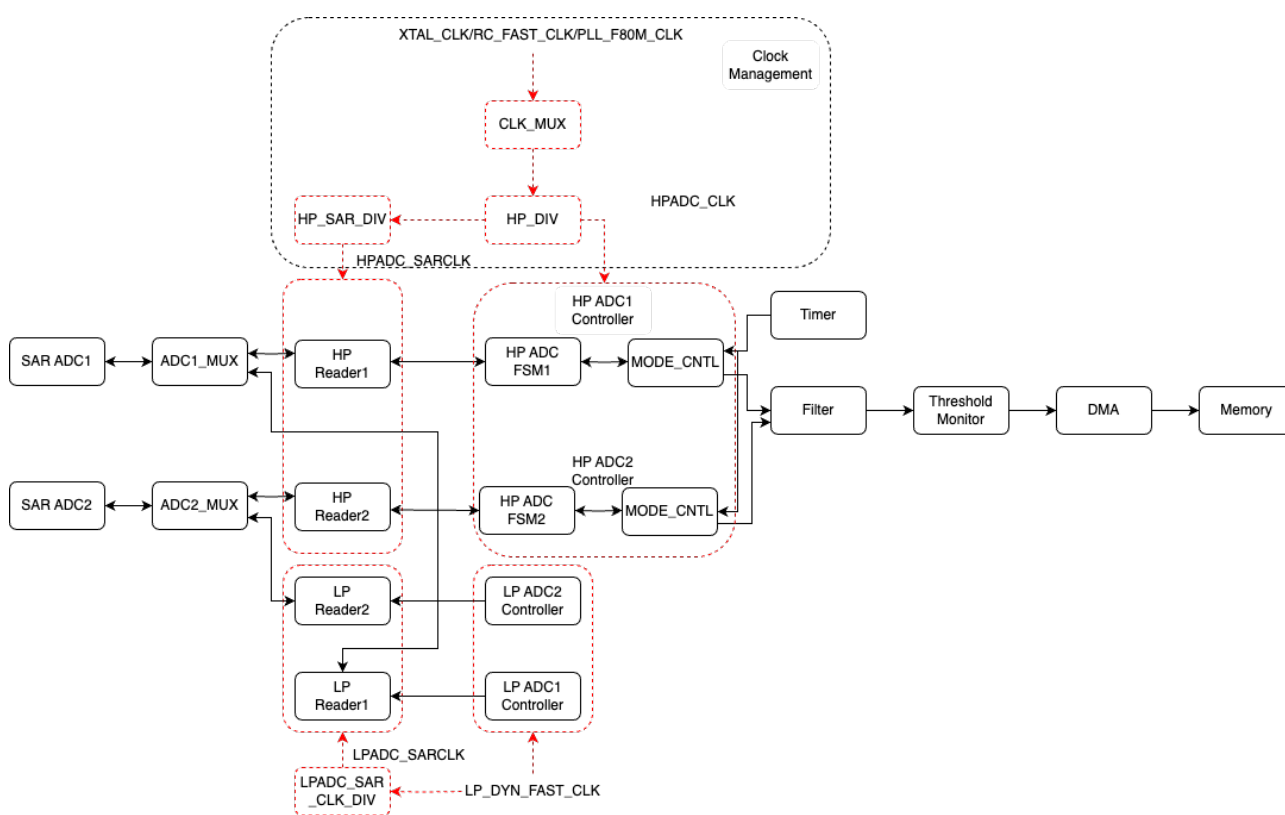

Figure 57.4-1. SAR ADC Architecture

- →: clock signals
- : clock divider, clock mux, and the blocks the clock works for

As Figure 57.4-1 shows, the SAR ADC module contains the following major functional blocks:

- SAR ADC1: Samples analog inputs from up to 8 pins
- SAR ADC2: Samples analog inputs from up to 6 pins
- Clock Management: Selects clock source and division
- Timer: Dedicated timer for the HP ADC~~x~~ controllers to generate sampling enable signal.
- HP ADC FSM~~x~~: FSM1 and FSM2 that can:

- receive the sampling enable signal from the timer.
  - determine the conversion rules defined in the patterns for HP ADC<sub>x</sub>.
  - drive the HP Reader<sub>x</sub> module to read conversion data.
  - transfer conversion data to the filter.
- Filter: Filter0 and filter1, used for filtering conversion results in multi-channel sampling mode.
  - Threshold Monitor: Threshold monitor 0 and threshold monitor 1 that trigger an interrupt when the filtered data is above a high threshold or below a low threshold.
  - MODE\_CNTL: Used for filtering the sampling signal triggered by the timer, supporting dual HP ADC sampling mode.
  - HP Reader<sub>x</sub>: HP reader 1 and HP reader 2, driven by HP ADC FSM<sub>x</sub> to read data from HP ADC<sub>x</sub>.
  - LP Reader<sub>x</sub>: LP reader 1 and LP reader 2, driven by LP ADC<sub>x</sub> Controller to read data from LP ADC<sub>x</sub>.
  - LP ADC<sub>x</sub> Controller: LP ADC1 Controller and LP ADC2 Controller. The controllers provide sampling enable signal, drive the LP Reader<sub>x</sub> module to read the conversion results of LP ADC<sub>x</sub>, and store the conversion results.

## 57.5 Functional Description

### 57.5.1 SAR ADC Power Up

The SAR ADCs can be powered up by setting [PMU\\_XPD\\_PERIF\\_I2C](#) and [PMU\\_PERIF\\_I2C\\_RST](#). The ADC sampling can be conducted immediately after power-up. Users need not be concerned about wait time, as it has been accounted for in the hardware design.

### 57.5.2 SAR ADC Channels

The SAR ADCs have 14 channels that are connected to 14 pins on the chip. To sample an analog signal, the SAR ADCs must first select the analog pin to measure via an internal multiplexer.

Table [57.5-1](#) shows the pins used as SAR ADC channels.

**Table 57.5-1. SAR ADC Channels and Chip Pins**

| Chip Pins | SAR ADC Channel | SAR ADC Selection |
|-----------|-----------------|-------------------|
| GPI016    | 0               | SAR ADC1          |
| GPI017    | 1               |                   |
| GPI018    | 2               |                   |
| GPI019    | 3               |                   |
| GPI020    | 4               |                   |
| GPI021    | 5               |                   |
| GPI022    | 6               |                   |
| GPI023    | 7               |                   |
| GPI049    | 0               |                   |
| GPI050    | 1               |                   |

SAR ADC2

| Chip Pins | SAR ADC Channel | SAR ADC Selection |
|-----------|-----------------|-------------------|
| GPIO51    | 2               |                   |
| GPIO52    | 3               |                   |
| GPIO53    | 4               |                   |
| GPIO54    | 5               |                   |

### 57.5.3 SAR ADC Clock

The clock for the HP ADC<sub>x</sub> Controller has three possible sources, selected by [HP\\_SYS\\_CLKRST\\_ADC\\_CLK\\_SRC\\_SEL](#):

- XTAL\_CLK
- RC\_FAST\_CLK
- PLL\_F80M\_CLK

The following clocks can be divided from the HP ADC<sub>x</sub> Controller's clock:

- HPADC\_SARCLK: It is the operating clock of HP ADC<sub>x</sub> and HP Reader<sub>x</sub>.
- HPADC\_CLK: It is the operating clock of HP ADC FSM<sub>x</sub>.

The frequency of HPADC\_SARCLK can affect the sampling accuracy. If the HPADC\_SARCLK frequency is higher than 5 MHz, the sampling accuracy will decrease. HPADC\_SARCLK is divided from HPADC\_CLK via a dedicated divider. The division is set in [ADC\\_SAR\\_CLK\\_DIV](#).

It takes 25 HPADC\_SARCLK clock cycles to complete one sampling, so the maximum sampling rate is limited by the frequency of HPADC\_SARCLK.

The LP ADC<sub>x</sub> Controller is clocked from LP\_DYN\_FAST\_CLK.

The following clocks can be divided from the LP ADC<sub>x</sub> Controller's clock:

- LPADC\_SARCLK: It is the operating clock of LP ADC<sub>x</sub> and LP Reader<sub>x</sub>. The division set in [LPADC\\_SAR1\\_CLK\\_DIV](#) and [LPADC\\_SAR2\\_CLK\\_DIV](#) should be at least 2. The frequency of LPADC\_SARCLK should not exceed 5 MHz.
- LPADC\_CLK: It is the operating clock of LP ADC FSM<sub>x</sub>.

For more information about clocks, please refer to Chapter 9 [Reset and Clock](#).

### 57.5.4 SAR ADC Conversion and Attenuation

The SAR ADCs can measure analog voltages from 0 mV to  $V_{ref}$ .  $V_{ref}$  is the SAR ADCs' internal reference voltage. The conversion result (*data*) is a 12-bit digital value, which is the raw data. To calculate the voltage  $V_{data}$  based on the raw data, the following formula can be used:

$$V_{data} = \frac{V_{ref}}{4095} \times data$$

To convert voltages larger than  $V_{ref}$ , apply attenuation to the input signals. The attenuation can be configured to 0 dB, 2.5 dB, 6 dB, or 12 dB.

### 57.5.5 HP ADC FSM

In multi-channel sampling mode HP ADC FSM (hereinafter referred to as FSM) generates all types of signals used in the sampling process. Figure 57.5-1 illustrates how the FSM works.

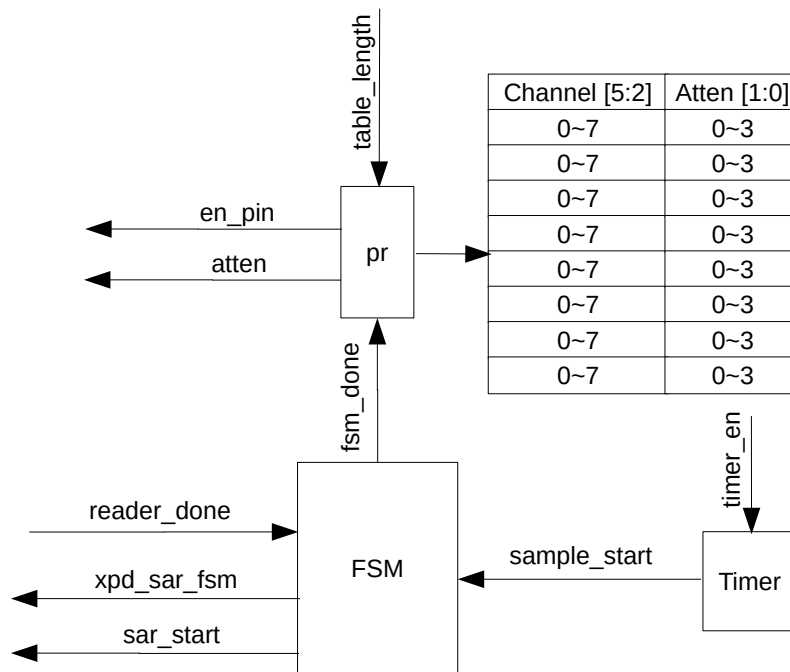

Figure 57.5-1. HP ADC FSM Block Diagram

Wherein:

- Timer: a dedicated timer for the HP ADC controller to generate **sample\_start** signal.
- pr: a pointer to the pattern table that defines the conversion rules for HP ADC. FSM sends out corresponding signals based on the conversion rules.

Set [ADC\\_TIMER\\_EN](#) to enable the timer. The timeout event of this timer triggers a **sample\_start** signal. This signal drives the FSM module to start sampling. When the FSM module receives the **sample\_start** signal, it starts the following operations:

- Powers up HP ADC.
- Determines the conversion rules (selected sample channels and attenuations) defined in the patterns that the current pr points to.
- Outputs the **en\_pin** and **atten** signals corresponding to the conversion rules to the analog side.
- Initiates the **sar\_start** signal and starts sampling.

When FSM receives the **reader\_done** signal from HP Reader, it starts the following operations:

- Stops sampling.
- Transfers the conversion result to the filter. Then the threshold monitor transfers the filtered result to memory via GDMA (see Figure 57.4-1).

- Updates `pr` and waits for the next sampling. The pointer `pr` counts cyclically between 0 and `ADC_SAR1/2_PATT_LEN` (`table_length`).

### 57.5.6 HP ADC Pattern Table

HP ADC FSM1/2 each contain a pattern table configured by `ADC_SARx_PATT_TAB $m$ _REG`, with  $m$  indicating registers 1 ~ 4. Each register contains four patterns and each pattern is 6 bits wide, as below shows.

|                 |  |  |  |  |  |  |  |        |  |  |  |  |  |      |  |        |  |  |  |      |  |  |  |        |  |      |  |  |  |  |  |        |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |
|-----------------|--|--|--|--|--|--|--|--------|--|--|--|--|--|------|--|--------|--|--|--|------|--|--|--|--------|--|------|--|--|--|--|--|--------|--|--|--|--|--|--|--|----|--|--|--|--|--|--|--|----|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|

`cmd  $n$`  ( $n = 12 - 15$ ) represents patterns 12 ~ 15.

Figure 57.5-5. `ADC_SARx_PATT_TAB4_REG` Contains Patterns 12 - 15

Each pattern is 6 bits wide, consisting of two fields where conversion rules are stored. Figure 57.5-6 shows the pattern format and is followed by the descriptions of each field.

| ch_sel |   | atten |   |
|--------|---|-------|---|
| 5      | 2 | 1     | 0 |
| xx     |   | x     | x |

Figure 57.5-6. Pattern Structure

**atten** Configures attenuation:

- 0: 0 dB
- 1: 2.5 dB
- 2: 6 dB
- 3: 12 dB

**ch\_sel** Configures channel. For HP ADC1, values 0-7 correspond to channels 0-7 individually, for HP ADC2, values 2-7 correspond to channels 0-5 individually.

### 57.5.7 HP ADC Pattern Configuration Example for Multi-channel Sampling

Assuming you want to implement the following sequence of HP ADC1 multi-channel sampling:

- Sample channel 2 of HP ADC1 with attenuation of 12 dB;
- Sample channel 0 of HP ADC1 with attenuation of 2.5 dB.

Then, the detailed configuration is as follows:

- Configure the first pattern (cmd0) of `ADC_SAR1_PATT_TAB1_REG[5:0]`:

| ch_sel |   | atten |   |
|--------|---|-------|---|
| 5      | 2 | 1     | 0 |
| 2      |   | 3     |   |

Figure 57.5-7. cmd0 configuration

**atten** write 3 to this field, to set the attenuation to 12 dB.

**ch\_sel** write 2 to this field, to select channel 2.

- Configure the second pattern (cmd1) of `ADC_SAR1_PATT_TAB1_REG[11:6]`:

| ch_sel |   | atten |   |
|--------|---|-------|---|
| 5      | 2 | 1     | 0 |
| 0      |   | 1     |   |

Figure 57.5-8. cmd1 Configuration

**atten** write 1 to this field, to set the attenuation to 2.5 dB.

**ch\_sel** write 0 to this field, to select channel 0.

- Configure `ADC_SAR1_PATT_LEN` to 1, i.e., set pattern table size to (this value + 1) = 2. Then patterns cmd0 and cmd1 will be used.
- Enable the timer so that the HP ADC1 Controller starts sampling the two channels periodically.

## 57.5.8 Dual HP ADC Sampling Control

`ADC_WORK_MODE` controls how two HP ADCs work together:

- 0: Single HP ADC sampling, i.e., only one HP ADC samples. When a sampling request is triggered by the timer, `ADC_SAR_SEL` controls which FSM receives the sampling request:
  - 0: HP ADC FSM1, i.e., using HP ADC1 for sampling.
  - 1: HP ADC FSM2, i.e., using HP ADC2 for sampling.
- 1: Dual HP ADC simultaneous sampling. When a sampling request is triggered by the timer, both HP ADC FSM1 and HP ADC FSM2 receive the sampling request.
- 2: Dual HP ADC alternative sampling. When an odd number of sampling requests are triggered by the timer, HP ADC FSM1 receives the sampling request. When an even number of sampling requests are triggered by the timer, HP ADC FSM2 receives the sampling request.

## 57.5.9 HP ADC Filters

The HP ADC<sub>x</sub> controllers provide two filters for filtering conversion results in multi-channel sampling mode. Both filters can be configured to any HP ADC channel, but cannot be configured to the same channel. If the two filters are configured to the same channel, the first one takes effect.

The filtered data is determined by the following equation:

$$data_{cur} = \frac{(k-1)data_{prev}}{k} + \frac{data_{in}}{k} + 0.5$$

- $data_{cur}$ : the filtered data
- $data_{in}$ : the conversion result
- $data_{prev}$ : the last filtered data
- $k$ : the filter coefficient

The filters are configured as follows:

- Configure `ADC_FILTER_CHANNELx` to select the HP ADC channel for filter  $x$ ,  $x=0, 1$ .
- Configure `ADC_FILTER_FACTORx` to set the coefficient  $k$  for filter  $x$ ,  $x=0, 1$ .

## 57.5.10 HP ADC Threshold Monitors

The HP ADC<sub>x</sub> controllers provide two threshold monitors to monitor the filtered data in multi-channel sampling mode. When the data is above the high threshold, a high threshold interrupt is triggered; when the data is below the low threshold, a low threshold interrupt is triggered. Both monitors can be configured to any HP ADC channel, but cannot be configured to the same channel.

Threshold monitors are configured as follows:

- Set `ADC_THRESx_EN` to enable threshold monitor  $x$  ( $x=0, 1$ ).
- Configure `ADC_THRESx_LOW` to set a low threshold.
- Configure `ADC_THRESx_HIGH` to set a high threshold.

- Configure `ADC_THRESx_CHANNEL` to select the channel to monitor.

### 57.5.11 HP ADC GDMA Support

When HP ADC converts data on multiple channels, it is necessary to enable GDMA so that the data can be transferred to memory continuously.

GDMA support is triggered by the timer in the HP ADC<sub>x</sub> controllers. Users can switch the GDMA data path to the HP ADC controller by configuring `ADC_APB_ADC_TRANS`. For specific GDMA configuration, please refer to Chapter 3 *GDMA Controller (GDMA-AHB, GDMA-AXI)*.

The HP ADC eventually passes 32-bit data to GDMA. The data format is shown in Figure 57.5-9.

Figure 57.5-9. GDMA Data Format

**data** 12-bit HP ADC conversion result

**ch\_sel** 3-bit channel information

### 57.5.12 LP ADC Wake-Up Modes for Automatic Monitoring

The LP ADC<sub>x</sub> controllers support automatic monitoring of the conversion data. A dedicated timer generates LP ADC sampling signals periodically based on the value of `LPADC_ADCx_HW_READ_RATE_I`. Then the conversion data is fed into a threshold monitor (not the HP ADC threshold monitors). If the data exceeds the threshold, an interrupt will be generated.

There are two wake-up modes for automatic monitoring, selected by `LPADC_SARx_WAKEUP_MODE`:

- 0: Absolute value mode  
Monitors the absolute value of the conversion data. Configure `LPADC_SARx_WAKEUP_TH_LOW` and `LPADC_SARx_WAKEUP_TH_HIGH` to set the thresholds. Wake-up will be triggered if the data is above the high threshold or below the low threshold.
- 1: Change value mode  
Monitors the changes of the conversion data. If the increment of two consecutive samplings exceeds the high threshold configured in `LPADC_SARx_WAKEUP_TH_HIGH`, or the decrement of two consecutive samplings exceeds the low threshold configured in `LPADC_SARx_WAKEUP_TH_LOW`, a wake-up will be triggered. For example, when `LPADC_SARx_WAKEUP_TH_LOW` is set to 8, and the two consecutive conversion results are 28 and 19, resulting in a decrement of 9, a wake-up will be triggered.

## 57.6 Event Task Matrix Feature

The SAR ADC on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows SAR ADC's ETM tasks to be triggered by any peripherals' ETM events, or SAR ADC's ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM tasks and events related to SAR ADC. For more information, please refer to Chapter 12 *Event Task Matrix (ETM)*.

The SAR ADC can receive the following ETM tasks:

- ADC\_TASK\_SAMPLEO: LP ADC starts one-shot sampling when this task is triggered.
- ADC\_TASK\_STARTO: HP ADC starts multi-channel sampling when this task is triggered.
- ADC\_TASK\_STOPO: SAR ADC stops sampling when this task is triggered.

The SAR ADC can generate the following ETM events:

- ADC\_EVT\_CONV\_CMPLTO: Generated each time SAR ADC completes a sampling in either one-shot sampling mode or multi-channel sampling mode.
- ADC\_EVT\_EQ\_ABOVE\_THRESH<sub>x</sub>: Generated when the HP ADC's filtered data is above the threshold. <sub>x</sub> = 0, 1, representing threshold monitor 0, 1.
- ADC\_EVT\_EQ\_BELOW\_THRESH<sub>x</sub>: Generated when the HP ADC's filtered data is below the threshold. <sub>x</sub> = 0, 1, representing threshold monitor 0, 1.
- ADC\_EVT\_STARTEDO: Generated when SAR ADC begins sampling; one-shot sampling will not trigger this event.
- ADC\_EVT\_STOPPEDO: Generated when SAR ADC stops sampling, one-shot sampling will not trigger this event.

In practical applications, SAR ADC's ETM events can trigger its own ETM tasks. For example, the ADC\_EVT\_EQ\_ABOVE\_THRESH<sub>x</sub> event can trigger the ADC\_TASK\_STOPO task.

## 57.7 Interrupts

ESP32-P4's SAR ADC can generate the following interrupt signals that will be sent to the [Interrupt Matrix](#).

- ADC\_INTR
- LP\_ADC\_INTR

The following internal interrupt sources from SAR ADC can generate the interrupt signal ADC\_INTR:

- ADC\_SAR<sub>x</sub>\_DONE\_INT: Triggered when HP ADC<sub>x</sub> completes one sampling.
- ADC\_THRES<sub>x</sub>\_HIGH\_INT: Triggered when the filtered data is above the high threshold.
- ADC\_THRES<sub>x</sub>\_LOW\_INT: Triggered when the filtered data is below the low threshold.

The following internal interrupt sources from SAR ADC can generate the interrupt signal LP\_ADC\_INTR:

- LPADC\_COCPU\_SARADC<sub>x</sub>\_DONE\_INT: Triggered when LP ADC<sub>x</sub> completes one sampling.
- LPADC\_COCPU\_SARADC<sub>x</sub>\_ERROR\_INT: Triggered when sampling error occurs.
- LPADC\_COCPU\_SARADC<sub>x</sub>\_WAKE\_INT: Triggered when LP ADC<sub>x</sub> generates a wake-up event (such as conversion data exceeding the threshold).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section [57.9 Register Summary](#).

## 57.8 Programming Procedure

### 57.8.1 HP ADC Multi-Channel Sampling Mode

The multi-channel sampling mode can be configured with the following procedure:

1. Set [PMU\\_XPD\\_PERIF\\_I2C](#) and [PMU\\_PERIF\\_I2C\\_RST](#) to power up HP ADC.
2. Configure [HP\\_SYS\\_CLKRST\\_ADC\\_CLK\\_SRC\\_SEL](#) to select HP ADC clock source.
3. Configure [HP\\_SYS\\_CLKRST\\_ADC\\_CLK\\_DIV\\_NUM](#) and [HP\\_SYS\\_CLKRST\\_ADC\\_SARx\\_CLK\\_DIV\\_NUM](#) to set clock division.
4. Set [HP\\_SYS\\_CLKRST\\_ADC\\_CLK\\_EN](#) to enable HP ADC clock.
5. Set [LPADC\\_SARx\\_DIG\\_FORCE](#) to enable the sampling channel.
6. Configure the pattern table as described in Section [57.5.6 HP ADC Pattern Table](#).
7. Configure channels and filtering coefficients as described in Section [57.5.9 HP ADC Filters](#).
8. Configure threshold monitoring as described in Section [57.5.10 HP ADC Threshold Monitors](#), as needed.
9. Set [ADC\\_APB\\_ADC\\_TRANS](#) to use GDMA.
10. Configure [ADC\\_TIMER\\_TARGET](#) to set trigger target for HP ADC timer.
11. Set [ADC\\_TIMER\\_EN](#) to enable the timer.

The timer timeout will trigger HP ADC FSM to start sampling according to the pattern table. The conversion result will be automatically stored in memory. When the sampling reaches the specified limit in [ADC\\_APB\\_ADC\\_EOF\\_NUM](#), it will terminate.

Once sampling is complete, an [ADC\\_SARx\\_DONE\\_INT\\_RAW](#) interrupt will be generated.

### 57.8.2 LP ADC One-shot Sampling Mode

The one-shot sampling mode can be configured with the following procedure:

1. Set [PMU\\_XPD\\_PERIF\\_I2C](#) and [PMU\\_PERIF\\_I2C\\_RSTB](#) to power up LP ADC.
2. Configure [LPPERI\\_LPADC\\_FUNC\\_DIV\\_NUM](#) and [LPPERI\\_LPADC\\_SARx\\_DIV\\_NUM](#) to set the frequency of [LPADC\\_CLK](#) and [LPADCx\\_SARCLK](#).
3. Configure [LPADC\\_SARx\\_EN\\_PAD](#) and [LPADC\\_SARx\\_ATTEN](#) to select sampling channels and attenuation.
4. Set [LPADC\\_SAR\\_MEASx\\_START\\_SAR](#) to enable the one-shot sampling mode of LP ADCx.

Once sampling is complete, an [LPADC\\_COCPU\\_SARADCx\\_INT\\_RAW](#) interrupt is generated. Software can read the conversion result from [LPADC\\_SAR\\_MEASn\\_DATA\\_SAR](#).

### 57.8.3 LP ADC Automatic Monitoring

The configuration process for the automatic monitoring of the LP ADC controller is as follows:

1. Configure [LPADC\\_ADCx\\_HW\\_READ\\_RATE\\_I](#) to set the sampling rate.
2. Configure [LPADC\\_SARx\\_WAKEUP\\_MODE](#) to select the wake-up mode.

3. Configure `LPADC_SARx_WAKEUP_TH_HIGH` and `LPADC_SARx_WAKEUP_TH_LOW` to set the high and low thresholds.
4. Set `LPADC_SARx_WAKEUP_EN` to enable automatic monitoring.
5. Set `LPADC_ADCx_HW_READ_EN_I` to enable periodic monitoring.

During the automatic monitoring process, the conversion data will not be stored, but software can always read the last conversion data from `LPADC_SAR_MEASn_DATA_SAR`.

## 57.9 Register Summary

### 57.9.1 HP ADC Register Summary

The addresses in the table below are relative to the base address of HP ADC (written as ADC Controller) in Table 6.3-2 in Chapter 6 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

| Name                                    | Description                                   | Address | Access   |
|---|---|---------|----------|

## 57.10 Registers

### 57.10.1 HP ADC Registers

The addresses in the following section are relative to the base address of HP ADC (written as ADC Controller) provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

**Register 571. ADC\_CTRL\_REG (0x0000)**

|            |    |                    |    |                    |    |            |    |                       |    |                       |    |                   |    |                   |  |                 |   |                   |   |             |   |               |   |          |       |
|------------|----|--------------------|----|--------------------|----|------------|----|-----------------------|----|-----------------------|----|-------------------|----|-------------------|--|-----------------|---|-------------------|---|-------------|---|---------------|---|----------|-------|
| (reserved) |    | ADC_XPD_SAR2_FORCE |    | ADC_XPD_SAR1_FORCE |    | (reserved) |    | ADC_SAR2_PATT_P_CLEAR |    | ADC_SAR1_PATT_P_CLEAR |    | ADC_SAR2_PATT_LEN |    | ADC_SAR1_PATT_LEN |  | ADC_SAR_CLK_DIV |   | ADC_SAR_CLK_GATED |   | ADC_SAR_SEL |   | ADC_WORK_MODE |   | reserved |       |
| 31         | 30 | 29                 | 28 | 27                 | 26 | 25         | 24 | 23                    | 22 | 21                    | 18 |                   | 17 | 14                |  | 13              | 6 |                   | 5 | 4           | 3 | 2             | 1 | 0        | Reset |
| 0          | 0  | 0                  | 0  | 0                  | 0  | 0          | 0  | 0                     | 0  | 15                    |    | 15                |    | 4                 |  | 1               |   | 0                 | 0 | 0           | 0 |               |   |          |       |

**ADC\_WORK\_MODE** Configures dual HP ADC sampling.

- 0: Single HP ADC sampling
  - 1: Dual HP ADC simultaneous sampling
  - 2: Dual HP ADC alternative sampling.
- (R/W)

**ADC\_SAR\_SEL** Configures which HP ADC to use for single HP ADC sampling.

- 0: Use HP ADC1
  - 1: Use HP ADC2
- (R/W)

**ADC\_SAR\_CLK\_GATED** Enable HP ADC clock gate when HP ADC is in idle.

- 0: Disable
  - 1: Enable
- (R/W)

**ADC\_SAR\_CLK\_DIV** Configures HP ADC clock division. Division = configured value + 1. (R/W)

**ADC\_SAR1\_PATT\_LEN** Configures how many pattern table entries will be used for HP ADC1.

- 0: Use only cmd0
  - 1: Use cmd0 and cmd1
  - n: Use cmd0 to cmdn, the maximum n is 7
- (R/W)

**ADC\_SAR2\_PATT\_LEN** Configures how many pattern table entries will be used for HP ADC2.

- 0: Use only cmd0
  - 1: Use cmd0 and cmd1
  - n: Use cmd0 to cmdn, the maximum n is 7
- (R/W)

**ADC\_SAR1\_PATT\_P\_CLEAR** Clears the pointer of pattern table for HP ADC1 Controller.

- 0: No effect
  - 1: Clear
- (R/W)

**ADC\_SAR2\_PATT\_P\_CLEAR** Clears the pointer of pattern table for HP ADC2 Controller.

- 0: No effect
  - 1: Clear
- (R/W)

Continued on the next page...

**Register 57.1. ADC\_CTRL\_REG (0x0000)**

Continued from the previous page...

**ADC\_XPD\_SAR1\_FORCE** Keep HP ADC1 powered on forcefully.

0: No effect

1: Power on forcefully

(R/W)

**ADC\_XPD\_SAR2\_FORCE** Keep HP ADC2 powered on forcefully.

0: No effect

1: Power on forcefully

(R/W)

**Register 57.2. ADC\_CTRL2\_REG (0x0004)**

|                 |  |  |  |  |  |  |  |              |  |  |  |                  |    |  |  |            |    |  |  |                              |    |     |   |                  |  |   |  |                    |  |       |  |   |  |
|-----------------|--|--|--|--|--|--|--|--------------|--|--|--|------------------|----|--|--|------------|----|--|--|------------------------------|----|-----|---|------------------|--|---|--|--------------------|--|-------|--|---|--|
| (reserved)      |  |  |  |  |  |  |  | ADC_TIMER_EN |  |  |  | ADC_TIMER_TARGET |    |  |  | (reserved) |    |  |  | ADC_SAR2_INV<br>ADC_SAR1_INV |    |     |   | ADC_MAX_MEAS_NUM |  |   |  | ADC_MEAS_NUM_LIMIT |  |       |  |   |  |
| 31              |  |  |  |  |  |  |  | 25           |  |  |  | 24               | 23 |  |  |            | 12 |  |  |                              | 11 | 10  | 9 | 8                |  |   |  | 1                  |  |       |  | 0 |  |
| 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  | 0            |  |  |  | 10               |    |  |  | 0          |    |  |  | 0                            | 0  | 255 |   |                  |  | 0 |  |                    |  | Reset |  |   |  |

**ADC\_MEAS\_NUM\_LIMIT** Configures whether to enable the limitation of HP ADC's maximum conversion times.

0: Disable

1: Enable

(R/W)

**ADC\_MAX\_MEAS\_NUM** Configures the HP ADC's maximum conversion times. (R/W)**ADC\_SAR1\_INV** Configures whether to invert the data of HP ADC1.

0: Do not invert.

1: Invert the date.

(R/W)

**ADC\_SAR2\_INV** Configures whether to to invert the data of HP ADC2.

0: Do not invert.

1: Invert the date.

(R/W)

**ADC\_TIMER\_TARGET** Configures HP ADC timer target. (R/W)**ADC\_TIMER\_EN** Configures whether to enable HP ADC timer trigger.

0: Disable

1: Enable

(R/W)

### Register 57.3. ADC\_FILTER\_CTRL1\_REG (0x0008)

[illegible]

**ADC\_FILTER\_FACTOR1** Configures the filter coefficient  $k$  for HP ADC filter 1.

0:  $k=0$  (i.e., the filter is disabled)

1:  $k=2$ 

2:  $k=4$

3:  $k=8$ 

4:  $k=16$

5:  $k=32$

6:  $k=64$ 

(R/W)

**ADC\_FILTER\_FACTOR0** Configures the filter coefficient  $k$  for HP ADC filter 0 (same as above). (R/W)

### Register 57.4. ADC\_SAR1\_PATT\_TAB1\_REG (0x0018)

Diagram of the SAR1\_PATT\_TAB1 register. The register is 32 bits wide, divided into a 9-bit reserved field (bits 31-24) and a 23-bit data field (bits 23-0). The data field contains the value 0x0000. The label 'SAR1\_PATT\_TAB1' is placed above the data field.

**ADC\_SAR1\_PATT\_TAB1** Configures entries 0 ~ 3 for HP ADC FSM1. Each entry is 6-bit wide. See Section [57.5.6 HP ADC Pattern Table](#). (R/W)

### Register 57.5. ADC\_SAR1\_PATT\_TAB2\_REG (0x001C)

|                 |  |  |  |  |  |  |  |                    |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |
|-----------------|--|--|--|--|--|--|--|--------------------|--|--|--|--|--|--|--|----|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|
| (reserved)      |  |  |  |  |  |  |  | ADC_SAR1_PATT_TAB2 |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |
| 31              |  |  |  |  |  |  |  | 24                 |  |  |  |  |  |  |  | 23 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |
| 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  | 0x0000             |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |

**ADC\_SAR1\_PATT\_TAB2** Configures entries 4 ~ 7 for HP ADC FSM1. Each entry is 6-bit wide. See Section [57.5.6 HP ADC Pattern Table](#). (R/W)

**Register 57.6. ADC\_SAR1\_PATT\_TAB3\_REG (0x0020)**

|            |  |  |  |  |  |  |  |                    |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |        |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |
|------------|--|--|--|--|--|--|--|--------------------|--|--|--|--|--|--|--|----|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|---|--|--|--|--|--|--|--|--------|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|
| (reserved) |  |  |  |  |  |  |  | ADC_SAR1_PATT_TAB3 |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |        |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |
| 31         |  |  |  |  |  |  |  | 24                 |  |  |  |  |  |  |  | 23 |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  |   |  |  |  |  |  |  |  |        |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |
| 0          |  |  |  |  |  |  |  | 0                  |  |  |  |  |  |  |  | 0  |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  | 0 |  |  |  |  |  |  |  | 0x0000 |  |  |  |  |  |  |  | Reset |  |  |  |  |  |  |  |

**ADC\_SAR1\_PATT\_TAB3** Configures entries 8 ~ 11 for HP ADC FSM1. Each entry is 6-bit wide. See Section [57.5.6 HP ADC Pattern Table](#). (R/W)

**Register 57.7. ADC\_SAR1\_PATT\_TAB4\_REG (0x0024)**

|                 |  |  |  |  |  |  |  |                    |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |
|-----------------|--|--|--|--|--|--|--|--------------------|--|--|--|--|--|--|--|----|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|---|
| (reserved)      |  |  |  |  |  |  |  | ADC_SAR1_PATT_TAB4 |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |
| 31              |  |  |  |  |  |  |  | 24                 |  |  |  |  |  |  |  | 23 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  | 0 |
| 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  | 0x0000             |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |  |  |  |  |  |  |  |   |

**ADC\_SAR1\_PATT\_TAB4** Configures entries 12 ~ 15 for HP ADC FSM1. Each entry is 6-bit wide. See Section [57.5.6 HP ADC Pattern Table](#). (R/W)

**Register 57.8. ADC\_SAR2\_PATT\_TAB1\_REG (0x0028)**

|                 |  |  |  |  |  |  |  |                    |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |
|-----------------|--|--|--|--|--|--|--|--------------------|--|--|--|--|--|--|--|----|--|--|--|--|--|--|--|--|--|--|--|--|--|--|-------|--|--|--|--|--|--|--|---|
| (reserved)      |  |  |  |  |  |  |  | ADC_SAR2_PATT_TAB1 |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  |   |
| 31              |  |  |  |  |  |  |  | 24                 |  |  |  |  |  |  |  | 23 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |       |  |  |  |  |  |  |  | 0 |
| 0 0 0 0 0 0 0 0 |  |  |  |  |  |  |  | 0x0000             |  |  |  |  |  |  |  |    |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Reset |  |  |  |  |  |  |  |   |

**ADC\_SAR2\_PATT\_TAB1** Configures entries 0 ~ 3 for HP ADC FSM2. Each entry is 6-bit wide. See Section [57.5.6 HP ADC Pattern Table](#). (R/W)

(reserved)

ADC\_SAR2\_PATT\_TAB2

**ADC\_SAR2\_PATT\_TAB2** Configures entries 4 ~ 7 for HP ADC FSM2. Each entry is 6-bit wide. See Section [57.5.6 HP ADC Pattern Table](#). (R/W)

(reserved)

ADC\_SAR2\_PAT\_TAB3

**ADC\_SAR2\_PATT\_TAB3** Configures entries 8 ~ 11 for HP ADC FSM2. Each entry is 6-bit wide. See Section [57.5.6 HP ADC Pattern Table](#). (R/W)

(reserved)

ADC\_SAR2\_PATT\_TAB4

**ADC\_SAR2\_PATT\_TAB4** Configures entries 12 ~ 15 for HP ADC FSM2. Each entry is 6-bit wide. See Section [57.5.6 HP ADC Pattern Table](#). (R/W)

**Register 57.12. ADC\_FILTER\_CTRL0\_REG (0x003C)**

Reset

**ADC\_FILTER\_CHANNEL0** Configures the ADC channel for filter 0. Value 0 ~ 7 corresponds to channel 0 ~ 7 in HP ADC1, value 10 ~ 15 corresponds to channel 0 ~ 5 in HP ADC2. (R/W)

**ADC\_FILTER\_CHANNEL1** Configure the ADC channel for filter 1. Same as above. (R/W)

**ADC\_FILTER\_RESET** Configures whether to reset the filter.

0: No effect

1: Reset

(R/W)

**Register 57.13. ADC\_THRES0\_CTRL\_REG (0x0044)**

Reset

**ADC\_THRES0\_CHANNEL** Configures the ADC channel for threshold monitor 0. Value 0 ~ 7 corresponds to channel 0 ~ 7 in HP ADC1, value 10 ~ 15 corresponds to channel 0 ~ 5 in HP ADC2. (R/W)

**ADC\_THRES0\_HIGH** Configures the high threshold for HP ADC threshold monitor 0. (R/W)

**ADC\_THRES0\_LOW** Configures the low threshold for HP ADC threshold monitor 0. (R/W)

**ADC\_THRES\_ALL\_EN** Configures whether to enable the threshold monitoring for all configured channels.  
 0: Disable  
 1: Enable  
 (R/W)

**ADC\_THRES1\_EN** Configures whether to enable threshold monitor 1.  
 0: Disable  
 1: Enable  
 (R/W)

**ADC\_THRES0\_EN** Configures whether to enable threshold monitor 0.  
 0: Disable  
 1: Enable  
 (R/W)

**Register 57.16. ADC\_INT\_ENA\_REG (0x0050)**

**ADC\_APB\_ADC\_EOF\_NUM** Configures the number of samples. When the sampling reaches the configured number, the EOF flag bit sent to GDMA will be pulled high. (R/W)

**ADC\_APB\_ADC\_RESET\_FSM** Configures whether to reset the status of HP ADC controller.

0: No effect

1: Reset

(R/W)

**ADC\_APB\_ADC\_TRANS** Configures whether to let HP ADC controller use GDMA.

0: No effect

1: HP ADC controller uses DMA

(R/W)

### Register 57.21. ADC\_CTRL\_DATA\_REG (0x03FC)

Diagram illustrating the structure of the `ADC_CTRL` register:

- Bit 31: (reserved)
- Bits 30-0: `ADC_CTRL_DATE`
- Bit 0: `Reset`

**ADC\_CTRL\_DATE** HP ADC version control register. (RO)

## 57.10.2 LP ADC Registers

The addresses in the following section are relative to LP ADC's base address provided in Table 6.3-2 in Chapter 6 *System and Memory*.

For how to program reserved fields, please refer to Section [Programming Reserved Register Field](#).

Register 57.22. LPADC\_READER1\_CTRL\_REG (0x0000)

**LPADC\_SAR1\_CLK\_DIV** Configures the division of LP ADC1’s clock LPADC\_SARCLK. (R/W)

**LPADC\_SAR1\_DATA\_INV** Configures whether to to invert the data of LP ADC1.

0: Do not invert the data.

1: Invert the data.

(R/W)

**LPADC\_SAR1\_INT\_EN** Enables LP ADC1 to send out interrupt. (R/W)

**LPADC\_SAR1\_EN\_PAD\_FORCE\_ENABLE** Configures whether to use software to force enable [LPADC\\_SAR1\\_EN\\_PAD](#).

2: Force off

3: Force enable

Other values: Hardware control (enabled during sampling)

(R/W)

Register 57.23. LPADC\_MEAS1\_CTRL2\_REG (0x000C)

|                         |     |  |  |  |  |  |  |  |  |  |                   |  |  |  |  |  |  |  |    |    |    |                         |    |  |  |  |  |  |  |  |  |  |                       |  |  |  |  |  |  |       |   |  |  |                      |  |  |  |  |  |  |  |  |  |  |                      |  |  |  |  |  |  |  |  |  |  |

| LPADC_SAR1_EN_PAD_FORCE |     |  |  |  |  |  |  |  |  |  | LPADC_SAR1_EN_PAD |  |  |  |  |  |  |  |    |    |    | LPADC_MEAS1_START_FORCE |    |  |  |  |  |  |  |  |  |  | LPADC_MEAS1_START_SAR |  |  |  |  |  |  |       |   |  |  | LPADC_MEAS1_DONE_SAR |  |  |  |  |  |  |  |  |  |  | LPADC_MEAS1_DATA_SAR |  |  |  |  |  |  |  |  |  |  |
| 31                      | 30  |  |  |  |  |  |  |  |  |  |                   |  |  |  |  |  |  |  | 19 | 18 | 17 | 16                      | 15 |  |  |  |  |  |  |  |  |  |                       |  |  |  |  |  |  |       | 0 |  |  |                      |  |  |  |  |  |  |  |  |  |  |                      |  |  |  |  |  |  |  |  |  |  |
| 0                       | 0x0 |  |  |  |  |  |  |  |  |  |                   |  |  |  |  |  |  |  | 0  | 0  | 0  | 0x00                    |    |  |  |  |  |  |  |  |  |  |                       |  |  |  |  |  |  | Reset |   |  |  |                      |  |  |  |  |  |  |  |  |  |  |                      |  |  |  |  |  |  |  |  |  |  |

**LPADC\_MEAS1\_DATA\_SAR** Stores LP ADC1's conversion data in one-shot sampling mode. (RO)

**LPADC\_MEAS1\_DONE\_SAR** Indicates whether LP ADC1 conversion is done. (RO)

**LPADC\_MEAS1\_START\_SAR** Configures whether to start LP ADC1 by software.

0: No effect

1: Start LP ADC1 by software

Valid only when [LPADC\\_MEAS1\\_START\\_FORCE](#) = 1.

(R/W)

**LPADC\_MEAS1\_START\_FORCE** Configures whether to use software to enable LP ADC1 sampling.

0: Select FSM to start LP ADC1 sampling

1: Select software to start LP ADC1 sampling

(R/W)

**LPADC\_SAR1\_EN\_PAD** Configures the sampling channel for LP ADC1. Value 0 ~ 7 corresponds to channel 0 ~ 7. (R/W)

**LPADC\_SAR1\_EN\_PAD\_FORCE** Configures whether to use software to select the sampling channel for LP ADC1.

0: No effect

1: Use software to control

(R/W)

LPADC\_SAR1\_DIG\_FORCE

(reserved)

LPADC\_SAR1\_ATTEN

Register 57.26. LPADC\_READER2\_CTRL\_REG (0x0024)

|                   |    |    |     |    |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |     |                                |  |  |  |  |  |  |  |                     |  |  |  |  |  |  |  |

- LPADC\_COCPU\_SARADC1\_INT\_ENA Enable bit of LPADC\_COCPU\_SARADC1\_DONE\_INT. (R/WTC)
- LPADC\_COCPU\_SARADC2\_INT\_ENA Enable bit of LPADC\_COCPU\_SARADC2\_DONE\_INT. (R/WTC)
- LPADC\_COCPU\_SARADC1\_ERROR\_INT\_ENA Enable bit of LPADC\_COCPU\_SARADC1\_ERROR\_INT. (R/WTC)
- LPADC\_COCPU\_SARADC2\_ERROR\_INT\_ENA Enable bit of LPADC\_COCPU\_SARADC2\_ERROR\_INT. (R/WTC)
- LPADC\_COCPU\_SARADC1\_WAKE\_INT\_ENA Enable bit of LPADC\_COCPU\_SARADC1\_WAKE\_INT. (R/WTC)
- LPADC\_COCPU\_SARADC2\_WAKE\_INT\_ENA Enable bit of LPADC\_COCPU\_SARADC2\_WAKE\_INT. (R/WTC)

### Register 57.33. LPADC\_INT\_ST\_REG (0x0050)

Diagram of the LPADC\_COCPU\_SARADC1\_WAKE\_INT\_ST register. The register is 32 bits wide. Bits 31-6 are reserved. Bits 5-0 are status bits for LPADC\_COCPU\_SARADC1\_WAKE\_INT\_ST, LPADC\_COCPU\_SARADC2\_WAKE\_INT\_ST, LPADC\_COCPU\_SARADC1\_ERROR\_INT\_ST, LPADC\_COCPU\_SARADC2\_ERROR\_INT\_ST, LPADC\_COCPU\_SARADC1\_INT\_ST, and LPADC\_COCPU\_SARADC2\_INT\_ST. The register is reset to 0.

**LPADC\_COCPU\_SARADC1\_INT\_ST** Status bit of [LPADC\\_COCPU\\_SARADC1\\_DONE\\_INT](#). (RO)

**LPADC\_COCPU\_SARADC2\_INT\_ST** Status bit of [LPADC\\_COCPU\\_SARADC2\\_DONE\\_INT](#). (RO)

LPADC\_COCPU\_SARADC1\_ERROR\_INT\_ST Status bit of LPADC\_COCPU\_SARADC1\_ERROR\_INT.  
(RO)

LPADC\_COCPU\_SARADC2\_ERROR\_INT\_ST Status bit of LPADC\_COCPU\_SARADC2\_ERROR\_INT.  
(RO)

LPADC\_COCPU\_SARADC1\_WAKE\_INT\_ST Status bit of LPADC\_COCPU\_SARADC1\_WAKE\_INT. (RO)

LPADC\_COCPU\_SARADC2\_WAKE\_INT\_ST Status bit of LPADC\_COCPU\_SARADC2\_WAKE\_INT.  
(RO)

Register 57.34. LPADC\_INT\_CLR\_REG (0x0054)

**LPADC\_ADC2\_HW\_READ\_EN\_I** Configures whether to enable automatic monitoring for LP ADC2.

0: Disable

1: Enable

(R/W)

**LPADC\_ADC2\_HW\_READ\_RATE\_I** Configures the sampling rate for hardware-triggered automatic monitoring for LP ADC2. The sampling period = configured value × LP ADC2's working clock cycle. (R/W)

## Chapter 58

# Analog Voltage Comparator

## 58.1 Introduction

ESP32-P4 integrates two analog voltage comparators, i.e., analog voltage comparator [0](#) and analog voltage comparator [1](#). These comparators rely on special pads that support voltage comparison functionality to monitor voltage changes on these pads. Each analog voltage comparator has two pads associated with it, for the main voltage and the reference voltage respectively. The voltage comparison result generated by the analog voltage comparator can be used as Event Task Matrix (ETM) events to drive ETM tasks of other peripherals or trigger interrupts.

**Note:**

The information provided in this chapter applies to both analog voltage comparator [0](#) and analog voltage comparator [1](#). Unless otherwise indicated, the analog voltage comparator in this chapter refer to both analog voltage comparator [0](#) and analog voltage comparator [1](#).

## 58.2 Feature List

The analog voltage comparator has the following features:

- Voltage comparison
  - Configurable voltage comparison mode
  - Configurable reference voltage
- Interrupt upon changes of voltage comparison result
- ETM event generation

## 58.3 Architectural Overview

Figure [58.3-1](#) shows the structure of the analog voltage comparator.

Figure 58.3-1. Analog Voltage Comparator Architecture

As shown in the figure above, the analog voltage comparator consists of:

- Two pad interfaces:
  - PAD1: Main voltage interface
  - PADO: External reference voltage interface
- VREF: Internal reference voltage interface
- mode\_control: Register-controlled switch for selecting the reference voltage source
- COMP\_OUT: Comparator voltage comparison result, which is an on-chip internal signal that cannot be directly accessed externally
  - If the main voltage is higher than the reference voltage, the COMP\_OUT signal is high.
  - If the main voltage is lower than the reference voltage, the COMP\_OUT signal is low.

## 58.4 Functional Description

The analog voltage comparator has the following functions:

- **Voltage comparison**

The analog voltage comparator relies on a specialized pads that support voltage comparison. For more information about general-purpose pads, please refer to Chapter 8 [GPIO Matrix and IO MUX](#). Table below shows the mapping between the PAD of analog voltage comparator *0* and GPIO pins.

Table 58.4-1. Mapping Between PAD and GPIO

| Analog Voltage Comparator          | PADO   | PAD1   |
|------------------------------------|--------|--------|
| Analog voltage comparator <i>0</i> | GPIO51 | GPIO52 |
| Analog voltage comparator <i>1</i> | GPIO53 | GPIO54 |

The comparison mode and reference voltage are configurable. For detailed configuration procedures, see Section 58.7 [Programming Procedures](#).

The voltage comparison results are output as the COMP\_OUT signal.

- **Voltage comparison mode control**

The analog voltage comparator compares the main voltage with the reference voltage, which can either be internal or external. There are two voltage comparison modes depending on the reference voltage selection:

- Comparing the main voltage with the external reference voltage.
- Comparing the main voltage with the internal reference voltage.

The voltage comparison mode can be configured through `LPSYSREG_MODE_COMP $n$`  ( $n = 0 \sim 1$ ).

- **Reference voltage configuration**

The internal reference voltage range is  $0 \sim (0.7 \times VDD\_IO\_6)$  V with a step of  $0.1 \times VDD\_IO\_6$  V, where `VDD_IO_6` is the supply voltage of the analog voltage comparator which is equal to the power supply voltage of the chip (usually 3.3 V). The internal reference voltage value can be configured through `LPSYSREG_DREF_COMP $n$`  ( $n = 0 \sim 1$ ).

The external reference voltage is accessed directly from the pad with an input range of  $0 \sim 0.7 \times VDD\_IO\_6$  V, same as the internal reference voltage, requiring no additional configuration.

- **Voltage comparison interrupt processing**

The voltage comparison result, i.e., the `COMP_OUT` signal, can be either high or low. Whenever the output value changes, a corresponding interrupt signal is generated.

## 58.5 Event Task Matrix Feature

The analog voltage comparator on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows analog voltage comparator ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM events related to analog voltage comparator. For more information, please refer to [Chapter 12 Event Task Matrix \(ETM\)](#).

The analog voltage comparator can generate the following ETM events:

- `GPIO_EVT_ZERO_DET_POS $n$` : Indicates that the `COMP_OUT` signal changes from low level to high level, i.e., the main voltage changes from below to above the reference voltage.
- `GPIO_EVT_ZERO_DET_NEG $n$` : Indicates that the `COMP_OUT` signal changes from high level to low level, i.e., the main voltage changes from higher to lower than the reference voltage.

The analog voltage comparator does not support any ETM tasks.

## 58.6 Interrupts

ESP32-P4's analog voltage comparator can generate the `GPIO_PAD_COMP_INT` interrupt signal that will be sent to the [Interrupt Matrix](#).

There are several internal interrupt sources from analog voltage comparator that can generate the above interrupt signal. The interrupt sources from analog voltage comparator are listed with their trigger conditions and the resulted interrupt signal(s) in [Table 58.6-1](#).

Table 58.6-1. Analog Voltage Comparator's Internal Interrupt Sources

| Internal Interrupt Source                 | Trigger Condition  | Interrupt Signal  |
|---|--|-------------------|
| GPIO_COMP $n$ _ALL_INT ( $n = 0 \sim 1$ ) | Any COMP_OUT signal transition occurs                    | GPIO_PAD_COMP_INT |
| GPIO_COMP $n$ _NEG_INT ( $n = 0 \sim 1$ ) | The COMP_OUT signal changes from high level to low level | GPIO_PAD_COMP_INT |
| GPIO_COMP $n$ _POS_INT ( $n = 0 \sim 1$ ) | The COMP_OUT signal changes from low level to high level | GPIO_PAD_COMP_INT |

**Note:**

For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter 11 [Interrupt Matrix](#) > Section 11.2 [Interrupt Terminology in ESP32-P4](#).

Each interrupt source can be configured by a common set of registers that are described in Section [Interrupt Configuration Registers](#). The specific registers can be found in Section 8.19.1 [HP GPIO Matrix Register Summary](#).

## 58.7 Programming Procedures

The programming procedure for the analog voltage comparator is as follows:

**Note:**

For more information about the register fields mentioned in this section, refer to Chapter 3 [System Registers](#) [to be added later].

1. Enable the comparator by setting LPSYSREG\_XPD\_COMP $n$  ( $n = 0 \sim 1$ ) to 1.
2. Disable normal digital pad functions (including IE, OE, WPU, and WPD) for PAD1, and if using the external reference voltage, also for PADO. For detailed configuration, see Chapter 8 [GPIO Matrix and IO MUX](#).
3. Configure the comparison mode by setting LPSYSREG\_MODE\_COMP $n$  ( $n = 0 \sim 1$ ):
  - 0: Configures to compare the main voltage with the internal reference voltage;
  - 1: Configures to compare the main voltage with the external reference voltage.
4. Configure the internal reference voltage through LPSYSREG\_DREF\_COMP $n$  ( $n = 0 \sim 1$ ), which offers a voltage range of  $0 \sim (0.7 \times VDD\_IO\_6)$  V with a step of  $0.1 \times VDD\_IO\_6$  V.

## Abbreviations Related to Registers

|        |   |
|--------|---|
| REG    | <b>Register.</b>  |
| SYSREG | <b>System registers</b> are a group of registers that control system reset, memory, clocks, software interrupts, power management, clock gating, etc.   |
| ISO    | <b>Isolation.</b> If a peripheral or other chip component is powered down, the pins, if any, to which its output signals are routed will go into a floating state. ISO registers isolate such pins and keep them at a certain determined value, so that the other non-powered-down peripherals/devices attached to these pins are not affected. |
| NMI    | <b>Non-maskable interrupt</b> is a hardware interrupt that cannot be disabled or ignored by the CPU instructions. Such interrupts exist to signal the occurrence of a critical error.   |
| W1TS   | Abbreviation added to names of registers/fields to indicate that such register/field should be used to set a field in a corresponding register with a similar name. For example, the register <code>GPIO_ENABLE_W1TS_REG</code> should be used to set the corresponding fields in the register <code>GPIO_ENABLE_REG</code> .                   |
| W1TC   | Same as <i>W1TS</i> , but used to clear a field in a corresponding register.  |

## Access Types for Registers

Sections *Register Summary* and *Register Description* in TRM chapters specify access types for registers and their fields.

Most frequently used access types and their combinations are as follows:

- |          |              |               |
|----------|--------------|---------------|
| • RO     | • R/W/SS     | • R/WS/SS/SC  |
| • WO     | • R/W/SS/SC  | • R/SS/WTC    |
| • WT     | • R/WC/SS    | • R/SC/WTC    |
| • R/W    | • R/WC/SC    | • R/SS/SC/WTC |
| • R/W1   | • R/WC/SS/SC | • RF/WF       |
| • WL     | • R/WS/SC    | • R/SS/RC     |
| • R/W/SC | • R/WS/SS    | • varies      |

Descriptions of all access types are provided below.

- R **Read.** User application can read from this register/field; usually combined with other access types.
- RO **Read only.** User application can only read from this register/field.
- HRO **Hardware Read Only.** Only hardware can read from this register/field; used for storing default settings for variable parameters.
- W **Write.** User application can write to this register/field; usually combined with other access types.
- WO **Write only.** User application can only write to this register/field.
- W1 **Write Once.** User application can write to this register/field only once; only allowed to write 1; writing 0 is invalid.
- SS **Self set.** On a specified event, hardware automatically writes 1 to this register/field; used with 1-bit fields.
- SC **Self clear.** On a specified event, hardware automatically writes 0 to this register/field; used with 1-bit and multi-bit fields.
- SM **Self modify.** On a specified event, hardware automatically writes a specified value to this register/field; used with multi-bit fields.
- SU **Self update.** On a specified event, hardware automatically updates this register/field; used with multi-bit fields.
- RS **Read to set.** If user application reads from this register/field, hardware automatically writes 1 to it.
- RC **Read to clear.** If user application reads from this register/field, hardware automatically writes 0 to it.
- RF **Read from FIFO.** If user application writes new data to FIFO, the register/field automatically reads it.
- WF **Write to FIFO.** If user application writes new data to this register/field, it automatically passes the data to FIFO via APB bus.
- WS **Write any value to set.** If user application writes to this register/field, hardware automatically sets this register/field.

- W1S **Write 1 to set.** If user application writes 1 to this register/field, hardware automatically sets this register/field.
- W0S **Write 0 to set.** If user application writes 0 to this register/field, hardware automatically sets this register/field.
- WC **Write any value to clear.** If user application writes to this register/field, hardware automatically clears this register/field.
- W1C **Write 1 to clear.** If user application writes 1 to this register/field, hardware automatically clears this register/field.
- W0C **Write 0 to clear.** If user application writes 0 to this register/field, hardware automatically clears this register/field.
- WT **Write 1 to trigger an event.** If user application writes 1 to this field, this action triggers an event (pulse in the APB bus) or clears a corresponding WTC field (see WTC).
- WTC **Write to clear.** Hardware automatically clears this field if user application writes 1 to the corresponding WT field (see WT).
- W1T **Write 1 to toggle.** If user application writes 1 to this field, hardware automatically inverts the corresponding field; otherwise - no effect.
- W0T **Write 0 to toggle.** If user application writes 0 to this field, hardware automatically inverts the corresponding field; otherwise - no effect.
- WL **Write if a lock is deactivated.** If the lock is deactivated, user application can write to this register/field.
- varies **The access type varies.** Different fields of this register might have different access types.

## Programming Reserved Register Field

### Introduction

A field in a register is reserved if the field is not open to users, or produces unpredictable results if configured to values other than defaults.

### Programming Reserved Register Field

The reserved fields should not be modified. It is not possible to write only part of a register since registers must always be written as a whole. As a result, to write an entire register that contains reserved fields, you can choose one of the following two options:

1. Read the value of the register, modify only the fields you want to configure and then write back the value so that reserved fields are untouched.

OR

2. Modify only the fields you want to configure and write back the default value of the reserved fields. The default value of a field is provided in the "Reset" line of a register diagram. For example, the default value of Field\_A in [Register X](#) is 1.

**Register 58.1. Register X (Address)**

|            |   |   |   |   |   |   |   |   |   |   |   |         |  |    |    |            |    |   |   |   |   |   |   |   |   |   |   |         |   |         |   |       |
|------------|---|---|---|---|---|---|---|---|---|---|---|---------|--|----|----|------------|----|---|---|---|---|---|---|---|---|---|---|---------|---|---------|---|-------|
| (reserved) |   |   |   |   |   |   |   |   |   |   |   | Field_C |  |    |    | (reserved) |    |   |   |   |   |   |   |   |   |   |   | Field_B |   | Field_A |   |       |
| 31         |   |   |   |   |   |   |   |   |   |   |   | 20      |  | 19 | 16 |            | 15 | 2 |   |   |   |   |   |   |   |   |   |         |   | 1       | 0 |       |
| 0          | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0000    |  | 0  | 0  | 0          | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0       | 0 | 0       | 1 | Reset |

Suppose you want to set Field\_A, Field\_B, and Field\_C of [Register X](#) to 0x0, 0x1, and 0x2, you can:

- Use option 1 and fill in the reserved fields with the value you have just read. Suppose the register reads as 0x0000\_0003. Then, you can modify the fields you want to configure, thus writing 0x0002\_0002 to the register.
- Use option 2 and fill in the reserved fields with their defaults, thus writing 0x0002\_0002 to the register.

## Interrupt Configuration Registers

Generally, the peripherals' internal interrupt sources can be configured by the following common set of registers:

- **RAW** (Raw Interrupt Status) register: This register indicates the raw interrupt status. Each bit in the register represents a specific internal interrupt source. When an interrupt source triggers, its RAW bit is set to 1.
- **ENA** (Enable) register: This register is used to enable or disable the internal interrupt sources. Each bit in the ENA register corresponds to an internal interrupt source.

By manipulating the ENA register, you can mask or unmask individual internal interrupt source as needed. When an internal interrupt source is masked (disabled), it will not generate an interrupt signal, but its value can still be read from the RAW register.

- **ST** (Status) register: This register reflects the status of enabled interrupt sources. Each bit in the ST register corresponds to a specific internal interrupt source. The ST bit being 1 means that both the corresponding RAW bit and ENA bit are 1, indicating that the interrupt source is triggered and not masked. The other combinations of the RAW bit and ENA bit will result in the ST bit being 0.

The configuration of ENA/RAW/ST registers is shown in Table 58.7-4.

- **CLR** (Clear) register: The CLR register is responsible for clearing the internal interrupt sources. Writing 1 to the corresponding bit in the CLR register clears the interrupt source.

Table 58.7-4. Configuration of ENA/RAW/ST Registers

| ENA Bit Value | RAW Bit Value | ST Bit Value |
|---------------|---------------|--------------|
| 0             | Ignored       | 0            |
| 1             | 0             | 0            |
|               | 1             | 1            |

## Revision History

| Date       | Version | Release notes       |
|------------|---------|---------------------|
| 2025-06-04 | v0.1    | Preliminary release |
